(57) **ABSTRACT**

A multi-chip module and a chip set that comprises a plurality of the multi-chip modules. The multi-chip module includes a plurality of functional circuits provided on a substrate, the circuits defining a plurality of signal inputs and outputs. A plurality of pins are secured in a single row along the periphery of the substrate and are connected to the inputs and outputs. The pins include a set of 91 signal pins, two ground pins, and a power pin, the signal pins having a configuration complying in number and signal type with the IEEE-Prequirements to define an ISA bus. The multi-chip module includes a rectangular housing wherein the pins, in the form of gull wing pins, extend laterally from a peripherally extending wall. The ISA bus pins extend along one side and partially along adjacent sides of the rectangular module. The functional circuits of one embodiment of the module include a CPU, serial interfaces, a parallel interface, a hard drive interface, a floppy disk interface, a keyboard interface, and flash memory. Other multi-chip modules can include a PCMCIA interface, an Ethernet interface, or a display controller.

**IBM PC COMPATIBLE MULTI-CHIP  
MODULE****CROSS REFERENCE TO RELATED  
APPLICATIONS**

This is a continuation of Ser. No. 08/757,896, filed Nov. 27, 1996, which is a continuation-in-part of Ser. No. 08/564,688, filed Nov. 29, 1995, now U.S. Pat. No. 5,742,844.

**FIELD OF THE INVENTION**

This invention relates to a multi-chip module.

**BACKGROUND OF THE INVENTION**

The most successful applications of computer technology have been those that people do not see. Microcontrollers and microprocessors govern automotive anti lock braking systems, automatic teller machines, elevators, subway ticket systems, and medical equipment. These hidden computers, otherwise known as embedded systems, permeate our lives. The embedded control market is, in fact, growing significantly faster than the desk top computing market. A major trend is the move from 4- and 8-bit processors to more powerful devices that provide more computing power and enable more "friendly" man-machine interfaces. A study by Desk Top Strategies showed that in 1994 over 320 million 16- and 32-bit embedded control processors were shipped to original equipment manufacturers (OEMs) for use in embedded control applications. In contrast, only 50 million were shipped to desk top computer manufacturers. The compound annual growth rate for 32-bit processors in the embedded market from 1992 to 1997 is projected to be 53 percent, compared with an estimated 32 percent in the desk top market.

The area of greatest growth in the embedded control market is the segment of ultra-miniature controllers for portable and transportable instruments. OEMs have indicated a strong interest in developing products with the PC architecture, but have found that size, integration, power, reliability, or cost constraints make existing broad-level products unsuitable for their applications.

The Cardio 386 developed by S-Mos Systems comprises a full function, small footprint, X86 computer that includes a CPU, all standard PC-type I/O controllers, PGA graphics, floppy and hard disk drive interfaces, DRAM, flash memory, and transparent power management. It adopts a PC AT architecture which complies with the ISA (industry standard architecture) bus pin configuration. However, it makes use of a unique edge connector comprising a plurality of tracks formed into rows on a card. This is received in a complementary slot for connection to peripheral devices. The use of a connector for connecting the module to a board makes its implementation inherently unreliable since vibrations can compromise the electrical connections between the various tracks forming the pins, and the corresponding contacts of the slot connector. Furthermore, no provision is made for integrating the module with proprietary hardware of OEMs (original equipment manufacturers).

Another prior art device is the Northstar III by Micro Module Systems that comprises a multi-chip module, including a Pentium processor, a cache controller, and RAM incorporated in a 349 pin PGA package. Once again, no facility is provided for interfacing with OEM proprietary hardware. Furthermore, the North Star module is packaged in a 349 pin PGA which makes simple direct connection to peripheral devices impossible without complicated track

2

layout design. Therefore it does not allow the module to be simply dropped into an OEM system.

**OBJECTS AND SUMMARY OF THE  
INVENTION**

It is an object of the invention to incorporate a multi-chip module in an ultra-miniature form factor. In particular it is an object of the invention to provide a module the size of a large integrated circuit.

It is a further object of the invention to provide an Intel X86 compatible computer module and peripheral controller modules wherein the computer module includes a CPU, I/O (a parallel port and two serial ports), a keyboard interface, a DRAM interface, floppy disk controller, hard disk controller, and flash disk functions based on Intel X86 architecture. Specifically, it is an object of the invention to provide a multi-chip module that provides an OEM (Original Equipment Manufacturer) with the facility for incorporating a feature set that is compatible with IBM PC/AT hardware, software, and bus pin configuration.

It is a further object of the invention to provide a module having low power consumption, broad thermal adaptability, low cost, and high reliability by eliminating cables and mounting hardware.

It is yet a further object of the invention to provide a module family having identical ISA bus pin configurations to facilitate easy interconnection.

It is yet a further object of the invention to provide a development board to form a platform for receiving a multi-chip module of the invention, thereby to provide for the quick development of pilot projects.

According to the invention there is provided a multi-chip module comprising a plurality of functional circuits provided on a substrate, the circuits defining a plurality of signal inputs and outputs, and a plurality of module pins secured in a single row along the periphery of the substrate and connected to the inputs and outputs, the module pins including a set of 91 pins, two ground pins, and a power pin, defining an ISA bus means, the signal pins having a configuration complying in number and signal type with the signal pins laid down under the IEEE-P996 specification, and as applied in the ISA (Industry Standard Architecture) requirements. For this reason it will hereinafter be referred as to as the ISA bus.

