[00108] "Pharmaceutically acceptable salt" includes both acid and base addition salts. A pharmaceutically acceptable salt of any one of the heterocyclic RBP4 inhibitory compounds described herein is intended to encompass any and all pharmaceutically suitable salt forms. Acid addition salts of basic compounds are, in some embodiments, prepared by contacting the free base forms with a sufficient amount of the desired acid to produce the salt according to methods and techniques with which a skilled artisan is familiar.

[00110] "Pharmaceutically acceptable base addition salt" refers to those salts that retain the biological effectiveness and properties of the free acids, which are not biologically or otherwise undesirable. These salts are prepared from addition of an inorganic base or an organic base to the free acid. [00111] As used herein, “treatment” or “treating,” or “palliating” or “ameliorating” are used interchangeably. These terms refer to an approach for obtaining beneficial or desired results including but not limited to therapeutic benefit and/or a prophylactic benefit. By “therapeutic benefit” is meant eradication or amelioration of the underlying disorder being treated. Also, a therapeutic benefit is achieved with the eradication or amelioration of one or more of the physiological symptoms associated with the underlying disorder such that an improvement is observed in the patient, notwithstanding that the patient is still afflicted with the underlying disorder. For prophylactic benefit, the compositions are, in some embodiments, administered to a patient at risk of developing a particular disease, or to a patient reporting one or more of the physiological symptoms of a disease, even though a diagnosis of this disease has not been made.

[00112] "Prodrug" is meant to indicate a compound that is, in some embodiments, converted under physiological conditions or by solvolysis to a biologically active compound described herein. Thus, the term "prodrug" refers to a precursor of a biologically active compound that is pharmaceutically acceptable. A prodrug is typically inactive when administered to a subject, but is converted *in vivo* to an active compound, for example, by hydrolysis. The prodrug compound often offers advantages of solubility, tissue compatibility or delayed release in a mammalian organism (*see, e.g.,* Bundgard, H., Design of Prodrugs (1985), pp. 7-9, 21-24 (Elsevier, Amsterdam).

[00113] A discussion of prodrugs is provided in Higuchi, T., et al., "Pro-drugs as Novel Delivery Systems," A.C.S. Symposium Series, Vol. 14, and in Bioreversible Carriers in Drug Design, ed. Edward B. Roche, American Pharmaceutical Association and Pergamon Press, 1987.

[00114] The term "prodrug" is also meant to include any covalently bonded carriers, which release the active compound *in vivo* when such prodrug is administered to a mammalian subject. Prodrugs of an active compound, as described herein, are prepared by modifying functional groups present in the active compound in such a way that the modifications are cleaved, either in routine manipulation or *in vivo*, to the parent active compound. Prodrugs include compounds wherein a hydroxy, amino or mercapto group is bonded to any group that, when the prodrug of the active compound is administered to a mammalian subject, cleaves to form a free hydroxy, free amino or free mercapto group, respectively. Examples of prodrugs include, but are not limited to, acetate, formate and benzoate derivatives of alcohol or amine functional groups in the active compounds and the like.

Retinol Binding Protein 4 (RBP4)

[00150] Retinol-binding protein 4 (RBP4), the sole retinol transporter in blood, is secreted from adipocytes and liver. Serum RBP4 levels correlate highly with insulin resistance, other metabolic syndrome factors, and cardiovascular disease. In some instances, elevated serum RBP4 causes insulin resistance and impaired glucose tolerance. In some instances, lowering of serum RBP4 improves insulin action and glucose tolerance. In some embodiments, the compounds described herein lower serum or plasma RBP4 and thus improve insulin action and glucose tolerance.

In some instances, a compound disclosed herein is used to treat or ameliorate a metabolic disease when administered to a subject in need thereof. Exemplary metabolic diseases include NASH, NAFLD, type II diabetes, diabetic retinopathy, obesity, fibrosis, cirrhosis, or liver cancer. In one embodiment, the fatty liver disease is selected from the group consisting of non-alcoholic fatty acid liver disease (NAFLD), non-alcoholic steatohepatitis (NASH), fatty liver disease resulting from hepatitis, fatty liver disease resulting from obesity, fatty liver disease resulting from diabetes, fatty liver disease resulting from insulin resistance, fatty liver disease resulting from hypertriglyceridemia, Abetalipoproteinemia, glycogen storage diseases, Weber-Christian disease, Wolmans disease, acute fatty liver of pregnancy, and lipodystrophy.

