Title: SANGLIFEHIN BASED COMPOUNDS

Abstract: There are provided inter alia compounds of formula (I) useful as cyclophilin inhibitors.
SANGLIFEHRIN BASED COMPOUNDS

Introduction

The present invention relates to sangulifehrin analogues, that are useful as cyclophilin inhibitors, e.g. in the treatment of viral infection by viruses such as Hepatitis C Virus (HCV), Hepatitis B Virus (HBV) and Human Immunodeficiency Virus (HIV). The present invention also provides methods for their use in medicine, in particular for the treatment of HCV, HBV and HIV infection, and in diseases where inhibition of the Mitochondrial Permeability Transition Pore (mPTP) is useful such as muscular dystrophy.

Background of the invention

Hepatitis C

Hepatitis C virus (HCV) is a positive strand RNA virus, and infection is a leading cause of post-transfusional hepatitis. HCV is the most common chronic blood borne infection, and the leading cause of death from liver disease in United States. The World Health Organization estimates that there are more than 170 million chronic carriers of HCV infection, which is about 3% of the world population. Among the un-treated HCV-infected patients, about 70%–85% develop chronic HCV infection, and are therefore at high risk to develop liver cirrhosis and hepatocellular carcinoma. In developed countries, 50-76% of all cases of liver cancer and two-thirds of all liver transplants are due to chronic HCV infection (Manns et al, 2007).

In addition to liver diseases, chronically infected patients may also develop other chronic HCV-related diseases, and serve as a source of transmission to others. HCV infection causes non-liver complications such as arthralgias (joint pain), skin rash, and internal organ damage predominantly to the kidney. HCV infection represents an important global health-care burden, and currently there is no vaccine available for hepatitis C (Strader et al., 2004; Jacobson et al. 2007; Manns et al., 2007 Pawlotsky, 2005; Zeuzem & Hermann, 2002).

Treatment of HCV

The current standard of care (SoC) is subcutaneous injections of pegylated interferon-α (pIFNα) and oral dosing of the antiviral drug ribavirin for a period of 24-48 weeks. Success in treatment is defined by sustained virologic response (SVR), which is defined by absence of HCV RNA in serum at the end of treatment period and 6 months later. Overall response rates to SoC depend mainly on genotype and pretreatment HCV RNA levels. Patients with genotype 2 and 3 are more likely to respond to SoC than patients infected with genotype 1 (Melnikova, 2008; Jacobson et al., 2007).

A significant number of HCV patients do not respond adequately to the SoC treatment, or cannot tolerate the therapy due to side effects, leading to frequent issues with completion of the full course. The overall clinical SVR rate of SoC is only around 50% (Melnikova, 2008).
Development of resistance is another underlying factor for failure of treatment (Jacobson et al. et al. 2007). SoC is also contraindicated in some patients who are not considered candidates for treatment, such as patients with past significant episodes of depression or cardiac disease. Side effects of the SoC, which frequently lead to discontinuation of treatment include a flu-like illness, fever, fatigue, haematological disease, anaemia, leucopenia, thrombocytopenia, alopecia and depression (Manns et al., 2007).

Considering the side effects associated with the lengthy treatments using SoC, development of resistance, and suboptimum overall rate of success, more efficacious and safer new treatments are urgently needed for treatment of HCV infection. The objectives of new treatments include improved potency, improved toxicity profile, improved resistance profile, improved quality of life and the resulting improvement in patient compliance. HCV has a short life cycle and therefore development of drug resistance during drug therapy is common.

Novel, specifically targeted antiviral therapy for hepatitis C (STAT-C) drugs are being developed that target viral proteins such as viral RNA polymerase NS5B or viral protease NS3 (Jacobson et al., 2007; Parfeniuk et al., 2007). In addition, novel compounds also are being developed that target human proteins (e.g. cyclophilins) rather than viral targets, which might be expected to lead to a reduction in incidence of resistance during drug therapy (Manns et al., 2007; Pockros, 2008; Pawlotsky J-M, 2005).

Cyclophilin inhibitors

Cyclophilins (CyP) are a family of cellular proteins that display peptidyl-prolyl cis-trans isomerase activity facilitating protein conformation changes and folding. CyPs are involved in cellular processes such as transcriptional regulation, immune response, protein secretion, and mitochondrial function. HCV virus recruits CyPs for its life cycle during human infection. Originally, it was thought that CyPs stimulate the RNA binding activity of the HCV non-structural protein NS5B RNA polymerase that promotes RNA replication, although several alternative hypotheses have been proposed including a requirement for CyP PPIase activity. Various isoforms of CyPs, including A and B, are believed to be involved in the HCV life cycle (Yang et al., 2008; Appel et al., 2006; Chatterji et al., 2009; Gaither et al., 2010). The ability to generate knockouts in mice (Colgan et al., 2000) and human T cells (Braaten and Luban, 2001) indicates that CyPA is optional for cell growth and survival. Similar results have been observed with disruption of CyPA homologues in bacteria (Herrier et al., 1994), Neurospora (Tropschug et al., 1989) and Saccharomyces cerevisiae (Dolinski et al. 1997). Therefore, inhibiting CyPs represent a novel and attractive host target for treating HCV infection, and a new potential addition to current SoC or STAT-C drugs, with the aim of increasing SVR, preventing emergence of resistance and lowering treatment side effects.
Cyclosporine A (Inoue et al. 2003) ("CsA") and its closely structurally related non-immunosuppressive clinical analogues DEBIO-025 (Paeshuyse et al. 2006; Flisiak et al. 2008), NIM811 (Mathy et al. 2008) and SCY-635 (Hopkins et al., 2009) are known to bind to cyclophilins, and as cyclophilin inhibitors have shown in vitro and clinical efficacy in the treatment of HCV infection (Crabbe et al., 2009; Flisiak et al. 2008; Mathy et al. 2008; Inoue et al., 2007; Ishii et al., 2006; Paeshuyse et al., 2006). Although earlier resistance studies on CsA showed mutations in HCV NS5B RNA polymerase and suggested that only cyclophilin B would be involved in the HCV replication process (Robida et al., 2007), recent studies have suggested an essential role for cyclophilin A in HCV replication (Chatterji et al. 2009; Yang et al., 2008). Considering that mutations in NS5A viral protein are also associated with CsA resistance and that NS5A interacts with both CyPA and CypB for their specific peptidyl-prolyl cis/trans isomerase (PPIase) activity, a role for both cyclophilins in viral life cycle is further suggested (Hanoule et al., 2009).

The anti-HCV effect of cyclosporine analogues is independent of the immunosuppressive property, which is dependent on calcineurin. This indicated that the essential requirement for HCV activity is CyP binding and calcineurin binding is not needed. DEBIO-025, the most clinically advanced cyclophilin inhibitor for the treatment of HCV, has shown in vitro and in vivo potency against the four most prevalent HCV genotypes (genotypes 1, 2, 3, and 4). Resistance studies showed that mutations conferring resistance to DEBIO-025
were different from those reported for polymerase and protease inhibitors, and that there was no cross resistance with STAT-C resistant viral replicons. More importantly, DEBIO-025 also prevented the development of escape mutations that confer resistance to both protease and polymerase inhibitors (Crabbe et al., 2009).

However, the CsA-based cyclophilin inhibitors in clinical development have a number of issues, which are thought to be related to their shared structural class, including: certain adverse events that can lead to a withdrawal of therapy and have limited the clinical dose levels; variable pharmacokinetics that can lead to variable efficacy; and an increased risk of drug-drug interactions that can lead to dosing issues.

The most frequently occurring adverse events (AEs) in patients who received DEBIO-025 included jaundice, abdominal pain, vomiting, fatigue, and pyrexia. The most clinically important AEs were hyperbilirubinemia and reduction in platelet count (thrombocytopenia). Peg-IFN can cause profound thrombocytopenia and combination with DEBIO-025 could represent a significant clinical problem. Both an increase in bilirubin and decrease in platelets have also been described in early clinical studies with NIM-811 (Ke et al., 2009). Although the hyperbilirubinemia observed during DEBIO-025 clinical studies was reversed after treatment cessation, it was the cause for discontinuation of treatment in 4 out of 16 patients, and a reduction in dose levels for future trials. As the anti-viral effect of cyclophilin inhibitors in HCV is dose related, a reduction in dose has led to a reduction in anti-viral effect, and a number of later trials with CsA-based cyclophilin inhibitors have shown no or poor reductions in HCV viral load when dosed as a monotherapy (Lawitz et al., 2009; Hopkins et al., 2009; Nelson et al., 2009). DEBIO-025 and cyclosporine A are known to be inhibitors of biliary transporters such as bile salt export pumps and other hepatic transporters (especially MRP2/cMOAT/ABCC2) (Crabbe et al., 2009). It has been suggested that the interaction with biliary transporters, in particular MRP2, may be the cause of the hyperbilirubinemia seen at high dose levels of DEBIO-025 (Nelson et al., 2009).

Moreover, DEBIO-025 and cyclosporine A are substrates for metabolism by cytochrome P450 (especially CYP3A4), and are known to be substrates and inhibitors of human P-glycoprotein (MDR1) (Crabbe et al., 2009). Cyclosporine A has also been shown to be an inhibitor of CYP3A4 in vitro (Niwa et al., 2007). This indicates that there could be an increased risk of drug-drug interactions with other drugs that are CYP3A4 substrates, inducers or inhibitors such as for example ketoconazole, cimetidine and rifampicin. In addition, interactions are also expected with drugs that are subject to transport by P-glycoprotein (e.g. digoxin), which could cause severe drug-drug interactions in HCV patients receiving medical treatments for other concomitant diseases (Crabbe et al. 2009). CsA is also known to have highly variable pharmacokinetics, with early formulations showing oral bioavailability from 1-89% (Kapurtzak et al., 2004). Without expensive monitoring of patient blood levels, this can lead to increased
prevalence of side effects due to increased plasma levels, or reduced clinical response due to lowered plasma levels.

Considering that inhibition of cyclophilins represent a promising new approach for treatment of HCV, there is a need for discovery and development of more potent and safer CyP inhibitors for use in combination therapy against HCV infection.

**Sanglifehrins**

Sanglifehrin A (SfA) and its natural congeners belong to a class of mixed non-ribosomal peptide/polyketides, produced by *Streptomyces* sp. A92-308110 (also known as DSM 9954) (see WO 97/02285), which were originally discovered on the basis of their high affinity to cyclophilin A (CyPA). SfA is the most abundant component in fermentation broths and exhibits approximately 20-fold higher affinity for CyPA compared to CsA. This has led to the suggestion that sanglifehrins could be useful for the treatment of HCV (WO2006/138507). Sanglifehrins have also been shown to exhibit a lower immunosuppressive activity than CsA when tested *in vitro* (Sanglier et al., 1999; Fehr et al., 1999). SfA binds with high affinity to the CsA binding site of CyPA (Kallen et al., 2005).

![Sanglifehrin A](image1)

![Hydroxymacrolide](image2)

![Sanglifehrin B](image3)

![Aldehydic macrocycle](image4)

The immunosuppressive mechanism of action of SfA is different to that of other known immunophilin-binding immunosuppressive drugs such as CsA, FK506 and rapamycin. SfA does not inhibit the phosphatase activity of calcineurin, the target of CsA (Zenke et al. 2001), instead its immunosuppressive activity has been attributed to the inhibition of interleukin-6 (Hartel et al., 2005), interleukin-12 (Steinschulte et al., 2003) and inhibition of interleukin-2-dependent T cell proliferation (Zhang & Liu, 2001). However, the molecular target and mechanism through which SfA exerts its immunosuppressive effect is hitherto unknown.
The molecular structure of SfA is complex and its interaction with CyPA is thought to be mediated largely by the macrocyclic portion of the molecule. In fact, a macrocyclic compound (hydroxymacrocycle) derived from oxidative cleavage of SfA has shown strong affinity for CyPA (Sedrani et al., 2003). X-ray crystal structure data has shown that the hydroxymacrocycle binds to the same active site of CyPA as CsA. Analogues based on the macrocycle moiety of SfA have also been shown to be devoid of immunosuppressive properties (Sedrani et al., 2003), providing opportunity for design of non-immunosuppressive CyP inhibitors for potential use in HCV therapy.

One of the issues in drug development of compounds such as sanglifehrins are the low solubilities if these highly lipophilic molecules. This can lead to issues with poor bioavailability, an increased chance of food effect, more frequent incomplete release from the dosage form and higher interpatient variability. Poorly soluble molecules also present many formulation issues, such as severely limited choices of delivery technologies and increasingly complex dissolution testing, with limited or poor correlation to in vivo absorption. These issues are often sufficiently formidable to halt development of many compounds (Hite et al., 2003).

Other therapeutic uses of cyclophilin inhibitors

Human Immunodeficiency Virus (HIV)

Cyclophilin inhibitors, such as CsA and DEBIO-025 have also shown potential utility in inhibition of HIV replication. The cyclophilin inhibitors are thought to interfere with function of CyPA during progression/completion of HIV reverse transcription (Ptak et al., 2008). However, when tested clinically, DEBIO-025 only reduced HIV-1 RNA levels ≥0.5 and >1 log_{10} copies/mL in nine and two patients respectively, whilst 27 of the treated patients showed no reduction in HIV-1 RNA levels (Steyn et al., 2006). Following this, DEBIO-025 was trialled in HCV/HIV coinfected patients, and showed better efficacy against HCV, and the HIV clinical trials were discontinued (see Watashi et al., 2010).

Treatment of HIV

More than 30 million people are infected by HIV-1 worldwide, with 3 million new cases each year. Treatment options have improved dramatically with the introduction of highly active antiretroviral therapy (HAART) (Schopman et al., 2010). By 2008, nearly 25 antiretroviral drugs had been licensed for treatment of HIV-1, including nine nucleoside reverse transcriptase inhibitors (NRTI), four non-nucleoside reverse transcriptase inhibitors (NNRTI), nine protease inhibitors (PI), one fusion inhibitor, one CCR5 inhibitor and one integrase inhibitor (Shafer and Schapiro, 2008). However, none of these current regimens lead to complete viral clearance, they can lead to severe side effects and antiviral resistance is still a major concern. Therefore, there still remains a need for new antiviral therapies, especially in mechanism of action classes where there are no approved drugs, such as is the case for cyclophilin inhibitors.

Hepatitis B Virus
Hepatitis B is a DNA virus of the family hepadnaviridae, and is the causative agent of
Hepatitis B. As opposed to the cases with HCV and HIV, there have been very few published
accounts of activity of cyclophilin inhibitors against Hepatitis B virus. Ptak et al. 2008 have
described weak activity of Debio-025 against HBV (IC50 of 4.1μM), whilst Xie et al., 2007
described some activity of CsA against HBV (IC50 >1.3μg/mL). This is in contrast to HIV and
HCV, where there are numerous reports of nanomolar antiviral activity of cyclophilin inhibitors.

Treatment of HBV

HBV infects up to 400 million people worldwide and is a major cause of chronic viral
hepatitis and hepatocellular carcinoma. As of 2008, there were six drugs licensed for the
treatment of HBV; interferon alpha and pegylated interferon alpha, three nucleoside analogues
(lamivudine, entecavir and telbivudine) and one nucleotide analogue (adefovir dipivoxil).
However, due to high rates of resistance, poor tolerability and possible side effects, new
therapeutic options are needed (Ferir et al., 2008).

Inhibition of the Mitochondrial Permeability Transition Pore (mPTP)

Opening of the high conductance permeability transition pores in mitochondria initiates
onset of the mitochondrial permeability transition (MPT). This is a causative event, leading to
necrosis and apoptosis in hepatocytes after oxidative stress, Ca2+ toxicity, and
ischaemia/reperfusion. Inhibition of Cyclophilin D (also known as Cyclophilin F) by cyclophilin
inhibitors has been shown to block opening of permeability transition pores and protects cell
death after these stresses. Cyclophilin D inhibitors may therefore be useful in indications where
the mPTP opening has been implicated, such as muscular dystrophy, in particular Ullrich
congenital muscular dystrophy and Bethlem myopathy (Millay et al., 2008, WO2008/084368,
Palma et al., 2009), multiple sclerosis (Forte et al., 2009), diabetes (Fujimoto et al., 2010),
amyotrophic lateral sclerosis (Martin 2009), bipolar disorder (Kubota et al., 2010), Alzheimer’s
disease (Du and Yan, 2010), Huntington’s disease (Perry et al., 2010), recovery after
myocardial infarction (Gomez et al., 2007) and chronic alcohol consumption (King et al., 2010).

Further therapeutic uses

Cyclophilin inhibitors have potential activity against and therefore in the treatment of
infections of other viruses, such as Varicella-zoster virus (Ptak et al., 2008), Influenza A virus
(Liu et al., 2009), Severe acute respiratory syndrome coronavirus and other human and feline
coronaviruses (Chen et al., 2005, Ptak et al., 2008), Dengue virus (Kaul et al., 2009), Yellow
fever virus (Qing et al., 2009), West Nile virus (Qing et al., 2009), Western equine encephalitis
virus (Qing et al., 2009), Cytomegalovirus (Kawasaki et al., 2007) and Vaccinia virus (Castro et
al., 2003).

There are also reports of utility of cyclophilin inhibitors and cyclophilin inhibition in other
therapeutic areas, such as in cancer (Han et al., 2009).
Therefore there remains a need to identify novel cyclophilin inhibitors, which may have utility, particularly in the treatment of HCV infection, but also in the treatment of other disease areas where inhibition of cyclophilins may be useful, such as virus infection, in particular HIV infection and HBV infection, muscular dystrophy, Ullrich congenital muscular dystrophy, Bethlem myopathy, multiple sclerosis, diabetes, amyotrophic lateral sclerosis, bipolar disorder, Alzheimer's disease, Huntington's disease, myocardial infarction and chronic alcohol consumption. Preferably, such cyclophilin inhibitors have improved properties over the currently available cyclophilin inhibitors, including one or more of the following properties: improved water solubility, improved antiviral potency against HCV, HIV or HBV or other viruses, reduced toxicity (including hepatotoxicity), improved pharmacological profile, such as high exposure to target organ (e.g. liver in the case of HCV) and/or long half life (enabling less frequent dosing), reduced drug-drug interactions, such as via reduced levels of CYP3A4 metabolism and inhibition and reduced (Pgp) inhibition (enabling easier multi-drug combinations) and improved side-effect profile, such as low binding to MRP2, leading to a reduced chance of hyperbilirubinaemia, lower immunosuppressive effect, such as might be shown by a mixed lymphocyte reaction (MLR) study., improved activity against resistant virus species, in particular CsA and CsA analogue (e.g DEBIO-025) resistant virus species and higher therapeutic (and/or selectivity) index. The present invention discloses novel sanglifehrin analogues which may have one or more of the above properties. In particular, the present invention discloses novel amide derivatives, which are anticipated to have one or more of the following beneficial properties: improved solubility, and therefore improved formulation, reduced immunosuppression and increased potency against certain virus types, including HCV, HIV and HBV.

