（式中、Rは水素原子、アルキル基またはアリール基を示す）で表される化合物、

下記式（II）
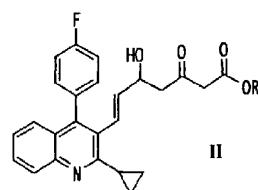

（式中、Rは前記と同義である）で表される化合物、及び、下記式（III）
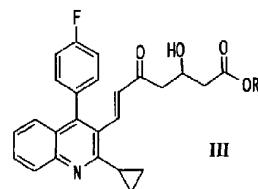

（式中、Rは前記と同義である）で表される化合物からなる群より選ばれる化合物を、ケト基を立体選択的に還元しうる能力を有する微生物の菌体及び／または該菌体処理物を作用させて還元することを特徴とする下記式（IV）
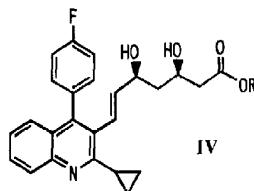

（式中、Rは前記と同義である）で表される化合物の製造方法。

Description

Process for Producing (3R,5S)-(E)-7-[2-Cyclopropyl-4-(4-
Fluorophenyl)-Quinolin-3-yl]-3,5-Dihydroxyhept-6-enic
5   Acid Esters

Technical Field

        The present invention relates to a novel process
for producing (3R, 5S)-(E)-7-[2-cyclopropyl-4-(4-
10   fluorophenyl)-quinolin-3-yl]-3,5-dihydroxyhept-6-enic
acid esters. This compound is useful as a synthetic
intermediate of "3-hydroxy-3-methylglutaryl CoA-
reductase inhibitor" disclosed in JP 1-279866 A as being
useful for a blood-cholesterol reducer.

15   In addition, the present invention relates to a
novel process for producing β-diketocarboxylate ester
derivative, which is required for synthesis of (3R, 5S)-
(E)-7-[2-cyclopropyl-4-(4-fluorophenyl)-quinolin-3-yl]-
3,5-dihydroxyhept-6-enic acid esters as described above.

20

Background Art

        As a process for chemically producing (3R, 5S)-
(E)-7-[2-cyclopropyl-4-(4-fluorophenyl)-quinolin-3-yl]-
3,5-dihydroxyhept-6-enic acid esters, for example, the
25   following production route has been known as disclosed
in JP 1-279866 A and Journal of Chromatography A, 832
(1999) p55-65.

F · · · CHO → F · · · OH O · · · COOR → F · · · OH OH · · · COOR
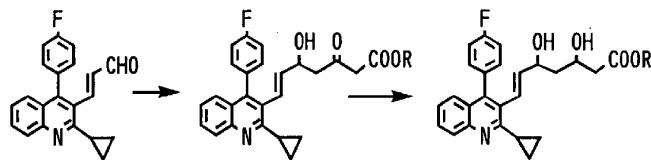

In these processes, however, a reaction product is a mixture of an optical isomer and an optically active

5   substance, so that only the desired optically active substance compound should be obtained through separation and purification by means of chromatography and so on in their respective final steps. It is rather difficult to say that the isolation of an isomer in the final step is

10   cost effective and efficient on an industrial scale.

Furthermore, in JP 8-92217 A, there is disclosed another production process using an optically active Schiff base.

Still furthermore, in JP 8-127585 A, there is

15   disclosed a production process using methyl (R)-3-tert-butyl dimethylsilyloxy-6-dimethoxyphosphinyl-5-oxohexanoate at a very low temperature.

On the other hand, as a process for producing an optically active alcohol product by a stereo-selective

20   reduction of a compound having a keto group using microbial cells and/or a cell preparation thereof, in Appl. Microbiol. Biotechnol. (1998) 49: p. 709-717, there is a description that the following chemical

reaction can be performed using Microbacterium

campoquemadoensis strain MB5614.
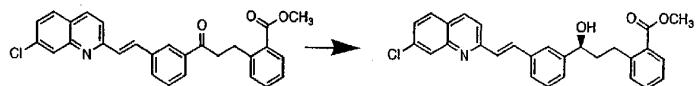

5   Furthermore, in Bioorg. Med. Chem. Lett., vol. 8,

p1403- (1998), there is a description that the following

reaction can be performed using a bakers yeast.
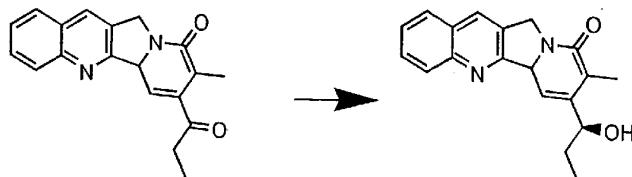

10   However, with respect to a compound in which

carbonyl groups continuously exist in the molecule

thereof in addition to the presence of olefin on the á-

position of the carbonyl group, such as (E)-7-[2-

cyclopropyl-4-(4-fluorophenyl)-quinolin-3-yl]-3,5-

15   dihydroxyhepto-6-enoic acid esters, any example in which

such a compound can be reduced using a microorganism in

a stereo-selective manner has not been known in the art.

It is to be understood that, if any prior art
publication is referred to herein, such reference does not
constitute an admission that the publication forms a part
of the common general knowledge in the art, in Australia
5   or any other country.

Disclosure of the Invention
        Therefore, it has been desired to develop a novel
production process which is capable of cost-effectively

producing (3R,5S)-(E)-7-[2-cyclopropyl-4-(4-

fluorophenyl)-quinolin-3-yl]-3,5-dihydroxyhept-6-enic

acid esters on an industrial scale.

5   For solving the above problem, the inventors of

the present invention have made extensive studies over

and over again and found out that the desired products

can be obtained at high optical purities when the

compounds represented by the following compounds (I) to

(III) and (II') and (III') are used as raw materials,

10   resulting in accomplishment of the present invention.

Therefore, a gist of the present invention resides in a

process for producing a compound represented by the

following formula (IV):

IV

15
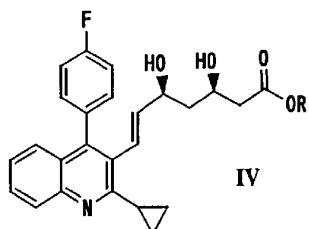

(where R denotes a hydrogen atom, an alkyl group, or an

aryl group), comprising reducing a compound selected

from the group consisting of:

a compound represented by the following formula (I):

20

where R is as defined in the formula (IV);

a compound represented by the following formula (II):

where R is as defined in the formula (IV); and

a compound represented by the following formula (III):

where R is as defined in the formula (IV), by reacting the compound with a cell of a microorganism and/or a cell preparation thereof capable of stereo-selectively reducing a keto group, wherein the microorganism is selected from the group consisting of the genera *Metschnikowia, Cryptococcus, Candida, Filobasidium, Ogataea, Citeromyces, Yarrowia, Rhodotorula, Exophiala, Trigonopsis, Shizosaccharomyces, Wickerhamiella, Pichia,*

Saccharomycopsis, Saitoella, Saccharomyces,
Rhodosporidium, Acinetobacter, Brevibacterium,
Cellulomonas, Coryebacterium, and genus *Curtobacterium.*

5   Further, another gist of the present invention
resides in a process for producing the compound (I),
comprising conducting a condensation reaction between 2-
cyclopropyl-4-(4-fluorophenyl) quinolin-3-carbaldehyde
represented by the following formula (A):

10

(A)
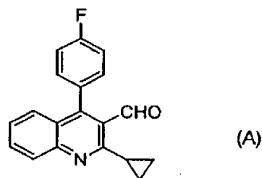

and a compound represented by the following formula (B):

(B)

15
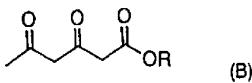

(where R denotes a hydrogen atom, an alkyl group, an
aralkyl group, or an aryl group).

20   Best Mode for Carrying out the Invention

       Hereinafter, the present invention will be
described in detail.

25   According to the present invention, a process
for producing (3R,5S)-(E)-7-[2-cyclopropyl-4-(4-
fluorophenyl)-quinolin-3-yl]-3, 5-dihydroxyhept-6-enic

acid esters comprising reducing a compound selected from

the group consisting of:

a compound represented by the following formula (I)
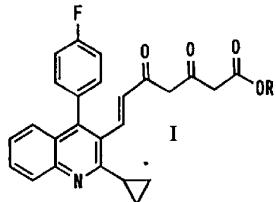

5   (where R denotes a hydrogen atom, an alkyl group, or an

aryl group);

a compound represented by the following formula (II)
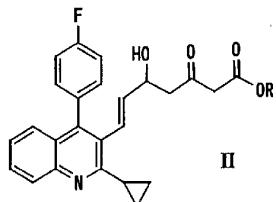

10   (where R is as defined in the formula); and

a compound represented by the following formula (III)
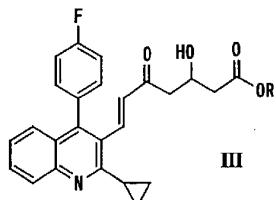

(where R is as defined in the formula), by reacting the

compound with a cell of a microorganism and/or a cell

preparation thereof capable of stereo-selectively

reducing a keto group.

In the compounds represented by the above formulae

5   (I) to (III), which are raw materials to be used in the

production process of the present invention, R

represents a hydrogen atom, an alkyl group, or an aryl

group.

The alkyl group may be an alkyl group such as an

10   methyl group, an ethyl group, an isopropyl group, a

cyclopropyl group, a butyl group, an isobutyl group, a

t-butyl group, a cyclohexyl group, a benzyl group, or a

phenethyl group, or a straight-, branched-, or cyclic-

alkyl group which may be substituted with an aryl group.

15   The aryl group may be a phenyl group or a naphthyl

group which may be substituted with an alkyl group, such

as a phenyl group, a mesityl group, or a naphthyl group.

The above R is preferably a C_1-C_4 alkyl group, a

benzyl group, or a phenyl group, more preferably a C_1-C_4

20   alkyl group, particularly preferably a methyl group or

an ethyl group.

According to the production process of the present

invention, the compounds represented by the formulae

(II) and (III) may be respectively optically active

25   substances represented by the following formula (II')

-12-
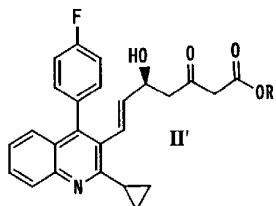

(where R is as defined in the formula), and the

following formula (III')
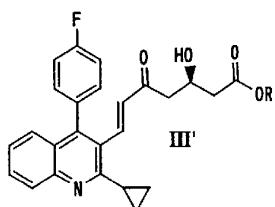

5   (where R is as defined in the formula).

        The compounds represented by the formula (I) to

(III) and (II') and (III') can be optionally produced

with a combination of a process disclosed in JP 1-279866

A, JP 8-127585 A, JP 5-178841 A, or the like and a

10   process well known in the art.

        Further, as a preferable process for producing the

compound represented by the formula (I), the inventors

of the present invention have reached the following

process in which the compound is obtained by a

15   condensation reaction between

2-cyclopropyl-4-(4-fluorophenyl) quinolin-3-carbaldehyde

represented by the following formula (A):

(A)
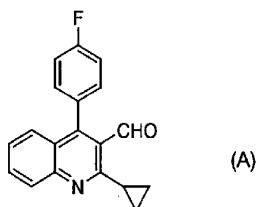

and a compound represented by the following formula (B):

(B)
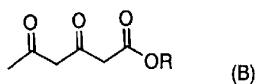

(where R denotes a hydrogen atom, an alkyl group, an

5   aralkyl group, or an aryl group). By employing this

process, the compound represented by the above formula

(I) can be produced easily and efficiently.