Non-Alcoholic Steatohepatitis (NASH)

[00162] Non-alcoholic steatohepatitis or NASH is a common liver disease, which resembles alcoholic liver disease, but occurs in people who drink little or no alcohol. The major feature in NASH is fat in the liver, along with inflammation and damage. In some instances, NASH progresses into advanced NASH, which is characterized, inter cilia, by hepatic fibrosis. In certain instances, NASH progresses to cirrhosis, in which the liver is damaged, scarred, and is no longer able to work properly. In some instances, a person with cirrhosis experiences fluid retention, muscle wasting, bleeding from the intestines, and/or liver failure. In some instances. NASH is associated with an increased risk of cardiovascular mortality and type II diabetes mellitus. Cirrhosis due to NASH increases the risk of hepatocellular carcinoma.

[00163] NASH is usually first suspected in a person who is found to have elevations in liver tests that are included in routine blood test panels, such as alanine aminotransferase (ALT) or aspartate aminotransferase (AST). When further evaluation shows no apparent reason for liver disease (such as medications, viral hepatitis, or excessive use of alcohol) and when X-rays or imaging studies of the liver show fat, NASH is suspected. NASH is diagnosed and separated from NAFLD by a liver biopsy. For a liver biopsy, a needle is inserted through the skin to remove a small piece of the liver. NASH is diagnosed when examination of the tissue with a microscope shows fat along with inflammation and damage to liver cells. A biopsy can provide information about scar tissue has development in the liver.

[00164] Some embodiments provided herein describe the use of the heterocyclic RBP4 inhibitory compounds described herein for treating NASH in a subject in need thereof. In some embodiments, the heterocyclic RBP4 inhibitory compounds inhibit NASH. In specific embodiments, the heterocyclic RBP4 inhibitory compounds are used to prevent or reduce the risk of developing NASH. In certain specific embodiments, the heterocyclic RBP4 inhibitory compounds cause the clinical symptoms of NASH not to develop in a subject who may be predisposed to NASH but who does not yet experience or display symptoms of NASH.

Non-Alcoholic Fatty Liver Disease (NAFLD)

[00166] Non-alcoholic fatty liver disease (NAFLD) is a disorder affecting as many as 1 in 3-5 adults and 1 in 10 children in the United States, and refers to conditions where there is an accumulation of excess fat in the liver of people who drink little or no alcohol. The most common form of NAFLD is a non-serious condition called hepatic steatosis (fatty liver), in which fat accumulates in the liver cells. NAFLD most often presents itself in individuals with a constellation of risk factors called the metabolic syndrome, which is characterized by elevated fasting plasma glucose (FPG) with or without intolerance to post-prandial glucose, being overweight or obese, high blood lipids such as cholesterol and triglycerides (TGs) and low high-density lipoprotein cholesterol (HDL-C) levels, and high blood pressure; but not all patients have all the manifestations of the metabolic syndrome.

Obesity is thought to be the most common cause of NAFLD; and some experts estimate that about two-thirds of obese adults and one-half of obese children may have fatty liver. The majority of individuals with NAFLD have no symptoms and a normal physical examination (although the liver may be slightly enlarged); children may exhibit symptoms such as abdominal pain and fatigue, and may show patchy dark skin discoloration (acanthosis nigricans). The diagnosis of NAFLD is usually first suspected in an overweight or obese person who is found to have mild elevations in their liver blood tests during routine testing, though NAFLD can be present with normal liver blood tests, or incidentally detected on imaging investigations such as abdominal ultrasound or CT scan. It is confirmed by imaging studies, most commonly a liver ultrasound or magnetic resonance imaging (MRI), and exclusion of other causes.

[00167] Some embodiments provided herein describe the use of the heterocyclic RBP4 inhibitory compounds described herein for treating NAFLD in a subject in need thereof. In some embodiments, the heterocyclic RBP4 inhibitory compounds inhibit NAFLD. In specific embodiments, the heterocyclic RBP4 inhibitory compounds arrest the development of NAFLD or its clinical symptoms. In specific embodiments, the heterocyclic RBP4 inhibitory compounds cause regression, reversal or amelioration of NAFLD. In certain specific embodiments, the heterocyclic RBP4 inhibitory compounds reduce the number, frequency, duration, or severity of NAFLD clinical symptoms.

