Note: Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European patent convention).

Description

The present invention relates to support appliances such as beds, chairs or couches designed to provide a high standard or comfort for all types of user, large or small, heavy or light in weight, or to sufferers from back complaints. For the purpose of this specification the term "bed or the like" will be used generally to describe all such appliances.

Normally, persons suffering from back trouble require beds that furnish a large amount of lumbar support, which the ordinary resilient mattress does not provide. A known remedy is either to provide a special, hard mattress or to insert a rigid board between the mattress and the sprung bed. It will be readily appreciated that, although this treatment is effective, it is also somewhat uncomfortable as the increased support is also applied to other parts of the body where no such support is required, and where the additional support may even be undesirable.

DE—B—2621803 (EGGENWEILER) discloses a bed having spaced, longitudinally extending rigid members each accommodating a closed elongate resilient tube which is pressurised to meet the requirements of the person using the bed. The upper surface of each tube has a plurality of spaced pockets vulcanised thereto with the pockets of one tube all facing towards the pockets of the other tube. The body support surface of the bed is formed by a plurality of transversely extending, laminated slats arranged parallel to each other with their ends fixedly mounted in the tube pockets.

This prior art arrangement is complicated and costly due to the vulcanising of the pockets to the tubes which, in addition, increases the possibility of failure at the seams of each pocket.

FR—A—2407692 (INDUSTRIE DE TRANSFORMATION DU BOIS) discloses a bed having spaced, longitudinally extending body elements each provided with a plurality of up-standing longitudinally aligned elastomeric blocks. The body support surface of the bed is formed by a plurality of transversely extending slats arranged parallel to each other with their ends supported by the elastomeric blocks and slidably mounted in vertical guides.

This known arrangement is extremely costly due to the necessity of providing a pair of elastomeric blocks for each slat with the possibility of the blocks being of varying heights and resilience.

It is an object of the present invention to provide a bed which provides adjustable increased lumbar support without sacrificing resilience of the bed in the region of the shoulders and the pelvis of the user.

Furthermore, present practice is for users to purchase beds having soft, medium or hard mattresses and once purchased, there is no adjustment possible. Guests and casual users

may therefore experience some discomfort and even detrimental after effects e.g. back complaints, for some time after use. Therefore, it is also an object of this invention to provide a means whereby users of such beds, whether having back troubles or not, have the ability to rapidly adjust the bed to the exact desired hardness or softness required by the user. For example, in the case of a so-called double bed, the user of one side might be light in weight and require a more resilient (softer) surface to lie on, whereas the other user may be of heavier build and require a firmer surface in order to compensate for the increased weight. The present invention enables both parties to have equal comfort by setting the resilience of the surface beforehand to their respective requirements, notwithstanding that each adjacent support surface was identically produced. Previously the mattress used was a compromise hardness or softness which was often not suitable for either user. Single or double beds manufactured in a like, exact manner with final adjustment easily effected by the purchaser thus substantially reduces manufacturing costs by standardisation of all the main components.

Accordingly, the present invention consists in a bed or the like comprising a frame and a body support surface formed by a plurality of members extending transversely of the frame, said members being guided for movement normal to the plane of the body support surface with spaced portions of each member positioned, respectively, on opposite sides of its centre and the portions of the members positioned on the same side of the centre all resting on a common pressurised, flexible elongate tube such that, in use, the support surface formed by the transversely extending members, when viewed from the side of the bed, conforms substantially to the profile of a user's body supported by said support surface, characterised in that said spaced portions of each member rest on, without connection to, the associated elongate tubes.

In the accompanying drawings in which like reference numerals have been used throughout the various Figures to designate similar or corresponding members:—

Fig. 1 is a plan view of a bed according to the present invention,

Fig. 2 is a cross-section, on an enlarged scale, taken along the line 2—2 of Fig. 1,

Fig. 3 is a view, similar to Fig. 2, but showing a slightly modified construction,

Fig. 4 is a cross-section of a second embodiment of a single bed according to the present invention,

Fig. 5 is a cross-section similar to Fig. 4, but showing a double bed arrangement,

Fig. 6 is a plan view showing a portion of the body support surface, and

Fig. 7 is a cross-section, similar to Fig. 4, but showing a modified construction.

In carrying the invention into effect accord-

ing to one convenient mode, by way of example, there is provided a rectangular bed frame 10 having longitudinally extending side members 12 and transverse end members 13. As shown in Fig. 2, each side member 12 has its lower portion of channel-shaped cross-section which is formed by an inwardly directed flange 14 provided at its inner end with an upwardly directed flange 16, spaced from, but parallel to the side member 12 with an elongate flexible tube 18 accommodated in the channel-shaped portion, the tube 18 having a filling valve 19 and containing air or liquid under pressure e.g. 1 to 5 lbs/sq. inch depending on the weight and configuration of the users.