The module can be rectangular in shape, having a first side, a second side opposite the first side, a third side, and a fourth side, and is defined by an upper surface, a lower surface, and a peripheral wall, and wherein the plurality of pins extend from the peripheral wall.

The pins of the ISA bus means of the present invention preferably comprise: pin 38 corresponding to signal IOCHCK; pin 39 corresponding to signal SD07; pin 40 corresponding to signal RESETDRV; pin 41 corresponding to signal SD06; pin 42 corresponding to signal SD05; pin 43 corresponding to signal IRQ9; pin 44 corresponding to signal SD04; pin 45 corresponding to signal SD03; pin 46 corresponding to signal DRQ2; pin 47 corresponding to signal DRQ2OUT-; pin 48 corresponding to signal SD02; pin 49 corresponding to signal SD01-; pin 50 corresponding to signal 0WS; pin 51 corresponding to signal SD00; pin 52 corresponding to signal IOCHRDY; pin 53 corresponding to signal SBHE-; pin 54 corresponding to signal MEMSC16-; pin 55 corresponding to signal AEN; pin 56 corresponding to signal SMEMW-; pin 57 corresponding to signal LA23; pin 58 corresponding to signal IOCS 16-; pin 59 corresponding to signal SA19; pin 60 corresponding to signal

SMEMR-; pin 61 corresponding to signal LA22; pin 62 corresponding to signal IRQ10; pin 63 corresponding to signal SA18; pin 64 corresponding to signal IOW-; pin 65 corresponding to signal LA21; pin 66 corresponding to signal IRQ11; pin 67 corresponding to GND; pin 68 corresponding to signal SA17; pin 69 corresponding to signal IOR-; pin 70 corresponding to signal LA20; pin 71 corresponding to signal IRQ12; pin 72 corresponding to signal SA16; pin 73 corresponding to signal DACK3-; pin 74 corresponding to signal LA19; pin 75 corresponding to signal IRQ15; pin 76 corresponding to signal SA15; pin 77 corresponding to signal DRQ3; pin 78 corresponding to signal LA18; pin 79 corresponding to signal IRQ14; pin 80 corresponding to signal SA14; pin 81 corresponding to signal DACK1-; pin 82 corresponding to signal LA17; pin 83 corresponding to signal DACK0-; pin 84 corresponding to signal SA13; pin 85 corresponding to VCC; pin 86 corresponding to signal DRQ1-; pin 87 corresponding to signal MEMR-; pin 88 corresponding to signal DRQ0; pin 89 corresponding to signal SA12; pin 90 corresponding to signal REFRESH-; pin 91 corresponding to signal MEMW-; pin 92 corresponding to signal DACK5-; pin 93 corresponding to signal SA11; pin 94 corresponding to signal SYSCLK; pin 95 corresponding to signal SD08; pin 96 corresponding to signal DRQS; pin 97 corresponding to signal SA10; pin 98 corresponding to signal IRQ7; pin 99 corresponding to signal IRQ7OUT; pin 100 corresponding to signal SD09; pin 101 corresponding to signal DACK6-; pin 102 corresponding to GND; pin 103 corresponding to signal SA09; pin 104 corresponding to signal IRQ6; pin 105 corresponding to signal IRQ6OUT; pin 106 corresponding to signal SD10; pin 107 corresponding to signal DRQ6; pin 108 corresponding to signal SA08; pin 109 corresponding to signal IRQ5; pin 110 corresponding to signal SD11; pin 111 corresponding to signal DACK7-; pin 112 corresponding to signal SA07; pin 113 corresponding to signal IRQ4; pin 114 corresponding to signal SD12; pin 115 corresponding to signal DRQ7; pin 116 corresponding to signal SA06; pin 117 corresponding to signal IRQ3; pin 118 corresponding to signal SD13; pin 119 corresponding to signal SA05; pin 120 corresponding to signal DACK2-; pin 121 corresponding to signal SD14; pin 122 corresponding to signal MASTER-; pin 123 corresponding to signal SA04; pin 124 corresponding to signal TC; pin 125 corresponding to signal SD15; pin 126 corresponding to signal SA03; pin 127 corresponding to signal BALE; pin 128 corresponding to signal SA02; pin 129 corresponding to signal SA01; pin 130 corresponding to signal OSC; and pin 131 corresponding to signal SA00.

The pin of the ISA bus means of the present invention can alternatively comprise: pin 38 corresponding to signal SA00; pin 39 corresponding to signal OSC; pin 40 corresponding to signal SA01; pin 41 corresponding signal SA02; pin 42 corresponding to signal BALE; pin 43 corresponding to signal SA03; pin 44 corresponding to signal SD15; pin 45 corresponding to signal TC; pin 46 corresponding to signal SA04; pin 47 corresponding to signal MASTER-; pin 48 corresponding to signal SD14; pin 49 corresponding to signal DACK2-; pin 50 corresponding to signal SA05; pin 51 corresponding to signal SD13; pin 52 corresponding to signal IRQ3; pin 53 corresponding to signal SA06; pin 54 corresponding to signal DRQ7; pin 55 corresponding to signal SD12; pin 56 corresponding to signal IRQ4; pin 57 corresponding to signal SA07; pin 58 corresponding to signal DACK7-; pin 59 corresponding to signal SD11; pin 60 corresponding to signal IRQ5; pin 61 corresponding to signal SA08; pin 62 corresponding to signal DRQ6; pin 63 corresponding to signal SD10; pin 64 corresponding to