A condensation reaction between the compound (A)

and the compound (B) can be progressed by the same

10   operation as that of one which is a so-called aldol

reaction. In general, a process, by which a base is

added in a solution containing the compound (B) and a

solution containing the compound (A) is then dropped

into the solution under a nitrogen or inert-gas

15   atmosphere, is preferably performed.

The bases to be used in the above condensation

reaction include: hydrides of alkali metals or alkaline-

earth metals, such as sodium hydride, potassium hydride,

and calcium hydride; lithium alkyl reagents such as n-

20   butyl lithium and t-butyl lithium; Grignard reagents

such as t-butyl magnesium chloride; alkali-metal
alkoxides such as sodium ethoxide; and $NaNH_2$. In
addition, solid bases of alkaline-earth metal oxides or
the like such as magnesium oxide may be included. Among
5   them, hydrides of alkali metals or alkali-earth metals,
and $NaNH_2$ are preferable, alkali-metal hydrides are more
preferable, and sodium hydride is particularly
preferable.

In general, the usage amount of the base is 1.5
10   equivalent weights or more, preferably 2 equivalent
weights or more with respect to the compound (B). If it
is excessively used, a side reaction may occur and a
reduction in yield may thus occur. Therefore, in
general, it is used in the range of 10 equivalent
15   weights or less. In the above range, it is preferably
in the range of 2 to 3 equivalent weights, particularly
preferably 2 to 2.7 equivalent weights.

The reaction is generally performed using a
solvent. The solvents to be used include: aromatic
20   hydrocarbon solvents such as toluene, benzene, and
xylene; ether solvents such as methyl-t-butyl ether,
dimethoxy ethane, and tetrahydrofuran; halogenated
hydrocarbon solvents such as methylene chloride; and
non-protonic solvents such as N,N-dimethyl formamide.
25   Among them, a preferable solvent is one having a
dielectric constant of 2.5 or more, more preferably 5 or
more at 20° C. Specific examples of the above preferable

solvent include tetrahydrofuran, dimethoxy ethane, N,N-dimethyl formamide, and N,N-dimethyl imidazolidinone, and tetrahydrofuran is particularly preferable.

5   The usage amount of the solvent is generally about 0.5 to 100-fold volume of a reaction substrate. In this range, from an industrial viewpoint, it is preferable to adopt the range of 20-fold volume or less.

As a reaction operation, the compound (A) may be added after mixing the base and the compound (B), a

10   mixture between the base and the compound (B) may be added in the compound (A), a mixture between the compounds (A) and (B) may be added in the base, or the base may be added in a mixture between the compounds (A) and (B). In any operation, the reaction can proceed.

15   However, a preferable process is to mix the base and the compound (B) and then add the compound (A) in the mixture.

The reaction may proceed at a temperature of -50°C to 100°C, preferably -20°C to 40°C, typically for 30

20   minutes or more, preferably 1 hour or more. If required, the temperature may be increased.

After termination of the reaction, after terminating the reaction by adding water, acetic acid, ammonium chloride, or the like in a reaction system, the

25   compound (I) can be obtained by conventional isolation and purification operations, such as washing with water and separatory extraction.

In the condensation reaction between the compound

(A) and the compound (B), by selecting the base and the

solvent to be used, the compound (I) can also be

produced after providing a compound [hereinafter,

5   referred to as compound (C)], represented by the

following general formula (C):

(C)
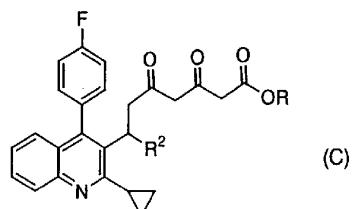

(where R is as defined in the formula, and R^2 is a

hydroxyl group, a halogen group, a silyloxy group, a

sulfonyloxy group, an acyloxy group, an

10   alkoxycarbonyloxy group, an alkylthiocarbonyloxy group,

an alkoxythiocarbonyloxy group, or an

alkylthiothiocarbonyloxy group) or a salt thereof as an

intermediate of the production.

    In the above-mentioned compound (C), R can use the

15   same previously mentioned groups. Further, R^2 denotes:

a hydroxyl group; a halogen atom such as a chorine atom

and a bromine atom; silyloxy groups such as trimethyl

silyloxy group and t-butyldimethyl silyloxy group;

sulfonyloxy groups such as methanesulfonyloxy group and

20   paratoluene sulfonyloxy group; acyloxy groups such as

acetoxy group and propionyloxy group; alkoxycarbonyloxy

groups such as methoxycarbonyloxy group and vinyloxycarbonyloxy group; alkylthiocarbonyloxy groups such as methylthiocarbonyloxy group; alkoxythiocarbonyloxy groups such as

5   methoxythiocarbonyloxy group; or alkylthiothiocarbonyloxy groups such as methylthiothiocarbonyloxy group. Of these groups, a hydroxyl group, a sulfonyloxy group or an acyloxy group is preferable, an acyloxy group is more preferable and

10   an acetoxy group is particularly preferable.

A preferable combination of substituents to be provided as the compound (C) described above may be a combination of R and R^2 as the preferable ones, which are mentioned in the description of the above

15   substituents.

One of the specific reaction steps when the above compound (C) is used as an intermediate will be described below. An intermediate having the above R^2 as a hydroxyl group in the compound (C) is obtained, for

20   example by the use of a combination of NaH and n-BuLi as a base to be used in a condensation reaction between the compound (A) and the compound (B). In addition, the compound (I) can be obtained by performing a dehydration reaction on the intermediate. Alternatively, the

25   compound (I) may be obtained by converting a hydroxyl group of the intermediate into another functional group such as halogen and then eliminating the functional

group therefrom. Here, the usage amount of the above NaH is approximately equimolar to the compound (A), and the usage amount of n-BuLi is approximately 1.5 to 2.5 equivalent weights. Furthermore, the dehydration

5 reaction and the elimination reaction of a functional group, which are described above, may be performed appropriately using conventionally well-known processes.

At the time of isolating the compound (I) produced by the above process, the isolation can be performed

10 more easily when the above compound (I) is provided as a salt. Thus, the compound may be obtained as a salt. The salt of the compound (I) can be obtained as an acid-addition salt by adding an acid in an organic phase which is washed with water after the termination of a

15 production reaction and separatory-extracted therefrom while optionally condensed and/or cooled, followed by stirring. Instead of acid, an ammonium salt and an amine addition salt can be obtained using ammonium and amines. When the compound (I) is obtained as a salt, it

20 is preferable to eliminate a salt thereof at the time of subjecting the compound (I) to a reduction reaction using the microbial cells and/or a cell preparation thereof described below to obtain the compound (I).

The present invention is characterized in that in

25 the compounds represented by the above formula (I) to (III), keto groups are stereo-selectively reduced using the microbial cells and/or a cell preparation thereof.

The microorganism to be used in the present
invention is any microorganism as far as it is capable
of stereo-selectively reducing a keto group.

More specifically, microorganisms belonging to the
5   genus *Metschnikowia* such as *Metschnikowia pulcherrima*,
Metschnikowia bicuspidata, *Metschnikowia reukaufii*, and
Metschnikowia lunata; microorganisms belonging to the
genus *Cryptococcus* such as *Cryptococcus curvatus*,
Cryptococcus flavus, *Cryptococcus humicolus* and
10   *Cryptococcus laurentii*; microorganisms belonging to the
genus *Candida* such as *Candida albicans*, *Candida azyma*,
Candida intermedia, *Candida solani*, *Candida famata*,
Candida guilliermondii, *Candida parapsilosis*, *Candida
rugosa*, *Candida tropicalis*, and *Candida molischiana*;
15   microorganisms belonging to the genus *Filobasidium* such
as *Filobasidium capsuligenum*; microorganisms belonging
to the genus *Ogataea* such as *Ogataea glucozyma* and
Ogataea minuta; microorganisms belonging to the genus
Citeromyces such as *Citeromyces matritensis*;
20   microorganisms belonging to the genus *Yarrowia* such as
Yarrowia lipolytica; microorganisms belonging to the
genus *Rhodotorula* such as *Rhodotorula glutinis*,
Rhodotorula aurantiaca, and *Rhodotorula mucilaginosa*;
microorganisms belonging to the genus *Exophiala* such as
25   *Exophiala dermatitidis*; microorganisms belonging to the
genus *Trigonopsis* such as *Trigonopsis variabilis*;
microorganisms belonging to the genus *Shizosaccharomyces*

such as *Shizosaccharomyces pombe*; microorganisms

belonging to the genus *Wickerhamiella* such as

Wickerhamiella domercqii; microorganisms belonging to

the genus *Pichia* such as *Pichia petersonii* and *Pichia*

5   *anomala*; microorganisms belonging to the genus

Saccharomycopsis such as *Saccharomycopsis fibuligera* and

Saccharomycopsis crataegensis; microorganisms belonging

to the genus *Saitoella* such as *Saitoella complicata*;

microorganisms belonging to the genus *Saccharomyces* such

10   as *Saccharomyces cerevisiae*; microorganisms belonging to

the genus *Rhodosporidium* such as *Rhodosporidium*

toruloides; microorganisms belonging to the genus

Acinetobacter such as *Acinetobacter calcoaceticus*;

microorganisms belonging to the genus *Brevibacterium*

15   such as *Brevibacterium linens*, and *Brevibacterium*

saccharolyticum; microorganisms belonging to the genus

Cellulomonas such as *Cellulomonas gelida*, *Cellulomonas*

flavigena, and *Cellulomonas uda*; microorganisms

belonging to the genus *Corynebacterium* such as

20   *Corynebacterium ammoniagenes*, *Corynebacterium glutamicum*,

Corynebacterium acetoacidophilum, *Corynebacterium*

vitaeruminis and *Corynebacterium variabile*; and

microorganisms belonging to the genus *Curtobacterium*

such as *Curtobacterium flaccumfaciens* can be given.

25   As a specific example of the above-mentioned

microorganisms, *Metschnikowia pulcherrima* IFO0863 strain,

Metschnikowia pulcherrima IAM12196 strain, *Metschnikowia*

pulcherrima IAM12197 strain, *Metschnikowia pulcherrima* IFO1407 strain, *Metschnikowia pulcherrima* IFO10796 strain, *Metschnikowia bicuspidata* IFO1408 strain, *Metschnikowia reukaufii* IFO10798 strain and

5   *Metschnikowia lunata* IFO1605 strain; *Cryptococcus curvatus* IFO1159 strain, *Cryptococcus humicolus* IFO10250 strain, *Cryptococcus flavus* IFO0407 stain, *Cryptococcus laurentii* IFO0609 strain, *Cryptococcus laurentii* IFO1376 strain, *Cryptococcus laurentii* var *laurentii* CBS5539

10   strain, *Cryptococcus laurentii* var *laurentii* CBS2174 strain, *Cryptococcus laurentii* var *laurentii* CBS5746 strain, *Cryptococcus laurentii* var *laurentii* CBS7140 strain and *Cryptococcus laurentii* var *laurentii* CBS7235 strain; *Candida albicans* IFO1594 strain, *Candida azyma*

Corynebacterium vitaeruminis JCM1323 strain, and

Corynebacterium variabile JCM2154 strain and

Curtobacterium flaccumfaciens ATCC12813 strain are

5   preferably given.