**Summary of the invention**

The present invention provides novel macrocyclic sanglifehrin analogues, which have been generated by semisynthetic modification of native sanglifehrins. These analogues may be generated by dihydroxylation of a sanglifehrin, such as SfA, followed by cleavage to generate the aldehydic macrocycle, followed by further chemistry, including Horner-Emmons type reactions, to generate molecules with a variety of substituents to replace the aldehyde. As a result, the present invention provides macrocyclic amide analogues of SfA, methods for the preparation of these compounds, and methods for the use of these compounds in medicine or as intermediates in the production of further compounds.

Therefore, in a first aspect, the present invention provides macrocyclic amides and derivatives thereof according to formula (I) below, or a pharmaceutically acceptable salt thereof:
wherein:

- $R_1$ or $R_2$ independently represent alkyl, alkenyl, cycloalkyl, cycloalkenyl, alkylcycloalkyl, alkylcycloalkenyl, alkenylcycloalkyl, alkenylcycloalkenyl, aryl, heteroaryl, alkylaryl,
- alkylheteroaryl, alkenylaryl or alkenylheteroaryl any of which groups may optionally be substituted by monocyclic aryl or monocyclic heteroaryl;
- or $R_1$ and/or $R_2$ represents hydrogen;
- and wherein one or more carbon atoms of $R_1$ and/or $R_2$ not being part of an aryl or heteroaryl group are optionally replaced by a heteroatom selected from $O$, $N$ and $S(O)_p$ in which $p$ represents 0, 1 or 2 and wherein one or more carbon atoms of $R_1$ and/or $R_2$ are optionally replaced by carbonyl;
- or $R_1$ and $R_2$ are joined to form a saturated or unsaturated heterocyclic ring containing the nitrogen atom shown and wherein one or more carbon atoms of said ring are optionally replaced by a heteroatom selected from $O$, $N$ and $S(O)_p$ in which $p$ represents 0, 1 or 2 and wherein one or more carbon atoms of said ring are optionally replaced by carbonyl and which heterocyclic ring may optionally be fused to an aryl or heteroaryl ring;
- and wherein one or more carbon atoms of an $R_1$ and/or $R_2$ group may optionally be substituted by one or more halogen atoms;
- $R_3$ represents $H$, $-(CO)_n$alkyl;
- $R_4$ represents $H$ or $OH$;
- $R_5$ represents $H$, $OH$ or $=O$;
- $n$ represents a single or double bond save that when $n$ represents a double bond $R_4$ represents $H$; and
- $m$ represents a single or double bond save that when $m$ represents a double bond $R_5$ represents $H$;
- $x$ represents 0 or 1;
- including any tautomer thereof; or an isomer thereof in which the C26, 27 C=C bond shown as trans is cis; and including a methanol adduct thereof in which a ketal is formed by the combination of the C-53 keto (if present) and the C-15 hydroxyl group and methanol.
The above structure shows a representative tautomer and the invention embraces all tautomers of the compounds of formula (I) for example keto compounds where enol compounds are illustrated and vice versa.

Specific tautomers that are included within the definition of formula (I) are those in which (i) the C-53 keto group forms a hemiketal with the C-15 hydroxyl, or (ii) the C-15 and C-17 hydroxyl can combine with the C-53 keto to form a ketal. All numberings use the system for the parent sanglifehrin A structure.

In another aspect, the present invention provides sanglifehrin analogues and derivatives thereof according to formula (III) or formula (IV) below, or a pharmaceutically acceptable salt thereof:

including any tautomer thereof; and including a methanol adduct thereof in which a ketal is formed by the combination of the C-53 keto and the C-15 hydroxyl group and methanol.

The above structure shows a representative tautomer and the invention embraces all tautomers of the compounds of formula (III) or (IV) for example keto compounds where enol compounds are illustrated and vice versa.

Specific tautomers that are included within the definition of formula (III) or (IV) are those in which (i) the C-53 keto group forms a hemiketal with the C-15 hydroxyl. All numberings use the system for the parent sanglifehrin A structure.

The compounds of formula (III) and (IV) are novel intermediates useful for the synthesis of certain compounds described herein. They may also have useful sanglifehrin like biological activity in their own right and as such may be useful as pharmaceuticals.
Definitions

The articles "a" and "an" are used herein to refer to one or to more than one (i.e. at least one) of the grammatical objects of the article. By way of example “an analogue” means one analogue or more than one analogue.

As used herein the term “analogue(s)” refers to chemical compounds that are structurally similar to another but which differ slightly in composition (as in the replacement of one atom by another or in the presence or absence of a particular functional group).

As used herein the term “sanglifiquehrin(s)” refers to chemical compounds that are structurally similar to sanglifiquehrin A but which differ slightly in composition (as in the replacement of one atom by another or in the presence or absence of a particular functional group), in particular those generated by fermentation of Streptomyces sp. A92-308110. Examples include the sanglifiquehrin-like compounds discussed in WO97/02285 and WO98/07743, such as sanglifiquehrin B.

As used herein, the term “HCV” refers to Hepatitis C Virus, a single stranded, RNA, enveloped virus in the viral family Flaviviridae.

As used herein, the term “HIV” refers to Human Immunodeficiency Virus, the causative agent of Human Acquired Immune Deficiency Syndrome.

As used herein, the term “HBV” refers to Hepatitis B Virus, a circular DNA, enveloped virus in the viral family Hepadnaviridae, and the causative agent of Hepatitis B.

As used herein, the term “bioavailability” refers to the degree to which or rate at which a drug or other substance is absorbed or becomes available at the site of biological activity after administration. This property is dependent upon a number of factors including the solubility of the compound, rate of absorption in the gut, the extent of protein binding and metabolism etc. Various tests for bioavailability that would be familiar to a person of skill in the art are described herein (see also Egorin et al. 2002).

The term “water solubility” as used in this application refers to solubility in aqueous media, e.g. phosphate buffered saline (PBS) at pH 7.4, or in 5% glucose solution. Tests for water solubility are given below in the Examples as “water solubility assay”.

As used herein, the term “macrocyclic amide” refers to an amide referred to above as representing the invention in its broadest aspect, for example a compound according to formula (I) above, or a pharmaceutically acceptable salt thereof. These compounds are also referred to as “compounds of the invention” or “derivatives of sanglifiquehrin” or “sanglifiquehrin analogues” and these terms are used interchangeably in the present application.

The pharmaceutically acceptable salts of compounds of the invention such as the compounds of formula (I) include conventional salts formed from pharmaceutically acceptable inorganic or organic acids or bases as well as quaternary ammonium acid addition salts. More specific examples of suitable acid salts include hydrochloric, hydrobromic, sulfuric, phosphoric,
nitric, perchloric, fumaric, acetic, propionic, succinic, glycolic, formic, lactic, maleic, tartaric, citric, palmoic, malonic, hydroxymaleic, phenylacetic, glutamic, benzoic, salicylic, fumaric, toluenesulfonic, methanesulfonic, naphthalene-2-sulfonic, benzenesulfonic hydroxynaphthoic, hydroiodic, malic, steroic, tannic and the like. Hydrochloric acid salts are of particular interest.

Other acids such as oxalic, while not in themselves pharmaceutically acceptable, may be useful in the preparation of salts useful as intermediates in obtaining the compounds of the invention and their pharmaceutically acceptable salts. More specific examples of suitable basic salts include sodium, lithium, potassium, magnesium, aluminium, calcium, zinc, N,N'-dibenzylethylenediamine, chloroprocaine, choline, diethanolamine, ethylenediamine, N-methylglucamine and procaine salts. References hereinafter to a compound according to the invention include both compounds of formula (I) and their pharmaceutically acceptable salts.

As used herein, the term "alkyl" represents a straight chain or branched alkyl group, containing typically 1-10 carbon atoms, for example a C₁₋₆ alkyl group. "Alkenyl" refers to an alkyl group containing two or more carbons (for example 2-10 carbons e.g. 2-6 carbons) which is unsaturated with one or more double bonds.

Examples of alkyl groups include C₁₋₄ alkyl groups such as methyl, ethyl, n-propyl, i-propyl, and n-butyl. Examples of alkenyl groups include C₂₋₄ alkenyl groups such as =CH=CH₂ and –CH₂=CH=CH₂.

As used herein, the term "cycloalkyl" represents a cyclic alkyl group, containing typically 3-10 carbon atoms, optionally branched, for example cyclobutyl, cyclopentyl, cyclohexyl or cycloheptyl. A branched example is 2-methylcyclopentyl. "Cycloalkenyl" refers to a cyclic alkenyl group containing typically 5-10 carbon atoms, for example cyclopentenyl, cyclohexenyl or cycloheptenyl. Cycloalkyl and cycloalkenyl groups may for example be monocyclic or bicyclic (including spirocyclic) but are suitably monocyclic.

As used herein, the term "heterocyclyl" represents a cycloalkyl group in which one or more one or more ring carbon atoms (e.g. 1, 2 or 3 ring carbon atoms such as 1 or 2 e.g. 1) are replaced by heteroatoms selected from O, N and S. Examples include morpholiny, piperidinyl, pyrrolidinyl, piperazinyl and N-methyl piperazinyl.

As used herein, the term "heterocyclylenyl" represents a cycloalkenyl group in which one or more one or more ring carbon atoms (e.g. 1, 2 or 3 ring carbon atoms such as 1 or 2 e.g. 1) are replaced by heteroatoms selected from O, N and S.

Examples of aryl groups include (except where indicated) monocyclic groups i.e. phenyl and bicyclic rings (e.g. 9 and 10 membered rings) which are aromatic or (in the case of bicyclic rings contain at least one aromatic ring). For example a bicyclic ring may be fully aromatic e.g. naphthyl or may be partially aromatic (e.g. containing one aromatic ring), such as tetraline, indene or indane. Preferred aryl is phenyl. Aryl groups may optionally be substituted e.g. with one or
more (e.g. 1, 2 or 3) substituents e.g. selected from alkyl (e.g. C\textsubscript{1-4}alkyl), hydroxyl, CF\textsubscript{3}, halogen, alkoxy (e.g. C\textsubscript{1-4}alkoxy), nitro, -SO\textsubscript{2}Me, cyano and -CONH\textsubscript{2}.

Examples of heteroaryl groups include (except where indicated) monocyclic groups (e.g. 5 and 6 membered rings) and bicyclic rings (e.g. 9 and 10 membered rings) which are aromatic or (in the case of bicyclic rings contain at least one aromatic ring) and contain one or more heteroatoms (e.g. 1, 2, 3 or 4) heteroatoms selected from N, O and S. Examples of 5 membered heteroaryl rings include pyrrole, furan, thiophene, oxazole, oxadiazole, thiazole and triazole. Examples of 6 membered heteroaryl rings include pyridine, pyrimidine and pyrazine. Examples of bicyclic rings include fully aromatic rings such as quinoline, quinazoline, isoquinoline, indole, cinnoline, benzthiazole, benzimidazole, purine and quinoxaline and partially aromatic rings such as chromene, chromane, tetrahydroquinoline, dihydroquinoline, isoindoline and indoline. Monocyclic heteroaryl groups are preferred. The aforementioned heteroaryl groups may be optionally substituted as described above for aryl groups.

When bicyclic aryl and heteroaryl groups are partially aromatic, the connection to the remainder of the molecule may be through the aromatic portion or through the non-aromatic portion.

The term “treatment” includes prophylactic as well as therapeutic treatment.

Description of the Invention

The present invention provides sanglifehrin macroyclic amide analogues, as set out above, methods for preparation of these compounds and methods for the use of these compounds in medicine.

In one embodiment, the compound is a methanol adduct thereof in which a ketal is formed by the combination of the C-53 keto (if present) and the C-15 hydroxyl groups and methanol. In another embodiment it is not.

When R₁ and/or R₂ contains a group S(O)ₚ, variable p suitably represents 0 or 1. In one embodiment p represents 0 in another embodiment p represents 1. In another embodiment p represents 2.

When R₁ and/or R₂ represent –alkylaryl, an example includes C₃₋₅alkylaryl e.g. benzyl.

When R₁ and/or R₂ represent –alkenylaryl, an example includes C₅₋₇alkenylaryl e.g. –ethenylphenyl.

When R₁ and/or R₂ represent –alkylheteroaryl, an example includes C₁₋₂alkylheteroaryl e.g. –methylpyridinyl.

When R₁ and/or R₂ represent –alkenylheteroaryl, an example includes C₃₋₅alkenylheteroaryl e.g. –ethenylpyridinyl.

In one embodiment R₁ represents alkyl, alkenyl, cycloalkyl, cycloalkenyl, alkylcycloalkyl, alkylcycloalkenyl, alkenylcycloalkyl, alkenylcycloalkenyl, aryl, heteroaryl, alkylaryl, alkylheteroaryl, alkenylaryl or alkenylheteroaryl.

In one embodiment R₂ represents alkyl, alkenyl, cycloalkyl, cycloalkenyl, alkylcycloalkyl, alkylcycloalkenyl, alkenylcycloalkyl, alkenylcycloalkenyl, aryl, heteroaryl, alkylaryl, alkylheteroaryl, alkenylaryl or alkenylheteroaryl.

In one embodiment R₁ represents aryl or heteroaryl optionally substituted by monocyclic aryl or monocyclic heteroaryl. R₁ may, for example, represent 4-biphenyl in which either of the phenyl rings is optionally substituted.

In certain embodiments, a carbon atom of R₁ and/or R₂ is replaced by a heteroatom, for example one, two or three e.g. one or two e.g. one carbon atom(s) of R₁ and/or R₂ is (are) replaced by a heteroatom. For example in certain embodiments in the -NR₁R₂ moiety one, two or three e.g. one or two e.g. one carbon atom(s) is (are) replaced by a heteroatom.
If -CH₂ is replaced by N, the group formed is -NH₂⁻. If -CH₂⁻ is replaced by N, the group formed is -NH⁻. If -CHR⁻ is replaced by N the group formed is -NR⁻. Hence nitrogen atoms within R₁ and R₂ may be primary, secondary or tertiary nitrogen atoms.

When a carbon atom of R₁ and/or R₂ is replaced by a heteroatom, it is suitably replaced by O or N, especially O.

In certain embodiments, a carbon atom of R₁ and/or R₂ is replaced by a heteroatom such that R₁ and/or R₂ represents heterocyclyl, heterocyclylenyl, alkylheterocyclyl, alkylheterocyclylenyl, alkenylheterocyclyl or alkenylheterocyclylenyl.

In an embodiment, R₁ may represent aryl or heteroaryl substituted by monocyclic aryl or monocyclic heteroaryl, -C₁₄ alkyl, -OC₁₄ alkyl, -COC₁₄ alkyl or -C₂₄ alkenyl.

Heterocyclic rings formed when R₁ and R₂ are joined typically contain 4-8 ring atoms, e.g. 5-7 ring atoms, particularly 5 or 6 ring atoms.

Heterocyclic rings formed when R₁ and R₂ are joined typically contain only the nitrogen atom shown or one or two (e.g. one) additional heteroatom, especially a nitrogen or oxygen atom.

When R₁ and/or R₂ contain more than one heteroatom, these should typically be separated by two or more carbon atoms.

For example, the ring formed when R₁ and R₂ are joined may be morpholinyl or 1,2-oxazinane.

When R₁ and R₂ are joined to form a saturated or unsaturated heterocyclic ring containing the nitrogen atom shown and wherein one or more carbon atoms of said ring are optionally replaced by a heteroatom selected from O, N and S(O)ₓ in which p represents 0, 1 or 2 and wherein one or more carbon atoms of said ring are optionally replaced by carbonyl and which heterocyclic ring is fused to an aryl or heteroaryl ring, an example is tetrahydroquinolinyl.

When a carbon atom of R₁ or R₂ is replaced by a carbonyl, the carbonyl is suitably located adjacent to another carbon atom or a nitrogen atom. Suitably carbonyl groups are not located adjacent to sulphur or oxygen atoms.

For example R₁ and/or R₂ may represent -COC₁₄ alkyl e.g. -COMe.

Suitably a carbon atom of R₁ is not replaced by a carbonyl.

Suitably a carbon atom of R₂ is not replaced by a carbonyl.

Suitably R₁ does not represent hydrogen.

Suitably R₁ and R₂ do not both represent hydrogen.

Suitably R₁ and R₂ groups do not comprise a C=C moiety adjacent to a heteroatom.

Suitably R₁ and R₂ groups do not comprise a terminal C=C moiety which is adjacent to the N group shown in formula (I).

Suitably a carbon atom of R₂ is not replaced by any heteroatom.

In some embodiments a carbon atom of R₁ is not replaced by any heteroatom.

Suitably R₂ represents hydrogen, alkyl or alkenyl.
Suitably $R_2$ represents hydrogen, C$_{1-4}$ alkyl or C$_{1-4}$ alkenyl, especially hydrogen, C$_{1-4}$ alkyl. In one embodiment $R_2$ represents hydrogen. In another embodiment $R_2$ represents C$_{1-4}$ alkyl.

Alternatively, suitably $R_1$ and $R_2$ together with the nitrogen to which they are attached represent a 5-7 membered heterocyclic ring, such as a pyrrolidine, piperidine, morpholine or piperazine ring in which the 4-nitrogen of piperazine is optionally substituted by C$_{1-4}$ alkyl.

In another embodiment, suitably $R_1$ and $R_2$ together with the nitrogen to which they are attached represent a 5-7 membered heterocyclic ring, such as a pyrrolidine, piperidine, morpholine or piperazine ring in which the 4-nitrogen of piperazine is optionally substituted by C$_{1-4}$ alkyl, and in which a carbon atom adjacent to a nitrogen atom within the ring is replaced with carbonyl. Thus, for example, $R_1$ and $R_2$ together with the nitrogen to which they are attached represent piperidinone.