signal IRQ6OUT; pin 65 corresponding to signal IRQ6; pin 66 corresponding to signal SA09; pin 67 corresponding to GND; pin 68 corresponding to signal DACK6-; pin 69 corresponding to signal SD09; pin 70 corresponding to signal IRQ7OUT; pin 71 corresponding to signal IRQ7; pin 72 corresponding to signal SA10; pin 73 corresponding to signal DRQ5; pin 74 corresponding to signal SD08; pin 75 corresponding to signal SYSCLK; pin 76 corresponding to signal SA11; pin 77 corresponding to signal DACK5-; pin 78 corresponding to signal MEMW-; pin 79 corresponding to signal REFRESH-; pin 80 corresponding to signal SA12; pin 81 corresponding to signal DRQ5; pin 82 corresponding to signal MEMR-; pin 83 corresponding to signal DRQ1; pin 84 corresponding to signal SA13; pin 85 corresponding to VCC; pin 86 corresponding to signal DACK0-; pin 87 corresponding to signal LA17; pin 88 corresponding to signal DACK1-; pin 89 corresponding to signal SA14; pin 90 corresponding to signal IRQ14; pin 91 corresponding to signal LA18; pin 92 corresponding to signal DRQ3; pin 93 corresponding to signal SA15; pin 94 corresponding to signal IRQ15; pin 95 corresponding to signal LA19; pin 96 corresponding to signal DACK3-; pin 97 corresponding to signal SA16; pin 98 corresponding to signal IRQ12; pin 99 corresponding to signal LA20; pin 100 corresponding to signal IOR-; pin 101 corresponding to signal SA17; pin 102 corresponding to GND; pin 103 corresponding to signal IRQ11; pin 104 corresponding to signal LA21; pin 105 corresponding to signal IOW-; pin 106 corresponding to signal SA18; pin 107 corresponding to signal IRQ10; pin 108 corresponding to signal LA22; pin 109 corresponding to signal SMEMR-; pin 110 corresponding to signal SA19; pin 111 corresponding to signal IOCS16-; pin 112 corresponding to signal LA23; pin 113 corresponding to signal SMEMW-; pin 114 corresponding to signal AEN; pin 115 corresponding to signal MEMCS 16-; pin 116 corresponding to signal SBHE-; pin 117 corresponding to signal IOCHRDY; pin 118 corresponding to signal SD00; pin 119 corresponding to signal OWS-; pin 120 corresponding to signal SD00; pin 121 corresponding to signal SD02; pin 122 corresponding to signal DRQ2OUT; pin 123 corresponding to signal DRQ2; pin 124 corresponding to signal SD03; pin 125 corresponding to signal SD04; pin 126 corresponding to signal IRQ9; pin 127 corresponding to signal SD05; pin 128 corresponding to signal SD06; pin 129 corresponding to signal RESETDRV; pin 130 corresponding to signal SD07; and pin 131 corresponding to signal IOCHCK-. The ISA bus pins preferably extend along the first side and at least partially along the third and fourth sides. The multi-chip module can include 240 module pins.

The functional circuits in a module can include a central processing unit. The functional circuits can further include two serial interfaces, a parallel interface, a hard drive interface, a floppy disk interface, a keyboard interface, and flash memory.

Other modules can include functional circuits that include a PCMCIA interface, an Ethernet interface, or a display controller.

The substrate can comprise a printed circuit board and the functional circuits comprise semiconductor devices which can be packaged or can be in bare die form secured to the printed circuit board.

Further, according to the invention, there is provided a multi-chip module comprising a plurality of functional circuits encapsulated in a rectangular housing, the housing having an upper surface and a lower surface, and a peripheral wall extending along a first side, a second side opposite the first side, a third side, and a fourth side; and a plurality

of pins extending laterally from the peripheral wall, wherein the pins include a set of 91 signal pins, two ground pins and a power pin defining an ISA bus means, the signal pins of which comply in number and signal type, with the signal pins laid down under the IEEE-P996, and as applied in the ISA (Industry Standard Architecture) requirements.

Still further, according to the invention, there is provided a module family comprising a plurality of functionally different modules, wherein each module has a plurality of pins and the pins of each module include a set of 91 signal pins, two ground pins, and a power pin, defining an ISA bus means, the signal pins of which comply in number and signal type with the signal pins laid down under the IEEE-P996, and as applied in the ISA (Industry Standard Architecture) requirements.

Each module can comprise at least one functional circuit encapsulated in a rectangular housing, the housing having an upper surface and a lower surface, and a peripheral wall extending along a first side, a second side opposite the first side, a third side, and a fourth side, and wherein the pins of the module extend laterally from the peripheral wall.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is a plan view of a multi-chip module of the invention;

FIG. 2 is a side view of the module of FIG. 1;

FIG. 3 is a block diagram of a multi-chip module of the invention;

FIG. 4 is a schematic representation of the first embodiment of a multi-chip module of the invention indicating the configuration of the pins;

FIG. 5 is a schematic representation of the alternative embodiment of a multi-chip module of the invention indicating the configuration of the pins;

FIG. 6 shows a PC board layout for a development board showing the mounting site for the module of FIG. 1, and

FIG. 7 is a schematic representation of a number of different modules in accordance with the invention connected to each other by means of their ISA buses to form a module family of the invention.