[00168] In some embodiments, the heterocyclic RBP4 inhibitory compounds are used prophylactically. In specific embodiments, the heterocyclic RBP4 inhibitory compounds are used to prevent or reduce the risk of developing NAFLD. In certain specific embodiments, the heterocyclic RBP4 inhibitory compounds cause the clinical symptoms of NAFLD not to develop in a subject who may be predisposed to NAFLD but who does not yet experience or display symptoms of NAFLD.

Type II Diabetes

[00169] Type II diabetes is a metabolic disorder characterized by hyperglycemia and abnormities in the glucose-protein- and lipid-metabolism. Type II diabetes is caused by insulin resistance which is not adequately compensated due to an insufficient β-cell secretory capacity. In recent years, type II diabetes and its chronic complications have become a major threat to human health. Long-term hyperglycemia associated with type II diabetes results in the damage of many tissues and organs, which in turn leads to a variety of diabetic chronic complications, such as coronary heart disease, atherosclerosis, cerebrovascular disease and other diabetic macrovascular diseases, diabetic nephropathy, diabetic retinopathy and other diabetic microangiopathy, diabetic neuropathy, diabetic

foot, diabetic maculopathy, diabetic cataract, diabetic glaucoma, refractive changes, iris and ciliary body diseases.

[00170] Some embodiments provided herein describe the use of the heterocyclic RBP4 inhibitory compounds described herein for treating type II diabetes, including its chronic complications, in a subject in need thereof. In some embodiments, the heterocyclic RBP4 inhibitory compounds inhibit type II diabetes, including its chronic complications. In specific embodiments, the heterocyclic RBP4 inhibitory compounds arrest the development of type II diabetes, its chronic complications, or its clinical symptoms. In other embodiments, the heterocyclic RBP4 inhibitory compounds reduce the development of type II diabetes, its chronic complications, or its clinical symptoms. In certain specific embodiments, the heterocyclic RBP4 inhibitory compounds reduce the number, frequency, duration, or severity of type II diabetes, its chronic complications, or its clinical symptoms.

[00171] In some embodiments, the heterocyclic RBP4 inhibitory compounds are used prophylactically. In specific embodiments, the heterocyclic RBP4 inhibitory compounds are used to prevent or reduce the risk of type II diabetes, its chronic complications, or its clinical symptoms. In certain specific embodiments, the heterocyclic RBP4 inhibitory compounds cause the clinical symptoms of type II diabetes not to develop in a subject who may be predisposed to type II diabetes but who does not yet experience or display symptoms of type II diabetes. In some embodiments, the subject is genetically, environmentally, dietarily or socially predisposed to type II diabetes.

Obesity

[00172] Obesity and disorders associated with obesity such as diabetes are a major global health concern. Obesity, which is generally associated with an abnormal accumulation of fat cells, develops when energy intake exceeds energy expenditure.

[00173] Obesity is associated with an increased risk of diabetes. Most obese people are insulin resistant and have to adapt by increasing insulin secretion. In some instances, type II diabetes mellitus manifests in individuals who lose the ability to produce sufficient quantities of insulin to maintain normoglycemia in the face of insulin resistance.

[00174] Obesity is a state of chronic, low-grade inflammation, and macrophages are thought to play an important role in maintaining this state in adipose tissue. Many molecules secreted by adipose tissue promote adipose tissue inflammation. Emerging evidence suggests a possible role for proinflammatory pathways in RBP4-induced insulin resistance. RBP4 expression in adipose tissue

and serum RBP4 levels strongly correlate with subclinical inflammation, including serum levels and adipose tissue expression of proinflammatory cytokines.

[00175] Some embodiments provided herein describe the use of the heterocyclic RBP4 inhibitory compounds described herein for treating obesity in a subject in need thereof. In specific embodiments, the heterocyclic RBP4 inhibitory compounds arrest the development of obesity or its clinical symptoms. In other embodiments, the heterocyclic RBP4 inhibitory compounds reduce the development of obesity or its clinical symptoms. In specific embodiments, the heterocyclic RBP4 inhibitory compounds cause regression, reversal or amelioration of obesity. In certain specific embodiments, the heterocyclic RBP4 inhibitory compounds reduce the number, frequency, duration, or severity of obesity clinical symptoms.