In another embodiment, an oxygen atom is adjacent to the nitrogen atom to which $R_1$ and $R_2$ are attached. For example, $R_1$ may represent alkyl or alkenyl in which the carbon atom adjacent to the nitrogen atom to which $R_1$ is attached represents O. For example $R_1$ may represent –OC$_{1-4}$ alkyl e.g. OMe. Alternatively $R_1$ and $R_2$ are joined and the carbon atom adjacent to the nitrogen atom to which $R_1$ is attached represents O e.g. to form a 1,2-oxazinane ring.

Suitably $x$ represents 0.

When one or more carbon atoms of an $R_1$ and/or $R_2$ group are substituted by one or more halogen atoms, exemplary halogen atoms are F, Cl and Br, especially F and Cl particularly F.

For example $R_1$ and/or $R_2$ moieties may be substituted by up to 6 halogen atoms (e.g. F atoms) for example up to 3 halogen atoms (e.g. F atoms).

An exemplary halogenated $R_1$ and/or $R_2$ moiety is –CF$_3$.

Suitably carbon atoms of an $R_1$ and/or $R_2$ group are not substituted by one or more halogen atoms i.e. $R_1$ or $R_2$ independently represent alkyl, alkenyl, cycloalkyl, cycloalkenyl, alkylcycloalkyl, alkylcycloalkenyl, alkenylcycloalkyl, alkenylcycloalkenyl, aryl, heteroaryl, alkyaryl, alkylheteroaryl, alkenylaryl or alkenylheteroaryl any of which groups may optionally be substituted by monocyclic aryl or monocyclic heteroaryl;

or $R_1$ and/or $R_2$ represents hydrogen;

and wherein one or more carbon atoms of $R_1$ and/or $R_2$ not being part of an aryl or heteroaryl group are optionally replaced by a heteroatom selected from O, N and S(O)$_p$ in which $p$ represents 0, 1 or 2 and wherein one or more carbon atoms of $R_1$ and/or $R_2$ are optionally replaced by carbonyl;

or $R_1$ and $R_2$ are joined to form a saturated or unsaturated heterocyclic ring containing the nitrogen atom shown and wherein one or more carbon atoms of said ring are optionally replaced by a heteroatom selected from O, N and S(O)$_p$ in which $p$ represents 0, 1 or 2 and
wherein one or more carbon atoms of said ring are optionally replaced by carbonyl and which heterocyclic ring may optionally be fused to an aryl or heteroaryl ring.

Exemplary R₁ groups include methyl, -CF₃, ethyl, propyl (e.g. n-propyl or i-propyl), -CH₂CH=CH or butyl (e.g. n-butyl, t-butyl or i-butyl). The aforementioned exemplary groups may, for example, be taken together with R₂ representing H, Me, ethyl, propyl (e.g. n-propyl or i-propyl) or butyl (e.g. n-butyl, t-butyl or i-butyl).

Further exemplary R₁ groups include cyclopentyl or cyclohexyl. The aforementioned exemplary groups may, for example, be taken together with R₂ representing H, Me, ethyl, propyl (e.g. n-propyl or i-propyl) or -OME.

Further exemplary R₁ groups include optionally substituted pyridinyl or optionally substituted phenyl, for example phenyl substituted by phenyl. The aforementioned exemplary groups may, for example, be taken together with R₂ representing H, Me or -OME.

Further exemplary R₁ groups include –OME, –OCF₃, –Oethyl, O-i-propyl, -SMe, O-n-propyl, -O-n-butyl, -O-t-butyl, O-i-butyl, O-CH₂C(Me)₃. The aforementioned exemplary groups may, for example, be taken together with R₂ representing H, Me, ethyl, i-propyl or t-butyl.

Further exemplary R₁ groups include –O-(optionally substituted phenyl) or –O-(optionally substituted pyridinyl). The aforementioned exemplary groups may, for example, be taken together with R₂ representing H or Me.

Exemplary moieties that NR₁R₂ may together form include morpholinyl, piperidinyl, pyrrolidinyl, oxazinane (e.g. 1,2-oxazinane) and those moieties disclosed in the following table:
Suitable $R_3$ represents H or (CO)$_n$C$_{1-4}$alkyl e.g. H or C$_{1-4}$alkyl such as H or methyl, especially H.

Suitably $n$ represents a single bond.

Suitably $m$ represents single bond.

Suitably $R_4$ represents OH.

Suitably $R_5$ represents =O.

In a suitable embodiment of the invention, $R_1$ represents OCH$_3$, $R_2$ represents Me, $R_3$ represents H, $R_4$ represents OH, $n$ represents a single bond, $m$ represents a single bond and $R_5$ represents =O as represented by the following structure:
In another suitable embodiment of the invention, $R_1$ represents ethyl, $R_2$ represents ethyl, $R_3$ represents $H$, $R_4$ represents $OH$, $n$ represents a single bond, $m$ represents a single bond and $R_5$ represents $=O$ as represented by the following structure:

In another suitable embodiment of the invention, $R_1$ represents $-CHMe_2$, $R_2$ represents $H$, $R_3$ represents $H$, $R_4$ represents $OH$, $n$ represents a single bond, $m$ represents a single bond and $R_5$ represents $=O$ as represented by the following structure:

In another suitable embodiment of the invention, $R_1$ represents methyl, $R_2$ represents $H$, $R_3$ represents $H$, $R_4$ represents $OH$, $n$ represents a single bond, $m$ represents a single bond and $R_5$ represents $=O$ as represented by the following structure:
In another suitable embodiment of the invention, $R_1$ represents methyl, $R_2$ represents H, $R_3$ represents Me, $R_4$ represents OH, $n$ represents a single bond, $m$ represents a single bond and $R_5$ represents $=O$ as represented by the following structure:

In another suitable embodiment of the invention, $R_1$ represents $-\text{CH}_2\text{CH}=\text{CH}_2$, $R_2$ represents H, $R_3$ represents H, $R_4$ represents OH, $n$ represents a single bond, $m$ represents a single bond and $R_5$ represents $=O$ as represented by the following structure:

In another suitable embodiment of the invention, $R_1$ represents methyl, $R_2$ represents methyl, $R_3$ represents H, $R_4$ represents OH, $n$ represents bond, $m$ represents bond and $R_5$ represents $=O$ as represented by the following structure:
In another suitable embodiment of the invention, \( R_1 \) represents \(-\text{CH}_2\text{CHMe}_2\), \( R_2 \) represents \(-\text{CH}_2\text{CHMe}_2\), \( R_3 \) represents \( \text{H} \), \( R_4 \) represents \( \text{OH} \), \( n \) represents a single bond, \( m \) represents a single bond and \( R_5 \) represents \( =\text{O} \) as represented by the following structure:

In another suitable embodiment of the invention, \( R_1 \) represents \( \text{OCH}_3 \), \( R_2 \) represents \( \text{Me} \), \( R_3 \) represents \( \text{H} \), \( R_4 \) represents \( \text{OH} \), \( n \) represents a single bond, \( m \) represents a double bond and \( R_5 \) represents \( \text{H} \) as represented by the following structure:

In another suitable embodiment of the invention, \( R_1 \) represents \( \text{OCH}_3 \), \( R_2 \) represents \( \text{Me} \), \( R_3 \) represents \( \text{H} \), \( R_4 \) represents \( \text{H} \), \( n \) represents a double bond, \( m \) represents a single bond and \( R_5 \) represents \( =\text{O} \) as represented by the following structure:
In another suitable embodiment of the invention, $R_1$ and $R_2$ together represent \(-\text{CH}_2\text{CH}_2\text{OCH}_2\text{CH}_3\)- connected in a 6-membered heterocycle, $R_3$ represents H, $R_4$ represents OH, $n$ represents a single bond, $m$ represents a single bond and $R_5$ represents \(-\text{O}\) as represented by the following structure:

In another suitable embodiment of the invention, $R_1$ represents 4-biphenyl, $R_2$ represents H, where, $R_3$ represents H, $R_4$ represents OH, $n$ represents a single bond, $m$ represents a single bond and $R_5$ represents \(-\text{O}\) as represented by the following structure:
In another suitable embodiment of the invention, \( R_1 \) represents cyclohexyl, \( R_2 \) represents Me, \( R_3 \) represents H, \( R_4 \) represents OH, \( n \) represents a single bond, \( m \) represents a single bond and \( R_5 \) represents =O as represented by the following structure:

![Chemical Structure 1]

In another suitable embodiment of the invention, \( R_1 \) represents cyclohexyl, \( R_2 \) represents H, \( R_3 \) represents H, \( R_4 \) represents OH, \( n \) represents a single bond, \( m \) represents a single bond and \( R_5 \) represents =O as represented by the following structure:

![Chemical Structure 2]

In another suitable embodiment of the invention, \( R_1 \) and \( R_2 \) together represent \(-OCH_2CH_2CH_2CH_2-\) connected in a 6-membered heterocycle. \( R_3 \) represents H, \( R_4 \) represents OH, \( n \) represents a single bond, \( m \) represents a single bond and \( R_5 \) represents =O as represented by the following structure:

![Chemical Structure 3]
In another suitable embodiment of the invention, \( R_1 \) represents 2-pyridinyl, \( R_2 \) represents H, \( R_3 \) represents H, \( R_4 \) represents OH, \( n \) represents a single bond, \( m \) represents a single bond and \( R_5 \) represents \( =O \) as represented by the following structure:

![Structure 1]

In a suitable embodiment of the invention, \( R_1 \) represents \( OCH_3 \), \( R_2 \) represents Me, \( R_3 \) represents H, \( R_4 \) represents OH, \( n \) represents a single bond, \( m \) represents a single bond and \( R_5 \) represents OH as represented by the following structure:

![Structure 2]

In another suitable embodiment of the invention, \( R_1 \) represents \( OCH_3 \), \( R_2 \) represents Me, \( R_3 \) represents H, \( R_4 \) represents H, \( n \) represents a single bond, \( m \) represents a single bond and \( R_5 \) represents \( =O \) as represented by the following structure:

![Structure 3]
In another suitable embodiment of the invention, R₁ represents ethyl, R₂ represents ethyl, R₃ represents H, R₄ represents H, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:

In another suitable embodiment of the invention, R₁ represents –CHMe₂, R₂ represents H, R₃ represents H, R₄ represents H, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:

In another suitable embodiment of the invention, R₁ represents methyl, R₂ represents H, R₃ represents H, R₄ represents H, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:
In another suitable embodiment of the invention, $R_1$ represents methyl, $R_2$ represents H, $R_3$ represents Me, $R_4$ represents H, $n$ represents a single bond, $m$ represents a single bond and $R_5$ represents $=O$ as represented by the following structure:

![Structure 1]

In another suitable embodiment of the invention, $R_1$ represents $-\text{CH}_2\text{CH}=\text{CH}_2$, $R_2$ represents H, $R_3$ represents H, $R_4$ represents H, $n$ represents a single bond, $m$ represents a single bond and $R_5$ represents $=O$ as represented by the following structure:

![Structure 2]

In another suitable embodiment of the invention, $R_1$ represents methyl, $R_2$ represents methyl, $R_3$ represents H, $R_4$ represents H, $n$ represents bond, $m$ represents bond and $R_5$ represents $=O$ as represented by the following structure:

![Structure 3]
In another suitable embodiment of the invention, R₁ represents –CH₂CHMe₂, R₂ represents –CH₂CHMe₂, R₃ represents H, R₄ represents H, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:

In another suitable embodiment of the invention, R₁ represents OCH₃, R₂ represents Me, R₃ represents H, R₄ represents H, n represents a single bond, m represents a double bond and R₅ represents H as represented by the following structure:

In another suitable embodiment of the invention, R₁ and R₂ together represent –CH₂CH₂OCH₂CH₂– connected in a 6-membered heterocycle, R₃ represents H, R₄ represents H, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:
In another suitable embodiment of the invention, R₁ represents 4-biphenyl, R₂ represents H, where, R₃ represents H, R₄ represents H, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:

![Chemical Structure 1]

In another suitable embodiment of the invention, R₁ represents cyclohexyl, R₂ represents Me, R₃ represents H, R₄ represents H, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:

![Chemical Structure 2]

In another suitable embodiment of the invention, R₁ represents cyclohexyl, R₂ represents H, R₃ represents H, R₄ represents H, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:
In another suitable embodiment of the invention, R₁ and R₂ together represent – OCH₂CH₂CH₂CH₂– connected in a 6-membered heterocycle. R₃ represents H, R₄ represents H, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:

In a suitable embodiment of the invention, R₁ represents 2-pyridinyl, R₂ represents H, R₃ represents H, R₄ represents H, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:

In another series of suitable embodiments, R₃ represents H, R₄ represents OH, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:
In these embodiments, $R_{10}$ represents one of the following moieties:
In some embodiments the double bond at the C26, 27 position (by reference to the structure of sanglifehrin A) may be in the cis form instead of the trans form.

In a suitable embodiment of the invention, the double bond at the C26, 27 position is in the cis form, as represented by the following formula:

Such compounds may be produced during chemical synthesis.

In general, the compounds of the invention are prepared by semi-synthetic derivatisation of a sanglifehrin. Sanglifehrins may be prepared using methods described in WO97/02285 and WO98/07743, which documents are incorporated in their entirety, or additional methods described herein. Sanglifehrins have also been produced by complex total synthetic chemistry which is capable of producing low amounts of material following extensive laboratory work. Semisynthetic
methods for generating the sanglifehrin macrocyclic aldehyde are described in US6,124,453, Metternich et al., 1999, Banteli et al., 2001 and Sedrani et al., 2003.

In general, a process for preparing certain compounds of formula (I) or a pharmaceutically acceptable salt thereof comprises:

5 (a) dihydroxylation of sanglifehrin A or other naturally occurring analogue of sanglifehrin (e.g. Sanglifehrin B) or an analogue thereof having variation at the positions denoted by variables R₃, R₄, R₅, n and m;
(b) oxidative cleavage of the 1,2-diol to yield an aldehyde; and
(c) coupling said aldehyde with a stabilised carbanion (or canonical form thereof), such as a phosphonate carbanion, using a compound of formula II.

This is shown retrosynthetically below:
Wherein for sanglifehrin A, \( R_\gamma = \)

\( R_6 \) groups, which may be the same or different, independently represent alkyl (e.g. C1-4 alkyl) or benzyl.

Hence, a process for preparing compounds of the invention comprises reacting a compound of formula II with an aldehydic macrocycle (compound of formula III).

The preparation of compounds of formula III has been described previously (Metternich et al. 1999). Briefly, a sanglifehrin, such as SfA, is dihydroxylated using modified Sharpless conditions (catalytic osmium tetroxide). The use of the chiral ligands aids in promoting selectivity. The resultant diol can then be cleaved oxidatively, using for instance sodium periodate. The resultant compound of formula III can then be used as a substrate for derivatisation to an homologated amide. Typically a compound of formula II is dissolved in an aprotic solvent, cooled and the treated with a base, for example sodium hydride. A compound of formula III is then added and the reaction warmed in temperature. After a suitable period of time the reaction is stopped and the compound of formula I is purified by standard conditions (e.g. preparative HPLC, preparative TLC etc).

Derivatisations to introduce changes to groups \( R_4, R_5, n \) and \( m \) can be carried out prior to generation of the compound of formula III or after the reaction to form the homologated amide. Briefly, the hydroxyl at \( R_4 \) can be eliminated by treatment of a suitable substrate in acidic conditions in order to generate a triene. The ketone at \( R_5 \) can be reduced to a hydroxyl group by treatment with a suitable reducing agent, such as sodium borohydride. The hydroxyl group can be converted to iodo and then eliminated by treatment with a suitable base, such as DBU.

Compounds of formula II may be known or readily synthesised from available amines (\( R_4 R_5 \text{NH} \)). As shown in scheme 1 (below) the amine may be used to treat chloroacetyl chloride or similar to form an alpha-chloroamide. The alpha-chloroamide is then treated in an Arbuzov reaction to generate the compound of formula II. Other routes to compounds of formula II will be apparent to one skilled in the art.
If desired or necessary, protecting groups may be employed to protect functionality in the aldehydic macrocycle, acid macrocycle or the amine, or in compounds of formula (II) as described in T. W. Green, P. G. M. Wuts, *Protective Groups in Organic Synthesis*, Wiley-Interscience, New York, 1999, 49-54, 708-711.

The methanol adduct may be prepared by fermentation and isolation from broth, or may be prepared from sanglifehrin A (WO97/02285).

In addition to the specific methods and references provided herein a person of skill in the art may also consult standard textbook references for synthetic methods, including, but not limited to Vogel’s Textbook of Practical Organic Chemistry (Furniss *et al.*, 1989) and March’s Advanced Organic Chemistry (Smith and March, 2001).

Polyketide biosynthetic engineering methods have also been described to enable generation of compounds of formula (I) where R₄=H and n=2 bond (see compounds of formula (III) and (IV) illustrated above). This involves replacing the reductive loop of sanglifehrin module 12 (see WO2010/034243 and Qu *et al.*, 2011), with a reductive loop conferring active dehydratase (DH), enoyl reductase (ER) and ketoreductase (KR) domains (e.g. the reductive loops from rapamycin modules 13,7 or 1 (Aparicio *et al.*, 1996), erythromycin module 4 (Bevitt *et al.*, 1992) or sanglifehrin module 6 (Qu *et al.*, 2011)). An individual skilled in the art will appreciate that a suitable reductive loop could be identified in a type I polyketide synthase module on the basis of homology to published sequences (eg Aparicio *et al* 1996), and consequently that this change could be accomplished by the introduction of any such loop containing the three active domains, DH, ER and KR. Methods for polyketide biosynthetic engineering and the concept of a reductive loop are described in WO98/01546 and WO00/01827. It is obvious to someone skilled in the art that these compounds can be synthesised *de novo* from commercially available compounds, i.e. total synthesis. The synthesis of the tripeptide and subsequent macrocycle formation has been described (Cubrejas *et al*, 1999). A process such as this could be modified to generate compounds of the invention.
Other compounds of the invention may be prepared by methods known per se or by methods analogous to those described above.