DESCRIPTION OF PREFERRED EMBODIMENTS

A need exists in the field of embedded applications for small, highly reliable computer systems that draw little power, are easy to integrate, have broad thermal adaptability and are relatively inexpensive. Applications for such devices include medical instruments, data logging devices, security systems, test equipment, point-of-sale terminals, communications devices, such as Internet and facsimile machines, and navigational instruments. OEMs (original equipment manufacturers) typically use the Intel X86 architecture since it offers the world's largest body of hardware and software. The present invention has accordingly been developed to address the problems in the prior art by providing a multi-chip module packaged to resemble a large integrated circuit chip comprising a 240 pin QFP having an overall footprint of 59.54×79.88 mm. The module includes a set of pins constituting a bus for connection to the OEM designer's proprietary internal hardware. The invention specifically contemplates providing this bus with a configuration complying with the ISA (Industry Standard Architecture) requirements. This will allow the OEM designer quickly to incorporate IBM PC/AT hardware and software and to implement the module in ISA compatible proprietary prod-

uct designs. The module is now described in greater detail with reference to FIGS. 1 and 2 which show a plan view and a side view, respectively, of the module.

The module 10 is a 240 pin QFP with gull wing pins having a 0.762 mm. pitch. The body is rectangular, the one side of which measures 76.2 mm and the overall footprint in this embodiment being 59.54×79.88 mm. The pins themselves are typically 0.5 mm wide, and the dimensions of distances 12 and 14 in FIG. 1 are 3.5 mm for this embodiment. By using a chip-like package in which the pins are formed around the periphery of the module 10 in a single row as illustrated in FIGS. 1 and 2, the module 10 can easily be soldered into place to form a very sturdy, reliable set of connections. Furthermore, tracks can be designed to lead directly from the pins to another device by making use of PC board tracks on one or both surfaces of the PC board without the need for several layers to route the various tracks. Since the pins are soldered directly to the interconnecting tracks, the system has inherent reliability in that it eliminates cables and mounting hardware that could otherwise vibrate loose. As many as half a dozen interconnecting cables, assorted connectors and mounting hardware required with many existing prior art single board computers, are thereby eliminated.

The module thus provides an Intel X86 compatible computer in an ultra-miniature form factor that can be integrated as easily as a semiconductor device and provides the full functionality of a desk top computer. As is described in greater detail below, the same concepts of using a chip-like module using a QFP package with gull wing pins and having an ISA compatible bus is extended also to peripheral controller modules.

By integrating a full X86 AT-compatible computer onto a proprietary OEM design, the need for multiple boards is eliminated, thereby eliminating cables and mounting hardware.

The full compatibility with PC-AT ISA allows for easy integration with low-cost hardware peripherals. The ISA, compliant bus makes it easy to interface with proprietary hardware design.

One embodiment of the module 10, having a CPU as one of its functional circuits, is illustrated in FIG. 3 and includes the standard I/O interfaces, serial ports, a parallel port, and floppy and hard disk interfaces allowing standard hardware, cables, and software libraries to be incorporated in the design. The module 10 includes an 80386 SX CPU 20 which is connected to a DRAM bus 22 and an ISA bus 24 by means of core logic 26. The core logic controls AT-compatible DMA controllers, interrupt controllers, and timers/counters. It also controls the AT keyboard controller 28 and the real time clock 30. Two serial ports 32, 34 and a parallel port 36 are provided, as are a floppy disk controller 40 and an IDE hard drive interface 42. In order to facilitate total solid state operation, internal flash memory 44 is provided that is controlled by a solid state flash disk controller 46. Power is controlled by means of a power monitor 48 that provides a power saving function by controlling CPU sleep modes, and by a watch dog timer 50. The watch dog timer 50 monitors CPU cycles to detect interrupts in the cycle thereby allowing the system to be automatically reset after a predetermined time delay.

The microprocessor and various controllers and interfaces comprise chips, optionally in die form, mounted on a multi-layer PC board, e.g. ten-layers. The CPU 20 can be a standard 33 MHz 80386 SX CPU having a DRAM controller for supporting up to 16 M bytes of DRAM. Alternatively,

CPU20 can be another standard microprocessor chip such as another type of 80386 chip or die, a 80486 chip or die, a Pentium chip or die, or any other desired microprocessor which is capable of providing the function of the 80386 device.

The standard DRAM interface provides all the signals for connecting standard page-mode DRAMs of various configurations, including standard 8- and 9-bit 30-pin SIMM modules and discrete components, such as standard 1M×4 and 4M×4 DRAM chips. The interface is designed to support 70 ns or faster DRAMs. The DRAM interface consists of.

Multiplexed addresses	MA00-MA10
Bi-directional data	D0-D15
Column Address Strobes	CASL0- to CASL3- (low byte) CASH0- to CASH3- (high byte)
Row Address Strobes	RAS0- to RAS3-
Memory Write Strobe	DRWE-

The serial ports 32, 34 are PC-compatible asynchronous serial ports, typically treated as COM 1 and COM 2 devices by DOS.

Serial Port Resources			
Serial Port	Typical Usage	I/O Address	Standard Interrupt
Serial 1	COM1	3F8-3FF	IRQ4
Serial 2	COM2	2F8-2FF	IRQ3

Either or both serial ports can be disabled using SETUP. When disabled, the port\*s I/O address and interrupt are made available for other expansion devices on the PC bus.