A plurality of independent, transversely extending body support members or slats 20 extend between the side members 12 and are guided for vertical movement in guideways 22, conveniently formed by slots in the side members 12 which engage the respective extremities of each slat 20. A downwardly depending support foot 21 is fixedly mounted at each corner of the bed frame 10.

As shown in Fig. 3, the end portions of each slat 20 may be formed with a downwardly extending portion 20a which engages with the respective pressurised tube 18 positioned along each side member 12 as described above. To avoid chafing, the lower surface 20b of each downwardly projecting portion 20a may be arcuate, or part-spherical, whilst the upper surface 20c of each slat 20 is preferably profiled to suit the user. In general, the upper surfaces of all the slats 20 may be flat as shown in Fig. 2, or concave as shown in Fig. 3 to form a longitudinally extending, concave, body support surface, so that the user is directed towards the centre of the bed, but if necessary, the upper surfaces of the slats 20 may collectively be formed to provide humps or ridges (not shown) in order to provide varying degrees of lumbar support so that a wide variety of users of different physique can receive the benefits of the bed construction in a simple and economical manner.

It will be seen that when a user lies on the bed, the slats 20 enable the support surface to conform accurately to the profile of the user's body in contact with the support surface so that all parts are adequately supported i.e. the end portions of slats 20 subjected to the greatest pressure are thrust downwardly onto the pressurised tubes 18 to urge any non-pressurised slats upwardly into contact with the user's body.

If desired, a thin foam mattress 23 may be provided to overlie the slats 20 and the bed may be provided with covers which are tailored to fit and provided with zips to allow easy removal thereof for laundering.

In the embodiment of the invention shown in Figure 4, there is provided a rectangular bed frame having longitudinally extending side members 12 and transverse end members (not

shown) as described with reference to the previous embodiment. Each side member 12 has at its lower portion an inwardly directed flange 14 provided at its inner end with an upwardly directed member 16 having a plurality of aligned, vertical bores 24 extending there-through. The member 16 is spaced from and parallel to the side member 12 with an elongate flexible tube 18 seated on the flange 14.

In this embodiment, the plurality of independent, transversely extending body support members or slats 20 are positioned with their larger dimension horizontally disposed and forming the body support surface. Each member 20 is guided for vertical movement by means of spaced downwardly depending dowels 26 fixedly mounted on the underside of the member 20 and slidable in the bores 24 in the respective upwardly directed members 16. Thus, in this embodiment, it is not necessary to have the extremities of the members 20 guided for vertical movement in the respective side members 12, a similar guiding effect being provided by the dowels 26 sliding in their respective bores 24 in the members 20, the respective end portions of which are supported by the tubes 18. The side members 12 are mounted on longitudinally extending support feet 28 positioned inwardly of the side members 12. A mattress or cover 23 may overlie the body support surface formed by the members or slats 20.

As shown in Figures 5 and 6, the construction described with reference to Figure 4 is particularly advantageous for double or king size beds. Thus, in a double bed construction, a central, longitudinally extending member 30 is positioned at a level lower than the side members 12 and provides a common support for the adjacent flanges 14 and the associated upwardly extending flanges 16. It will be appreciated that this arrangement obviates a central ridge extending longitudinally of the bed as would be caused by the arrangement shown in Figs. 1 to 3 and as shown in Figure 6, enables the respective adjacent inner portions 20d, 20f of the members 20 to be in juxtaposed relationship and thus provide a "merging" of the two independent body support surfaces.

In Fig. 7 which shows a modification of the arrangement shown in Figure 4, the downwardly depending dowels 26 are slidable in bearing bushes 32 fixedly mounted in a panel 34 interconnecting the respective inwardly directed flanges 14. In this construction, the lower end of each downwardly depending dowel 26 is provided with a part-spherical member 36 engaging the resilient tube 18 which, in this modified arrangement, is accommodated in a base member 38. Abutment members 40 may be provided to limit the vertical movement of the transversely extending members 20.

The slats 20 may be of wood or moulded from a synthetic resinous material.

A bed according to the present invention has the advantage that it is of normal shape, as opposed to a number of previous designs of orthopaedic, or other types of bed which tend to be of unusual shape, thus requiring special bed clothes and other covers.

Also, the basic frame and assembly may be utilised in place of a deep spring or other mattress, on top of the existing base in order to conveniently convert existing beds into the improved construction described above.

A further advantage is that beds made according to the present invention may conveniently be supplied in kit form which facilitates transit. Such beds are provided with connector members which simplifies re-assembly.