The above-mentioned microorganisms preferably

belong to the genus *Metschnikowia*, the genus

Cryptococcus, the genus *Candida*, the genus *Filobasidium*,

the genus *Ogataea*, the genus *Citeromyces*, the genus

10   *Rhodotorula*, the genus *Exophiala*, the genus

Shizosaccharomyces, the genus *Wickerhamiella*, the genus

Pichia, the genus *Saccharomycopsis*, the genus *Saitoella*,

the genus *Saccharomyces*, the genus *Rhodosporidium*, the

genus *Brevibacterium* or the genus *Corynebacterium*.

15   Further, as the micororganisms belonging to the

genus *Metschnikowia*, *Metschnikowia pulcherrima* and

Metschnikowia reukaufii are preferably given.

As the microorganisms belonging to the genus

Cryptococcus, *Cryptococcus flavus*, *Cryptococcus*

20   *humicolus* and *Cryptococcus laurentii* are preferably

given.

As the microorganisms belonging to the genus

Candida, *Candida intermedia*, *Candida solani*, *Candida*

famata and *Candida molischiana* are preferably given.

25   As the microorganisms belonging to the genus

Filobasidium, *Filobasidium capsuligenum* is preferably

given.

As the microorganisms belonging to the genus

Ogataea, *Ogataea glucozyma*, and *Ogataea minuta* are

preferably given.

As the microorganisms belonging to the genus

5   *Citeromyces*, *Citeromyces matritensis* is preferably given.

As the microorganisms belonging to the genus

Rhodotorula, *Rhodotorula glutinis*, *Rhodotorula*

aurantiaca and *Rhodotorula mucilaginosa* are preferably

given.

10   As the microorganisms belonging to the genus

Exophiala, *Exophiala dermatitidis* is preferably given.

As the microorganisms belonging to the genus

Shizosaccharomyces, *Shizosaccharomyces pombe* is

preferably given.

15   As the microorganisms belonging to the genus

Wickerhamiella, *Wickerhamiella* domercqiae is preferably

given.

As the microorganisms belonging to the genus

Pichia, *Pichia petersonii* and *Pichia anomala* are

20   preferably given.

As the microorganisms belonging to the genus

Saccharomycopsis, *Saccharomycopsis fibuligera* is

preferably given.

As the microorganisms belonging to the genus

25   *Saitoella*, *Saitoella complicata* is preferably given.

As the microorganisms belonging to the genus

Saccharomyces, *Saccharomyces cerevisiae* is preferably

given.

As the microorganisms belonging to the genus
Rhodosporidium, *Rhodosporidium toruloides* is preferably
given.

5   As the microorganisms belonging to the genus
Brevibacterium, *Brevibacterium saccharolyticum* is
preferably given.

As the microorganisms belonging to the genus
Corynebacterium, *Corynebacterium ammoniagenes*,

10   *Corynebacterium glutamicum*, *Corynebacterium*
acetoacidophilum and *Corynebacterium vitaeruminis* are
preferably given.

Furthermore, when a compound represented by the
formula (IV) is manufactured using a compound

15   represented by the formula (I) as a raw material, an
*intermedia*te of the production may be prepared through a
compound represented by the formula (II') or may be
prepared through a compound represented by the formula
(III').

20   In this case, the compound represented by the
formula (II') and the compound represented by the
formula (III') are produced from the compound
represented by the formula (I) in advance. Then, they
are isolated and introduced into the compound

25   represented by the formula (IV). Alternatively, the
compound represented by the formula (IV) may be produced
directly without isolating the compound represented by

the formula (II') and compound represented by the
formula (III').

Furthermore, in the case of using the compound
represented by the formula (I) as a raw material, the
5   compound represented by the formula (IV) may be produced
using one species of the microorganism, or two or more
species of the microorganism may be used in combination
for production.

As the material, microorganisms that are
10   particularly preferable when using the compound
represented by formula (I) are; microorganisms belonging
to the genus *Cryptococcus*, the genus *Candida*, the genus
Filobasidium, the genus *Ogataea*, the genus *Yarrowia*, the
genuis *Rhodotorula*, the genus *Exophiala*, and the genus
15   *Trigonopsis*; microorganisms belonging to the genus
Cryptococcus, the genis *Candida*, the genus *Filobasidium*,
the genus *Ogataea* and the genus *Rhodotorula* are more
preferable, and microorganisms belonging to the genus
Ogataea are most preferable.

20   As the material, microorganisms that are
particularly preferable when using the compound
represented by formula (II) are; microorganisms
belonging to the genus *Metschnikowia*, the genus
Cryptococcus, the genus *Candida*, the genus *Filobasidium*,
25   the genus *Ogataea*, the genus *Citeromyces*, the genus
Yarrowia, the genus *Rhodotorula*, the genus *Exophiala*,
the genus *Trigonopsis*, the genus *Shizosaccharomyces*, the

24

genus *Wickerhamiella*, the genus *Saccharomycopsis*, the

genus *Saitoella*, the genus *Pichia*, the genus

Saccharomyces, the genus *Rhodosporidium*, the genus

Acinetobacter, the genus *Brevibacterium*, the genus

5   *Cellulomonas*, the genus *Corynebacterium*, and the genus

Curtobacterium.

      The above-mentioned microorganisms more preferably

belong to the genus *Metschnikowia*, the genus

Cryptococcus, the genus *Candida*, the genus *Filobasidium*,

10   the genus *Ogataea*, the genus *Citeromyces*, the genus

Rhodotorula, the genus *Shizosaccharomyces*, the genus

Wickerhamiella, the genus *Saccharomycopsis*, the genus

Saitoella, the genus *Pichia*, the genus *Saccharomyces*,

the genus *Rhodosporidium*, the genus *Brevibacterium* and

15   the genus *Corynebacterium*; and the microorganisms

belonging to the genus *Metschnikowia*, the genus *Candida*,

the genus *Ogataea*, the genus *Rhodotorula*, the genus

Shizosaccharomyces, the genus *Wickerhamiella*, the genus

Saccharomycopsis, the genus *Saitoella*, the genus

20   *Rhodosporidium*, the genus *Brevibacterium* and the genus

Corynebacterium are even more preferable. The

microorganisms belonging to the genus *Metschnikowia*, the

genus *Candida*, the genus *Ogataea*, the genus

Shizosaccharomyces, the genus *Saitoella*, the genus

25   *Rhodosporidium*, the genus *Brevibacterium* and the genus

Corynebacterium are most preferable.

      As the material, microorganisms that are

particularly preferable when using the compound

represented by formula (III) are; microorganisms

belonging to the genus *Cryptococcus*, the genus *Candida*,

the genus *Filobasidium*, the genus *Rhodotorula*, and the

5   genus *Pichia*; the microorganisms belonging to the genus

Cryptococcus, the genis *Candida*, and the genus

Rhodotorula are more preferable.

Note that, among the above microorganisms,

microorganisms with the IFO numbers are described in an

10   internet catalog (http://www.ifo.or.jp) published by the

Institute for Fermentation, Osaka (IFO), and they are

available from the IFO.

Microorganisms with the CBS numbers are described

in an internet catalog (http://www.cbs.knaw.nl) of The

15   Centraalbureau voor Schimmelcultures (CBS), and they are

available from the CBS.

Microorganisms with the ATCC numbers are described

in an internet catalog (http://www.atcc.org) of the

American Type Culture Collection (ATCC), and they are

20   available from the ATCC.

Microorganisms with the IAM numbers are described

in an internet catalog (http://www.iam.u-

tokyo.ac.jp/misyst/ColleBOX/IAMcollection.html) of the

IAMCulture Collection (IAM), and they are available from

25   the IAM.

Microorganisms with the JCM numbers are described

in an internet catalog (http://www.jcm.riken.go.jp) of

the Japan Collection of Microorganism (JCM), and they

are available from the JCM.

Microorganisms with their respective RIFY numbers

are described in a catalog of the Research Institute of

5   Fermentation, Yamanashi Univ. Kofu Japan (RIFY), and

they are available from the RIFY.

As the above microorganism, a mutant strain

obtained by a conventional mutagenesis treatment such as

an UV irradiation or an NTG treatment may be used as

10   well as a wild strain. Alternatively, it may be any

strain such as a recombinant strain induced by a genetic

technique such as a cell fusion or a gene recombination.

In addition, as an expression strain of the

recombinant strain, a bacterium such as a colon bacillus

15   or yeast other than the original strain may be used, and

their recombinant strains are also included in the

concept of the above microorganism.

In the production process of the present invention,

one species or two or more species of the above

20   microorganisms are supplied to the reaction as microbial

cells and/or a cell preparation thereof.

Specifically, the microbial cells obtained by

culturing the above microorganism can be used without

any treatment. Alternatively, a cell preparation

25   obtained by treating the microbial cells, which are

obtained by the culture, with a well-known technique

such as an acetone treatment, a freeze-drying process,

mechanical or enzymatical fragmentation of microbial

cells or processed products thereof, or the like can be

used. In addition, it is also possible to extract an

enzyme fraction having a reduction ability from these

5   microbial cells or a cell preparation thereof as a crude

product or a purified product. Furthermore, it is also

possible to use the microbial cells, the processed

products of the microbial cells, the enzyme fraction,

and so on obtained as described above, which are

10   immobilized on a carrier such as a polyacrylamide or

carrageenan gel using a conventional immobilization

technique. In this specification, therefore, the term

"microbial cells and/or a cell preparation thereof" is

used as the concept including all of the above-described

15   microbial cells, processed products of the microbial

cells, enzyme fractions, and immobilized products

thereof.

     Next, the production process of the present

invention will be specifically described.

20   In the production process of the present invention,

a microorganism is generally used after incubation.

This incubation can be performed by a general technique.

A culture medium to be used for culturing the

microorganism of the present invention includes a carbon

25   source, a nitrogen source, inorganic ions, and so on,

which can be assimilated by the microorganism. For the

carbon source, carbohydrates such as glucose, fructose,

and saccharose, polyalcohols such as glycerol, mannitol, and xylitol, organic acids, and so on are appropriately used. For the nitrogen source, organic nitrogen sources such as NZ amine, triptose, yeast extract, polypeptone,

5   meat extract, and soybean extract, or inorganic nitrogen sources such as ammonium sulfate and ammonium nitrite are appropriately used. For the inorganic ions, a phosphate ion, a magnesium ion, an iron ion, a manganese ion, a molybdenum ion, and so on are used appropriately

10   if required. Furthermore, it is effective to add inositol, pantothenic acid, nicotinamide, and other vitamins if required.

     The contents of the above carbon source, nitrogen source, inorganic ions, and vitamins in the culture

15   medium are not specifically limited as far as their contents are within their respective ranges typically used for the culture of a strain. The carbon source and the nitrogen source are added typically at a concentration of 0.001 to 50 wt%, preferably 0.1 to 5

20   wt%, respectively. The inorganic ions are added typically at a concentration of 0.0001 to 5 wt%, preferably 0.001 to 1 wt%. Vitamins are added typically at a concentration of 0.00001 to 10 wt%, more preferably 0.001 to 1 wt%.