A full complement of input and output handshaking lines are supported by the serial ports, and all serial port signals are at standard LSTTL levels. In another embodiment, RS232C signal compatibility can be achieved by including a TTL-RS232C level converter to provide the necessary bipolar signal levels. The parallel port is a fully-compatible PC/AT parallel port providing bidirectional operation. It is typically used to support a line printer. As appears from the table below:

Parallel Port Resources			
Parallel Port	Typical Usage	I/O Address	Standard Interrupt
Parallel 1	LPF1	378H-37FH	IRQ7

4.7K-ohm pull-ups (+5V) are typically provided to the following parallel port signals:

- STROBE-
- SLIN-
- INIT-
- AUTOFD-

Generally, if the parallel port will be connected to a cable for high speed data communication (as opposed to static digital output levels or static TTL level sensing), certain signals require a 2.2 nF capacitor connected to ground. These include:

PD0-PD7  
STRB-

Parallel port register are provided for the parallel port as appears from the table set out below:

Parallel Port Registers					
Register	Signal Bit	Name	In/Out	Active High/Low	DB25F Pin
DATA (A + 0)	0	PD0	I/O	HIGH	2
	1	PD1	I/O	HIGH	3
	2	PD2	I/O	HIGH	4
	3	PD3	I/O	HIGH	5
	4	PD4	I/O	HIGH	6
	5	PD5	I/O	HIGH	7
	6	PD6	I/O	HIGH	8
STATUS (A + 1))	7	PD7	I/O	HIGH	9
	0	1	—	—	—
	1	1	—	—	—
	2	1	—	—	—
	3	ERROR-	IN	LOW	15
	4	SLCT-	IN	HIGH	13
	5	PE	IN	HIGH	12
CONTROL (A + 2)	6	ACK-	IN	HIGH	10
	7	BUSY	IN	LOW	11
	0	STRB-	OUT	LOW	1
	1	AUTOFD-	OUT	LOW	14
	2	INIT-	OUT	HIGH	16
	3	SLCTIN-	OUT	LOW	17
	4	IRQ ENABLE	—	HIGH	—
	5	1	—	—	—
	6	1	—	—	—
	7	1	—	—	—

The DOS-compatible floppy drive interface 40 allows cable connections for up to four floppy drives. In pC-compatible systems, the BIOS and DOS support two drives. These are configure using the BIOS SETUP function. Hardware controls for two additional drives are provided.

The floppy drive interface supports the following standard floppy formats:

Capacity	Drive Size	Tracks	Data Rate
360K	5-1/4 inch	40	250 KHz
1.2M	5-1/4 inch	80	500 KHz
720K	3-1/2 inch	80	250 KHz
1.44M	3-1/2 inch	80	500 KHz

The various floppy interface resources are given in the table below

Floppy Interface Resources	
Resource	Function
I/O Address 3F0h-3F7h	3F2 FDC Digital Output Register (LDOR) 3F4 FDC Main Status Register 3F5 FDC Data Register 3F7 FDC Control Register (LDCR)
IRQ6	Interrupt
DRQ2BDACK2	DMA Controller Channel

Outputs to the floppy drive and from the floppy drive are Aopen collector=. Pull-up resistors are therefore required for proper termination, both on the SMX/386 board and on one of the attached floppy drives (not both).

330-Ohm pull-ups are required for the following floppy interface signals:

DSKCHG-  
RDATA-  
WRPRT-  
TRK0-  
INDEX-  
The pin numbers and functions associated with the floppy drive are given in the table below:

Floppy Drive Interface				
Pin	Floppy Pin	Signal Name	Function	In/Out
11	2	DENSEL	Speed/Precomp	
	4	N/A		N/A
	6	N/S	Key pin	N/A
12	8	INDEX-	Index Pulse	IN
13	10	MTR0-	Motor On 0	OUT
15	12	DRV1-	Drive Select 2	OUT
18	14	DRV0-	Drive Select 1	OUT
20	16	MTR1-	Motor On 1	OUT
22	18	DIR-	Direction Select	OUT
23	20	STEP-	Step Pulse	OUT
24	22	WDATA-	Write Data	OUT
25	24	WGATE-	Write Gate	OUT
26	26	TRK0-	Track 0	INPUT
27	28	WRPRT-	Write Protect	INPUT
28	30	RDATA-	Read Data	INPUT
29	32	HDSSEL-	Head Select	OUT
30	34	DSKCHG-	Disk Change	INPUT
	1B33	Ground	Ground	

The IDE hard drive interface 42 is a standard interface used in PC-compatible systems for haed disk drives. Up to two drives can be connected in a master-slave arrangement. The resources are depicted in the table below:

IDE Hard Disk Resources	
Resource	Function
I/O Address 1F0h-1F7h	Hard Disk Interface
IRQ14	Interrupt

The IDE interface pins are arranged to easily attach to a male PC-mounted ribbon-cable connector, the IDE drives typically being attached to the drive interface using a 40-pin ribbon cable.