A sanglifehrin macrocycle of the invention may be administered alone or in combination with other therapeutic agents. Co-administration of two (or more) agents allows for lower doses of each to be used, thereby reducing side effect, can lead to improved potency and therefore higher SVR, and a reduction in resistance.

Therefore in one embodiment, the sanglifehrin macrocycle of the invention is co-administered with one or more therapeutic agent/s for the treatment of HCV infection, taken from the standard of care treatments. This could be an interferon (e.g. pIFNα and/or ribavirin).

In an alternative embodiment, a sanglifehrin macrocycle of the invention is co-administered with one or more other anti-viral agents, such as a STAT-C (specifically targeted agent for treatment of HCV), which could be one or more of the following: Non-nucleoside Polymerase inhibitors (e.g. ABT-333, ABT-072, BMS 791325, IDX375, VCH-222, BI 207127, ANA598, VCH-916, GS 9190, PF-00868554 (Filibuvir) or VX-759), Nucleoside or nucleotide polymerase inhibitors (e.g. 2'-C-methylcytidine, 2'-C-methyladenosine, R1479, PSI-6130, R7128, R1626, PSI 7977 or IDX 184), Protease inhibitors (e.g. ABT-450, ACH-1625, BI 201355, BILN-2061, BMS-650032, CTS 1027, Danoprevir, GS 9256, GS 9451, MK 5172, IDX 320, VX-950(Telaprevir), SCH503034(Boceprevir), TMC435350, MK-7009 (Vaneprivir), R7227/ITMN-191, EA-058, EA-063 or VX 985), NS5A inhibitors (e.g. A-831, BMS 790052, BMS 824393, CY-102 or PPI-461), silymarin, NS4b inhibitors, serine C-palmitoyltransferase inhibitors, Nitazoxanide or viral entry inhibitors (e.g. PRO 206).

In an alternative embodiment, a sanglifehrin macrocycle of the invention is co-administered with one or more other anti-viral agents (such as highly active antiretroviral therapy (HAART)) for the treatment of HIV, which could be one or more of the following: nucleoside reverse transcriptase inhibitors (NRTI) (e.g. Emtricitabine or Tenofovir), non-nucleoside reverse transcriptase inhibitors (NNRTI) (e.g. Rilpivirine or Efavirenz), protease inhibitors (PI) (e.g. Ritonavir or Lopinavir), fusion inhibitors (e.g. Maraviroc or Enfuviytide), CCR5 inhibitors (e.g. Aplaviroc or Vicriviroc), maturation inhibitors (e.g. Bevirimat), CD4 monoclonal antibodies (e.g. Ibalizumab) and integrase inhibitors (e.g. Eltidepress).

In an alternative embodiment, a sanglifehrin macrocycle of the invention is co-administered with one or more other anti-viral agents for the treatment of HBV, which could be one or more of the following: interferons (e.g. interferon alpha or pegylated interferon alpha), nucleoside or nucleotide analogues (e.g. lamivudine, entecavir, adefovir dipivoxil or telbivudine), other immunomodulators (e.g. Thymosin alpha, CYT107 or DV-601) or HMG CoA reductase inhibitors (e.g. Simvastatin).

The formulations may conveniently be presented in unit dosage form and may be prepared by any of the methods well known in the art of pharmacy. Such methods include the step of
bringing into association the active ingredient (compound of the invention) with the carrier which constitutes one or more accessory ingredients. In general the formulations are prepared by uniformly and intimately bringing into association the active ingredient with liquid carriers or finely divided solid carriers or both, and then, if necessary, shaping the product.

The compounds of the invention will normally be administered orally in the form of a pharmaceutical formulation comprising the active ingredient, optionally in the form of a non-toxic organic, or inorganic, acid, or base, addition salt, in a pharmaceutically acceptable dosage form. Depending upon the disorder and patient to be treated, as well as the route of administration, the compositions may be administered at varying doses.

For example, the compounds of the invention can be administered orally, buccally or sublingually in the form of tablets, capsules, ovules, elixirs, solutions or suspensions, which may contain flavouring or colouring agents, for immediate-, delayed- or controlled-release applications.

Such tablets may contain excipients such as microcrystalline cellulose, lactose, sodium citrate, calcium carbonate, dibasic calcium phosphate and glycine, disintegrants such as starch (preferably corn, potato or tapioca starch), sodium starch glycollate, croscarmellose sodium and certain complex silicates, and granulation binders such as polyvinylpyrrolidone, hydroxypropylmethylcellulose (HPMC), hydroxypropycellulose (HPC), sucrose, gelatin and acacia. Additionally, lubricating agents such as magnesium stearate, stearic acid, glyceryl behenate and talc may be included.

Solid compositions of a similar type may also be employed as fillers in gelatin capsules. Preferred excipients in this regard include lactose, starch, a cellulose, milk sugar or high molecular weight polyethylene glycols. For aqueous suspensions and/or elixirs, the compounds of the invention may be combined with various sweetening or flavouring agents, colouring matter or dyes, with emulsifying and/or suspending agents and with diluents such as water, ethanol, propylene glycol and glycerin, and combinations thereof.

A tablet may be made by compression or moulding, optionally with one or more accessory ingredients. Compressed tablets may be prepared by compressing in a suitable machine the active ingredient in a free-flowing form such as a powder or granules, optionally mixed with a binder (e.g. povidone, gelatin hydroxypropylmethyl cellulose), lubricant, inert diluent, preservative, disintegrant (e.g. sodium starch glycolate, cross-linked povidone, cross-linked sodium carboxymethyl cellulose), surface-active or dispersing agent. Moulded tablets may be made by moulding in a suitable machine a mixture of the powdered compound moistened with an inert liquid diluent. The tablets may optionally be coated or scored and may be formulated so as to provide slow or controlled release of the active ingredient therein using, for example, hydroxypropylmethylcellulose in varying proportions to provide desired release profile.
Formulations in accordance with the present invention suitable for oral administration may be presented as discrete units such as capsules, cachets or tablets, each containing a predetermined amount of the active ingredient; as a powder or granules; as a solution or a suspension in an aqueous liquid or a non-aqueous liquid; or as an oil-in-water liquid emulsion or a water-in-oil liquid emulsion. The active ingredient may also be presented as a bolus, electuary or paste.

It should be understood that in addition to the ingredients particularly mentioned above the formulations of this invention may include other agents conventional in the art having regard to the type of formulation in question, for example those suitable for oral administration may include flavouring agents.

Advantageously, agents such as preservatives and buffering agents can be dissolved in the vehicle. To enhance the stability, the composition can be frozen after filling into the vial and the water removed under vacuum. The dry lyophilized powder is then sealed in the vial and an accompanying vial of water for injection may be supplied to reconstitute the liquid prior to use.

The dosage to be administered of a compound of the invention will vary according to the particular compound, the disease involved, the subject, and the nature and severity of the disease and the physical condition of the subject, and the selected route of administration. The appropriate dosage can be readily determined by a person skilled in the art.

The compositions may contain from 0.1% by weight, preferably from 5-60%, more preferably from 10-30% by weight, of a compound of invention, depending on the method of administration.

It will be recognized by one of skill in the art that the optimal quantity and spacing of individual dosages of a compound of the invention will be determined by the nature and extent of the condition being treated, the form, route and site of administration, and the age and condition of the particular subject being treated, and that a physician will ultimately determine appropriate dosages to be used. This dosage may be repeated as often as appropriate. If side effects develop the amount and/or frequency of the dosage can be altered or reduced, in accordance with normal clinical practice.

Further aspects of the invention include:
- A compound according to the invention for use as a pharmaceutical;
- A compound according to the invention for use as a pharmaceutical for the treatment of viral infections (especially RNA virus infections) such as HCV, HBV or HIV infection or other diseases such as muscular dystrophy, Ullrich congenital muscular dystrophy, Bethlehem myopathy, multiple sclerosis, diabetes, amyotrophic lateral sclerosis, bipolar disorder, Alzheimer's disease, Huntington's disease, myocardial infarction or chronic alcohol consumption;
- A pharmaceutical composition comprising a compound according to the invention together with a pharmaceutically acceptable diluent or carrier;

- A pharmaceutical composition comprising a compound according to the invention together with a pharmaceutically acceptable diluent or carrier further comprising a second or subsequent active ingredient, especially an active ingredient indicated for the treatment of viral infections such as HCV, HBV or HIV infection or muscular dystrophy, Ullrich congenital muscular dystrophy, Bethlem myopathy, multiple sclerosis, diabetes, amyotrophic lateral sclerosis, bipolar disorder, Alzheimer’s disease, Huntington’s disease, myocardial infarction or chronic alcohol consumption;

- A method of treatment of viral infections (especially RNA virus infections) such as HCV, HBV or HIV infection or muscular dystrophy, Ullrich congenital muscular dystrophy, Bethlem myopathy, multiple sclerosis, diabetes, amyotrophic lateral sclerosis, bipolar disorder, Alzheimer’s disease, Huntington’s disease, myocardial infarction or chronic alcohol consumption, which comprises administering to a subject a therapeutically effective amount of a compound according to the invention;

- Use of a compound according to the invention for the manufacture of a medicament for the treatment of viral infections such as HCV, HBV or HIV infection or muscular dystrophy, Ullrich congenital muscular dystrophy, Bethlem myopathy, multiple sclerosis, diabetes, amyotrophic lateral sclerosis, bipolar disorder, Alzheimer’s disease, Huntington’s disease, myocardial infarction or chronic alcohol consumption.

In one embodiment the aforementioned conditions are selected from HCV, HIV infection and muscular dystrophy. In another embodiment the aforementioned condition is HBV infection.

25 General Methods

Materials and Methods

Bacterial strains and growth conditions

The sanglifehrin producer *Streptomyces* sp. A92-308110 (DSM no 9954, purchased from DSMZ, Braunschweig, Germany) also termed BIOT-4253 and BIOT-4370 is maintained on medium oatmeal agar, MAM, or ISP2 (see below) at 28 °C.

*Streptomyces* sp. A92-308110 was grown on oatmeal agar at 28 °C for 7-10 days. Spores from the surface of the agar plate were collected into 20% w/v sterile glycerol in distilled and stored in 0.5-ml aliquots at -80 °C. Frozen spore stock was used for inoculating seed media SGS or SM25-3. The inoculated seed medium was incubated with shaking between 200 and 300 rpm at 5.0 or 2.5 cm throw at 27 °C for 24 hours. The fermentation medium SGP-2 or BT6 were inoculated with 2.5%-
10% of the seed culture and incubated with shaking between 200 and 300 rpm with a 5 or 2.5 cm throw at 24 °C for 4-5 days. The culture was then harvested for extraction.

*Media Recipes*

Water used for preparing media was prepared using Millipore Elix Analytical Grade Water Purification System

### Analysis of culture broths by LC-UV and LC-UV-MS

Culture broth (1 mL) and ethyl acetate (1 mL) is added and mixed for 15-30 min followed by centrifugation for 10 min. 0.4 mL of the organic layer is collected, evaporated to dryness and then re-dissolved in 0.20 mL of acetonitrile.

HPLC conditions:
- C18 Hyperclone BDS C18 Column 3u, 4.6 mm x 150 mm
- Fitted with a Phenomenex Analytical C18 Security Guard Cartridge (KJ0-4282)
- Column temp at 50 °C
- Flow rate 1 mL/min
Monitor UV at 240 nm
Inject 20 uL aliquot

Solvent gradient:

5  0 min: 55% B
1.0 min: 55% B
6.5 min: 100% B
10.0 min: 100% B
10.05 min: 55% B
10 13.0 min: 55% B

Solvent A is Water + 0.1% Formic Acid
Solvent B is Acetonitrile + 0.1% Formic Acid

15 Under these conditions SfA elutes at 5.5 min
Under these conditions SfB elutes at 6.5 min

LCMS is performed on an integrated Agilent HP1100 HPLC system in combination with a Bruker Daltonics Esquire 3000+ electrospray mass spectrometer operating in positive ion mode using the chromatography and solvents described above.

Synthesis
All reactions are conducted under anhydrous conditions unless stated otherwise, in oven dried glassware that is cooled under vacuum, using dried solvents. Reactions are monitored by LC-UV-MS, using an appropriate method, for instance the method described above for monitoring culture broths.

QC LC-MS method

*In vitro replicon assay for assessment of HCV antiviral activity*

Antiviral efficacy against genotype 1 HCV may be tested as follows: One day before addition of the test article, Huh5.2 cells, containing the HCV genotype 1b I389Luc-ubi-neo/NS3-3'/5.1 replicon (Vrolijk et al., 2003) and subcultured in cell growth medium [DMEM (Cat No. 41965039) supplemented with 10% FCS, 1% non-essential amino acids (11140035), 1% penicillin/streptomycin (15140148) and 2% Geneticin (10131027); Invitrogen] at a ratio of 1.3-1.4 and grown for 3-4 days in 75cm² tissue culture flasks (Techno Plastic Products), were harvested and seeded in assay medium (DMEM, 10% FCS, 1% non-essential amino acids, 1% penicillin/streptomycin) at a density of 6 500 cells/well (100µL/well) in 96-well tissue culture microtitre plates (Falcon, Beckton Dickinson for evaluation of the anti-metabolic effect and CulturPlate, Perkin Elmer for evaluation of antiviral effect). The microtitre plates are incubated overnight (37°C, 5% CO₂, 95-99% relative humidity), yielding a non-confluent cell monolayer. Dilution series are prepared; each dilution series is performed in at least duplicate. Following assay setup, the microtitre plates are incubated for 72 hours (37°C, 5% CO₂, 95-99% relative humidity).

For the evaluation of anti-metabolic effects, the assay medium is aspirated, replaced with 75µL of a 5% MTS (Promega) solution in phenol red-free medium and incubated for 1.5 hours (37°C, 5% CO₂, 95-99% relative humidity). Absorbance is measured at a wavelength of
498nm (Safire², Tecan) and optical densities (OD values) are converted to percentage of untreated controls.

For the evaluation of antiviral effects, assay medium is aspirated and the cell monolayers are washed with PBS. The wash buffer is aspirated, 25μL of Glo Lysis Buffer (Cat. N°. E2661, Promega) is added after which lysis is allowed to proceed for 5min at room temperature. Subsequently, 50μL of Luciferase Assay System (Cat. N°. E1501, Promega) is added and the luciferase luminescence signal is quantified immediately (1000ms integration time/well, Safire², Tecan). Relative luminescence units are converted to percentage of untreated controls.

The EC₅₀ and EC₉₀ (values derived from the dose-response curve) represent the concentrations at which respectively 50% and 90% inhibition of viral replication would be observed. The CC₅₀ (value derived from the dose-response curve) represents the concentration at which the metabolic activity of the cells would be reduced to 50% of the metabolic activity of untreated cells. The selectivity index (SI), indicative of the therapeutic window of the compound, is calculated as CC₅₀/EC₅₀.

A concentration of compound is considered to elicit a genuine antiviral effect in the HCV replicon system when, at that particular concentration, the anti-replicon effect is above the 70% threshold and no more than 30% reduction in metabolic activity is observed.

20 Assessment of water solubility

Water solubility may be tested as follows: A 10 mM stock solution of the sanglifehrin analogue is prepared in 100% DMSO at room temperature. Triplicate 0.01 mL aliquots are made up to 0.5 mL with either 0.1 M PBS, pH 7.3 solution or 100% DMSO in amber vials. The resulting 0.2 mM solutions are shaken, at room temperature on an IKA® vibrax VXR shaker for 6 h, followed by transfer of the resulting solutions or suspensions into 2 mL Eppendorf tubes and centrifugation for 30 min at 13200 rpm. Aliquots of the supernatant fluid are then analysed by the LCMS method as described above.

Alternatively, solubility in PBS at pH7.4 may be tested as follows: A calibration curve is generated by diluting the test compounds and control compounds to 40μM, 16μM, 4μM, 1.6μM, 0.4μM, 0.16μM, 0.04μM and 0.002μM, with 50% MeOH in H₂O. The standard points are then further diluted 1:20 in MeOH:PBS 1:1. The final concentrations after 1:20 dilution are 2000nM, 800nM, 200nM, 80nM, 20nM, 8nM, 2nM and 1nM. Standards are then mixed with the same volume (1:1) of ACN containing internal standard (hydroxymacrocycle, 6). The samples are centrifuged (5min, 12000rpm), then analysed by LC/MS.

Test compounds are prepared as stock solutions in DMSO at 10 mM concentration. The stock solutions are diluted in duplicate into PBS, pH 7.4 in 1.5 mL Eppendorf tubes to a target concentration of 100 µM with a final DMSO concentration of 1% (e.g. 4 µL of 10 mM DMSO stock solution into 396 µL 100 mM phosphate buffer). Sample tubes are then gently shaken for 4 hours at room temperature. Samples are centrifuged (10 min, 15000 rpm) to precipitate undissolved particles. Supernatants are transferred into new tubes and diluted (the dilution factor for the individual test article is confirmed by the signal level of the compound on the applied analytical instrument) with PBS. Diluted samples are then mixed with the same volume (1:1) of MeOH. Samples are finally mixed with the same volume (1:1) of ACN containing internal standard (hydroxymacrocycle, 6) for LC-MS/MS analysis.

Assessment of cell permeability

Cell permeability may be tested as follows: The test compound is dissolved to 10 mM in DMSO and then diluted further in buffer to produce a final 10 µM dosing concentration. The fluorescence marker lucifer yellow is also included to monitor membrane integrity. Test compound is then applied to the apical surface of Caco-2 cell monolayers and compound permeation into the basolateral compartment is measured. This is performed in the reverse direction (basolateral to apical) to investigate active transport. LC-MS/MS is used to quantify levels of both the test and standard control compounds (such as Propanolol and Acebutolol).

In vivo assessment of pharmacokinetics

In vivo assays may also be used to measure the bioavailability of a compound.

