(54) **Title:** PERSONAL CLOUD COMPUTING WITH SESSION MIGRATION

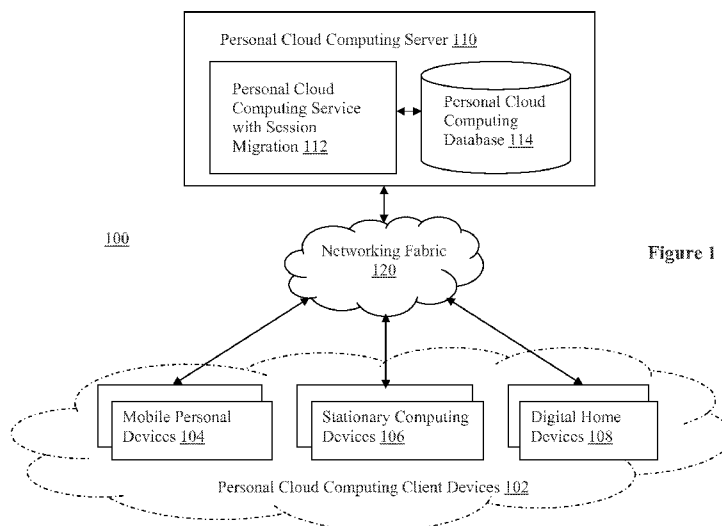

Figure 1

(57) **Abstract:** Methods and systems associated with personal cloud computing (PCC) are disclosed herewith. In embodiments, a method may include receiving, by a PCC client device, a message from a PCC server. The message may include information for migrating a session of an application executing on another PCC client device off the other client device. In response, an application may be launched, by the client device, to migrate the session onto the client device, using the information included in the message. In embodiments, a PCC server may be configured to receive a request from a PCC client device to migrate a session of an application executing on the client device off the client device; and in response, to send a message to another PCC client device equipped to launch an application on the other client device to migrate the session onto the other client device. The message may include information for the migration. Other embodiments are also disclosed and claimed.

WO 2012/033667 A2

PERSONAL CLOUD COMPUTING WITH SESSION MIGRATION

TECHNICAL FIELD

Embodiments relate to the fields of data processing, in particular, to methods, apparatuses and articles associated with personal cloud computing with session
5 migrating.

BACKGROUND

Unless otherwise indicated herein, the materials described in this section are not prior art to the claims in this application and are not admitted to be prior art by inclusion in this section.

10 In today's digital, interconnected environment, most users own several computing, communication, and/or entertainment devices. In most cases, under the current art, these devices operate as isolated entities, as it is often difficult or requires technical knowledge and/or skill to have the different devices seamlessly work together. In general, there is a lack of continuous experience for whatever activity the user is performing on or with the
15 various devices.

For example, many users listen to music through their laptops, using their respective playlists built-up and/or associated with online music stores. Often times, they also own in-vehicle infotainment devices, with Internet enabled media players. However, under today's technology, these users are generally not able to enjoy a continuous experience
20 when they move from their offices/homes into their vehicles or vice versa.

Similarly, many users often desire to switch Internet browsing from their desktops to their Smart Phones or vice versa. Again, under today's technology, the experience is often discontinuous.

25 **BRIEF DESCRIPTION OF THE DRAWING**

Embodiments of the present disclosure will be presented by way of exemplary embodiments, but not limitations, illustrated in the accompanying drawings in which like references denote similar elements, and in which:

Figure 1 illustrates an overview of a personal computing cloud with session migration;

Figure 2 illustrates one of the personal cloud computing Client Devices of Figure 1 in further details;

5 Figure 3 illustrates the personal cloud computing server of Figure 1 in further details;

Figure 4 illustrates the personal cloud computing database of Figure 1 in further details;

Figure 5 illustrates various personal cloud computing processes;

10 Figure 6 illustrate an example personal cloud computing display;

Figure 7 illustrate an example session migration; and

Figure 8 illustrates an example computer system suitable for use to practice various Client Device and/or server aspects of personal cloud computing, where all of the foregoing illustrations are arranged in accordance with embodiments of the present disclosure.