The pin configuration for the IDE interface is given in the table below:

IDE Drive Interface				
Pin	IDE Pin	Signal Name	Function	In/Out
223	1	HDRESET-	Reset signal from host	OUT
	2	GND	Ground	OUT

237	31	HED 14	Drive interrupt request	IN

One embodiment of the pin configuration for the module 10 as a whole is illustrated in FIG. 4 and is given in the pin description table below:

Pin	Pin Name	Description	Type
1	HDIOR-	IDE I/O Read, active low. Buffered version of IOR	O24
2	HDALE	IDE Address Latch Enable, active high. Buffered version of BALE	O24
3	IRQ14	IDE Interrupt Request 14. For use with IDE interface. Same signal appears on pin 90.	I
4	IOCS16	IDE I/O Chip Select 16. A low requests a 16-bit transfer on the SA bus. Same signal appears on pin 238. This one is used for the IDE interface.	I
5	HDA1	IDE Address 1. Buffered version of SA1.	O24
6	HDAO	IDE Address 0. Buffered version of SA0	O24
7	HDA2	IDE Address 2. Buffered version of SA2	O24
8	HDCS-	IDE Chip Select. A low indicates that data is being transferred to or from the IDE drive.	O24
9	FDCS-	Floppy disk chip Select. A low indicates that data is being transferred to or from the floppy disk.	O24
10	LEDIN	LED signal form IDE drive	I
11	DENSEL		
12	INDEX-	Floppy disk index pulse, input from drive	I
13	MTR0-	Floppy disk active lower open drain output selects motor driver 0. The motor enable bits are software controlled via the floppy's Digital Output Register (DOR).	
14	MTR2-	Floppy disk active low open drain output selects motor driver 2. The motor enable bits are software controlled via the floppy's Digital Output Register (DOR).	
15	DRV1-	Floppy disk active lower open drain output that selects floppy drive 1	
16	DRV3-	Floppy disk active low open drain output that selects floppy drive 3	
17	GND		
18	DRV0-	Floppy disk active low open drain output that selects floppy drive 0	
19	DRV2-	Floppy disk active low open drain output that selects floppy drive 2	
20	MTR1-	Floppy disk active low open drain output selects motor driver 1. The motor enable bits are software controlled via the floppy's Digital Output Register (DOR).	
21	MTR3-	Floppy disk active low open drain output	

-continued

Pin	Pin Name	Description	Type
		selects motor driver 3. The motor enable bits are software controlled via the floppy's Digital Output Register (DOR).	
22	DIR	Floppy disk open drain output that controls floppy read/write head movement direction. Low = set pin.	5
23	STEP-	Floppy disk active low output provides the step pulse to move the floppy read/write head	10
24	WDATA-	Floppy disk active lower signal writes precompensated serial data to the selected floppy drive. This is a high open current drain output and is gated internally with WGATE-.	
25	WGATE-	Floppy disk active low open drain signal that enables the head to write onto the floppy disk.	15
26	TRK0-	Floppy disk active lower Schmitt input indicates that the head is on track 0 of the selected drive	IS
27	WRPRT-	Floppy disk active low Schmitt input indicating that the disk is write protected. Any WDATA-command is ignored.	IS
28	RDATA-	Floppy disk active lower Schmitt input that reads raw data from the floppy disk.	IS
29	HDSEL	Floppy disk open drain output that selects the head on the selected drive. Low = side 0.	
30	DSKCHG	Floppy disk input signal indicating that the floppy door has been opened.	I
31	5VBB		
32	GND		
33	PFI	Powerfail	
34	PFO	Powerfail	
35	MR-	Powerfail	
36	RTCIRQ	Alarm output from the onboard real time clock	30
37	WDO	Watchdog timer	
38	SA00	ISA System Address 00	O24
39	OSC	ISA 14.318 MHz clock. This clock is asynchronous to all other system clocks	
40	SA01	ISA System Address 01	O24
41	SA02	ISA System Address 02	O24
42	BALE	ISA Buffered Address Latch Enable	
43	SA03	ISA System Address 03	O24
44	SD15	ISA System Data 15	
45	TC	ISA DMA Terminal Count	
46	SA04	ISA System Address 04	O24
47	MASTER-	ISA	
48	SD14	ISA System Data 14	40
49	DACK2-	ISA DMA 2 Acknowledge strobe	
50	SA05	ISA System Address 05	O24
51	SD13	ISA System Data 13	
52	IRQ3	ISA Interrupt Request 3	I
53	SA06	ISA System Address 06	O24
54	DRQ7	ISA DMA 7 Request	I
55	SD12	ISA System Data 12	
56	IRQ4	ISA Interrupt Request 4	I
57	SA07	ISA System Address 07	O24
58	DACK7-	ISA DMA 7 Acknowledge strobe	
59	SD11	ISA System Data 11	
60	IRQ5	ISA Interrupt Request 5	I
61	SA08	ISA System Address 08	O24
62	DRQ6	ISA DMA 6 Request	I
63	SD10	ISA System Data 10	
64	IRQ6OUT	Floppy disk interrupt request. Normally connects to IRQ6 (pin 65)	
65	IRQ6	ISA Interrupt Request 6	I
66	SA09	ISA System Address 09	O24
67	GND		
68	DACK6-	ISA DMA 6 Acknowledge strobe	
69	SD09	ISA System Data 09	
70	IRQ7OUT	Parallel port interrupt request. Normally connects to IRQ7 (pin 71).	
71	IRQ7	ISA Interrupt Request 7	I
72	SA10	ISA System Address 10	O24
73	DRQ5	ISA DMA 5 Request	I
74	SD08	ISA System Data 08	
75	SYSCLK	ISA System clock	
76	SA11	ISA System Address 11	O24
77	DACK5-	ISA DMA 5 Acknowledge strobe	
78	MEMW-	ISA active low memory write strobe	