Generally, a compound is administered to a test animal (e.g. mouse or rat) both intravenously (i.v.) and orally (p.o.) and blood samples are taken at regular intervals to examine how the plasma concentration of the drug varies over time. The time course of plasma concentration...
over time can be used to calculate the absolute bioavailability of the compound as a percentage using standard models. An example of a typical protocol is described below. Mice are dosed with 1, 10, or 100 mg/kg of the compound of the invention or the parent compound i.v. or p.o.. Blood samples are taken at 5, 10, 15, 30, 45, 60, 90, 120, 180, 240, 360, 420 and 2880 minutes and the concentration of the compound of the invention or parent compound in the sample is determined via HPLC. The time-course of plasma concentrations can then be used to derive key parameters such as the area under the plasma concentration-time curve (AUC – which is directly proportional to the total amount of unchanged drug that reaches the systemic circulation), the maximum (peak) plasma drug concentration, the time at which maximum plasma drug concentration occurs (peak time), additional factors which are used in the accurate determination of bioavailability include: the compound’s terminal half life, total body clearance, steady-state volume of distribution and F%. These parameters are then analysed by non-compartmental or compartmental methods to give a calculated percentage bioavailability, for an example of this type of method see Egorin et al. 2002, and references therein.

**In vitro assessment of inhibition of MDR1 and MRP2 transporters**

To assess the inhibition and activation of the MDR1 (P-glycoprotein 1) and MRP2 transporters, an *in vitro* ATPase assay from Solvo Biotechnology Inc. can be used (Glavinis et al., 2003). The compounds (at 0.1, 1, 10 and 100μM) are incubated with MDR1 or MRP2 membrane vesicles both in the absence and presence of vanadate to study the potential ATPase activation. In addition, similar incubations are conducted in the presence of verapamil/sulfasalazine in order to detect possible inhibition of the transporter ATPase activity. ATPase activity is measured by quantifying inorganic phosphate spectrophotometrically. Activation is calculated from the vanadate sensitive increase in ATPase activity. Inhibition is determined by decrease in verapamil/sulfasalazine mediated ATPase activity.

**In vitro assay for assessment of HIV antiviral activity**

Antiviral efficacy against HIV may be tested as follows: Blood derived CD4+ T-lymphocytes and macrophages are isolated as described previously (Bobardt et al., 2008). Briefly, human PBMCs were purified from fresh blood by banding on Ficoll–Hypaque (30 min, 800 g, 25°C). Primary human CD4+ T cells were purified from PBMCs by positive selection with anti-CD4 Dynabeads and subsequent release using Detachabead. Cells were cultured in RPMI medium 1640 (Invitrogen) supplemented with 10% FCS, MEM amino acids, L-glutamine, MEM vitamins, sodium pyruvate, and penicillin plus streptomycin and were subsequently activated with bacterial superantigen staphylococcal enterotoxin B (SEB; 100 ng/ml) and mitomycin C-killed PBMC from another donor (10:1 PBMC:CD4 cell ratio). Three days after stimulation, cells
were split 1:2 in medium containing IL-2 (200 units/ml final concentration). Cultures were then split 1:2 every 2 days in IL-2 medium and infected with HIV at 7 days after stimulation. For generating primary human macrophages, monocytes were purified from human PBMCs by negative selection and activated and cultured at a cell concentration of 106/ml in DMEM, supplemented with 10% FCS, MEM amino acids, L-glutamine, MEM vitamins, sodium pyruvate, and penicillin (100 units/ml), streptomycin (100 mg/ml), and 50 ng/ml recombinant human granulocyte–macrophage colony-stimulating factor (GM-CSF) and maintained at 37°C in a humidified atmosphere supplemented with 5% CO2. To obtain monocyte-derived macrophages, cells were allowed to adhere to plastic and cultured for 6 days to allow differentiation.

CD4+ HeLa cells, Jurkat cells, activated CD4+ peripheral blood T-lymphocytes and macrophages (500,000 cells/100 μL) were incubated with pNL4.3-GFP (X4 virus) or pNL4.3-BaL-GFP (R5 virus) (100 ng of p24) in the presence of increasing concentrations of test article, Forty-eight hours later, infection was scored by analyzing the percentage of GFP-positive cells by FACS and EC50 calculated.

**In vitro assay for assessment of HBV antiviral activity**

Antiviral efficacy against HBV may be tested as follows: HepG2 2.2.15 cells are plated in 96-well microtiter plates. After 16-24 hours the confluent monolayer of HepG2 2.2.15 cells is washed and the medium is replaced with complete medium containing various concentrations of a test compound in triplicate (eg six half-log concentrations). Three days later the culture medium is replaced with fresh medium containing the appropriately diluted test compounds. Six days following the initial administration of the test compound, the cell culture supernatant is collected, treated with pronase and then used in a real-time quantitative TaqMan qPCR assay. The PCR-amplified HBV DNA is detected in real-time by monitoring increases in fluorescence signals that result from the exonucleolytic degradation of a quenched fluorescent probe molecule that hybridizes to the amplified HBV DNA. For each PCR amplification, a standard curve is simultaneously generated using dilutions of purified HBV DNA. Antiviral activity is calculated from the reduction in HBV DNA levels (IC50). A dye uptake assay is then employed to measure cell viability, which is used to calculate toxicity (TC50). The therapeutic index (TI) is calculated as TC50/IC50.

**In vitro mixed lymphocyte reaction (MLR) assay for assessment of immunosuppressant activity**

Immunosuppressant activity was tested as follows: Peripheral blood mononuclear cell (PBMC) populations were purified from the blood of two normal, unrelated volunteer donors (A & B), using centrifugation over histopaque. Cells were counted and plated out at 1 x 10^5 cells per well in 96 well plates in RPMI media, with supplements and 2% Human AB serum.
Culture conditions included: cell populations A & B alone and a mixed population of cells A&B in the absence or presence of test compounds, each at 6 different concentrations. Compounds were tested at doses ranging from 10μM to 0.0001 μM in 1-log increments. Control wells contained a comparable concentration of vehicle (0.5% DMSO) to that present in the test compound wells. Cultures were established in triplicate in a 96 well plate and incubated at 37°C in 5% CO₂ in a humidified atmosphere. 3H-thymidine was added on day 6 after assay set up and harvested 24hrs later. The levels of proliferation between the different culture conditions were then compared.

The ability of each dilution of test compound to inhibit proliferation in the MLR was calculated as percentage inhibition. This allowed estimation of the IC₅₀ (concentration of test compound which resulted in a 50% reduction of counts per minute). In order to calculate the IC₅₀, the X axis was transformed to a log scale. Non-linear regression was used to fit to the mean data points. A sigmoidal variable slope was selected.

**ELISA analysis of Cyp-NS5A interaction.**

This assay was used to measure the disruption of Cyp-NS5A complexes, which can be used to show the potency of interaction with Cyclophilin D. Briefly, production and purification of recombinant GST, GST-CypD and Con1 NS5A-His proteins was carried out as described previously (Chatterji et al., 2010). Nunc MaxiSorb 8-well strip plates were coated with GST or GST-CypD for 16 h at 4°C and blocked. Recombinant NS5A-His (1 ng/mL) was added to wells in 50 μL of binding buffer (20 mM Tris pH 7.9, 0.5 M NaCl, 10% glycerol, 10 mM DTT and 1% NP-40) for 16 h at 4°C. Captured NS5A-His was subsequently detected using mouse anti-His antibodies (1 μg/mL) (anti-6xHis, Clontech) and rabbit anti-mouse-horseradish peroxidase phosphatase (HRP) antibodies (1:1000 dilution). All experiments were conducted twice using two different batches of recombinant CypD and NS5A proteins.

**Anti-PPIase analysis of cyclophilin inhibition**

An alternative methodology for analysing interaction with cyclophilins is described as follows: The PPIase activity of recombinant CypD, produced by thrombin cleavage of GST-CypD, was determined by following the rate of hydrolysis of N-succinyl-Ala-Ala-Pro-Phe-p-nitroanilide by chymotrypsin. Chymotrypsin only hydrolyzes the trans form of the peptide, and hydrolysis of the cis form, the concentration of which is maximized by using a stock dissolved in trifluoroethanol containing 470 mM LiCl, is limited by the rate of cis-trans isomerization. CypD was equilibrated for 1 h at 5°C with selected test article using a drug concentration range from 0.1 to 20 nM. The reaction was started by addition of the peptide, and the change in absorbance was monitored spectrophotometrically at 10 data points per second. The blank rates of hydrolysis (in the absence of CypD) were subtracted from the rates in the presence of CypD. The initial rates of
the enzymatic reaction were analyzed by first-order regression analysis of the time course of the change in absorbance.

EXAMPLES

Example 1 — Production of sanglifehrin A and its natural congers in 15-L stirred bioreactors with secondary seed

Vegetative cultures were prepared by inoculating 0.2 mL from a spore stock of Streptomyces sp. A92-308110 into 400mL seed medium SGS in 2-L Erlenmeyer flasks with foam plugs.

The culture flasks were incubated at 27°C, 250 rpm (2.5 cm throw) for 24 h. From the seed culture, 300 mL was transferred into 15 litres of primary seed medium SGS containing 0.02% antifoam SAG 471, in a 15 L Braun fermentor. The fermentation was carried out for 24 hours at 27 °C, with starting agitation set at ≥ 300rpm aeration rate at 0.5 V/V/M and dissolved oxygen (DO) level controlled with the agitation cascade at ≥30% air saturation.

From the secondary seed culture prepared in the fermentor, 600 mL was taken under aseptic conditions and transferred into 15 litres of production medium SGP-2 containing 0.02% antifoam SAG 471, in 15 L Braun fermentor. The fermentation was carried out for 5 days at 24 °C, with starting agitation set at 300 rpm, aeration rate at 0.5 V/V/M and dissolved oxygen (DO) level controlled with the agitation cascade at ≥30% air saturation. SFa was seen to be produced at 10-20 mg/L in fermentation broths.

Example 2 — Extraction and purification of sanglifehrin A

The whole broth (30 L) was clarified by centrifugation. The resulting cell pellet was extracted twice with ethyl acetate (2 x 10 L), each by stirring for 1 hour with overhead paddle stirrer and leaving to settle before pumping off solvent. The ethyl acetate layers were then combined (~20 L) and the solvent removed under reduced pressure at 40°C to obtain an oily residue. This oily residue was then suspended in 80:20 methanol:water (total volume of 500 mL), and twice extracted with hexane (2 x 500 mL). The 80:20 methanol:water fraction was then dried under reduced pressure to yield a crude dry extract which contained SFa and SFB. This extract was dissolved in methanol (100 ml), mixed with 15 g Silica gel and dried to a powder. The powder was loaded into a silica gel column (5 x 20 cm) packed in 100% CHCl₃. For every one litre of elution solvent the methanol concentration was increased stepwise by 1% and 250 ml fractions collected. After three litres of solvent elution the methanol concentration was increased stepwise by 2% up to 8%. Fractions containing SFa and / or SFB were combined and reduced in vacuo to dryness and SFa and SFB purified by preparative HPLC. Preparative HPLC was achieved over a Waters Xterra Prep MS C18 OBD 10mm (19 x 250 mm) column
running with solvent A (water) and solvent B (acetonitrile) at 20 ml/min with the following timetable:

\[
\begin{align*}
  t &= 0 \text{ mins, 55% B} \\
  t &= 4 \text{ mins, 55% B} \\
  t &= 30 \text{ mins, 100% B} \\
  t &= 32 \text{ mins, 100% B} \\
  t &= 36 \text{ mins, 55% B}
\end{align*}
\]

Fractions containing SfA were combined and taken to dryness.

Example 3 - Synthesis of 8 (aldehydic macrocycle)

3.1 The preparation of 26,27-dihydroxyssanglifehrin, 9

![Chemical structures]

To a stirred solution of sanglifehrin A, 5 (135 mg, 0.1238 mmol), (DHQ)₂PHAL (5.76 mg, 0.0074 mmol), 2.5 wt% solution of osmium tetroxide in tert-butyl alcohol (47 µL, 0.0037 mmol), and methanesulfonamide (23.6 mg, 0.2476 mmol) in tert-butyl alcohol (4 mL) were added at room temperature together with a solution of potassium ferricyanide (122.3 mg, 0.3714 mmol) and potassium carbonate (51.3 mg, 0.3714 mmol) in 4 mL of water. After stirring for 1 h, a solution of saturated aqueous sodium sulfite (187.3 mg, 1.4857 mmol) was added. The resulting mixture was stirred for 30 min and then extracted with three portions of ethyl acetate. The organic layers were washed with brine, dried over anhydrous sodium sulfate, filtered, and concentrated under reduced pressure. The residue was purified by CombiFlash using reverse phase column (C18 column, A = H₂O, B = acetonitrile, t = 2 min, B = 0%; t = 4 min, B = 30%, t = 9 min, B = 35%; t = 12 min, B = 45%; t = 16 min, B = 70%) to afford 26,27-dihydroxyssanglifehrin, 9 (102 mg, 70%) as a white solid. QC LC-MS, RT = 5.3 mins, m/z = 1124.8 [M+H]⁺, 1122.7 [M-H]⁻

3.2 The preparation of the aldehydic macrocycle, 8
To a solution of 26,27-dihydroxysanglifehrin, 9 (60.0 mg, 0.053 mmol) in THF and water (2:1, 5 mL) was added sodium periodate (22.8 mg, 0.107 mmol). The resulting mixture was stirred at room temperature for 2 h, and saturated aqueous sodium bicarbonate was added. This mixture was extracted with three portions of ethyl acetate. The combined organic layers were washed with brine, dried over anhydrous sodium sulfate, filtered, and concentrated under reduced pressure. The residue was purified by Combiniflash using reverse phase column (C18 column, A = water, B = CH$_3$CN, t = 3 min, B = 0%; t = 12 min, B = 40%; t = 17 min, B = 40%, t = 21 min, B = 70%) to afford the aldehydic macrocycle, 8 (35 mg, 90%) as a white solid. QC LC-MS, RT = 4.0 mins, m/z = 761.4 [M+Na]$^+$, 737.3 [M-H]$^-$

**Example 4 — Synthesis of 10**

To a suspension of NaH (0.974 mg, 0.041 mmol) in anhydrous THF (1.0 ml) was added dropwise a solution of diethyl 2-(methoxy(methyl)amino)-2-oxoethylphosphonate (25.8 mg, 0.108 mmol) in anhydrous THF (0.2 ml) under N$_2$ atmosphere at -3 $^\circ$C with stirring. The solution was then stirred at room temperature until it became clear. A solution of 8 (20 mg, 0.027 mmol) in anhydrous THF (0.2 ml) was added dropwise to the clear solution and the mixture stirred at room temperature for 30 min. The mixture was quenched with water and the THF was removed under reduced pressure. The residue was extracted with ethyl acetate. The organic layer was washed with brine then dried. The solvent was removed under reduced pressure to yield a residue of 14 mg. The crude compound (dissolved in acetone) was loaded on TLC plate (1 mm,
20*20 cm) and developed with acetone/petroleum ether=3:2. The target band (visualized by UV) was collected and mixed with acetone, then filtered through a pad of silica gel (2-3 cm height, pre-rinsed with acetone to remove impurities). The filtration was concentrated under vacuo. Finally, adding acetonitrile and water to the obtained sample, the solution was freeze-dried to give the desired product as white solid powder (8.2 mg, 37%). LC-MS: 824 [M+1]⁺. See figure 2 for ¹H NMR.

**Example 5 — Synthesis of 13**

**5.1 Synthesis of intermediate 12**

A mixture of N, N-diethylchloroacetamide (17.5 mL, 0.127 mmol) and triethyl phosphite 22 mL, 0.1309 mmol) was stirred at 180°C for 8 h. The reaction mixture was cooled to room temperature and distilled to give intermediate 12 (15g, 47%) as a colorless oil.

**5.2 Synthesis of 13**

To a suspension of NaH (0.776 mg, 0.0324 mmol) in anhydrous THF (1.0 mL) was added dropwise a solution of diethyl 2-(diethylamino)-2-oxoethylphosphonate (28.5 mg, 0.1134 mol) in
anhydrous THF (0.2 mL) under N₂ atmosphere at -3 °C with stirring. The solution was then stirred at room temperature until it became clear. A solution of 8 (20 mg, 0.027 mmol) in anhydrous THF (0.2 mL) was added dropwise to the clear solution and the mixture stirred at rt for 30 min. The mixture was quenched with water and THF was evaporated under reduced pressure. The residue was extracted with EA. The organic layer was washed with brine then dried. The solvent was evaporated off, giving a residue of 17 mg which was purified with Prep TLC. The crude compound (dissolved in acetone) was loaded on TLC plate (1mm, 20*20 cm) and developed with acetone/petroleum ether=3:2. The target band (visualized by UV) was collected and mixed with acetone, then filtered through a pad of silica gel (2-3 cm height, pre-rinsed with acetone to remove impurities). The filtrate was concentrated under vacuo. Finally, adding acetonitrile and water to the obtained sample, the solution was freeze-dried to give the desired product as white solid powder. (9.0 mg, 40%). LC-MS: 836 [M+1]⁺. See figure 3 for ¹H NMR.

**Example 6 — Synthesis of 16**

![Chemical Structures]

6.1 Synthesis of intermediate 15

A mixture of N₆-isopropylchloroacetamide (1g, 7.41mmol) and triethyl phosphite1.6mL, 9.09mmol) was stirred at 140 °C for 8h. The reaction mixture was cooled to room temperature and 200 mg sample was used to be purified by Prep HPLC to give intermediate 15 (60mg, 34%) as a colorless oil.
6.2 Synthesis of 16

To a suspension of NaH (0.972 mg, 0.0405 mmol) in anhydrous THF (1.0 mL) was added dropwise a solution of diethyl 2-(isopropylamino)-2-oxoethylphosphonate (26 mg, 0.108 mmol) in anhydrous THF (0.2 mL) under N₂ atmosphere at -3 °C with stirring. The solution was then stirred at room temperature until it became clear. A solution of 8 (20 mg, 0.027 mmol) in anhydrous THF (0.2 mL) was added dropwise to the clear solution and the mixture stirred at rt for 30 min. The mixture was quenched with water and THF was evaporated under reduced pressure. The residue was extracted with EA. The organic layer was washed with brine then dried. The solvent was evaporated off, giving a residue of 18 mg which was purified with Prep TLC. The crude compound (dissolved in acetone) was loaded on TLC plate (1 mm, 20*20 cm) and developed with acetone/petroleum ether=3:2. The target band (visualized by UV) was collected and mixed with acetone, then filtered through a pad of silica gel (2-3 cm height, pre-rinsed with acetone to remove impurities). The filtration was concentrated under vacuo. Finally, adding acetonitrile and water to the obtained sample, the solution was freeze-dried to give the desired product as white solid powder (8.5 mg, 38%). LC-MS: 822 [M+1]⁺. See figure 4 for ¹H NMR.