Claims

1. A bed or the like comprising a frame (10) and a body support surface formed by a plurality of members (20) extending transversely of the frame (10), said members (20) being guided for movement normal to the plane of the body support surface with spaced portions of each member (20) positioned, respectively, on opposite sides of its centre and the portions of the members (20) positioned on the same side of the centre all resting on a common pressurised, flexible elongate tube (18) such that, in use, the support surface formed by the transversely extending members (20), when viewed from the side of the bed, conforms substantially to the profile of a user's body supported by said support surface, characterised in that said spaced portions of each member (20) rest on, without connection to, the associated elongate tubes.

2. A bed or the like as claimed in claim 1, characterised in that said elongate tubes extend, respectively, along spaced members (12, 14, 16) forming the sides of said frame.

3. A bed or the like as claimed in claim 2, characterised in that the lower portion of each side member (12, 14, 16) is of channel-shaped configuration and said elongate tube (18) is accommodated therein.

4. A bed or the like as claimed in claim 2 or 3, characterised in that the ends of each of said transversely extending members (20) are, respectively, guided for movement in a slot (22) formed in the adjacent side member (12).

5. A bed or the like as claimed in any of the preceding claims, characterised in that the end portions of each transversely extending member (20) are provided, respectively, with a downwardly extending portion (20a) which rests on the tube (18).

6. A bed or the like as claimed in claim 2, characterised in that each transversely extending member (20) has spaced, downwardly depending guide members (26) slidably mounted in bores (24) formed, respectively, in said side members (16).

7. A bed or the like as claimed in claim 6,

characterised in that two independent body support surfaces are provided, the adjacent inner portions (20d, 20f) of the transversely extending members (20) forming each support surface being in juxtaposed relationship.

8. A bed or the like as claimed in claim 1, characterised in that each transversely extending member (20) has spaced downwardly depending guide members (26) slidably mounted in bearing bushes (32) fixedly mounted in a panel (34) interconnecting spaced members (14) forming the sides of said frame (10).

9. A bed or the like as claimed in claim 8, characterised in that the lower extremities of the guide members (26) rest on said common tube (18).

10. A bed or the like as claimed in any of the preceding claims, characterised in that the upper surface (20c) of each of the transversely extending members (20) is curved to provide a longitudinally extending, concave body support surface.

Patentansprüche

1. Ein Bett od.dgl. mit einem Rahmen (10) und einer Körperstützfläche, die von einer Vielzahl von quer zum Rahmen verlaufenden Teilen (20) gebildet ist, welche normal zur Ebene der Körperstützfläche beweglich gelagert sind, wobei voneinander distanzierte Bereiche jedes Teiles (20) hinsichtlich deren Mitte einander gegenüberliegend angeordnet sind und die auf derselben Seite der Mitte liegenden Bereiche der Teile (20) alle auf einem gemeinsamen, unter Druck stehenden, flexiblen längsgerichteten Rohr (18) aufliegen, sodaß im Gebrauch die von den querverlaufenden Teilen (10) gebildete Stützfläche in Seitenansicht des Bettes im wesentlichen dem Körperprofil des von der Stützfläche getragenen Benützers entspricht, dadurch gekennzeichnet, daß die voneinander distanzierten Bereiche jedes Teiles (20) auf den zugehörigen, längsgerichteten Röhren (18) aufliegen, ohne mit diesen verbunden zu sein.

2. Ein Bett od.dgl. nach Anspruch 1, dadurch gekennzeichnet, daß sich den längsgerichteten Röhren entlang voneinander distanzierte Seitenteile (12, 14, 16) des Rahmens erstrecken.

3. Ein Bett od.dgl. nach Anspruch 2, dadurch gekennzeichnet, daß der untere Bereich jedes Seitenteiles (12, 14, 16) rinnenförmig ausgebildet und die längsgerichtete Röhre (18) darin angeordnet ist.

4. Ein Bett od.dgl. nach Anspruch 2 oder 3, dadurch gekennzeichnet, daß die Enden des querverlaufenden Teiles (20) jeweils in einem Schlitz (22) im angrenzenden Seitenteil (12) beweglich gelagert sind.

5. Ein Bett od.dgl. nach einem der vorangehenden Ansprüche, dadurch gekennzeichnet, daß die Endbereiche jedes querverlaufenden Teiles (20) jeweils einen nach unten verlauf-

enden Abschnitt (20a) aufweisen, welcher auf der Röhre (18) aufliegt.

6. Ein Bett od.dgl. nach Anspruch 2, dadurch gekennzeichnet, daß jeder der querverlaufenden Teile (20) in Abständen nach unten verlaufende Führungsglieder (26) aufweist, die gleitend in Bohrungen (24) der Seitenteile (16) gelagert sind.