25   The culture is performed for 1 to 100 hours under aerobic conditions, while adjusting pH within an appropriate range of about 3 to 11 and a temperature

within an appropriate range of 4 to 50°C.

As a reaction process, a process by which the microorganism of the present invention is incubated, and the compound represented by each of the formulae (I) to

5   (III) or a mixture thereof is added in an aqueous medium that contains the resulting microbial cells and/or a cell preparation thereof to obtain the objective compound represented by the formula (IV); a process by which the compound represented by each of the formulae

10   (I) to (III) or a mixture thereof is added in the culture medium to perform the reaction while culturing the microorganism; a process by which after terminating the culture, the compound represented by each of the formulae (I) to (III) or a mixture thereof is added in

15   the culture medium as it is, and the reaction is successively performed; a process by which the compound represented by the formula (I) is subjected to one of the above processes, and after the reaction proceeds to some extent, the microorganism separately cultured is

20   additionally added on the basis of the contents of the compounds represented by the formulae (I) to (III) in the system; or the like, can be appropriately used.

For the above aqueous medium, a buffer using sodium phosphate, potassium phosphate, or the like is

25   provided, and, in this buffer, the organic solvent, the surfactant, and so on are appropriately added.

The organic solvents include water-soluble

solvents such as dimethyl sulfoxide (DMSO) and tetrahydrofuran (THF) and water-insoluble organic solvents such as butyl acetate and hexane. The surfactants include Tween 80, sugar ester, and so on.

5   The concentration of the buffer may be 1 M or less, preferably 0.2 M or less when in use.

The reaction may proceed at a temperature of 4 to 70°C, preferably 15 to 50°C, and at pH of 2 to 9, preferably 4 to 8.

10   The concentration of the respective compounds represented by the formulae (I) to (III) or a mixture thereof is in the range of 0.0001 to 10 wt%, preferably in the range of 0.001 to 5 wt% with respect to a reaction solution. If required, the compounds

15   represented by the formulae (I) to (III) or a mixture thereof may be supplementally added during the reaction.

In addition, for accelerating the reaction, a co-enzyme, both of the co-enzyme and its regeneration system, or a carbon source may be appropriately added.

20   The co-enzymes typically include β-nicotinamide adenine dinucleotide, reduced form (hereinafter, abbreviated as NADH) or β-nicotinamide adenine dinucleotide phosphate, reduced form (hereinafter, abbreviated as NADPH). The addition amount thereof may

25   be one-1000000th to 10 equivalent weights, preferably one-10000th to 10 equivalent weights of the reaction substrate.

The regeneration system of a co-enzyme may be a combination of an enzyme capable of reducing β-nicotinamide adenine dinucleotide (hereinafter, abbreviated as NAD) such as formic acid dehydrogenase

5   into NADH and an enzyme substrate (formic acid), a combination of an enzyme capable of reducing β-nicotinamide adenine dinucleotide phosphate (hereinafter, abbreviated as NADP) such as glucose dehydrogenase into NADPH and an enzyme substrate (glucose or the like), or

10   the like. These enzymes that regenerate the co-enzyme may be one commercially available, or may be a microbial cell and/or a cell preparation thereof having a regeneration ability of the co-enzyme. The addition amounts of these systems are suitably determined on the

15   basis of the amount of the reaction substrate.

A carbon source for accelerating the above reaction may be any of carbon sources to be useful in the regeneration of a co-enzyme with the microbial cells and/or a cell preparation thereof to be used in the

20   reaction. For instance, the carbon sources include carbohydrates such as glucose, fructose, and saccharose, and polyalcohols such as glycerol, mannitol, and xylitol, organic acids, and so on, and the addition amount thereof is 0.0001 to 50 wt%, preferably 0.01 to 10 wt%.

25   As described above, the reaction is performed using an aqueous medium. However, the compounds represented by the formulae (I) to (III) have low

solubility in water, so that it is preferable to
disperse the compound uniformly in the reaction system
by dissolving or suspending it in an organic solvent, a
surfactant, or the like upon the addition in advance.

5   For a compound represented by the formula (IV)
obtained by the above production process, in general,
impurities are removed by a conventional purification
process, namely, a chromatography and a crystallizing
technique after extracting the compound from a reaction

10   solution with an organic solvent to obtain the purified
compound represented by the formula (IV). Specifically,
after dissolving the compound represented by the formula
(IV) with an organic solvent, a solid fraction including
a microorganism is eliminated by a conventional

15   separator used in a centrifugation, a filter press, an
ultrafiltration, etc. to obtain a liquid containing a
compound represented by the formula (IV). Using the
conventional method such as chromatography or
crystallizing technique, impurities are removed from the

20   resulting liquid. Thus, a purified compound represented
by the formula (IV) can be obtained.

Hereinafter, the present invention will be
described in more detail with reference to examples.
However, general modifications can be performed in the

25   technical field of the present invention without
departing from the gist of the present invention.

In the meantime, (E)-7-[2-cyclopropyl-4-(4-

fluorophenyl)-quinolin-3-yl]-3,5-dihydroxyhept-6-enic

acid esters (hereinafter, abbreviated as "DOLE") have

isomers: (3S, 5R)-isomer, (3R, 5R)-isomer, and (3S, 5S)-

isomer, in addition to the objective (3R, 5S)-isomer.

5   The structural formula is as follows.

    3S, 5R-DOLE and 3R, 5S-DOLE are Syn isomers of

DOLE, and 3S, 5S-DOLE and 3R, 5R-DOLE are anti isomers

of DOLE.

    In the examples, the purity of the (3R, 5S)-isomer

10   which is the objective product is expressed by the

excess diastereomer ratio and the excess enantiomer

ratio. In this specification, the excess diastereomer

ratio is represented by (syn-DOLE - anti-DOLE) / (syn-

DOLE + ant-DOLE), and the excess enantiomer ratio is

15   represented by (3R, 5S isomer - 3S, 5R isomer) / (3R, 5S

isomer + 3S, 5R isomer).

Production Example 1

Synthesis of (E)-7-[2-cyclopropyl-4-(4-fluorophenyl)-quinolin-3-yl]-3,5-dioxohept-6-enic acid ethyl ester (hereinafter, abbreviated as DOXE)

5   In a 500-ml four-neck flask equipped with a stirrer, a dropping funnel, and a thermo-meter, 5.02 g (11.22 mmol) of (E)-7-[2-cyclopropyl-4-(4-fluorophenyl)-quinolin-3-yl]-5- hydroxy-3-oxohept-6-enic acid ethyl ester (hereinafter, abbreviated as 5-MOLE) and 420 mL of

10   acetone were added and stirred. Then, 10.5 mL of a prepared Jones oxidizing agent (i.e., a reagent obtained by mixing 3 mL of a concentrated sulfuric acid and 3.35 g of chromium oxide together, followed by diluting up to 25 mL with water) was dropped at 0°C in 20 minutes, and

15   was then stirred under ice cooling for 2 hours, followed by gently adding 10 mL of methanol to terminate the reaction. Subsequently, a reaction mixture solution was placed at reduced pressure to allow acetone to be distilled off, followed by the addition of 250 mL of

20   ethyl acetate. The resulting solution was washed twice with 60 mL of saturated sodium bicarbonate aqueous solution, and was then washed twice with 60 mL of a saturated brine, followed by drying an ethyl acetate solution with anhydrous magnesium sulfate. Subsequently,

25   the solvent was distilled off, and a purification was performed using a silica gel column chromatography (an

eluting solvent; hexane : ethyl acetate = 2 : 1),
resulting in 3.03 g of an entitled compound (yield:
60.6%).

^{1}H-NMR (300MHz, CDCl$_3$, δppm): 7.79-7.19 (8H, m),
5   7.71 (1H, d), 6.03 (1H, d), 5.51 (1H, s), 4.21 (2H, q),
3.40 (2H, s), 2.35-2.40 (1H, m), 1.39-1.41 (2H, m), 1.28
(3H, t), 1.07-1.09 (2H, m).

Production Example 2

10   Synthesis of 5S-(E)-7-[2-cyclopropyl-4-(4-
fluorophenyl)-quinolin-3-yl]-5-hydroxy-3-oxohept-6-enic
acid ethyl ester (hereinafter, abbreviated as 5S-MOLE)

In a Schlenk tube introduced with nitrogen gas
after being heated and dried at a reduced pressure, 0.87
15   g (3.3 mmol) of (S)-2-[N-(3,5-di-tert-butyl
salicylidene) amino]-3-methyl-1-butanol, 5 ml of
methylene chloride, and 0.63 ml (6.0 mmol) of titanium
tetraethoxide were added, and stirred and mixed at a
room temperature for 1 hour. After cooling the Schlenk
20   tube down to -50°C, 0.95 g (3.0 mmol) of (E)-3-[2-
cyclopropyl-4-(4-fluorophenyl)-quinolin-3-yl]-prop-2-en-
1-al was dissolved in 2 ml of methylene chloride and was
then dropped. After stirring it for 5 minutes, 0.51 g
(6 mmol) of diketene was further added, and stirred for
25   22 hours while keeping the temperature at -50°C for
reaction. The resulting reaction mixture solution was
added in a mixture solution of 25 ml of methylene

chloride and 25 ml of a 0.24M sodium bicarbonate aqueous

solution, and was mixed by being vigorously stirred for

2 hours at a room temperature to obtain a two-layer

solution. The resulting two-layer solution was

5 separated. A water layer was extracted twice with 10 ml

of methylene chloride. The methylene chloride solution

and the methylene chloride extract were combined

together, resulting in a methylene chloride solution.

The methylene chloride solution was dried with anhydrous

10 magnesium sulfate, and the solvent was distilled off,

followed by being purified with a silica gel column

chromatography (an eluting solvent; hexane : ethyl

acetate = 3 : 2), resulting in 0.75 g of 5(S)-(E)-7-[2-

cyclopropyl-4-(4-fluorophenyl)-quinolin-3-yl]-5-hydroxy-

15 3-oxohept-6-enic acid ethyl ester (optical purity: 73%

ee, and yield for (E)-3-[2-cyclopropyl-4-(4-

fluorophenyl)-quinolin-3-yl]-prop-2-en-1-al: 56%).