[00176] In some embodiments, the heterocyclic RBP4 inhibitory compounds are used prophylactically. In specific embodiments, the heterocyclic RBP4 inhibitory compounds are used to prevent or reduce the risk of developing obesity. In certain specific embodiments, the heterocyclic RBP4 inhibitory compounds cause the clinical symptoms of obesity not to develop in a subject who may be predisposed to obesity but who does not yet experience or display symptoms of obesity.

Those of relevant skill in the art are well able to prepare suitable solutions using, for example, isotonic vehicles, such as Sodium Chloride injection, Ringer's injection, or Lactated Ringer's injection. In some embodiments, preservatives, stabilizers, buffers, antioxidants, and/or other additives are included.

[00184] In yet another embodiment, the pharmaceutical compositions are provided in a dosage form for topical administration, which comprise a compound provided herein, and one or more pharmaceutically acceptable excipients or carriers.

Methods of Dosing and Treatment Regimens

[00185] The dose of the composition comprising at least one heterocyclic RBP4 inhibitory compound as described herein differ, depending upon the patient's condition, that is, stage of the disease, general health status, age, and other factors.

[00186] Pharmaceutical compositions are administered in a manner appropriate to the disease to be treated (or prevented). An appropriate dose and a suitable duration and frequency of administration will be determined by such factors as the condition of the patient, the type and severity of the patient's disease, the particular form of the active ingredient, and the method of administration. In general, an appropriate dose and treatment regimen provides the composition(s) in an amount sufficient to provide therapeutic and/or prophylactic benefit (*e.g.,* an improved clinical outcome), or a lessening of symptom severity. Optimal doses are generally determined using experimental models and/or clinical trials. The optimal dose depends upon the body mass, weight, or blood volume of the patient.

[00187] In one embodiment, the compounds described herein, or a pharmaceutically acceptable salt thereof, are used in the preparation of medicaments for the treatment of diseases or conditions in a mammal that would benefit from administration of any one of the compounds disclosed. Methods for treating any of the diseases or conditions described herein in a mammal in need of such treatment, involves administration of pharmaceutical compositions that include at least one compound described herein or a pharmaceutically acceptable salt, active metabolite, prodrug, or pharmaceutically acceptable solvate thereof, in therapeutically effective amounts to said mammal.

[00188] In certain embodiments, the compositions containing the compound(s) described herein are administered for prophylactic and/or therapeutic treatments. In certain therapeutic applications, the compositions are administered to a patient already suffering from a disease or condition, in an amount sufficient to cure or at least partially arrest at least one of the symptoms of the disease or condition. Amounts effective for this use depend on the severity and course of the disease or condition, previous therapy, the patient's health status, weight, and response to the drugs, and the judgment of the treating physician. Therapeutically effective amounts are optionally determined by methods including, but not limited to, a dose escalation and/or dose ranging clinical trial.

[00189] In prophylactic applications, compositions containing the compounds described herein are administered to a patient susceptible to or otherwise at risk of a particular disease, disorder or condition. Such an amount is defined to be a “prophylactically effective amount or dose.” In this use, the precise amounts also depend on the patient's state of health, weight, and the like. When used in patients, effective amounts for this use will depend on the severity and course of the disease, disorder or condition, previous therapy, the patient's health status and response to the drugs, and the judgment of the treating physician. In one aspect, prophylactic treatments include administering to a mammal, in which the mammal previously experienced at least one symptom of the disease being treated and is currently in remission, a pharmaceutical composition comprising a compound described herein, or

a pharmaceutically acceptable salt thereof, in order to prevent a return of the symptoms of the disease or condition.

[00190] In certain embodiments wherein the patient's condition does not improve, upon the doctor's discretion the administration of the compounds are administered chronically, that is, for an extended period of time, including throughout the duration of the patient's life in order to ameliorate or otherwise control or limit the symptoms of the patient's disease or condition.

[00191] Oral doses typically range from about 1.0 mg to about 1000 mg, one to four times, or more, per day. In general, however, doses employed for adult human treatment are typically in the range of 0.01 mg to 5000 mg per day. In one aspect, doses employed for adult human treatment are from about 1 mg to about 1000 mg per day. In one embodiment, the desired dose is conveniently presented in a single dose or in divided doses administered simultaneously or at appropriate intervals, for example as two, three, four or more sub-doses per day.

Example 5: Phase 1 Protocol for Human Clinical Study for Compounds 1 and 2

[00212] Subjects. The subject population consists of healthy volunteers.