15

DETAILED DESCRIPTION

Embodiments of methods and systems associated with personal cloud computing (PCC) with session migration are disclosed herewith. In embodiments, a method may include receiving, by a PCC Client Device (hereinafter, simply Client Device), a
20 message from a PCC server (hereinafter, simply server). The message may include information for migrating a session of an application executing on another Client Device off the other Client Device. In response, an application may be launched, by the Client Device, to migrate the session onto the Client Device, using the information included in the message.

25 In various embodiments, receiving a message may include receiving, by the Client Device, a message from the server, wherein the message includes metadata of the application of the other Client Device, actions supported by the application of the other Client Device, data formats supported by the application of the other Client Device, a

locator identifying resources used by the application of the other Client Device, or one or more parameter values to enable resumption of the session on the Client Device in a particular state. In various embodiments, launching an application may include launching an application, by the Client Device, that supports the actions supported by the application of the other Client Device, or the data formats supported by the application of the other Client Device.

In various embodiments, the method may further comprise determining, by the Client Device, an application on the Client Device that supports the actions supported by the application of the other Client Device, or the data formats supported by the application of the other Client Device. In various embodiments, the method may further include registering, by the Client Device, an application of the Client Device, with the server, including registering metadata of the application being registered, actions supported by the application being registered, or data formats supported by the application being registered. In various embodiments, the method may further include registering, by the Client Device, the Client Device, with the server. In various embodiments, the method may further include, receiving, by the Client Device, from the server, statuses of applications of other Client Devices of the personal computing cloud; and displaying, by the Client Device, the statuses.

In various embodiments, a Client Device with a networking interface, a processor and storage medium, may be provided with programming instructions configured to cause the Client Device to perform the above described methods, in response to execution of the instructions by the Client Device.

In various embodiments, a server may be configured to receive a request from a Client Device to migrate a session of an application executing on the Client Device off the Client Device; and in response, to send a message to another Client Device equipped to launch an application on the other Client Device to migrate the session onto the other Client Device. The message may include information for the migration.

In various embodiments, an article of manufacture with storage medium may

include programming instructions stored therein configured to program a server to perform the above described server methods, in response to execution of the programming instructions by the server.

Various aspects of the illustrative embodiments will be described using terms commonly employed by those skilled in the art to convey the substance of their work to others skilled in the art. However, it will be apparent to those skilled in the art that alternate embodiments may be practiced with only some of the described aspects. For purposes of explanation, specific numbers, materials, and configurations are set forth in order to provide a thorough understanding of the illustrative embodiments. However, it will be apparent to one skilled in the art that alternate embodiments may be practiced without the specific details. In other instances, well-known features are omitted or simplified in order not to obscure the illustrative embodiments.

Further, various operations will be described as multiple discrete operations, in turn, in a manner that is most helpful in understanding the illustrative embodiments; however, the order of description should not be construed as to imply that these operations are necessarily order dependent. In particular, these operations need not be performed in the order of presentation.

The phrase “in one embodiment” is used repeatedly. The phrase generally does not refer to the same embodiment; however, it may. The terms “comprising,” “having,” and “including” are synonymous, unless the context dictates otherwise. The phrase “A/B” means “A or B”. The phrase “A and/or B” means “(A), (B), or (A and B)”. The phrase “at least one of A, B and C” means “(A), (B), (C), (A and B), (A and C), (B and C) or (A, B and C)”. The phrase “(A) B” means “(B) or (A B)”, that is, A is optional.

Figure 1 illustrates an overview of a personal computing cloud with session migration, in accordance with embodiments of the present disclosure. As illustrated, personal cloud computing (PCC) environment 100 includes a number of PCC Client Devices (hereinafter, simply Client Device) 102, coupled with PCC server (hereinafter, simply Server) 110, via networking fabric 120. Client Devices 102 may include one or

more mobile personal devices 104, stationary computing devices 106 and/or digital home devices 108. Server 110 may include PCC service with session migration (hereinafter, simply Service) 112 and PCC database (hereinafter, simply Database) 114.

Client Devices 102, except for the teachings of the present disclosure, are intended to represent a broad range of these devices known in the art. Examples of mobile personal devices 104 may include, but are not limited to, smart phones (also sometimes simply referred to as mobile phones, as the functionalities of mobile phones continue to improve), mobile internet devices, personal digital assistants, portable media players, laptop computers, tablet computers, electronic book readers, portable game players, digital cameras, and so forth. Stationary computing devices 106 may include, but are not limited to, various desktop computers and in-vehicle infotainment devices. Digital home devices 108 may include, but are not limited to, digital communication enabled televisions, digital video recorders, and other digital home appliances.

