UNITED STATES PATENT OFFICE

LEVONA LISCHIED, OF NATIONAL CITY, CALIFORNIA, ASSIGNOR TO KARL LISCHIED, OF
NATIONAL CITY, CALIFORNIA

HOLDER FOR PENS AND PENCILS

Application filed February 7, 1930. Serial No. 426,483.

My invention relates to holders for pens and pencils, and the objects of my invention are: First, to provide a pen and pencil holder which may be readily attached to a garment not ordinarily having a pocket, such as a shirt; second, to provide a holder of this description having means for receiving the clips of the pen or pencil and enclosing the body portion thereof; third, to provide a holder of this description which adequately protects the clothes of the wearer from possible damage or stain and the wearer from injury due to the point of the pen or pencil; fourth, to provide a holder which will accommodate pens and pencils of various thickness and length; fifth, to provide a holder which may extend into a pocket of a garment without preventing the use thereof for carrying other articles; and sixth, to provide a holder which is simple and economical of manufacture, durable, and which will not readily deteriorate or get out of order.

With these and other objects in view as will appear hereinafter, my invention consists of certain novel features of construction, combination and arrangement of parts and portions as will be hereinafter described in detail and particularly set forth in the appended claims, reference being had to the accompanying drawings and to the characters of reference thereon, which form a part of this application, in which:

Figure 1 is a fragmentary view of a garment to which my novel holder is secured; Fig. 2 is a developed view of the holder; Fig. 3 is a view thereof seen from its upper end, with parts and portions broken away; Fig. 4 is an elevational view, while Fig. 5 is a fragmentary, sectional view thereof taken along the line 5—5 in Fig. 4.

Similar characters of reference refer to similar parts and portions throughout the several views of the drawings.

Referring to Fig. 2, it will be noted that the holder is made preferably of a single piece of a relatively flexible, strong, moisture proof material, and in its developed plan comprises a relatively long, rectangular portion 1 and a narrower transversely directed portion 2, the two portions forming substantially a T.

The longer portion 1 is folded upwardly along its transverse median line 1c, forming thereby the front portion 1a and rear portion 1b of a pocket, said portions being sewed together along their side margins with the upper end remaining open substantially along the base of the upper portion 2. The upper portion 2 is folded downwardly along its longitudinal median line 2a, and is sewn along its margins including its base 2b adjacent the upper end of the pocket 1, thereby forming a band of double thickness material. The ends of the band 2 may be bevelled as at 2c in Fig. 4, and to their rear sides are sewn clips 3, which are adapted to be engaged by studs provided in proper spaced relation on the garment to which the pocket is to be attached.

Along the front portion of the band 2, a strip 4 is secured in such a manner as to form loops 4a of various sizes through which the pens and pencils are adapted to be inserted, as indicated in Fig. 1.

The strip 4 is positioned above the opening of the pocket 1. The loop portion of the strip 4 is of somewhat shorter length than the width of the pocket 1, so that the extending portion of the pens and pencils will readily enter the pocket. The clip on the pen or pencil if such is provided, will pass over the strip and be retained thereby, thus serving the function for which it was intended.

It will be noted that in forming the holder in the manner described, the band portion 2, which is adapted to be secured to the garment, is of relatively great strength, and this is enhanced by the stitching in the strip 4 forming the loop. It will also be noted that the rear portion 1b, while forming an integral portion or continuation of the rear portion of the band 2, is further secured to the front portion of the band by the marginal stitching along the base 2b of the band 2. This structure results in a strong and durable holder.

The pocket portion 1 protects the pens and pencils from possible damage, and at the same time protects the garments of the wearer from damage or ink stains due to a leaky pen, and also protects the wearer from per-

sonal injury which might occur as the result of a fall causing a pencil to become misplaced and the point thereof inflicting a wound.

5 As indicated in Fig. 1, when the holder is placed within the pocket on a garment, the front portion 2 occupies a position slightly above the opening of the garment pocket P so that the upper ends of the pencils and pens
10 are entirely clear of the garment. This enables the wearer to place other articles, such as the memo book A indicated in Fig. 1 between the front portion 1a of the pocket and the outer portion of the garment pocket P.

15 Though I have shown and described a particular construction, combination and arrangement of parts and portions, I do not wish to be limited to this particular construction, combination and arrangement, but
20 desire to include in the scope of my invention the construction, combination and arrangement substantially as set forth in the appended claims.

Having thus described my invention, what
25 I claim as new and desire to secure by Letters Patent is:

1. In a pen and pencil holder, a pocket portion shaped to fit into a conventional pocket for receiving the lower portion of pens and
30 pencils, a band portion extending transversely above the opening of the pocket and beyond the side margins thereof, and a strip forming a plurality of loops on said band portion above the opening of said pocket for receiving the upper end of said pens and pencils.

2. In a device of the class described, a rectangular portion of flexible material doubled along its transverse median line, the contiguous side margins being secured together, an integral rectangular portion extending transversely of the said first portion forming a T therewith and doubled over
40 along its longitudinal median line, the contiguous side edges being secured together, said first rectangular portion forming a pocket, said second portion forming a supporting band for said pocket.

In testimony whereof, I have hereunto set my hand at San Diego, California, this 29th day of January, 1930.

LEVONA LISCHIED.