-continued

Pin	Pin Name	Description	Type
79	RE-	ISA active low signal indicating current bus cycle is a memory refresh	
80	SA12	ISA System Address 12	O24
81	DRQ0	ISA DMA 0 Request	I
82	MEMR-	ISA active low memory read strobe	
83	DRQ1	ISA DMA 1 Request	I
84	SA13	ISA System Address 13	O24
85	VCC		
86	DACK0-	ISA DSMA 0 Acknowledge strobe	
87	LA17	ISA Latched Address 17	O24
88	DACK1-	ISA DMA 1 Acknowledge strobe	
89	SA14	ISA System Address 14	O24
90	IRQ14	ISA Interrupt Request 14, normally used for IDE interface	I
91	LA18	ISA Latched address 18	O24
92	DRQ3	ISA DMA 3 Request strobe	
93	SA15	ISA System Address 15	O24
94	IRQ15	ISA Interrupt Request 15	I
95	LA19	ISA Latched Address 19	O24
96	DACK3-	ISA DMA 3 Acknowledge strobe

107	IRQ10	ISA Interrupt Request 10	I
108	LA22	ISA Latched Address 22	O24
109	SMEMR-	ISA System Memory Read strobe	
110	SA19	ISA System Address 19	O24
111	IOCS16-	ISA 16-bit I/O Chip Select request Indicates that the current I/O transaction is 16-bits.	I
112	LA23	ISA Latched Address 23	O24
113	SMEMW-	ISA System Memory Write strobe	
114	AEN	ISA Address Enable	
115	MEMCS-16	ISA 16-bit Memory Chip Select request. Indicates that the current memory transaction is 16-bits.	I
116	SBHE-	ISA System Byte High Enable	
117	IOCH-	ISA I/O Channel Ready. A low adds wait states to the current ISA bus cycle	I
118	SD00	ISA System Data 00	
119	OWS	ISA active low causing current memory cycle to be completed without additional wait states.	I
120	SD01	ISA System Data 01	
121	SD02	ISA System Data 02	
122	DRQ2	Floppy DMA 2 Request Normally connected to DRQ2 (pin 123)	
123	DRQ2	ISA DMA 2 Request strobe	I
124	SD03	ISA System Data 03	
125	SD04	ISA System Data 04	
126	IRQ9	ISA Interrupt Request 09	I
127	SD05	ISA System Data 05	
128	SD06	ISA System Data 06	
129	RESET	ISA active high system reset signal	
130	SD07	ISA System Data 07	
131	IOCH-CHK-	ISA gated non-maskable interrupt input	I
132	HISPEED	Input to select CPU speed. High = high speed.	I
133	SPKR	Speaker output	
134	KDATA	Keyboard data	
135	KCLOCK	Keyboard clock	
136	PWRDN-		
137	GND		
138	COLOR	Video Color/Mono jumper	I
139	KBLOCK	Keyboard lock. Low blocks keyboard input	I
140	SLCT	Parallel Port	
141	PE	Parallel Port	
142	BUSY	Parallel Port	
143	ACK-	Parallel Port	
144	PD7	Parallel Port Data 7

As mentioned above, the core logic **26** supports a DRAM bus **22** and an ISA compatible expansion bus **24** complying in number and signal type with the IEEE-P996 requirements (and corresponding to the ISA (Industry Standard Architecture) requirements). The pin configuration for the expansion bus **24** is given in the table below with corresponding pin numbers for expansion bus connectors A, B, C, D. The bus **24** comprises 94 pins that includes VCC and two GND pins.

Pin	Signal Name	Function	In/Out	Current	Load*
38	A31	SA00	Address bit 0	I/O	12 mA PU
39	B30	OSC	14.318 MHz clock	Out	6 mA 33 SER
40	A30	SA01	Address bit 1	I/O	12 mA PU
41	A29	SA02	Address bit 2	I/O	12 mA PU
42	B28	BALE	Address latch enable	Out	12 mA
43	A28	SA03	Address bit 3	I/O	12 mA PU
44	C18	SD15	System Data bit 15	I/O	12 mA PU
45	B27	TC	DMA Terminal Count	Out	4 mA
46	A27	SA04	Address bit 4	I/O	12 mA PU

An alternative embodiment of the pin configuration for the module 10 as a whole is illustrated in FIG. 5 and is given in the pin description table below:

Pin	Pin Name	Description	Type
1	HDIOR-	IDE I/O Read, active low. Buffered version of IOR	O24
2	HDALE	IDE Address Latch Enable, active high. Buffered version of BALE	O24
3	IRQ14	IDE Interrupt Request 14. For use with IDE interface. Same signal appears on pin 90.	I
4	IOCS16-	IDE I/O Chip Select 16. A low requests a 16-bit transfer on the SA bus. Same signal appears on pin 238. This one is used for the IDE interface.	I
5	HDA1	IDE Address 1. Buffered version of SA1.	O24
6	HDA0	IDE Address 0. Buffered version of SA0	O24
7	HDA2	IDE Address 2. Buffered version of SA2	O24
8	HDCS-	IDE Chip Select. A low indicates that data is being transferred to or from the IDE drive.	O24
9	FDCS-	Floppy disk Chip Select. A low indicates that data is being transferred to or from the floppy disk.	O24
10	LEDIN	LED signal from IDE drive	I
11	DENSEL		
12	INDEX-	Floppy disk index pulse, input from drive	I
13	MTR0-	Floppy disk active lower open drain output selects motor driver 0. The motor enable bits are software controlled via the floppy's Digital Output Register (DOR).	
14	MTR2-	Floppy disk active low open drain output selects motor driver 2. The motor enable bits are software controlled via the floppy's Digital Output Register (DOR).	
15	DRV1 -	Floppy disk active lower open drain output that selects floppy drive 1	
16	DRV3-	Floppy disk active low open drain output that selects floppy drive 3	
17	GND		
18	DRV0-	Floppy disk active low open drain output that selects floppy drive 0	
19	DRV2-	Floppy disk active low open drain output that selects floppy drive 2	
20	MTR1-	Floppy disk active low open drain output selects motor driver 1. The motor enable bits are software controlled via the floppy's Digital Output Register (DOR).	
21	MTR3-	Floppy disk active low open drain output selects motor driver 3. The motor enable bits are software controlled via the floppy's Digital Output Register (DOR).	
22	DIR	Floppy disk open drain output that controls floppy read/write head movement direction. Low = set pin.	
23	STEP-	Floppy disk active low output provides the step pulse to move the floppy read/write head	
24	WDATA-	Floppy disk active lower signal writes precompensated serial data to the selected floppy drive. This is a high open current drain output and is gated internally with WGATE-.	
25	WGATE-	Floppy disk active low open drain signal that enables the head to write onto the floppy disk.	