Server 110, except for the teachings of the present disclosure, is intended to represent a broad range of server devices known in the art. Server 110 may be a single server or a cluster of servers locally and/or remotely coupled via direct coupling, local area networks and/or wide area networks. The couplings may be wired and/or wireless.

Networking fabric 120 is intended to represent a broad range of private and/or public local and/or wide area networks known in the art. The networks may be wired or wireless. A portion or the entire networking fabric may be local area network and/or wide area network.

As will be described in more details below, with references to Figures 2-8, by virtue of the teachings of the present disclosure, application session on one Client Device 102 may be seamlessly migrated to another Client Device 102. As a result, users of Client Device 102 may enjoy a continuous experience, otherwise not available under current technology. Figure 7 illustrates an example migration of a video session from a digital home device (television) 652 to a laptop computer 654.

Referring now to Figure 2, wherein a Client Device 102 of Figure 1 is illustrated

in further details, in accordance with various embodiments of the present disclosure. As shown, for the illustrated embodiments, Client Device 102 may include one or more applications 202, a personal cloud computing client (hereinafter, simply Client) 204 and various system (communication) services 206, operatively coupled to each other.

5 Applications 202, except for the teachings of present disclosure, are intended to represent a broad range of applications known in the art. Examples of applications 202, may include, but are not limited to, video, audio, internet browsing and/or gameplay applications. Beside their primary functions, that is, video rendering, audio rendering, gameplay, and so forth, applications 202 may be additionally configured to register
10 themselves with Client 204. In particular, applications 202 may be additionally configured to register their metadata, actions and/or data/file formats supported.

For example, a video application may register its metadata, the fact that it supports the actions of “play,” “pause,” “stop” and “seek,” and video data/file formats of ogv (promulgated by the Xiph.Org Foundation), avi (Audio Video Interleaved
15 introduced by Microsoft Corp.), mpg (promulgated by Moving Picture Experts Group), and/or wmv (Window Media Video developed by Microsoft Corp.), or an audio application may register its metadata, the fact that it supports similar actions, as well as audio data/file formats of ogg (promulgated by the Xiph.Org Foundation), mps (promulgated by Moving Picture Experts Group), wma (Window Media Audio
20 developed by Microsoft Corp.), acc (Advanced Audio Coding, standardized by International Organization for Standardization), and/or wav (Waveform Audio File Format, developed by Microsoft Corp.). Similarly, a multimedia player may register its metadata, and the fact that it supports the actions of “open” and “book marking,” and data/file formats of m3u (developed by Nullsoft), asx (Advanced Stream Redirector by
25 Microsoft Corp) , xspf (XMF Shareable Playlist Format, sponsored by Xiph.Org Foundation), wpl (Windows Media Player Playlist, developed by Microsoft Corp.), and/or pls (Playlist format), whereas an e-book application may register its metadata, the fact that it supports similar actions, and data/file formats of txt (Text File Format), azw

(a Kindle eBook File Format), opf (Open Packaging File Format), tr3 (TomeRaider eBook File Format), xml (Extensible Markup Language, produced by W3C), chm (Compiled HTML File Format), or pdf (Portable Document Format by Adobe Systems).

In various embodiments, Client 204 may be configured to register Client Device and its applications 202, including the applications' metadata, actions and/or data/file formats supported, with service 112 of server 110. Further, Client 204 may be configured to report the status of applications 202 to service 112, receive status of other applications 202 on other Client Device 102, as well as to display status of its own and other applications 202. In various embodiments, Client 204 is configured to be conversant in Extensible Messaging and Presence Protocol (XMPP). System (communication) services 206 may be configured to provide various conventional system, in particular, communication services for applications 202 and Client 204. Services 206 may include resource (such as processor, memory and storage) allocations, and/or network communications with external devices, such as server 110.