Production Example 3

20   Synthesis of 7-[2-cyclopropyl-4-(4-fluorophenyl)-

quinolin-3-yl]-7-hydroxy-3,5-dioxoheptanoic acid ethyl

ester

25
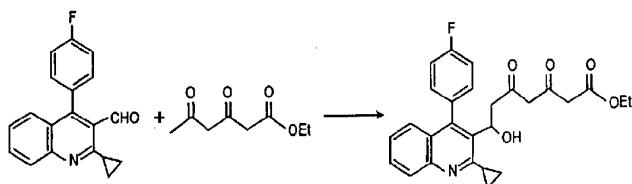

In a mixture solution of 2.40 g of an oily 60%
sodium hydride and 200 ml of tetrahydrofuran, a mixture
solution of 10.3 g of 3,5-dioxohexanoic acid ethyl ester

5   and 40 ml of tetrahydrofuran was dropped in 20 minutes
while keeping an inner temperature at 2°C or less.
After allowing a reaction for 50 minutes at -10°C, 75 ml
of a hexane solution of 1.6 M n-butyl lithium was
dropped in 40 minutes with the inner temperature kept at

10   -20 to -15°C, while allowing a reaction for 40 minutes
at an inner temperature of 2°C or less. In this case,
furthermore, while keeping an inner temperature of -15°C
or less, a mixture of 11.7 g of 2-cyclopropyl-4-(4-
fluorophenyl)quinolin-3-carbaldehyde and 80 ml of

15   tetrahydrofuran was dropped in 40 minutes and was then
reacted at 10°C or less for 1 hour. Furthermore, while
keeping an inner temperature of 5°C or less, 14.4 ml of
acetic acid and 40 ml of toluene were added in a
reaction system, followed by washing with 100 ml of

20   water and 100 ml of saturated brine in that order.
After the solvent is distilled off, the residue thus
obtained was added with 100 ml of hexane and 5 ml of
ethyl acetate so as to be crystallized, followed by

filtrating and drying it to obtain 16.6 g (yield: 89%)

of 7-[2-cyclopropyl-4-(4-fluorophenyl) quinolin-3-yl]-7-

hydroxy-3,5-dioxoheptanoic acid ethyl ester was obtained.

NMR of the compound is as follows.

5   ^{1}H-NMR (CDCl$_3$): 1.11 (2H, m), 1.13 (1H, m), 1.27

(3H, t, J=10), 1.76 (1H, m), 2.40 (1H, m), 2.48 (2H, ABq,

J=66,14), 2.69 (2H, ABq, J=52,16), 2.78 (1H, m), 3.30

(1H, m), 4.18 (2H, m), 5.25 (1H, d, J=3), 5.58 (1H, dd,

J=12,4), 7.16-7.26 (5H, m), 7.33 (1H, dd, J=7,7), 7.61

10   (1H, dd, J=7,7), 7.93 (1H, d, J=7)

Production Example 4

Synthesis of DOXE
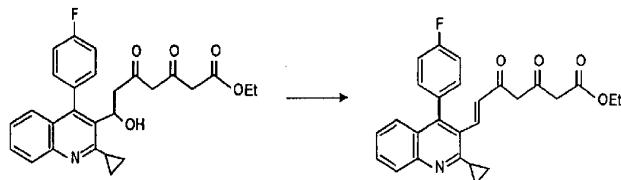

15   20.0 g of 7-[2-cyclopropyl-4-(4-fluorophenyl)

quinolin-3-yl]-7-hydroxy-3,5-dioxoheptanoic acid ethyl

ester obtained in Production Example 3 was dissolved in

120 ml of toluene. In addition, 10 g of silica gel and

8 g of anhydrous magnesium sulfate were added for the

20   reaction for 16 hours at 95°C. After removing the

silica gel and the inorganic salt from the reaction

system, the solvent was distilled off, and the resulting

residue was purified by a column chromatography

(an eluting solvent; hexane : ethyl acetate = 2 : 1),
resulting in 8.4 g (yield 44%) of (E)-7-[2-cyclopropyl-
4-(4-fluorophenyl) quinolin-3-yl]-3,5-dioxohept-6-enic
acid ethyl ester (DOXE).

5   NMR of this compound is as follows.

^{1}H-NMR (CDCl$_3$): 1.09 (2H, m), 1.28 (3H, t, J=7),
1.40 (2H, m), 2.38 (1H, m), 3.40 (2H, s), 4.20 (2H, q,
J=7), 5.51 (1H, s), 6.02 (1H, d, J=16), 7.16-7.26 (4H,
m), 7.30-7.40 (2H, m), 7.70 (1H, d, J=16), 7.63 (1H, m),
10   7.97 (1H, m)

Production Example 5

Synthesis of DOXE

       A mixture solution of 5.0 g of 7-[2-cyclopropyl-4-
15   (4-fluorophenyl) quinolin-3-yl]-7-hydroxy-3,5-
dioxoheptanoic acid ethyl ester obtained in Production
Example 3, 10 ml of toluene, and 0.37 g of p-
toluenesulfonic acid anhydride was reacted for 3 hours
at 110°C. This reaction system was washed with sodium
20   bicarbonate aqueous solution. Subsequently, the solvent
was distilled, and a purification was performed using a
column chromatography (an eluting solvent; hexane =
ethyl acetate = 2 : 1), resulting in 3.0 g (yield 63%)
of (E)-7-[2-cyclopropyl-4-(4-fluorophenyl)quinolin-3-
25   yl]-3,5-dioxohept-6-enic acid ethyl ester (DOXE).

Production Example 6

Synthesis of DOXE

A mixture solution of 0.50 g of 7-[2-cyclopropyl-4-(4-fluorophenyl) quinolin-3-yl]-7-hydroxy-3,5-dioxoheptanoic acid ethyl ester obtained in Production

5   Example 3, 20 ml of toluene, and 0.037 g of p-toluenesulfonic acid anhydride was reacted for 1 hour at an inner temperature of 105°C under a reduced pressure, while water generated during the reaction was distilled off by a component distillation with toluene. After

10   recovering the pressure to normal pressure, 0.097 g of water was added in the reaction system to allow a reaction at 10 minutes at 90°C, followed by allowing the reaction for 1 hour under a reduced pressure while the water was distilled off at an inner temperature of 105°C

15   once more. The reaction system was analyzed using a high-performance liquid chromatography. It was confirmed that 0.37 g (yield 78%) equivalent of (E)-7-[2-cyclopropyl-4-(4-fluorophenyl)-quinolin-3-yl]-3,5-dioxohept-6-enic acid ethyl ester (DOXE) was produced.

20

Production Example 7

Synthesis of DOXE

0.01 g of sulfuric acid was added in a mixture solution of 0.2 g of 7-[2-cyclopropyl-4-(4-fluorophenyl)

25   quinolin-3-yl]-7-hydroxy-3,5-dioxoheptanoic acid ethyl ester obtained in Production Example 3 and 2 ml of vinyl acetate, followed by reaction through reflux under heat

for 5 hours. This reaction system was diluted with
ethyl acetate, and was then washed with sodium
bicarbonate aqueous solution. The solvent was distilled
off, and the resulting residue was purified by a column
5   chromatography (an eluting solvent; hexane : ethyl
acetate = 2 : 1), resulting in 0.14 g (yield 73%) of
(E)-7-[2-cyclopropyl-4-(4-fluorophenyl)-quinolin-3-yl]-
3,5-dioxohept-6-enic acid ethyl ester (DOXE).

10   Production Example 8
Synthesis of DOXE

A mixture solution of 2.0 g of 7-[2-cyclopropyl-4-
(4-fluorophenyl) quinolin-3-yl]-7-hydroxy-3,5-
dioxoheptanoic acid ethyl ester obtained in Production
15   Example 3, 10 ml of acetic acid, 0.66 g of acetic
anhydride, and 0.01 g of N,N-dimethyl-4-aminopyridine
was reacted for 4 hours at 90°C. This reaction system
was diluted with ethyl acetate, and was then washed with
water and sodium bicarbonate aqueous solution.
20   Thereafter, the solvent was distilled off, and the
resulting residue was crystallized from hexane to obtain
1.55 g (yield 80%) of (E)-7-[2-cyclopropyl-4-(4-
fluorophenyl)-quinolin-3-yl]-3,5-dioxohept-6-enic acid
ethyl ester (DOXE).

25

Production Example 9
Synthesis of DOXE

0.250 g of 7-[2-cyclopropyl-4-(4-fluorophenyl)
quinolin-3-yl]-7-hydroxy-3,5-dioxoheptanoic acid ethyl
ester obtained in Production Example 3 was dissolved in
5 ml of 4 mol/L hydrochloric acid/ethyl acetate solution,
5   and stirring was continued at 20°C for 12 hours. The
reaction system was analyzed by a high-performance
liquid chromatography. It was confirmed that 0.198 g
(yield 82%) equivalent of (E)-7-[2-cyclopropyl-4-(4-
fluorophenyl)-quinolin-3-yl]-3,5-dioxohept-6-enic acid
10   ethyl ester (DOXE) was generated.

Production Example 10

Synthesis of hydrochloride of DOXE

        In a mixture solution of 1.37 g of an oily 60%
15   sodium hydride and 10 ml of tetrahydrofuran, a mixture
solution of 2.36 g of 3,5-dioxohexanoic acid ethyl ester
and 10 ml of tetrahydrofuran was dropped in 5 minutes
while keeping an inner temperature of 20°C. After
stirring the mixture for 1 hour at that temperature, a
20   mixture of 2.01 g of 2-cyclopropyl-4-(4-
fluorophenyl)quinolin-3-carbaldehyde and 20 ml of
tetrahydrofuran was dropped for 20 minutes. After
stirring the mixture for 4 hours, a reaction solution
was added in 3.09 g of acetic acid and 20 ml of water to
25   terminate the reaction. An organic phase was extracted
with 40 ml of ethyl acetate and was then washed with 20
ml of saturated brine, followed by being dried with 2 g

of anhydrous sodium sulfate. As a result of analysis on

the resulting organic phase, 2.52 g of (E)-7-[2-

cyclopropyl-4-(4-fluorophenyl)quinolin-3-yl]-3,5-

dioxohept-6-enic acid ethyl ester (DOXE) (yield 82%) was

5   obtained.

      After distilling the solvent off, 1.7 ml of 4

mol/L hydrochloric acid/ethyl acetate solution was added

in the resulting residue at a room temperature. After

the generation of a crystal, the temperature was lowered

10   to 5°C. Then, the crystal was obtained through a

filtration and was then dried, resulting in 2.49 g of

hydrochloride (yield 75%) of (E)-7-[2-cyclopropyl-4-(4-

fluorophenyl) quinolin-3-yl]-3,5-dioxohept-6-enic acid

ethyl ester.

15

Example 1

Production of DOLE from DOXE

      Each kind of strains listed in Table 1 was

inoculated in a liquid culture medium (2.5 mL) composed

20   of 5 g/L of yeast extract (manufactured by Difco Co.,

Ltd.), 5g/L of polypeptone (manufactured by Nihon

Pharmaceutical Co., Ltd.), 3 g/L of malt extract

(manufactured by Difco Co., Ltd.), and 20 g/L of glucose

(manufactured by Nihon Shokuhinkako Co., Ltd.), and was

25   then incubated at 30°C for 21 hours under aerobic

conditions. The resulting culture medium was

centrifuged in an amount of 1 ml at a time to collect

microbial cells. Then, 0.25 mL of a reaction solution

containing the compound (I) (which is a compound, in the

formula, R = ethyl group: DOXE) was added in the

microbial cells to allow a reaction under aerobic

5   conditions at 30°C for 20 hours.

The composition of the above reaction solution

includes 0.3 g/L of DOXE, 20 g/L of glucose(manufactured

by Nihon Shokuhinkako Co., Ltd.), 20 mL/L of dimethyl

sulfoxide (DMSO) (manufactured by Kishida Chemical Co.,

10   Ltd.), and a 100 mM potassium phosphate buffer (pH 7.0).

After terminating the reaction, 0.5 mL of ethyl

acetate was added in the reaction solution and was mixed

therewith vigorously, followed by separation into an

organic layer and a water layer by a centrifugation. The

15   organic layer was transferred to another container. A

solvent was distilled off with a condensation centrifuge.