Example 7 — Synthesis of 19
7.1 Synthesis of intermediate 18

A mixture of N-methylchloroacetamide (200mg, 1.87mmol) and triethyl phosphite (0.67mL, 3.74mmol) was stirred at 130°C for 8h. The reaction mixture was cooled to room temperature and was purified by Prep HPLC to give intermediate 18 (60mg, 15%) as a colorless oil.

7.2 Synthesis of 19

To a suspension of NaH (0.972 mg, 0.0405 mmol) in anhydrous THF (1.0 ml) was added dropwise a solution of diethyl 2-(methylamino)-2-oxoethylphosphonate (23 mg, 0.108 mmol) in anhydrous THF (0.2 ml) under N₂ atmosphere at -3°C with stirring. The solution was then stirred at room temperature until it became clear. A solution of 8 (20 mg, 0.027 mmol) in anhydrous THF (0.2 ml) was added dropwise to the clear solution and the mixture stirred at rt for 30 min. The mixture was quenched with water and THF was evaporated under reduced pressure. The residue was extracted with EA. The organic layer was washed with brine then dried. The solvent was evaporated off, giving a residue of 14 mg which was purified with Prep TLC. The crude
compound (dissolved in acetone) was loaded on TLC plate (1 mm, 20*20 cm) and developed with acetone/petroleum ether=3:2. The target band (visualized by UV) was collected and mixed with acetone, then filtered through a pad of silica gel (2-3 cm height, pre-rinsed with acetone to remove impurities). The filtration was concentrated under vacuo. Finally, adding acetonitrile and water to the obtained sample, the solution was freeze-dried to give the desired product as white solid powder (7.0 mg, 37%). LC-MS: 794 [M+1]⁺. See figure 5 for ¹H NMR.

Example 8 — Synthesis of 22

8.1 Synthesis of intermediate 21

A mixture of 2-chloro-\(N,N\)-dimethylacetamide (300 mg, 2.47 mmol) and triethyl phosphite (820 mg, 4.94 mmol) was stirred at 150 °C overnight. The reaction mixture was cooled to room temperature and was purified by Prep HPLC to give intermediate 21 (105 mg, 20%).

8.2 Synthesis of 22
To a solution of 21 (50 mg, 0.224 mmol) in THF (1.0 mL) was added NaH (1.6 mg, 0.068 mmol) in anhydrous THF (0.2 mL) at 0 °C with stirring. The solution was then stirred at room temperature until it became clear. Then 8 (40 mg, 0.054 mmol) was added to the clear solution and the mixture stirred at room temperature for 1 h. The mixture was quenched with water (10 mL) and extracted with EA (3 x 20 mL). The organic layer was washed with brine and dried over Na₂SO₄, filtered, evaporated. The residue was purified by Prep HPLC [Column: Spring C18(25*250mm, 10μm), Mobile phase: A:H₂O B:Acetonitrile, Gradient: B from 30% to 40% over 10 min] to obtained 22 as a white solid (12.4 mg, 28%). LC-MS: 808 [M+1]+. See figure 6 for ¹H NMR.

Example 9 — Synthesis of 25

9.1 Synthesis of intermediate 24
A mixture of P(Oet)$_3$ (0.63 ml, 3.75 mmol) and 23 (500 mg, 3.74 mmol) were stirred at 180°C for 6 h. The reaction was cooled and purified by prep-HPLC to obtain intermediate 24 as colorless oil (100 mg, 11%).

5 9.2 Synthesis of 25

\[
\text{8} \quad \text{24} \quad \text{25}
\]

To a solution of 24 (38 mg, 0.1624 mmol) dissolved in THF (1 mL) was added NaH (1.5 mg, 0.0625 mmol) at 0°C and stirred for 10 min. Then the solution was stirred at room temperature and compound 8 (30 mg, 0.0406 mmol) was added. The reaction was stirred for 30 min at room temperature and quenched with water (5 mL). The reaction was extracted with ethyl acetate (3 x 20 mL). The combined organic phase was washed with brine, dried over sodium sulfate and reduced in vacuo. The residue was purified by Pre-HPLC to obtain 25 as white solid (7.4 mg, 22%). See figure 7 for $^1$H NMR.

15 Example 10 — Synthesis of 26 and 28
10.1 Synthesis of 26

To a solution of 10 (25 mg, 0.0304 mmol, 1 eq) dissolved in methanol (2 mL) at 0°C was added sodium borohydride (2.3 mg, 0.0608 mmol, 2 eq). The reaction mixture was stirred 3 h at 0°C. The reaction was added sodium bicarbonate solution and extracted with ethyl acetate (3 x 20 mL). The combined organic layers were washed with brine, dried over sodium sulfate and removed in vacuo. The residue was used directly to the next step.

10.2 Synthesis of intermediate 27

To a solution of triphenylphosphine (24 mg, 0.0915 mmol, 3 eq) dissolved in CH₂Cl₂ (1.5 ml) were added imidazole (8.2 mg, 0.1206 mmol, 4 eq) and iodine (23 mg, 0.0914 mmol, 3 eq). The reaction mixture was stirred 30 min and cooled to 0°C. The compound 27 (crude 25 mg, 0.0303 mmol, 1 eq) was added and the reaction stirred for 4.5 h at room temperature. The reaction was quenched with saturated aqueous sodium bicarbonate solution (2 mL) and extracted with ethyl acetate (3 x 10 mL). The combined organic layers were washed with saturated aqueous Na₂S₂O₃ (10 mL) and brine, dried over sodium sulfate and evaporated. The residue was used directly in the next step.

10.3 Synthesis of 28
To a solution of 27 (25 mg, 0.02673 mmol, 1 eq) dissolved in CH$_2$Cl$_2$ (1.5 mL) was added DBU (8.2 mg, 0.1206 mmol, 4 eq) at 0°C. The reaction mixture was stirred 2 h at room temperature. The reaction was quenched with saturated aqueous sodium bicarbonate solution (4 mL) and extracted with ethyl acetate (3 x 20 mL). The combined organic layers were washed with brine, dried over sodium sulfate and evaporated. The residue was purified by Pre-HPLC to give 28 as a white solid. (7 mg, 29%). See figure 8 for $^1$H NMR.

**Example 11 — Synthesis of 29**

To a solution of 10 (30 mg, 0.0365 mmol) dissolved in dioxane (2 mL) was added aqueous HCl solution (2 M, 0.18 ml, 0.36 mmol). The reaction was stirred at room temperature for 4 days and the reaction was quenched with water and extracted with ethyl acetate (3 x 10 mL). The organic phase was dried over sodium sulfate and evaporated. The residue was purified by prep-HPLC to give 29 as a white solid (11 mg, 38%). See figure 9 for $^1$H NMR.

**Example 12 — Synthesis of 32**
12.1 Synthesis of intermediate 31

A mixture of 2-chloro-N,N-diisobutylacetamide, 31 (206 mg, 1.00 mmol) and triethyl phosphite (332 mg, 2.00 mmol) was stirred at 140 °C for 6 h. The reaction mixture was cooled to room temperature and was purified by combiflash to give intermediate 31 (222 mg, 20%).

12.2 Synthesis of 32

To a solution of 31 (58 mg, 0.188 mmol) in THF (1.0 mL) was added NaH (1.4 mg, 0.0564 mmol) in anhydrous THF (0.2 mL) at room temperature with stirring. Then 8 (35 mg, 0.047 mmol) was added to the clear solution and the mixture stirred at room temperature for 3 h. The mixture was quenched with water (10 mL) and extracted with EA (3 x 30 mL). The organic layer was washed with brine and dried over Na2SO4, filtered and evaporated. The residue was purified by Prep HPLC to obtained 32 as a white solid (16.2 mg 38%). LC-MS: 892 [M+1]+. See figure 10 for 1H NMR.
Example 13 — Synthesis of 35

13.1 Synthesis of intermediate 34

A mixture of 2-chloro-1-morpholinoethanone 33 (327 mg, 2 mmol) and triethyl phosphite (665 mg, 4 mmol) was stirred at 140°C overnight. The reaction mixture was cooled to room temperature and was purified by combiflash to give intermediate 34 as a colourless oil (190 mg, 36%).

13.2 Synthesis of 35

To a solution of 34 (50 mg, 0.188 mmol) in THF (1.0 mL) was added NaH (1.4 mg, 0.056 mmol) in anhydrous THF (0.2 mL) at 0°C with stirring. The solution was then stirred at room temperature until it became clear. Then 8 (35 mg, 0.047 mmol) was added to the clear solution and the mixture stirred at rt for 3 h. The mixture was quenched with water (10 mL) and extracted
with EA (20 mL×3). The organic layer was washed with brine and dried over Na₂SO₄, filtered, evaporated. The residue was purified by pre-HPLC to obtain 14 mg pure product 35 as a white solid (yield, 35%). LC-MS: 850 [M+1]⁺. See figure 11 for ¹H NMR.

Example 14 — Synthesis of 41

14.1 Synthesis of intermediate 37

A mixture of 4-bromobiphenyl 36 (5 g, 21.55 mmol), allylamine (2.4 mL, 32.33 mmol), sodium tert-butoxide (3.11 g, 32.33 mmol), Pd(DPPF)Cl₂ (0.79 g, 1.08 mmol) and DPPF (1.79 g, 3.23 mmol) in 20 mL anhydrous THF was heated to 80 °C for 4 h. TLC indicated the complete disappearance of the starting 4-bromobiphenyl. The dark red reaction mixture was filtered through Celite and concentrated in vacua leaving a dark colored oil. The oil was chromatographed on silica gel using PE/EA (5:1) to give 37 (3.5 g, 60% yield) as a yellow solid.

14.2 Synthesis of intermediate 38
A mixture of N-allylbiphenyl-4-amine 37 (3 g, 14.35 mmol), 10% Pd/C (0.3 g) and methanesulfonic acid (922 uL, 14.35 mmol, 1 eq.) in 50 mL of absolute ethanol was refluxed for 2 h. TLC indicated the disappearance of starting N-allylbiphenyl-4-amine. The reaction mixture was filtered through a Celite pad and wash with aq. NaOH (10%), and extracted with ethyl acetate. The organic layer was washed with brine and dried over Na₂SO₄, filtered, concentrated in vacuo to give 1.6 g of the crude product 38 which was used to the next step without any further purification.

14.3 Synthesis of intermediate 39

To a solution of crude 38 (1.6 g, 9.462 mmol), Et₃N (1.052 g, 10.408 mmol) in dry DCM (50 mL) was added dropwise chloroacetyl chloride (1.165 g, 10.408 mmol). The reaction mixture was stirred at 0–10 °C for 3 h, poured into ice water, and extracted with ethyl acetate. The organic layer was washed with brine and dried over Na₂SO₄, filtered, concentrated in vacuo to give a light yellow solid. The solid was purified by pre-TLC with PE/EA (4:1), and give the desired compound 39 (200 mg, 6% yield for two steps).

14.4 Synthesis of intermediate 40

A mixture of N-(biphenyl-4-yl)-2-chloroacetamide 39 (200 mg, 0.8161 mmol) and triethyl phosphite 271 mg, 1.6323 mmol) was stirred at 140 °C overnight. The reaction mixture was cooled to room temperature and was purified by combiflash to give intermediate 40 (77 mg, 27%) as a light yellow solid.
14.5 Synthesis of 41

To a solution of 40 (65 mg, 0.188 mmol) in THF (1.0 mL) was added NaH (1.4 mg, 0.056 mmol) in anhydrous THF (0.2 mL) at 0 °C with stirring. The solution was then stirred at room temperature until it became clear. Then 8 (35 mg, 0.047 mmol) was added to the clear solution and the mixture stirred at rt for 3 h. The mixture was quenched with water (10 mL) and extracted with EA (20 mL×3). The organic layer was washed with brine and dried over Na₂SO₄, filtered, evaporated. The residue was purified by pre-HPLC to obtained 9.4 mg pure product 41 as a white solid (yield, 21%). LC-MS: 932 [M+1]⁺. See figure 12 for ¹H NMR.

Example 15 — Synthesis of 45

15.1 Synthesis of intermediate 43

To a solution of 42 (1 g, 8.834 mmol), Et₃N (0.983 g, 9.724 mmol) in dry DCM (10 mL) was added dropwise chloroacetyl chloride (1.088 g, 9.724 mmol). The reaction mixture was stirred
at 0–10 °C for 3 h, poured into ice water, and extracted with ethyl acetate. The organic layer was washed with brine and dried over Na₂SO₄, filtered, concentrated in vacua to give a light yellow liquid (1.95 g) which was used to the next step without any further purification.

5 15.2 Synthesis of intermediate 44

\[
\begin{align*}
43 & \xrightarrow{P(OE)\text{eq}} 44 \\
\end{align*}
\]

A mixture of 43 (crude, 400 mg, 2.11 mmol) and triethyl phosphite 701 mg, 4.22 mmol) was stirred at 140°C overnight. The reaction mixture was cooled to room temperature and purified by combiflash to give intermediate 44 (265 mg, 43 %) as a light yellow liquid.

15.3 Synthesis of 45

\[
\begin{align*}
8 & \xrightarrow{44} 45 \\
\end{align*}
\]

To a solution of 44 (55 mg, 0.188 mmol) in THF (1.0 mL) was added NaH (1.4 mg, 0.056 mmol) in anhydrous THF (0.2 mL) at 0°C with stirring. The solution was then stirred at room temperature until it became clear. Then 8 (35 mg, 0.047 mmol) was added to the clear solution and the mixture stirred at rt for 3 h. The mixture was quenched with water (10 mL) and extracted with EA (20 mL×3). The organic layer was washed with brine and dried over Na₂SO₄, filtered, evaporated. The residue was purified by pre-HPLC to obtained 2.5 mg pure product 45 as a white solid (yield, 6%). LC-MS: 876 [M+1]⁺. See figure 13 for ¹H NMR.

Example 16 — Synthesis of 48
16.1 Synthesis of intermediate 47

A mixture of 2-chloro-N-(pyridin-2-yl)acetamide (170 mg, 1.00 mmol) and triethyl phosphite (332 mg, 2.00 mmol) was stirred at 140°C for 6 h. The reaction mixture was cooled to room temperature and was purified by combiflash to give intermediate 47 (48 mg, 18%).

16.2 Synthesis of 48

To a solution of 47 (51 mg, 0.188 mmol) in THF (1.0 mL) was added NaH (1.4 mg, 0.0564 mmol) in anhydrous THF (0.2 mL) at rt with stirring. Then 8 (35 mg, 0.047 mmol) was added to the clear solution and the mixture was stirred at rt for 3 h. The mixture was quenched with water (10 mL) and extracted with EA (30 mL×3). The organic layer was washed with brine and dried over Na₂SO₄, filtered, evaporated. The residue was purified by Prep HPLC to obtained 19.7 mg pure product 48 as a white solid (yield, 48.5%). LC-MS: 857 [M+1]^+.

Example 17 — Synthesis of 51
17.1 Synthesis of intermediate 49

49 and 2 equivalents of triethyl phosphite were stirred at 120°C overnight. The reaction mixture was cooled to room temperature and purified by crystallisation to give intermediate 50.

17.2 Synthesis of 51

To a solution of 50 in THF was added NaH in anhydrous THF at 0°C with stirring. The solution was then stirred at room temperature until it became clear. Then 8 (30 mg) was added to the clear solution and the mixture stirred at rt for 3 h. The mixture was quenched with water and extracted with ethyl acetate. The organic layer was washed with brine and dried over Na₂SO₄, filtered, evaporated. The residue was purified by prep-TLC and prep-HPLC to obtained 2.4 mg pure product 51 as a white solid. LC-MS: 862 [M+1]^+. See figure 14 for ^1H NMR.

**Example 18 — Synthesis of 55**
18.1 Synthesis of intermediate 53

To a solution of 52, Et₃N in dry DCM was added dropwise chloroacetyl chloride. The reaction mixture was stirred at 0–10 °C for 30 minutes, and extracted with ethyl acetate. The organic layer was washed and to give a liquid which was used to the next step without any further purification.

18.2 Synthesis of intermediate 54

A mixture of 53 and triethyl phosphite were stirred at 120 °C overnight. The reaction mixture was cooled to room temperature and was purified by combiflash to give intermediate 54.

18.3 Synthesis of 55
To a solution of 54 in THF was added NaH in anhydrous THF at 0 °C with stirring. The solution was then stirred at room temperature until it became clear. Then 8 was added to the clear solution and the mixture stirred at room temperature. The mixture was quenched with water and extracted with ethyl acetate. The organic layer was washed with brine and dried over Na₂SO₄, filtered, evaporated. The residue was purified by prep-HPLC to obtained 55 as a white solid. LC-MS: 850 [M+1]⁺.

**Example 19 — Biological data – *in vitro* evaluation of HCV antiviral activity in the replicon system**

Compounds were analysed in the replicon assay as described in the General Methods. Cyclosporine A, 1, sanglifehrin A, 5, and the hydroxymacrocycle, 6 were included as a comparison.

As can be seen, 10, 13, 16, 22, 28, 29, 32, 41, 45, 48, 51 and 55 are all very potent in the Huh5.2 replicon assay (as shown by the low EC<sub>50</sub>), with the majority of them also showing low cytotoxicity against the cell line (as shown by a high CC<sub>50</sub>). The previously described macrocyclic sanglifehrin hydroxymacrocycle, 6, is less potent at HCV inhibition, and cyclosporine A, 1 and sanglifehrin A, 5 both show more cytotoxicity.

**Example 20 – Solubility in PBS**

Solubility of the compounds in PBS pH 7.4 was analysed as described in the General Methods. Cyclosporine A, 1 and sanglifehrin A, 5 were included as a comparison.

</table>

As can be seen, the compound of the invention, 29, is remarkably potent at inhibiting replication of HBV, and shows no cytotoxicity at concentrations up to 32µM, leading to a large therapeutic index.