Referring now to Figure 3, wherein Server 110 of Figure 1 is illustrated in further details, in accordance with various embodiments of the present disclosure. As shown, for the illustrated embodiments, Server 110 may include service 112 and system (communication) services 306, operatively coupled to each other. Service 112 may include registration and status services 302 and session migration services 304. In various embodiments, registration and status services 302 may be configured to cooperate with Client 204 of Client Device 102 to register the respective applications 202. Further, registration and status services 302 may be configured to cooperate with the various Clients 204 to enable the various Clients 204 to be aware of, and able to respectively display the status of selected ones or all applications 202. Session migration services 304 may be configured to enable the seamless migration of application sessions from one Client Device 102 to another Client Device 102. System (communication) services 306, similar to system (communication) services 206, may be configured to provide various conventional system services, in particular,

communication services for registration and status service 302 and session migration service 304. Services 306 may include resource (such as processor, memory and storage) allocations, and/or network communications with external devices, such as Client Device 102. In various embodiments, both registration and status services 302 and session migration services 304 are configured to support Extensible Messaging and Presence Protocol (XMPP).

Referring now to Figure 4, wherein Database 114 of Figure 1 is illustrated in further details, in accordance with various embodiments of the present disclosure. As shown, for the illustrated embodiments, Database 114 may include various data structures (not shown), e.g., tables to store the identification of the registered Client Device 102, their applications 202, and the associated information of applications 202. In various embodiments, the data structures may be configured to store identification 402 and status 404 of each registered Client Device 102. Further, for each registered Client Device 102, identification 406 of each registered application 202 may be stored. Additionally, for each registered application, metadata 408, supported actions 410, and supported data/file format 412 may also be stored.

Referring now to Figure 5, wherein various PCC processes, in accordance with various embodiments of the present disclosure, are illustrated. As shown, the processes may include a process wherein a client 204 of a Client Device 102 may register or deregister the Client Device 102 with service 112, 502. In response, registration and status services 302 of service 112 may register or de-register the Client Device 102 accordingly, 504.

Additionally, the processes may include a process wherein an application 202 of a Client Device 102 may register or deregister itself with client 204 of the Client Device 102, 512. In response, client 204 of the Client Device 102 may store or discard the identification of the application, and associated information, as well as register or deregister the application and the associated information with service 112, 514. Similarly, in response, registration and status services 302 of service 112 may register or

de-register the applications 202 of Client Device 102 accordingly, 516.

Continuing to refer to Figure 5, the processes may include a process wherein on status change of an application 202 of a Client Device 102 or the Client Device 102 itself (e.g., online, idle, and so forth), the client 204 of the Client Device 102 may report
5 the status change to registration and status service 302, 522. In response, registration and status service 302, may broadcast the new status information to the other Client Device 102, and update the status it maintains, 524. On receipt of new status of one of its own application 202 or an application 202 of another Client Device 102, client 204 may update a local status display of the various Client Device 102, 526.

10 An example status display is shown in Figure 6. Accordingly, a user of Client Device 102 of the present disclosure, may be able to discern the status of all the Client Devices 102 within his/her personal computing cloud with session migration 100.

Referring back to Figure 5, the processes may include a process wherein client 204 of a Client Device 102 (e.g., Client Device _A) may request session migration
15 services 304 to migrate a session of one its applications to another Client Device (e.g., Client Device _B) 102, 532. In various embodiments, Client 204 may offer the function that enables a user to make such a request. For these embodiments, Client 204 may initiate the request in response to receipt of a user request. In other embodiments, applications 202 may offer the function that enables a user to make such a request. For
20 these embodiments, Client 204 may initiate the request in response to receipt of the user request through an application 202. In either case, the session migration request may be sent to service 112 in the form of a message. The message may include the metadata of the application, the supported actions and data/file format of the application. Additionally, the message may include a locator (e.g., an Uniform Resource Locator,
25 identifying the location of the data used by the application session, and/or the parameter values for a successor application of the session to re-launch the session in a particular state.

In various embodiments, the Client Device_B 102 may be determined/selected by

session migration services 304, based on the provided information in the message, e.g., metadata of the application, actions and data/file format supported and so forth. In other embodiments, the specification of Client Device_B 102 may be provided to session migration services 304. On receipt or determination of the target Client Device_B 102, session migration services 304 may inform (534) client 204 of Client Device_B 102 of the metadata of the application, which session is being migrated, the application's supported actions and/or data/file formats. In various embodiments, session migration services 304 may further inform client 202 of Client Device_B 102, of the location of the resource associated with the session, and parameter values for re-starting the session at a particular state.