Then, the dried solid product was dissolved in 0.01 mL

of ethyl acetate, and was then subjected to a thin-layer

chromatography (TLC). The TLC used a silica gel plate

20   (silica gel 60 F_{254} manufactured by Merck & Co.), and

developing solvent used was of hexane / ethyl acetate =

1 / 1.

After terminating the development, the product was

confirmed with an UV lamp. As for the compound (I), Rf

25   = 0.76 to 0.86. As for compounds (II) and (III), Rf =

0.54 to 0.61. As for the compound (IV) (which is a

compound, in the formula, R = ethyl group: DOLE), Rf =

0.33. A spot of the DOLE on the TLC was scraped and

eluted with 0.25 mL of isopropanol. After the

centrifugation, a supernatant was subjected to a high-

performance liquid chromatography (HPLC) to analyze its

5 optical purity and the concentration of a TLC-scraped-

off sample.

The following is the conditions of HPLC.

Column: CHIRALCEL AD (manufactured by Daicel Chemical

Industries, Ltd.)

10 Eluting solution: Hexane / ethanol = 9 / 1

Flow rate: 0.5 ml/min.

Detection: UV 254 nm

Temperature: Room temperature

The results are listed in Table 1.

15

DOXE   (3R,5S)-DOLE
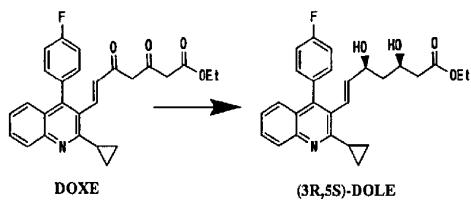

Table 1

Microorganism used	Concentration of TLC-scraped-off sample (Excess diastereomer ratio, excess enantiomer ratio)
Candida famata var *famata* RIFY7455	7.1mg/L (97.1%d.e.,100.0%e.e.)
Cryptococcus laurentii IFO0609	0.4mg/L (100.0%d.e.,100.0%e.e.)
Filobasidium capsuligenum IFO1185	2.7mg/L (100.0%d.e.,100.0%e.e.)
Ogataea minuta var *nonfermentans* IFO1473	7.4mg/L (92.0%d.e.,100.0%e.e.)

Example 2

5   Production of DOLE from DOXE

Ogataea minuta var *nonfermentans* IFO1473 was

inoculated in 2.5 mL of a liquid culture medium having

the same composition as that of Example 1, and was then

incubated at 27°C for each of 24 hours and 48 hours

10   under aerobic conditions, respectively. The obtained

culture solution was centrifuged in an amount of 1 ml at

a time to collect microbial cells. Then, 0.2 ml of a

100 mM potassium phosphate buffer (pH 7.0) was added in

the microbial cells to suspend them completely, followed

15   by adding 20 μl of a 50%(w/v) glucose solution and 50 μl

of a 5g/L DOXE (DMSO solution) in the suspension and

then stirring the mixture well to initiate a reaction

for 20 hours at 27°C.

After terminating the reaction, an extraction with

20   ethyl acetate and TLC were performed just as in the case

of Example 1 and a spot of the DOLE on the TLC was scraped and eluted with 200 μl of isopropanol. After centrifugation, a supernatant was subjected to a high-performance liquid chromatography (HPLC) to analyze the

5   optical purity thereof and the amount of the generation of DOLE.

The following is the conditions of HPLC.

Column: CHIRALCEL AD (manufactured by Daicel Chemical Industries, Ltd.)

10   Eluting solution: Hexane / ethanol = 95 / 5

Flow rate: 1 ml/min.

Detection: UV 254 nm

Temperature: Room temperature

The results are listed in Table 2.

15

DOXE   (3R,5S)-DOLE
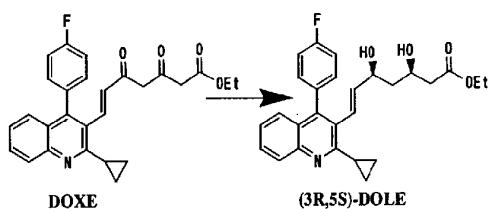

Table 2

Incubation time	Concentration of TLC-scraped-off sample (Excess diastereomer ratio, Excess enantiomer ratio)
24 hours	113.3mg/L (97.4%d.e.,100.0%e.e.)
48 hours	72.8mg/L (100.0%d.e.,100.0%e.e.)

48

Furthermore, at the time of performing the above TLC, there was an Rf spot corresponding to 5-MOLE or 3-MOLE. Thus, only the spot of the 24-hour incubation was scraped off and was then subjected to the analysis on the amount of the generation using a high-performance liquid chromatography (HPLC).

The following is the conditions of HPLC.

Column: MCIGEL CHP2MGM (4.6 x 150 mm) (manufactured by Mitsubishi Chemical Corporation)

Eluting solution: Methanol / acetonitrile / water / phosphoric acid = 800 / 100 / 100 / 0.5

Flow rate: 0.6 ml/min.

Detection: UV 254 nm

Temperature: 60° C

Under this HPCL conditions, when the 5-MOLE had a retention time of 4.73 and the 3-MOLE had a retention time of 5.47, the TLC scraped-off sample concentration of the 5-MOLE was 25.2 mg/L, and the sample concentration of the 3-MOLE was 2.2 mg/L.

Incidentally, the DOLE had a retention time of 4.02 and the DOXE had a retention time of 8.02 under the above analysis conditions.

Example 3

Production of MOLE from DOXE

Rhodotorula aurantiaca IFO0754 and *Rhodotorula glutinis* var dairenensis IFO0415 were respectively

inoculated in 2.5 mL of a liquid culture medium having the same composition as that of Example 1. At 27°C under aerobic conditions, *Rhodotorula aurantiaca* was incubated for 24 hours and *Rhodotorula glutinis* var

5   dairenensis was incubated for 48 hours, respectively. The obtained culture solution was centrifuged in an amount of 1 ml at a time to collect microbial cells. Then, 0.2 ml of a 100 mM potassium phosphate buffer (pH 7.0) was added in the microbial cells to suspend them

10 completely, followed by adding 20 μl of a 50%(w/v) glucose solution, 20μl of a mixed solution of 2g/L NADP and NAD, and 30 μl of a 10g/L DOXE (DMSO solution) in the suspension and then stirring the mixture well to initiate a reaction for 12 hours at 27°C under the

15 aerobic conditions.

After terminating the reaction, the extraction with ethyl acetate and the TLC were performed in the same way as those of Example 1. An Rf spot portion corresponding to the 5-MOLE or the 3-MOLE and an Rf spot

20 portion corresponding to the DOLE were scraped off, respectively.

Thereafter, DOLE and MOLE were analyzed using a high-performance liquid chromatography (HPLC) under the following conditions.

25 The following is the conditions of DOLE.
Column: CHIRALCEL AD (manufactured by Daicel Chemical Industries, Ltd.)

Eluting solution: Hexane / ethanol = 95 / 5

Flow rate: 1 ml/min.

Detection: UV 254 nm

Temperature: Room temperature

5   Further, the following is the conditions of MOLE.

Column: MCIGEL CHP2MGM (4.6 x 150 mm) (manufactured by

Mitsubishi Chemical Corporation)

Eluting solution: Methanol / acetonitrile / water /

phosphoric acid = 800 / 100 / 100 / 0.5

10   Flow rate: 0.6 ml/min.

Detection: UV 254 nm

Temperature: 60° C

The results are listed in Table 3.

15   Table 3

Microorganism used	Concentration of TLC-scraped-off sample (each mg/L)		
	5-MOLE	3-MOLE	DOLE
Rhodotorula glutinis var *dairenensis* IFO0415	44.9	2.2	2.9 (100%de,100%ee)
Rhodotorula aurantiaca IFO0754	118.9	N.D.	15.3 (98.7%de,100%ee)

Example 4

Production of 3-MOLE from DOXE

Candida intermedia IFO0761 was inoculated in 2.5

20   mL of a liquid culture medium having the same

composition as that of Example 1. After incubating it

at 27° C for 24 hours, it was brought into a reaction

with DOXE by the same operation as that of Example 2.

Likewise, after the reaction, the extraction with ethyl acetate and the TLC were performed. An HPLC analysis on the spot revealed that the concentration of the TLC scraped-off sample of the 3-MOLE was 156.9 mg/L.

5

Example 5

Production of 3-MOLE from DOXE

Filobasidium capsuligenum IFO1185 strain was inoculated in 2 L of a liquid culture medium having the

10 same composition as that of Example 1 and incubated at 30°C for 21 hours under aerobic conditions. The obtained culture solution was centrifuged and microbial cells were collected. A 10% (w/v) microbial cell suspension was prepared using a 10 mM potassium

15 phosphate buffer (pH 7). Each 12-mL aliquot of the suspension was sampled into each of six tubes having a size of 30 φ. Then, 0.1 mL of 10% (w/v) DOXE (DMSO solution) and 0.15 ml of 50% (w/v) glucose solution were added in each tube to initiate a reaction at 30°C for 20

20 hours under aerobic conditions.

After terminating the reaction, a reaction mixture was extracted using ethyl acetate. The extract was subjected to TLC under the same conditions as those of Example 1. A portion containing the compound (III) was

25 scraped off. From the silica gel portion being scraped off, the extraction with ethyl acetate was performed, and the sample was analyzed by ^{1}H-NMR.

^{1}H-NMR (400MHz, CDCl$_3$, δppm): 1.02 (dt, J=6.4,

3.2Hz, 2H), 1.21 (t, J=7.2Hz, 3H), 1.33 (dt, J=6.4,

3.2Hz, 2H), 2.26 (m, 1H), 2.43 (d, J=6.4Hz, 2H), 2.60-

2.66 (dd, J=6.4, 6.4Hz, 2H), 3.37 (m, 1H), 4.11 (q,

5   J=6.8Hz, 2H), 4.34-4.41 (m, 1H), 6.27 (d, J=16.8Hz, 1H),

7.06-7.36 (m, 6H), 7.52-7.62 (m, 1H), 7.60 (d, J=16.8Hz,

1H), 7.90 (d, J=8.4Hz, 1H)

From the results, the generation of 3-MOLE was

confirmed.

10   Furthermore, the optical purity was analyzed using

a high-performance liquid chromatography (HPLC) under

the following conditions. As a result, it was found

that the optical purity of the compound (III') was

obtained at 87.3% ee.

15   The following is the conditions of HPLC in this

example.

Column: CHIRALCEL AD (manufactured by Daicel Chemical

Industries, Ltd.)

Eluting solution: Hexane / ethanol / trifluoroacetic

20   acid = 900 / 100 / 1

Flow rate: 1 ml/min.

Detection: UV 254 nm

Temperature: Room temperature

25   Example 6

Production of DOLE and 3R-MOLE from DOXE

500-ml flasks each containing 50 mL of the liquid

culture medium having the same composition as that of

Example 1, were sterilized at 120°C for 20 minutes,

respectively. The eight flasks were inoculated with

Ogataea minuta var *nonfermentans* IFO1473, followed by

5   incubating it at 28°C for 24 hours under aerobic

conditions. The resulting culture solution

corresponding to four of eight flasks was inoculated in

each of two 30 L- jar fermentors, which contains 20 L of

a liquid culture medium composed of 10 g/L of yeast

10   extract (manufactured by Difco Co., Ltd.), 10 g/L of

polypeptone (manufactured by Nihon Pharmaceutical Co.,

Ltd.), 6 g/L of malt extract (manufactured by Difco Co.,

Ltd.), and 20 g/L of glucose (manufactured by Nihon

Shokuhinkako Co., Ltd.), followed by incubating them at

15   28°C for 24 hours. After the incubation, the culture

solution was centrifuged to collect microbial cells.