Example 23 – Biological data – Assessment of immunosuppressive activity in a mixed lymphocyte reaction (MLR)

Immunosuppressive activity is an unwanted side effect for use as an antiviral therapy. Therefore the compounds were tested in a mixed lymphocyte reaction (MLR) as described in the general methods. Cyclosporine A, 1, and sanglifehrin A, 5, were included as a comparison.

<table>

<td>0.23</td>
</tr>
</tbody>
</table>

As can be seen, the compounds of the invention, 29, 48 and 55, all show potent disruption of the CypD-NS5A complex, at a more potent level than CsA, 1, and SfA, 5. It was also confirmed that these assays gave comparable data (and similar rank orders) to a PPlase assay measuring direct inhibition of CypD isomerase activity (data not shown – see general methods for details of methodology).

**Example 24 - Generation of bio-engineered Streptomyces sp. A92-308110 (DSM9954) (BIOT-4370) strains in which the reductive loop of module 12 of the biosynthetic cluster for sanglifehrin biosynthesis is replaced by the reductive loop from rapamycin module 13 or sanglifehrin module 6 using a reductive loop swap strategy.**

The reductive loop of sanglifehrin module 12 contains a ketoreductase which is responsible for the hydroxyl group at C17 of the sanglifehrin molecule. The reductive loops from both rapamycin module 13 and sanglifehrin module 6 contain all of the functional domains to result in full processing of the beta-keto group to result in a methylene; specifically they contain a keto reductase to reduce the keto to a hydroxyl group, a dehydratase to remove water and result in a double bond, and an enoyl reductase to reduce the double bond to a methylene. Vectors pMGo136 and pMGo137 are vectors to engineer the replacement of the reductive loop of module 12 of the biosynthetic cluster for sanglifehrin biosynthesis with the reductive loop from rapamycin module 13 or sanglifehrin module 6, respectively.
Positions of DNA fragments used in this example are given according to the sequence available in January 2011 but reported as approximate because Genbank DNA sequences can be updated.

The vectors are constructed as follows:

24.1 The DNA homologous to the upstream flanking region of the reductive loop of sauglifehrin module 12.

This 2072 bp DNA fragment (SEQ ID NO: 1) shown in Figure 16 contains a region of homology upstream of the reductive loop of sauglifehrin module 12 (approximately from 86654 bp – 88798 bp in the published sequence Genbank accession number FJ809786.1) along with additional sequences both 5’ and 3’ to incorporate restriction enzyme sequences to aid cloning. This fragment (SEQ ID NO:1) was synthesised by GenScript (860 Centennial Ave., Piscataway, NJ 08854, USA) and provided, according to the GenScript protocol with 12 protective flanking bases on each side which do not participate in the cloning beyond this point, in pUC57 resulting in plasmid pMG0128.

24.2 Cloning of DNA homologous to the downstream flanking region of the reductive loop of sauglifehrin module 12.

Oligos MG0013 (SEQ ID NO: 2) and MG0014 (SEQ ID NO: 3) were used to amplify a 1994 bp DNA fragment (SEQ ID NO: 4) in a standard PCR reaction using cosmid pTL3102 (Qu et al. 2011) DNA as the template and KOD Hot Start DNA polymerase. A 5’ extension was designed in each oligo to introduce restriction sites to facilitate cloning of the amplified fragment. Alternatively, genomic DNA from Streptomyces sp. A92-308110 (DSM9954) (BIOT-4370) could have been used as the template for this PCR reaction to give the same DNA fragment, or the DNA fragment could be obtained by DNA synthesis for example using GenScript (860 Centennial Ave., Piscataway, NJ 08854, USA). The resulting 1995 bp PCR product (SEQ ID NO: 4) contains a region of homology downstream of the reductive loop of sauglifehrin module 12 (approximately from 90415 bp – 92381 bp in the published sequence genbank accession number FJ809786.1) with an undesired insertion, G at position 1978 (see Figure 17; inserted G is bold and underlined). The 1995 bp PCR product (SEQ ID NO: 4) was cloned into pUC19 (New England Biolabs) that had been linearised with Smal and dephosphorylated, resulting in plasmid pMG0123.

MG0013 5’GCTCTCGAGGGCGGCCTAGCCTCCCTGCCCGAGCCG XhoI NheI

(SEQ ID NO: 2)

MG0014 5’AGAAAGCTTCCGCCCCGTTGCAGCGCCCTGGGCC HindIII
(SEQ ID NO: 3)

The orientation of the 1995 bp PCR product (SEQ ID NO: 4) in pUC19 was such that the HindIII site on the insert was adjacent to the HindIII site of the pUC19 polylinker. The sequence of the insert in pMGo123 was confirmed by sequencing.

In order to avoid the region containing the additional base, a shorter downstream region was targeted as follows: Oligos MGo037 (SEQ ID NO: 5) and MGo038 (SEQ ID NO: 6) were used to amplify a 1956 bp DNA fragment (SEQ ID NO: 7) in a standard PCR reaction using plasmid pMGo123 DNA as the template and KOD Hot Start DNA polymerase. A 5’ extension was designed in each oligo to introduce restriction sites to facilitate cloning of the amplified fragment. The 1956 bp PCR product (SEQ ID NO: 7) contains a region of homology downstream of the reductive loop of sanglifehrin module 12 (approximately from 90415 bp – 92343 bp in the published sequence Genbank accession number FJ809786.1). The 1956 bp PCR product (SEQ ID NO: 7) was cloned into pUC19 (New England Biolabs) that had been linearised with SmaI and dephosphorylated, resulting in plasmid pMGo125.

MGo037
5’GCTCTCGAGGCTAGGCTCCCTC
\hfill XhoI \hfill NheI
(SEQ ID NO: 5)

MGo038
5’AAAAAGCTTGGGGGGGTCGGGGTTGCCGGCGAC
\hfill HindIII
(SEQ ID NO: 6)

The orientation of the 1956 bp PCR product (SEQ ID NO: 7) in pUC19 was such that the HindIII site on the insert was adjacent to the HindIII site of the pUC19 polylinker. The sequence of the insert in pMGo125 was confirmed by sequencing.

24.3 Cloning strategy for generating pMGo136 and pMGo137.

The upstream and downstream regions of homology of the sanglifehrin reductive loop of module 12 are cloned together as follows: The 2065 bp upstream region is excised from pMGo128 by digestion with EcoRI and XhoI and the 1944 bp downstream region is excised from pMGo125 by digestion with XhoI and HindIII. Both fragments are cloned together into the large backbone fragment generated when pUC19 (New England Biolabs) is digested with EcoRI and HindIII in a three part ligation. Plasmids containing both inserts correctly cloned are identified by restriction enzyme analysis, one correct plasmid is designated pMGo130.

pMGo130 is designed such that a reductive loop on a suitable NheI/BglII fragment, can be cloned into the NheI and BglII sites to yield a portion of a type I PKS module in which the DNA sequence is in frame and can be translated to give an amino acid sequence. The exact
positioning of these sites in the in-coming loop is crucial in maintaining the frame of the sequence and this translation into a functional amino acid sequence.

Source of rapamycin module 13 reductive loop: Rapamycin module 13 reductive loop has been used previously as a donor loop in other systems (eg. Gaisser et al., 2003). Rapamycin module 13 loop, flanked by appropriate regions of homology from avermectin module 2 is present in pPF137 (Gaisser et al., 2003). pPF137 is constructed from pJLK137 as described in Gaisser et al 2003. The full description of the construction of pJLK137 is contained within International patent application WO00/01827/1998 and references therein. A brief summary follows: The rapamycin module 13 loop was isolated by PCR amplification using the following oligos.

5’TAAGATCTTCGACCTACGCCTCCAAC
 BglII
(SEQ ID NO: 8)

5’TATGCTACGACCTCGTGGCGTGCGCGGT
 NsiI
(SEQ ID NO: 9)

which contain introduced restriction enzyme sites, and using the template rapamycin cos 31 (Schwecke et al. 1995). This fragment was cloned into pUC18 previously digested with Smal and dephosphorylated to give pJLK120. This loop was then introduced into pJLK133, which was constructed as follows: The linker was removed from pJLK117 on a BglII/Nhel fragment and cloned between 2 regions of homology to avermectin module 2 to give pJLK133. The rapamycin module 13 reductive loop was cloned from pJLK120 as a BglII/NsiI fragment into BglII/NsiI digested pJLK133.

pJLK117 (refer to International patent application WO00/01827/1998 and references therein) is an expression plasmid containing a PKS gene comprising the erythromycin loading module, the first and the second extension modules of the erythromycin PKS and the erythromycin chain terminating thioesterase, except the DNA segment between the end of the acyltransferase (AT) and the beginning of the acyl carrier protein (ACP) has been substituted by a synthetic oligonucleotide linker containing the recognition sites of the following restriction enzymes: AvrII, BglII, SnaBI, PstI, Spel, NsiI, BsU36I, and Nhel and was made in multiple steps as described in the patent application. These restriction enzyme sites were selected because they can be incorporated with minimal disruption to the original protein sequence in module 2 of the erythromycin PKS. The first linker containing vector, pJLK114 contains the generated by annealing the oligos Plf (SEQ ID NO: 10) and Plb (SEQ ID NO: 11).
The plasmid pJLK117 was constructed by replacing the 5’ end of the linker of pJLK114 with a fragment in which the only difference is that the HpaI site, GTTAAAC is replaced by an Nhel site, GCTAGC.

The source of the rapamycin module 13 reductive loop in this example is pPF137. One skilled in the art will appreciate that it is not necessary to follow this complex series of steps in order to obtain this fragment. The same fragment maybe obtained as follows: First the multiple cloning region of pUC18, or pUC19 may be replaced by a synthetic linker containing the sites BgIII, NsiI and Nhel for example this could be achieved by digesting the pUC vector with EcoRI and HindIII and using two oligonucleotides to make a synthetic linker with the sites listed above, which, when annealed, leave the appropriate overhangs to ligate into the digested backbone.

Incorporating the sequence of the linker of pJLK117 between the NsiI and Nhel sites will provide part of the required sequence and the remainder can be obtained by PCR amplification from a cosmid such as rapamycin cos 31 or genomic DNA of Streptomyces hygroscopicus NRRL 5491 and the oligos shown as SEQ ID NO: 08 and SEQ IP NO: 09. This provide the rapamycin module 13 loop on a BgIII/NsiI fragment which can be cloned into the BgIII/NsiI sites of the modified pUC vector and then the desired loop cloned out as a BgIII/Nhel fragment.

Alternatively, the rapamycin module 13 loop could be amplified directly as a BgIII/Nhel fragment for example using the oligos SEQ ID NO: 8 as shown above and SEQ ID NO:12

5’ TAGCTAGCGCCGGGCTCAGGGCTGAGCCGACCT
(SEQ ID NO: 12)

The rapamycin module 13 reductive loop was cloned from pPF137 into pKC1139WMB02 as a BgIII/Nhel fragment to give pKC1139WMB02-137. pKC1139WMB02 is a pKC1139-based plasmid and contains a 7.8 kb DNA fragment containing the rapamycin module 11 reductive loop and flanking regions. It has been engineered such that the reductive loop can be excised as a BgIII/Nhel fragment and replaced with other loops. pKC1139WMB02-137 was constructed to effect a loop swap in rapamycin and contains the rapamycin module 13 reductive
loop with flanking regions from rapamycin module 11. In this example, rapamycin module 13 loop is cloned from pKC1139WMB02-137 as a BglII/Nhel fragment. This is the identical fragment that can be obtained from pPF137, or pJLK120 or by carrying out an equivalent PCR reaction using the oligos sequences provided and genomic DNA and cloning it into a suitable vector such as pUC18 or pUC19.

The sanglifehrin reductive loop of module 6 is obtained as follows: Oligos MGo019 (SEQ ID NO: 13) and MGo020 (SEQ ID NO: 14) are used to amplify a 3176 bp DNA fragment (SEQ ID NO: 15) in a standard PCR reaction using KOD Hot Start DNA polymerase and the 5 kb – 6 kb fraction of AlwNI digested genomic DNA from Streptomyces sp. A92-308110 (DSM9954) (BIOT-4370) as the template. This fraction contains the 5402 bp AlwNI fragment of the sanglifehrin gene cluster (approximately from 56578 bp – 61979 bp in the published sequence genbank accession number FJ809786.1). Alternatively, undigested genomic DNA from Streptomyces sp. A92-308110 (DSM9954) (BIOT-4370) is used as the template. Genomic DNA is obtained using the Edge BioSystems bacterial genomic DNA purification kit (Edge BioSystems, 201 Perry Parkway, Suite 5, Gaithersburg, MD 20877, USA). A 5’ extension is designed in each oligo to introduce restriction sites to facilitate cloning of the amplified fragment in-frame with the flanking regions. The 3176 bp PCR product (SEQ ID NO: 15) contains the reductive loop of sanglifehrin module 6 (approximately from 57166 bp – 60326 bp in the published sequence genbank accession number FJ809786.1). The 3176 bp PCR product (SEQ ID NO: 15) is cloned into pUC19 (New England Biolabs) that has been linearised with SmaI and dephosphorylated, resulting in plasmid pMGo127.

MGo019
5’CCGTAGATCTGCCCACCTACGCTTTCCAGCGCG
\[\text{BglII}\]

MGo020
5’TCCGGCTAGCCCCTTGGGCGCGCGG
\[\text{Nhel}\]

pKC1139WMB02-137 and pMGo127 are each digested with Nhel and BglII to isolate the rapamycin module 13 reductive loop and the sanglifehrin module 6 reductive loop. Each loop is cloned into pMGo130 digested with Nhel and BglII. Insert-containing plasmids are analysed by restriction enzyme analysis, one correct plasmid containing rapamycin module 13 reductive loop is designated pMGo132 and one correct plasmid containing sanglifehrin module 6 reductive loop is designated pMGo133.

pMGo132 and pMGo133 each contain an appropriate DNA insert to effect a reductive loop swap in sanglifehrin module 12 by double recombination. Each insert is cloned as an EcoRI/HindIII fragment into pKC1139 digested with EcoRI and HindIII to provide suitable plasmid functions for transformation of Streptomyces sp. and selection of transformants as well
as a temperature sensitive origin. Insert-containing plasmids are analysed by restriction enzyme analysis, one correct plasmid containing the fragment with rapamycin module 13 reductive loop is designated pMGo136 and one correct plasmid containing the fragment with sanglifehrin module 6 reductive loop is designated pMGo137.

23.4 Conjugation of Streptomyces sp. A92-308110 (DSM9954) (BIOT-4370) and engineering of a reductive loop swap in sanglifehrin module 12.

Plasmids pMGo136 and pMGo137 are transformed into E. coli ET12567 pUZ8002 using standard techniques and selected on 2TY plates containing apramycin (50 μg/mL), kanamycin (25 μg/mL) and chloramphenicol (12.5 μg/mL). The resulting strains are used to inoculate 3 mL of liquid 2TY containing apramycin (50 μg/mL), kanamycin (25 μg/mL) and chloramphenicol (12.5 μg/mL) and incubated overnight at 37°C, 250rpm. 0.8 mL of each culture is used to inoculate 10 mL liquid 2TY containing apramycin (50 μg/mL), kanamycin (25 μg/mL) and chloramphenicol (12.5 μg/mL) in a 50 mL Falcon tube and incubated at 37°C 250 rpm until OD<sub>600nm</sub> ~0.5 is reached. The resulting cultures are centrifuged at 3500 rpm for 10 min at 4°C, washed twice with 10 mL 2TY medium using centrifugation to pellet the cells after each wash. The resulting pellets are resuspended in 0.5 mL 2TY and kept on ice ready for use. This process is timed to coincide with the completion of preparation of Streptomyces spores described below.

Spores of Streptomyces sp. A92-308110 (DSM9954) (BIOT-4370) are harvested from a 1-2 week old confluent plate by resuspending in ~3 mL 20% glycerol and splitting equally between 2 Eppendorf tubes. Alternatively, ~1.5 mL of a cryopreserved spore suspension prepared in the same way is used. Spores are centrifuged (6000 rpm, 5 min room temperature) and washed twice with 1 mL 50 mM TES buffer before resuspending in 0.5 mL 50 mM TES buffer. This tube is heat shocked at 50°C for 10 min in a water bath before adding 0.5 mL of TSB medium and incubating in an Eppendorf Thermomixer compact at 37°C for 4-5 hours.

The prepared E. coli ET12567 pUZ8002 pMGo136 and E. coli ET12567 pUZ8002 pMGo137 are each mixed with BIOT-4370 at ratios 1:1 (100 μL each strain) and 1:3 (100 μL E. coli + 300 μL BIOT-4370) and immediately spread on R6 plates and transferred to a 37°C incubator. After approximately 2 hours incubation these plates are overlaid with 2 mL of sterile water containing nalidixic acid to give a final in-plate concentration of 50 μg/L. Plates are returned to the 37°C incubator overnight before overlaying with 2 mL of sterile water containing apramycin to give a final in-plate concentration of 20-25 μg/L. Alternatively, the plates are initially incubated for 16-18 hours, then overlaid with the nalidixic acid solution and allowed to dry for 1-2 hours before being overlaid with the apramycin solution. Ex-conjugant colonies
appear after ~4-7 days and are patched onto ISP4 media containing apramycin (25 µg/L) and nalidixic acid (50 µg/L) and incubated at 37°C. Incubation at 37°C in the presence of apramycin should ensure that integration of the plasmid occurs, since the temperature sensitive origin does not function at this temperature. Integration should occur in one of the flanking regions where there is homology between the genome and the plasmid insert. Once adequate mycelial growth is observed strains are repatched to ISP4 media containing apramycin (25 µg/L) at 37°C and allowed to sporulate. Strains are then subcultured three times (to promote removal of the temperature sensitive plasmid) by patching to ISP4 (without antibiotic) and incubating at 37°C for 3-4 days each time. Strains are finally patched onto ISP4 and incubated at 28°C to allow for sporulation (5-7 days). Spores are harvested and serially diluted onto ISP4 plates at 28°C to allow selection of single colonies. Sporulated single colonies are doubly patched to ISP4 plates with and without apramycin (25 µg/L) to identify colonies which loose the plasmid and allowed to grow ~7 days before testing for production of sanglifehrins and sanglifehrin analogues. Strains selected for analysis are those that do not grow in the presence of apramycin, indicating loss of the resistance marker desirably by secondary recombination.