In various embodiments, on receipt of the migration information (metadata et al), Client 204 of a Client Device 102, determines which registered application 202 of the Client Device 102 is the appropriate successor application for the session, 536. In various embodiments, if multiple applications 202 are eligible, Client 204 may offer a menu of the eligible applications for a user to select (not shown). In any event, on determination or selection of the successor application, if not launched already, Client 204 may launch the successor application, and transfer execution to the successor application, 538, thereby enabling seamless migration of a session from one Client Device of a personal computing cloud to another Client Device of the personal computing cloud.

Figure 8 illustrates an example computer system suitable for use to practice Client Device and/or server aspects of various embodiments of the present disclosure. As shown, computing system 700 includes a number of processors or processor cores 702, and system memory 704. For the purpose of this application, including the claims, the terms "processor" and "processor cores" may be considered synonymous, unless the context clearly requires otherwise. Additionally, computing system 700 includes mass storage devices 706 (such as diskette, hard drive, compact disc read only memory (CDROM) and so forth), input/output devices 708 (such as display, keyboard, cursor control and so

forth) and communication interfaces 710 (such as network interface cards, modems and so forth). The elements are coupled to each other via system bus 712, which represents one or more buses. In the case of multiple buses, they are bridged by one or more bus bridges (not shown).

5 Each of these elements performs its conventional functions known in the art. In particular, system memory 704 and mass storage 706 may be employed to store a working copy and a permanent copy of the programming instructions implementing the various components, such as client 204, registration and status service 302, or session migration service 304, herein collectively denoted as 722. The various components may
10 be implemented by assembler instructions supported by processor(s) 702 or high-level languages, such as, for example, C, that can be compiled into such instructions.

The permanent copy of the programming instructions may be placed into permanent storage 706 in the factory, or in the field, through, for example, a distribution medium (not shown), such as a compact disc (CD), or through communication interface
15 710 (from a distribution server (not shown)). That is, one or more distribution media having an implementation of the agent program may be employed to distribute the agent and program various computing devices.

The constitution of these elements 702-712 are known, and accordingly will not be further described.

20 Although specific embodiments have been illustrated and described herein, it will be appreciated by those of ordinary skill in the art that a wide variety of alternate and/or equivalent implementations may be substituted for the specific embodiments shown and described, without departing from the scope of the embodiments of the present invention. This application is intended to cover any adaptations or variations of the embodiments
25 discussed herein. Therefore, it is manifestly intended that the embodiments of the present invention be limited only by the claims and the equivalents thereof.

What is claimed is:

1. A method for personal cloud computing, comprising:
receiving, by a client device of a personal computing cloud, a message from a server associated with the personal computing cloud, wherein the message includes
5 information for migrating a session of an application executing on another client device of the personal computing cloud off the other client device;
launching an application, by the client device, to migrate the session onto the client device, using the information included in the message.
2. The method of claim 1, wherein receiving a message comprises receiving, by the
10 client device, a message from the server, wherein the message includes metadata of the application of the other client device, actions supported by the application of the other client device, data formats supported by the application of the other client device, a locator identifying resources used by the application of the other client device, or one or more
parameter values to enable resumption of the session on the client device in a particular
15 state.
3. The method of claim 2, wherein launching an application comprises launching an application, by the client device, that supports the actions supported by the application of the other client device, or the data formats supported by the application of the other client device.
- 20 4. The method of claim 1, further comprising determining, by the client device, an application on the client device that supports the actions supported by the application of the other client device, or the data formats supported by the application of the other client device.
5. The method of claim 1, further comprising registering, by the client device, an
25 application of the client device, with the server, including registering metadata of the application being registered, actions supported by the application being registered, or data formats supported by the application being registered.
6. The method of claim 1, further comprising registering, by the client device, the

client device, with the server.

7. The method of claim 1, further comprising

receiving, by the client device, from the server, statuses of applications of other client devices of the personal computing cloud; and

5 displaying, by the client device, the statuses.