    The microbial cells were completely suspended

while being added in 9 L of a 100 mM potassium phosphate

buffer (pH 7.0) and divided into three equal volumes.

20   Then, each of them was placed in a 5 L- jar fermentor.

In each fermentor, 53 g of glucose (manufactured by

Nihon Shokuhinkako Co., Ltd.), 2 g of NADPH

(manufactured by Oriental Yeast Co., Ltd.), and a

solution in which 1.66 g of DOXE was dissolved in 130 ml

25   of DMSO were added and reacted at 40°C for 6 hours under

aerobic conditions. Further, 2 g of NADPH was readded

thereinto at a time 1 hour after the reaction. After

the reaction, a part of a reaction solution in each

fermentor was taken and the amount of the generation was

analyzed using a high-performance liquid chromatography

(HPLC). As a result, 3.43 g of DOLE was generated in

5   total (yield 71%).

Each of the reaction solutions was centrifuged and

precipitates were collected. In each of the

precipitates, 600 ml of acetonitrile was added. After

stirring the mixture sufficiently, a centrifugation was

10   performed to separate the mixture into a supernatant and

a precipitate. On the precipitate side, 200 ml of

acetonitrile was additionally used for resuspension and

centrifugation. All of supernatants were collected

together and condensed with an evaporator. After the

15   condensation, 600 ml of ethyl acetate was added,

followed by washing with 50 ml of water twice after

being dissolved.

An ethyl acetate layer was condensed and purified

with a silica gel column chromatography. 400 ml of

20   silica gel was placed in a column and was previously

equilibrated with a solution of hexane : ethyl acetate =

2 : 1. Then, a condensed sample was applied and 2 L of

developing solvent of hexane : ethyl acetate = 2 : 1 was

fed. Subsequently, it was replaced with developing

25   solvent of hexane : ethyl acetate = 3 : 2, and 2 L

thereof was fed to make an elution.

The eluted solution was divided into 200-ml

fractions (20 in total). Each fraction was confirmed
with TLC. The fractions in which the presence of DOLE
was detected were collected and condensed, resulting in
3.4 g of crude oily DOLE. It was estimated in terms of

5   purity, which corresponds to 2.5 g of DOLE.

The optical purity of the compound was
investigated by an HPLC analysis under the conditions
described in Example 2 above. In terms of an area ratio,
3S, 5R isomer : 3R, 5R isomer : 3R, 5S isomer : 3S, 5S

10   isomer = 0.3 : 0.2 : 98.9 : 0.6 (98.4%de, 99.4%ee).

On the other hand, when the fractions of the
column purification, which correspond to portions where
the 3-MOLE was detected as a main component, were
collected, 1.5 g of crude oily product was obtained, so

15   that 0.7 g of 3R-MOLE was obtained by subjecting it to
another silica gel column chromatography for the
purification again.

The optical purity was 98%ee when the same
analysis as that of Example 2 was performed.

20

Example 7

Production of DOLE from 5-MOLE

A reaction was performed by the same operation as
that of Example 1, except for the use of various kinds

25   of strains shown in Table 4 and 5-MOLE that contains R-
5MOLE and S-5MOLE at a ratio of 1 : 1 as a reaction
substrate instead of DOXE.

Among the products, DOLE, 3S, 5R isomer and 3R, 5R
isomer are generated from 5R-MOLE, and 3R, 5S isomer and
3S, 5S isomer are generated from 5S-MOLE.

After terminating the reaction, the extraction
5   with ethyl acetate and the TLC were performed as in the
case of Example 1. Subsequently, a high-performance
liquid chromatography (HPLC) was used for analyzing the
optical purity and the amount of the generation.

The results are shown in Table 4.

10

5-MOLE   (3R,5S)-DOLE
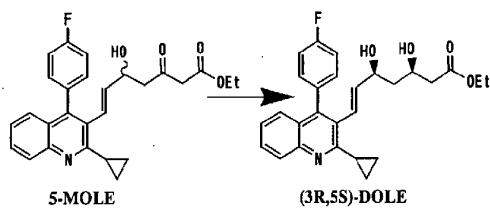

Table 4

Microorganism used	Concentration of TLC-scraped-off sample (each mg/L) 3s,5r 3r,5r 3r,5s 3s,5s	3-position asymmetric reduction selectivity from 5S-MOLE	Excess enantiomer ratio (ee%)

Example 8

Production of DOLE from 5-MOLE

5   Each kind of strains listed in Table 5 was

inoculated in 2.5 mL of a liquid culture medium composed

of 10 g/L of yeast extract (manufactured by Difco Co.,

Ltd.), 8 g/L of polypeptone (manufactured by Nihon

Pharmaceutical Co., Ltd.), 7 g/L of soybean extract

HINUTE SMS (manufactured by Fuji Oil Co., Ltd.), 5 g/L

of glucose (manufactured by Nihon Shokuhinkako Co.,

Ltd.), 10 g/L of glycerol (manufactured by Kishida

5   Chemical Co., Ltd.), 1 g/L of potassium phosphate

(manufactured by Wako Pure Chemical Industries, Ltd.), 3

g/L of dibasic potassium phosphate (manufactured by Wako

Pure Chemical Industries, Ltd.), 0.5 g/L of magnesium

sulfate (manufactured by Kishida Chemical Co., Ltd.),

10   and 10 mg/L of manganese chloride (manufactured by Wako

Pure Chemical Industries, Ltd.), and was then incubated

at 30°C for 24 hours under aerobic conditions. The

resulting culture solution was centrifuged in an amount

of 1 ml at a time and microbial cells were collected.

15   Then, 0.2 ml of a 100 mM potassium phosphate buffer (pH

7.0) was added to suspend the microbial cells completely,

followed by mixing with 10 μl of 50% (w/v) glucose

solution, 10 μl of a mixture of 2 g/L-NADP (manufactured

by Oriental Yeast Co., Ltd.) and NAD (manufactured by

20   Oriental Yeast Co., Ltd.), and 10μl of 5g/L-DMSO

solution of 5-MOLE in which R-5MOLE and S-5MOLE are

contained at a ratio of 1 : 1. After stirred well, they

were reacted at 30°C for 20 hours under aerobic

conditions.

25   After terminating the reaction, an extraction with

ethyl acetate and TLC were performed just as in the case

of Example 1 and a spot of the DOLE on the TLC was

scraped and eluted in 200 μl of isopropanol. After

centrifugation, a supernatant was subjected to a high-

performance liquid chromatography (HPLC) to analyze the

optical purity thereof and the amount of the generation

5   of DOLE.

The following is the conditions of HPLC.

Column: CHIRALCEL AD (manufactured by Daicel Chemical

Industries, Ltd.)

Eluting solution: Hexane / ethanol = 95 / 5

10   Flow rate: 1 ml/min.

Detection: UV 254 nm

Temperature: Room temperature

The results are listed in Table 5.

Example 10

Production of DOLE from 5-MOLE

5   Each kind of strains listed in Table 7 was

inoculated in 2 m+ of a liquid culture medium composed

of 10 g/L of yeast extract (manufactured by DIfco Co.,

Ltd.), 5 g/L of Nutrient Broth (manufactured by DIfco

Co., Ltd.), 3 g/L of soybean extract HINUTE SMS

(manufactured by Fuji Oil Co., Ltd.), and 15 g/L of

glucose (manufactured by Nihon Shokuhinkako Co., Ltd.),

5   and was then incubated at 30°C for 24 hours under

aerobic conditions. The resulting culture solution was

centrifuged in an amount of 1 ml at a time and microbial

cells were collected. The same operation as that of

Example 1 was performed, except that 5-MOLE containing

10   R-5MOLE and S-5MOLE at a ratio of 1 : 1 was used as a

reaction substrate for the microbial cells instead of

DOXE.

    After terminating the reaction, as in the case of

Example 1, an extraction with ethyl acetate and TLC were

15   performed, followed by a high-performance liquid

chromatography (HPLC) to analyze the optical purity and

the amount of the generation. The results are listed in

Table 7.

5-MOLE   (3R,5S)-DOLE

Example 11

Production of DOLE from 5S-MODE

5   Each kind of strains listed in Table 8 was

incubated in the same way as that of Example 1. The

resulting culture solution was centrifuged in an amount

of 1 ml at a time and microbial cells were collected.

Then, 0.25 ml of a 100 mM sodium phosphate buffer (pH

10   6.5) containing 5 g/L of glucose (Nihon Shokuhinkako Co.,

Ltd.), 60 μg/L of NADP (manufactured by Oriental Yeast

Co., Ltd.), and 20 μg/L of glucose dehydrogenase

(manufactured by Amano pharmaceutical Co., Ltd.: 73

units/mg) was added in the microbial cells to suspend

15   them well.

In this suspension, 10 μl of DMSO that contains 10

g/L of 5S-MOLE having an optical purity of 73.0%ee,

which was obtained according to Production Example 2,

was added, followed by reaction at 30°C for 20 hours

under the aerobic conditions.

After terminating the reaction, an extraction with

5   ethyl acetate and TLC were performed just as in the case

of Example 1. After that, a high-performance liquid

chromatography (HPLC) was used to analyze the optical

purity and the amount of the generation.

The results are listed in Table 8.

Example 12

Production of DOLE from 3R-MODE

Each kind of strains listed in Table 9 was

inoculated in 2.5 mL of a liquid culture medium having

the same composition as that of Example 1 and was

5   incubated at 27°C for 48 hours under the aerobic

conditions. The resulting culture solution was

centrifuged in an amount of 1 ml at a time and microbial

cells were collected. Then, microbial cells were

completely suspended by the addition of 0.2 ml of a 100

10 mM sodium phosphate buffer (pH 7.0). Subsequently, 10

μl of 2g/L of NADP (manufactured by Oriental Yeast Co.,

Ltd.) and NAD (manufactured by Oriental Yeast Co., Ltd.),

10 μl of a 25 units/ml-glucose dehydrogenase

(manufactured by Amano pharmaceutical Co., Ltd.), 10 μl

15 of a 50% (w / v) glucose solution, and 20 μl of 5g/L-

DMSO solution of 3R-MOLE prepared by Example 6 were

added and stirred well, followed by reaction at 27°C for

20 hours.

After terminating the reaction, an extraction with

20 ethyl acetate and TLC were performed just as in the case

of Example 8. After that, a high-performance liquid

chromatography (HPLC) was used to analyze the optical

purity and the amount of the generation.

The results are listed in Table 9.