7. Ein Bett od.dgl. nach Anspruch 6, dadurch gekennzeichnet, daß zwei unabhängige Körperstützflächen vorgesehen sind, wobei die einander benachbarten inneren Bereiche (20d, 20f) der querverlaufenden Teile (20), welche jede Stützfläche bilden, einander überlappen.

8. Ein Bett od.dgl. nach Anspruch 1, dadurch gekennzeichnet, daß jeder querverlaufende Teil (20) in Abständen nach unten verlaufende Führungsglieder (26) aufweist, welche gleitend in Lagerbuchsen (32) gelagert sind, welche fest in einer voneinander distanzierte Seitenteile (14) des Rahmens verbindenden Platte (34) angeordnet sind.

9. Ein Bett od.dgl. nach Anspruch 8, dadurch gekennzeichnet, daß die unteren Enden der Führungsglieder (26) auf der gemeinsamen Röhre (18) aufliegen.

10. Ein Bett od.dgl. nach einem der vorangehenden Ansprüche, dadurch gekennzeichnet, daß die obere Oberfläche (20c) jedes querverlaufenden Teiles (20) gekrümmt ist, um eine konkave längsverlaufende Körperstützfläche zu bilden.

Revendications

1. Lit ou analogue comprenant un cadre (10) et une surface d'appui pour le corps, formée par une pluralité de pièces (20) s'étendant transversalement par rapport au cadre (10), lesdites pièces (20) étant guidées en un mouvement normal au plan de la surface d'appui pour le corps, des parties espacées de chaque pièce (20) étant positionnées respectivement sur les côtés opposés par rapport à leur centre et les parties des pièces (20) positionnées du même côté par rapport à leur centre reposant toutes sur un tube flexible commun, allongé et sous pression (18) de façon telle que lors de l'usage, la surface d'appui formée par les pièces (20), s'étendant transversalement, considérée à partir du bord du lit, se conforme substantiellement au profil du corps de l'utilisateur supporté par ladite surface d'appui, caractérisé en ce que lesdites parties espacées de chaque pièce (20) reposent sans aucune liaison, sur les tubes allongés associés.

2. Lit ou analogue comme revendiqué dans la revendication 1, caractérisé en ce que lesdits

tubes allongés s'étendent respectivement le long de pièces espacées (12, 14, 16) formant les côtés dudit cadre.

3. Lit ou analogue comme revendiqué dans la revendication 2, caractérisé en ce que la partie inférieure de chaque pièce de côté (12, 14, 16) a la configuration d'une gouttière et que ledit tube allongé (18) s'adapte dans ladite gouttière.

4. Lit ou analogue comme revendiqué dans les revendications 2 ou 3, caractérisé en ce que les extrémités de chacune des pièces (20) s'étendant transversalement sont respectivement guidées dans leur mouvement par une fente (22) formée dans la pièce de côté adjacente (12).

5. Lit ou analogue comme revendiqué dans l'une quelconque des revendications précédentes, caractérisé en ce que les parties d'extrémité de chaque pièce (20) s'étendant transversalement sont pourvues respectivement d'une partie (20a) s'étendant vers le bas qui repose sur le tube (18).

6. Lit ou analogue comme revendiqué dans la revendication 2, caractérisé en ce que chaque pièce (20) s'étendant transversalement possède des pièces de guidage (26) dirigées vers le bas montées coulissantes dans des trous (24) formés respectivement dans les pièces de côté (16).

7. Lit ou analogue comme revendiqué dans la revendication 6, caractérisé en ce que deux surfaces d'appui pour le corps indépendantes sont prévues, les parties intérieures adjacentes (20d, 20f) des pièces (20) s'étendant transversalement formant chaque surface d'appui pour le corps étant en relation de juxtaposition.

8. Lit ou analogue comme revendiqué dans la revendication 1, caractérisé en ce que chaque pièce (20) s'étendant transversalement possède des pièces de guidage (26) espacées dirigées vers le bas, montées coulissantes dans des bagues de support (32) montées de façon fixe sur un panneau (34) interconnectant les pièces espacées (14) formant les côtés dudit cadre (10).

9. Lit ou analogue comme revendiqué dans la revendication 8, caractérisé en ce que les extrémités basses des pièces de guidage (26) reposent sur ledit tube commun (18).

10. Lit ou analogue comme revendiqué dans l'une quelconque des revendications précédentes, caractérisé en ce que la surface supérieure (20c) de chacune des pièces (20) s'étendant transversalement est incurvée pour présenter une surface d'appui pour le corps, concave et s'étendant longitudinalement.