8. A client apparatus for personal cloud computing, comprising:

a networking interface configured to couple the client apparatus to a network;

a processor coupled with the networking interface, and configured to execute instructions; and

10 a storage medium coupled with the processor, and having stored therein a plurality of programming instructions configured to program the client apparatus, to enable the apparatus, in response to execution of the programming instructions, to operate as a client device of a personal computing cloud, including to

receive a message from a server associated with the personal computing cloud,

15 wherein the message includes information for migrating a session of an application executing on another client device of the personal computing cloud off the other client device;

launch an application to migrate the session onto the client apparatus, using the information included in the message.

20 9. The client apparatus of claim 8, wherein to receive a message comprises to receive a message from the server, with metadata of the application of the other client device, actions supported by the application of the other client device, data formats supported by the application of the other client device, a locator identifying resources used by the application of the other client device, or one or more parameter values to enable
25 resumption of the session on the client device in a particular state.

10. The client apparatus of claim 9, wherein to launch an application comprises to launch an application that supports the actions supported by the application of the other client device, or the data formats supported by the application of the other client device.

11. The client apparatus of claim 9, wherein the programming instructions further enable the apparatus, in response to execution of the programming instructions, to determine an application on the client apparatus that supports the actions supported by the application of the other client device, or the data formats supported by the application of
5 the other client device.

12. The client apparatus of claim 9, wherein the programming instructions further enable the apparatus, in response to execution of the programming instructions, to register an application of the client apparatus, with the personal cloud computing server, including registration of metadata of the application being registered, actions supported by the
10 application being registered, or data formats supported by the application being registered.

13. The client apparatus of claim 9, wherein the programming instructions further enable the apparatus, in response to execution of the programming instructions, to register the client apparatus, with the personal cloud computing server.

14. The client apparatus of claim 9, wherein the programming instructions further
15 enable the apparatus, in response to execution of the programming instructions, to receive from the personal cloud computing server, statuses of applications of other client device of the personal computing cloud; and display the statuses.

15. The client apparatus of claim 9 wherein the client apparatus comprises a selected
20 one of a mobile personal device, a stationary computing device, or a digital home device.

16. An article of manufacture for personal cloud computing, comprising non-transitory tangible computer readable storage medium; and programming instructions stored in the storage medium, and configured to program an apparatus, to enable the apparatus, in response to execution of the instructions by the
25 apparatus, to perform operations of a server of a personal computing cloud, including: receiving a request from a client device of the personal computing cloud to migrate a session of an application executing on the client device off the client device; and

sending a message to another client device of the personal computing cloud equipped to launch an application on the other client device to migrate the session onto the other client device, wherein the message includes information for the migration.

5 17. The article of claim 16, wherein sending a message comprises sending a message that includes metadata of the application of the client device, actions supported by the application of the client device, data formats supported by the application of the client device, a locator identifying resources used by the application of the client device, or one or more parameter values to enable resumption of the session on the other client device in
10 a particular state.

18. The article of claim 16, wherein the operations further comprise determining the client device.

19. The article of claim 16, wherein the operations further comprise registering an application of the client device, including registering metadata of the application being
15 registered, actions supported by the application being registered, or data formats supported by the application being registered.

20. The article of claim 16, wherein the operations further comprise registering the client device.

21. A server for personal cloud computing, comprising
20 a networking interface configured to couple the server to a network;
a processor coupled to the networking interface, and configured to execute instructions;

storage medium coupled to the processor, and having stored therein programming instructions configured to program the server, to enable the server, in response to
25 execution of the instructions by the server, to operate in a personal computing cloud, to receive a request from a client device of the personal computing cloud to migrate a session of an application executing on the client device off the client device; and

send a message to another client device of the personal computing cloud
equipped to launch an application on the other client device to migrate the
session onto the other client device, wherein the message includes
information for the migration.

5 22. The server of claim 21, wherein to send a message comprises to send a message
that includes metadata of the application of the client device, actions supported by the
application of the client device, data formats supported by the application of the client
device, a locator identifying resources used by the application of the client device, or one
or more parameter values to enable resumption of the session on the other client device in
10 a particular state.

23. The server of claim 21, wherein the programming instructions further enable the
apparatus to determine the client device.

24. The server of claim 21, wherein the programming instructions further enable the
apparatus to register an application of the client device, including registration of metadata
15 of the application being registered, actions supported by the application being registered,
or data formats supported by the application being registered.

25. The server of claim 21, wherein the programming instructions further enable the
apparatus to register the client device.