5   **Example 13**

Production of DOLE from 3R-MODE

Each kind of strains listed in Table 10 was

inoculated in 2.5 mL of a liquid culture medium having

-72-

the same composition as that of Example 1 and was

incubated at 27°C for 48 hours under the aerobic

conditions. The resulting culture solution was

centrifuged in an amount of 1 ml at a time and microbial

5　　cells were collected. Then, microbial cells were

completely suspended by the addition of 0.2 ml of a 100

mM sodium phosphate buffer (pH 7.0). Subsequently, 10

μl of 2g/L of a mixed solution of NADP (manufactured by

Oriental Yeast Co., Ltd.) and NAD (manufactured by

10　　Oriental Yeast Co., Ltd.), 10 μl of isopropanol, and 20

μl of 5g/L-DMSO solution of 3R-MOLE prepared according

to Example 6 were added and stirred well, followed by

reaction at 27°C for 20 hours.

　　　After terminating the reaction, an extraction with

15　　ethyl acetate and TLC were performed just as in the case

of Example 8. After that, a high-performance liquid

chromatography (HPLC) was used to analyze the optical

purity and the amount of the generation.

　　　The results are listed in Table 10.

3R-MOLE　　　　　　　　(3R,5S)-DOLE

20

5   Example 14

Production of DOLE from DOXE

In a 2.5 mL liquid culture medium having the same composition as that of Example 1, *Rhodotorula glutinis* variant dairenensis IFO0415 was inoculated and incubated
10   at 27° C for 48 hours under the aerobic conditions. The resulting culture solution in an amount of 1 ml was centrifuged, and microbial cells were collected.

Furthermore, in a 2.5 mL liquid culture medium having the same composition as that of Example 8,
15   *Corynebacterium glutamicum* ATCC13826 was inoculated and incubated at 30° C for 24 hours under aerobic conditions. The centrifugation was made on 1 ml of the obtained culture solution to collect the cells.

Both were combined together, in which 0.2 ml of a

100 mM potassium phosphate buffer (pH 7.0) was added to

completely suspend them, and 10 µl of a mixture solution

of 2g/L of NADP (manufactured by Oriental Yeast Co.,

5   Ltd.) and NAD (manufactured by Oriental Yeast Co., Ltd.),

10 µl of 50% (w/v) glucose solution, and 30 µl of 20 g/L

DOXE (DMSO solution) were mixed and stirred well,

followed by reaction at 27°C for 18 hours.

After terminating the reaction, an extraction with

10   ethyl acetate and TLC were performed just as in the case

of Example 1. After that, under the same conditions as

those of Example 8, a high-performance liquid

chromatography (HPLC) was used to analyze the optical

purity and the amount of the generation. As a result,

15   3R, 5S-DOLE was only obtained in this reaction. Here, a

concentration of a TLC-scraped-off sample was 9.5 mg/L.

Example 15

Production of DCOOH from DOXE

20   Each kind of strains shown in Table 11 was

incubated for reaction in the same way as that of

Example 1. A spot (developing solvent; hexane : ethyl

acetate = 1 : 1, Rf = 0) corresponding to the compound

(IV) (which is a compound, in the formula, R = hydrogen:

25   hereinafter, abbreviated as DCOOH) on the TLC was

scraped off and was then eluted with 0.25 mL of

isopropanol. After centrifugation, a high-performance

liquid chromatography (HPLC) was used to analyze the

supernatant.

The following is the conditions of HPLC.

Column: CHIRALCEL AD (manufactured by Daicel Chemical

5   Industries, Ltd.)

Eluting solution: Hexane / ethanol / trifluoroacetic

acid = 900 / 100 / 1

Flow rate: 1 ml/min.

Detection: UV 254 nm

10   Temperature: Room temperature

The results are listed in Table 11.

Example 16

Production of DCOOH from 5-MOLE

     Each kind of strains shown in Table 12 was

5   incubated in the same way as that of Example 1, except

that 5-MOLE was used instead of DOXE. A spot

(developing solvent; hexane : ethyl acetate = 1 : 1, Rf

= 0) corresponding to the compound (IV) (which is a

compound, in the formula, R = hydrogen: hereinafter,

10   abbreviated as DCOOH) on the TLC was scraped off and was

then eluted with 0.25 mL of isopropanol. After

centrifugation, a supernatant was subjected to a high-

performance liquid chromatography (HPLC) under the same

conditions as those of Example 15, to analyze the

15   optical purity. The results are listed in Table 12.

MOLE   DCOOH

Industrial Applicability

According to the present invention, 3R, 5S-(E)-7-[2-
5   cyclopropyl-4-(4-fluorophenyl)-quinolin-3-yl]-3,5-
dihydroxyhept-6-enic acid esters can be efficiently
produced with high optical purities.

In the claims which follow and in the preceding
10 description of the invention, except where the context
requires otherwise due to express language or necessary
implication, the word "comprise" or variations such as
"comprises" or "comprising" is used in an inclusive sense,
i.e. to specify the presence of the stated features but
15 not to preclude the presence or addition of further
features in various embodiments of the invention.

What is claimed is:

     1.   A process for producing a compound represented by the following formula (IV):

IV

wherein R denotes a hydrogen atom, an alkyl group, or an aryl group, comprising reducing a compound selected from the group consisting of:
a compound represented by the following formula (I):

I

wherein R is as defined in the formula (IV);
a compound represented by the following formula (II):

II

wherein R is as defined in the formula (IV);and
a compound represented by the following formula (III):

III

wherein R is as defined in the formula (IV),
by reacting the compound with a cell of a microorganism
and/or a cell preparation thereof capable of stereo-
selectively reducing a keto group, wherein the
microorganism is selected from the group consisting of the
genera *Metschnikowia, Cryptococcus, Candida, Filobasidium,
Ogataea, Citeromyces, Yarrowia, Rhodotorula, Exophiala,
Trigonopsis, Shizosaccharomyces, Wickerhamiella, Pichia,
Saccharomycopsis, Saitoella, Saccharomyces,
Rhodosporidium, Acinetobacter, Brevibacterium,
Cellulomonas, Coryebacterium,* and genus *Curtobacterium.*

2. The process for producing a compound
according to claim 1, wherein the compounds represented by
the formulae (II) and (III) are optically active
substances each represented by the following formula
(II'):

II'
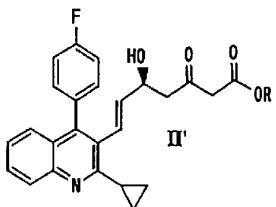

wherein R is as defined in the formula (IV),
and the following formula (III'):

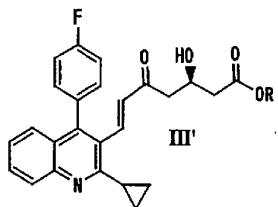

wherein R is as defined in the formula (IV).

3. The process for producing a compound according to claim 2, wherein each of the compounds represented by the formula (II') and the formula (III') is obtained from the compound represented by the formula (I).

4. The process for producing a compound according to claim 1, wherein the microorganism is selected from the group consisting of the genera *Metschnikowia*, *Cryptococcus*, *Candida*, *Filobasidium*, *Ogataea*, *Citeromyces*, *Rhodotorula*, *Exophiala*, *Shizosaccharomyces*, *Wickerhamiella*, *Pichia*, *Saccharomycopsis*, *Saitoella*, *Saccharomyces*, *Rhodosporidium*, Brevibacterium and *Coryebacterium*.

5. The process for producing a compound according to claim 1, wherein the compound represented by the following formula (I):

I
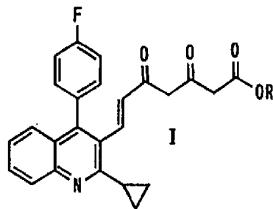

wherein R is as defined in the formula (IV),
is reacted with the microorganism selected from the group
consisting of the genera *Cryptococcus*, *Candida*,
Filobasidium, *Ogataea*, *Yarrowia*, *Rhodotorula*, *Exophiala*
and *Trigonopsis*.

6. The process for producing a compound
according to claim 5, wherein the microorganism is
selected from the group consisting of the genera
Cryptococcus, *Candida*, *Filobasidium*, *Ogataea*, and
Rhodotorula.

7. The process for producing a compound
according to any one of claims 1 to 3, wherein the
compound represented by the following formula (II):

II

wherein R is as defined in the formula (IV),
is reacted with the microorganism selected from the group
consisting of the genera *Metschnikowia*, *Cryptococcus*,
Candida, *Filobasidium*, *Ogataea*, *Citeromyces*, *Yarrowia*,
*Rhodotorula*, *Exophiala*, *Trigonopsis*, *Shizosaccharomyces*,

Wickerhamiella, Saccharomycopsis, Saitoella, Pichia,
Saccaromyces, Rhodosporidium, Acinetobacter,
Brevibacterium, Cellulomonas, Coryebacterium, and
Curtobacterium.

8.   The process for producing a compound
according to claim 7, wherein the microorganism is
selected from the group consisting of the genera
Metschnikowia, Cryptococcus, Candida, Filobasidium,
Ogataea, Citeromyces, Rhodotorula, Shizosaccharomyces,
Wickerhamiella, Saccharomycopsis, Saitoella, Pichia,
Saccaromyces, Rhodosporidium, Brevibacterium, and
Coryebacterium.

9.   The process for producing a compound
according to any one of claims 1 to 3, wherein the
compound represented by the following formula (III):

III
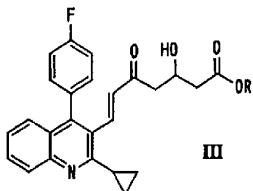

wherein R is as defined in the formula (IV),
is reacted with the microorganism selected from the group
consisting of the genera *Cryptococcus, Candida,*
Rhodotorula, Filobasidium, and *Pichia.*

10.   The process for producing a compound
according to any one of claims 1 and 4 to 6, wherein the
compound represented by the formula (I) is obtained by a
condensation reaction between 2-cyclopropyl-4-(4-
fluorophenyl) quinolin-3-carbaldehyde represented by the
following formula (A):

(A)

and a compound represented by the following formula (B):

(B)
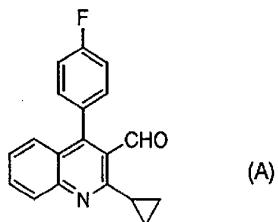

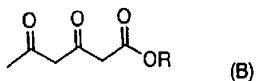

wherein R denotes a hydrogen atom, an alkyl group, an aralkyl group, or an aryl group.

11. The process for producing a compound according to claim 10, wherein when the compound represented by the formula (I) is produced by the condensation reaction between the compound represented by the formula (A) and the compound represented by the formula (B), and a compound represented by the following general formula (C):
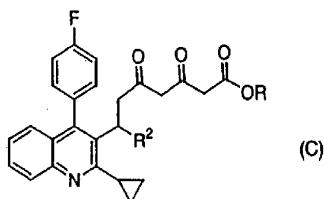

(C)

wherein R is as defined in the formula (IV), and R^2 denotes a hydroxyl group, a halogen group, a silyloxy group, a sulfonyloxy group, an acyloxy group, an

alkoxycarbonyloxy group, an alkylthiocarbonyloxy group, an
alkoxythiocarbonyloxy group, or an
alkylthiothiocarbonyloxy group or a salt thereof
is produced as an intermediate of the reaction.

5

      12.   The process for producing a compound
according to claim 11, wherein the compound represented by
the formula (I) is obtained by an elimination reaction in
which R^2 is removed from the intermediate represented by
10 the formula (C).

      13.   A process for producing a compound of
formula (IV) as defined in claim 1 substantially as herein
described with reference to the accompanying examples.

15

      14.   A product produced by the process according
to any one of claims 1 to 13.