-continued			
Pin	Pin Name	Description	Type
26	TRK0-	Floppy disk active lower Schmitt input indicates that the head is on track 0 of the selected drive	IS
27	WRPRT-	Floppy disk active low Schmitt input indicating that the disk is write protected. Any WDATA-command is ignored.	IS
28	RDATA-	Floppy disk active lower Schmitt input that reads raw data from the floppy disk.	IS
29	HDSEL	Floppy disk open drain output that selects the head on the selected drive. Low = side 0.	
30	DSKCHG	Floppy disk input signal indicating that the floppy door has been opened.	I
31	5VBB		
32	GND		
33	PFT	Powerfail	
34	PFO	Powerfail	
35	MR-	Powerfail	
36	RTCIRQ-	Alarm output from the onboard real time clock	
37	WDO	Watchdog timer	
38	IOCHCK	ISA System Address 00	O24
39	SD07	ISA 14.318 MHz clock. This clock is asynchronous to all other system clocks	
40	RESET- DRV	ISA System Address 01	O24
41	SD06	ISA System Address 02	O24

The exact pin configuration as illustrated for the expansion bus on FIG. 5 is a critical feature of the invention. Since it forms a single row of pins on the module 10, the pins can be easily connected directly to the expansion bus connectors without having to resort to multiple layer boards to route the PC board tracks from the module 10 to the expansion bus connectors A, B, C, D. Furthermore, as mentioned above, the present invention includes both microprocessor modules as illustrated in FIG. 3, as well as peripheral controller modules such as display controller modules, Ethernet control modules, and PCMCIA compatible modules for extended memory (RAM, ROM, EEPROM, flash memory, etc.), as well as for modem, fax, and network interfaces, and also for wireless communication devices. By providing an identical pin configuration for the ISA buses, the various modules can easily be connected to one another.

A further feature of the invention is illustrated in FIG. 6. FIG. 6 illustrates a card 54 having a mounting site 56 for a module having a pin configuration as described above with reference to FIG. 4. The card 54 provides an integrated way for system development in standard ISA passive backplane systems. The card includes an AT-bus and a PC/104 bus, and occupies a single slot in an AT-class (16-bit) passive backplane. This allows development to be performed using a terminal on a serial port as a console. A standard VGA or SVGA display controller can be plugged into another slot on the backplane if desired. Instead, a PC/104 display controller can be installed directly on the PC/104 header 58 on the card 54. Since the module 10 is fully compatible with PC/AT ISA, a wide selection of hardware peripherals may be integrated. The ISA-compatible bus allows an OEM to easily interface his proprietary hardware design with the module 10. Furthermore, the standard BIOS and embedded DOS allows application software to be developed using standard desk top PCs and standard development tools for implementation on the system using one or more modules of the present invention. It will be appreciated that, depending on the nature of the module, the size of the module and the number of pins may vary, however it is an important feature of this invention that the pins for the ISA bus retain their configuration in each module to allow the modules to be readily connected to one another as illustrated in FIG. 7 in which different modules 60, 62, 64 of the invention are connected to each other by means of bus lines 66, 68 extending between the ISA compatible bus pins indicated by reference numerals 70, 72, 74, respectively.

I claim:

1. A computer module comprising a central processing unit, a serial port, a parallel port, a drive controller, a keyboard interface, a DRAM interface and flash memory mounted in a relatively flat housing which is adapted to be mounted on a circuit board in a flat position, and a plurality

23

of gull wing connector pins extending from the housing and arranged in a single row along the periphery of the housing for connection to electrical conductors on the circuit board.

2. The computer module of claim 1 wherein the housing is rectangular.

3. The computer module of claim 1 wherein the module has a footprint no larger than about 60×80 mm.

4. The computer module of claim 1 wherein the connector pins correspond in signal type and in number to a standard ISA bus.

5. A computer module comprising a central processing unit, a serial port, a parallel port, a drive controller, a keyboard interface, a DRAM interface and flash memory

24

mounted in a relatively flat rectangular housing which is adapted to be mounted on a circuit board in a flat position, and a plurality of connector pins extending from the housing and arranged in a single row along three adjacent peripheral edges of the housing for connection to electrical conductors on the circuit board.

6. The computer module of claim 5 wherein the module has a footprint no larger than about 60×80 mm.

7. The computer module of claim 5 wherein the connector pins correspond in signal type and in number to a standard ISA bus.