24.5 Screening strains for production of sanglifehrins and sanglifehrin analogues in falcon tubes

A single ~7 mm agar plug of each well sporulated patch is used to inoculate 7 mL of sterile SM25-3 media and incubated at 27°C 200 rpm in a 2 inch throw shaker. After 48 hours of growth 0.7 mL of each culture is transferred to a sterilised falcon tube containing 7 mL of SGP6 media (30 g/L Nutrisoy (Toasted Soy Flour), 60 g/L glycerol, 21 g/L MOPS; pH 6.8) with 5% HP20 resin. Cultures are grown at 24°C 300 rpm on a 1 inch throw shaking incubator for 5 days before harvest. 0.8 mL of each bacterial culture is removed and aliquoted into a 2 mL Eppendorf tube ensuring adequate dispersal of the resin in throughout the culture prior to aliquoting. 0.8 mL acetonitrile and 15 µL of formic acid are added and the tube mixed for 30 min. The mixture is cleared by centrifugation and 150 µL of the extract removed into a HPLC vial and analysed by HPLC.

24.6 Analysis of strains for reversion to wild type or module 12 loop swap.

Extracts of strains are analysed by HPLC. Strains that produced sanglifehrin A and B are not analysed further as this result indicates reversion to wild type. Strains lacking sanglifehrin A and B production and showing peaks consistent with the production of 17-deoxy-sanglifehrin A and 17-deoxy-sanglifehrin B are taken forward.

Example 25 - Isolation of 17-deoxysanglifehrin A and generation of semisynthetic derivatives.
A strain producing 17-deoxy sanglifehrin A and/or B is then grown using a similar method to that described in Example 1, the compound isolated using a similar method to that described in Example 2, and the aldehyde generated using a similar method to that described in example 3. This is then used as a template for semisynthesis as described to generate compounds of formula 1.

**Example 26 - Synthesis of 144**

Synthesis of intermediate 146

\[
\begin{align*}
145 & \quad \text{PO(\text{OE})}_3 \quad \rightarrow \quad 146 \\
\end{align*}
\]

A mixture of N-methylchloroacetamide (145, 200 mg, 1.87 mmol) and triethyl phosphite (0.67 mL, 3.74 mmol) was stirred at 130°C for 8 h. The reaction mixture was cooled to room temperature and was purified by Prep HPLC to give intermediate 146 (60 mg, 15%) as colourless oil.

**Synthesis of 147**

\[
\begin{align*}
147 & \quad \text{CH}_3\text{I, Cs}_2\text{CO}_3 \quad \text{Acetone, rt, overnight} \\
\end{align*}
\]

CH\(_3\)I (13.5 μL, 0.203 mmol) was added to a stirred acetone (4.0 mL) solution of 8 (50 mg, 0.068 mmol) and Cs\(_2\)CO\(_3\) (75 mg, 0.203 mmol) at room temperature. The mixture was stirred at room temperature overnight and concentrated in vacuo. The residue was extracted with ethyl acetate and washed with water. The organic layers was dried with Na\(_2\)SO\(_4\), filtered and evaporated, the residue was purified by Prep TLC (Acetone/Petroleum=1.2/1) to get 22 mg 147 (86% pure) which was used directly for the next step.

**Synthesis of 144**
To a suspension of NaH (1.052 mg, 0.044 mmol) in anhydrous THF (0.2 mL) was added dropwise a solution of 146 (24.5 mg, 0.117 mmol) in anhydrous THF (0.2 mL) under N₂ atmosphere at -3 °C with stirring. The solution was then stirred at room temperature until it became clear. A solution of 147 (22 mg) in anhydrous THF (0.6 mL) was added dropwise to the clear solution and the mixture stirred at room temperature for 30 minutes. The mixture was quenched with water and THF was evaporated under reduced pressure. The residue was extracted with ethyl acetate. The organic layer was washed with brine then dried. The solvent was removed in vacuo and the residue was purified by preparative TLC (Acetone/Petroleum=1,3/1) to obtained 12 mg crude 144 which was purified again by preparative HPLC to yield the product as a white solid (5 mg, 20 %). LC-MS: 808 [M+H]⁺.

Throughout the specification and the claims which follow, unless the context requires otherwise, the word ‘comprise’, and variations such as ‘comprises’ and ‘comprising’, will be understood to imply the inclusion of a stated integer or step or group of integers but not to the exclusion of any other integer or step or group of integers or steps.
Claims

1. A compound according to formula (I) below, or a pharmaceutically acceptable salt thereof:

   \[
   \text{(I)}
   \]

   wherein:
   
   \( R_1 \) and \( R_2 \) independently represent alkyl, alkenyl, cycloalkyl, cycloalkenyl, alkylcycloalkyl, alkylcycloalkenyl, alkenylcycloalkyl, alkenylcycloalkenyl, aryl, heteroaryl, alkylaryl, alkylheteroaryl, alkenylaryl or alkenylheteroaryl any of which groups may optionally be

   substituted by monocyclic aryl or monocyclic heteroaryl;

   or \( R_1 \) represents hydrogen; and wherein one or more carbon atoms of \( R_1 \) and/or \( R_2 \) not being part of an aryl or heteroaryl group are optionally replaced by a heteroatom selected from \( O, N \) and \( S(O)_p \) in which \( p \) represents 0, 1 or 2 and wherein one or more carbon atoms of \( R_1 \) and/or \( R_2 \) are optionally replaced by carbonyl;

   or \( R_1 \) and \( R_2 \) are joined to form a saturated or unsaturated heterocyclic ring containing the nitrogen atom shown and wherein one or more carbon atoms of said ring are optionally replaced by a heteroatom selected from \( O, N \) and \( S(O)_p \) in which \( p \) represents 0, 1 or 2 and wherein one or more carbon atoms of said ring are optionally replaced by carbonyl and which heterocyclic ring may optionally be fused to an aryl or heteroaryl ring;

   and wherein one or more carbon atoms of an \( R_1 \) and/or \( R_2 \) group may optionally be substituted by one or more halogen atoms;

   \( R_3 \) represents \( H, -(CO)_n \text{alkyl} \);

   \( R_4 \) represents \( H \) or \( OH \);

   \( R_5 \) represents \( H, \text{OH or } =O \);

   \( n \) represents a single or double bond save that when \( n \) represents a double bond \( R_4 \) represents \( H \); and

   \( m \) represents a single or double bond save that when \( m \) represents a double bond \( R_5 \) represents \( H \);

   \( x \) represents 0 or 1;
including any tautomer thereof; or an isomer thereof in which the C26, 27 C=C bond shown as trans is cis; and including a methanol adduct thereof in which a ketal is formed by the combination of the C-53 keto (if present) and the C-15 hydroxyl groups and methanol.

5 2. A compound according to claim 1 wherein R₁ and R₂ independently represent alkyl, alkenyl, cycloalkyl, cycloalkenyl, alkylcycloalkyl, alkylcycloalkenyl, alkenylcycloalkyl, alkenylcycloalkenyl, aryl, heteroaryl, alkylaryl, alkylheteroaryl, alkenylaryl or alkenylheteroaryl any of which groups may optionally be substituted by monocyclic aryl or monocyclic heteroaryl; or R₁ represents hydrogen; and wherein one or more carbon atoms of R₁ and/or R₂ not being part of an aryl or heteroaryl group are optionally replaced by a heteroatom selected from O, N and S(O)ₚ in which p represents 0, 1 or 2 and wherein one or more carbon atoms of R₁ and/or R₂ are optionally replaced by carbonyl;

or R₁ and R₂ are joined to form a saturated or unsaturated heterocyclic ring containing the nitrogen atom shown and wherein one or more carbon atoms of said ring are optionally replaced by a heteroatom selected from O, N and S(O)ₚ in which p represents 0, 1 or 2 and wherein one or more carbon atoms of said ring are optionally replaced by carbonyl and which heterocyclic ring may optionally be fused to an aryl or heteroaryl ring.

3. A compound according to claim 2 wherein R₁ represents aryl or heteroaryl substituted by monocyclic aryl or monocyclic heteroaryl, –C₆₋₉alkyl, –OC₆₋₉alkyl, –COC₆₋₉alkyl or –C₃₋₆alkenyl.

4. A compound according to any one of claims 1 to 3, wherein R₂ represents hydrogen, C₁₋₄ alkyl or C₁₋₄ alkenyl.

5. A compound according to claim 4 wherein R₂ represents hydrogen or C₁₋₄ alkyl.

6. A compound according to claim 2 wherein R₁ and R₂ together with the nitrogen to which they are attached represent a 5-7 membered heterocyclic ring, such as a pyrroldine, piperidine, morpholine or piperazine ring in which the 4-nitrogen of piperazine is optionally substituted by C₁₋₄ alkyl and in which a carbon atom adjacent to a nitrogen atom within the ring is optionally replaced with carbonyl.

7. A compound according to any one of claims 1 to 6 wherein, independently or in any combination:

R₃ represents H or (CO)ₓC₁₋₉alkyl, wherein x is as defined in claim 1;

n represents a single bond;

m represents single bond;
8. A compound according to any one of claims 1 to 7, wherein $x$ represents 0.

9. A compound according to claim 1 wherein:
   $R_1$ represents OCH$_3$, $R_2$ represents Me, $R_3$ represents H, $R_4$ represents OH, $n$ represents a single bond, $m$ represents a single bond and $R_5$ represents $=$O as represented by the following structure:

   ![Chemical Structure 1]

   ; or

   $R_1$ represents ethyl, $R_2$ represents ethyl, $R_3$ represents H, $R_4$ represents OH, $n$ represents a single bond, $m$ represents a single bond and $R_5$ represents $=$O as represented by the following structure:

   ![Chemical Structure 2]

   or

   $R_1$ represents $\text{-CHMe}_2$, $R_2$ represents H, $R_3$ represents H, $R_4$ represents OH, $n$ represents a single bond, $m$ represents a single bond and $R_5$ represents $=$O as represented by the following structure:
R₁ represents methyl, R₂ represents H, R₃ represents H, R₄ represents OH, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:

R₁ represents methyl, R₂ represents H, R₃ represents Me, R₄ represents OH, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:

R₁ represents —CH₂CH=CH₂, R₂ represents H, R₃ represents H, R₄ represents OH, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:
R₁ represents methyl, R₂ represents methyl, R₃ represents H, R₄ represents OH, n represents bond, m represents bond and R₅ represents =O as represented by the following structure:

R₁ represents −CH₂CHMe₂, R₂ represents −CH₂CHMe₂, R₃ represents H, R₄ represents OH, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:

R₁ represents OCH₃, R₂ represents Me, R₃ represents H, R⁴ represents OH, n represents a single bond, m represents a double bond and R₅ represents H as represented by the following structure:
R₁ represents OCH₃, R₂ represents Me, R₃ represents H, R₄ represents H, n represents a double bond, m represents a single bond and R₅ represents =O as represented by the following structure:

R₁ and R₂ together represent –CH₂CH₂OCH₂CH₂– connected in a 6-membered heterocycle, R₃ represents H, R₄ represents OH, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:

R₁ represents 4-biphenyl, R₂ represents H, where, R₃ represents H, R₄ represents OH, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:
R₁ represents cyclohexyl, R₂ represents Me, R₃ represents H, R₄ represents OH, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:

R₁ and R₂ together represent –OCH₂CH₂CH₂CH₂– connected in a 6-membered heterocycle, R₃ represents H, R₄ represents H, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:

R₁ represents 2-pyridinyl, R₂ represents H, R₃ represents H, R₄ represents OH, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:
R₁ represents cyclohexyl, R₂ represents H, R₃ represents H, R₄ represents OH, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:

R₁ represents OCH₃, R₂ represents Me, R₃ represents H, R₄ represents OH, n represents a single bond, m represents a single bond and R₅ represents OH as represented by the following structure:

or a pharmaceutically acceptable salt of any one thereof; including any tautomer thereof; or an isomer thereof in which the C26, 27 C=C bond shown as trans is cis; and including a methanol adduct thereof in which a ketal is formed by the combination of the C-53 keto (if present) and the C-15 hydroxyl groups and methanol.
10. A compound according to claim 1 wherein:

\[ R_1 \text{ represents } \text{OCH}_3, R_2 \text{ represents Me, } R_3 \text{ represents } \text{H, } R_4 \text{ represents } \text{H, } n \text{ represents a single bond, } m \text{ represents a single bond and } R_9 \text{ represents } =\text{O} \text{ as represented by the following structure:} \]

\[ \text{Diagram of a compound with structural elements as described.} \]

5

\[ \text{or} \]

\[ R_1 \text{ represents ethyl, } R_2 \text{ represents ethyl, } R_3 \text{ represents } \text{H, } R_4 \text{ represents } \text{H, } n \text{ represents a single bond, } m \text{ represents a single bond and } R_9 \text{ represents } =\text{O} \text{ as represented by the following structure:} \]

\[ \text{Diagram of another compound with structural elements as described.} \]

10

\[ \text{or} \]

\[ R_1 \text{ represents } -\text{CHMe}_2, R_2 \text{ represents } \text{H, } R_3 \text{ represents } \text{H, } R_4 \text{ represents } \text{H, } n \text{ represents a single bond, } m \text{ represents a single bond and } R_9 \text{ represents } =\text{O} \text{ as represented by the following structure:} \]

\[ \text{Diagram of yet another compound with structural elements as described.} \]

15

\[ \text{or} \]
R₁ represents methyl, R₂ represents H, R₃ represents H, R₄ represents H, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:

; or

R₁ represents methyl, R₂ represents H, R₃ represents Me, R₄ represents H, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:

; or

R₁ represents \(-\text{CH₂CH}=\text{CH₂}\), R₂ represents H, R₃ represents H, R₄ represents H, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:

; or
R\textsubscript{1} represents methyl, R\textsubscript{2} represents methyl, R\textsubscript{3} represents H, R\textsubscript{4} represents H, n represents bond, m represents bond and R\textsubscript{5} represents =O as represented by the following structure:

\[ \text{Structure 1} \]

5

R\textsubscript{1} represents –CH\textsubscript{2}CHMe\textsubscript{2}, R\textsubscript{2} represents –CH\textsubscript{2}CHMe\textsubscript{2}, R\textsubscript{3} represents H, R\textsubscript{4} represents H, n represents a single bond, m represents a single bond and R\textsubscript{5} represents =O as represented by the following structure:

\[ \text{Structure 2} \]

10

R\textsubscript{1} represents OCH\textsubscript{3}, R\textsubscript{2} represents Me, R\textsubscript{3} represents H, R\textsubscript{4} represents H, n represents a single bond, m represents a double bond and R\textsubscript{5} represents H as represented by the following structure:

\[ \text{Structure 3} \]
R₁ and R₂ together represent –CH₂CH₂OCH₂CH₂– connected in a 6-membered heterocycle, R₃ represents H, R₄ represents H, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:

; or

R₁ represents 4-biphenyl, R₂ represents H, where, R₃ represents H, R₄ represents H, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:

; or

R₁ represents cyclohexyl, R₂ represents Me, R₃ represents H, R₄ represents H, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:

; or
R₁ represents cyclohexyl, R₂ represents H, R₃ represents H, R₄ represents H, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:

; or

R₁ and R₂ together represent \( -\text{OCH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{-} \) connected in a 6-membered heterocycle. R₃ represents H, R₄ represents H, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:

; or

R₁ represents 2-pyridinyl, R₂ represents H, R₃ represents H, R₄ represents H, n represents a single bond, m represents a single bond and R₅ represents =O as represented by the following structure:

;
or a pharmaceutically acceptable salt of any one thereof; including any tautomer thereof; or an isomer thereof in which the C26, 27 C=C bond shown as trans is cis; and including a methanol adduct thereof in which a ketal is formed by the combination of the C-53 keto (if present) and the C-15 hydroxyl groups and methanol.

11. A compound according to claim 1 wherein:

R₃ represents H, R₄ represents OH, n represents a single bond, m represents a single bond and R₆ represents =O as represented by the following structure:

![Chemical Structure](image)

wherein R₁₀ represents a group as shown in the following table:

<table>
<thead>
<tr>

or a pharmaceutically acceptable salt of any one thereof; including any tautomer thereof; or an isomer thereof in which the C26, 27 C=C bond shown as trans is cis; and including a methanol adduct thereof in which a ketal is formed by the combination of the C-53 keto (if present) and the C-15 hydroxyl groups and methanol.

12. A compound according to any one of claims 1 to 11 for use as a pharmaceutical.

13. A compound according to any one of claims 1 to 11 for use as a pharmaceutical for the treatment of viral infections such as HCV, HBV or HIV infection.

14. A pharmaceutical composition comprising a compound according to any one of claims 1 to 11 together with a pharmaceutically acceptable diluent or carrier.

15. A pharmaceutical composition comprising a compound according to any one of claims 1 to 11 together with a pharmaceutically acceptable diluent or carrier further comprising a second or subsequent active ingredient.

16. A method of treatment of viral infections such as HCV, HBV or HIV which comprises administering to a subject a therapeutically effective amount of a compound according to any one claims 1 to 11.

17. A process for preparing a compound according to any one of claims 1 to 11 which comprises reacting a compound of formula II:

\[
\begin{align*}
\text{formula II} \\
R_1 \stackrel{\text{N}}{\text{C}}(\text{O})R_2 OR_8 \\
\end{align*}
\]

wherein \(R_1\) and \(R_2\) are as defined in any one of claims 1 to 11 and \(R_8\) represents \(C_{1-4}\) alkyl or benzyl;

with an aldehydic macrocycle (compound of formula III):
wherein \( R_3, R_4, R_5, m \) and \( n \) are as defined in any one of claims 1 to 11.

18. A compound of formula (III) or formula (IV) below, or a pharmaceutically acceptable salt thereof:

![Chemical Structure](image)

in (III)

including any tautomer thereof; and including a methanol adduct thereof in which a ketal is formed by the combination of the C-53 keto and the C-15 hydroxyl group and methanol.

* Special categories of cited documents:
  * "A" document defining the general state of the art which is not considered to be of particular relevance
  * "E" earlier document but published on or after the international filing date
  * "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
  * "O" document referring to an oral disclosure, use, exhibition or other means
  * "P" document published prior to the international filing date but later than the priority date claimed

* "T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

* "X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

* "Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

* "Z" document member of the same patent family