[00213] Objectives. Objects of the study are to characterize the systemic and hepatic safety of single and multiple doses of Compound 1 or 2, characterize the pharmacokinetics (PK) of single and multiple doses of Compound 1 or 2, and determine effects of single and multiple doses of Compound 1 or 2 on serum levels of retinol binding protein 4 (RBP4), a pharmacodynamics (PD) marker.

[00214] Study Design and Duration. The study is a randomized, double blind, placebo-controlled, sequential single and multiple ascending dose study. There are 5 dose levels in the single and 5 dose levels in the multiple ascending dose components. Each cohort consists of 8 subjects, 6 receiving compound 1 or 2 and 2 receiving placebo. Consistent with NINDS policies, 3-5 subjects in each cohort are female and efforts should be made to include diverse races and ethnicity. All subjects participate in a screening period lasting up to 28 days, during which they are assessed for eligibility.

[00215] Single Ascending Dose Treatment Group. Cohorts 1-3 reside in the research unit from Day -1 through Day 3; Cohorts 4 and 5 on Days -1 to 4. On Day -1 baseline safety and PD markers are obtained. Subjects receive a single oral dose on the morning of Day 1. Safety, PK and PD are obtained through Day 3 in early cohorts, though Day 4 in later. A phone call to ask about adverse events and concomitant medications takes place on Day 6. Subjects return for an outpatient visit on Day 8.

[00216] Multiple Ascending Dose Treatment Group. Cohorts 1-3 reside in the research unit from Day -1 to Day 3; Cohorts 4 and 5 from Day -1 to Day 4. Subjects receive the first oral dose on the morning of Day 1. Safety, PK and PD are obtained through Day 3 or 4, as appropriate, and subjects are discharged from the research unit with investigational product (IP) to take as an outpatient. Subjects return for outpatient visits on Days 6, 8, and 12. They are readmitted to the unit on the morning of Day 15 and receive the final oral dose in the research unit. Safety, PK and PD are collected until discharge on Day 17 for Cohorts 1-3, day 18 for Cohorts 4 and 5. Subjects return for a last safety visit on Day 22. Specifics regarding safety, PK and PD collection for both SAD and MAD are described verbally in following sections, and presented in tabular form in Tables 5-10.

[00217] Number of Subjects. 40 subjects are in the single dose ascending group, 40 subjects are in the multiple dose ascending group, and there are 80 subjects total. Only subjects who discontinue prior to their first dose of IP are replaced.

[00218] Safety evaluation. Safety is evaluated by collecting adverse events, physical examination, Ocular examination (including slit lamp biomicroscopy, dilated ophthalmoscopy and intraocular pressure), Visual acuity, D-28 color vision text, Visual fields, Night vision questionnaire (multiple dose only), Vital signs (blood pressure, heart rate, temperature, respiratory rate), Weight, CBC with differential and platelets, serum chemistry, urinalysis, and ECG.

[00219] Twelve lead ECG are performed following recommendations in ICH E14 regarding evaluation of QTc prolongation in patients in early stage clinical trials. ECGs are performed in triplicate on Days 1, 2, 8, 15, and 16. Visual acuity is measured using Early Treatment of Diabetic Retinopathy Study (ETDRS) Visual Acuity charts 1 and 2. The chart is placed on an ETDRS light box which is hung at eye level on the wall or placed on a stand. Room lighting is at office levels and uniform between the subject and the light box. The distance from the patient's eyes to the Visual Acuity Chart is 4.0 meters. If vision tests are performed on the same day as an ERG, they are completed prior to pupil dilation.

[00220] Outcome Measures (PK). PK sampling of plasma is conducted in all subjects (for example predose, 0.5, 1, 1.5, 2, 3, 4, 8, 8, 10, 12, 16, 24, 36 and 48 hours post dose on Days 1-3 and 15-17; trough predose on other days; and times are finalized based on toxicokinetics). Compound 1 or 2 concentrations are determined using a high-pressure liquid chromatography coupled with a mass spectrometer(LC/MS/MS) method. The method is determined during toxicokinetic studies and then validated for human application. Validation includes determination of the limits of quantitation. If toxicokinetics show significant urinary excretion, then urine PK methods would be added. If toxicokinetics show significant metabolites, this method would be added.

[00221] Outcome Measures (PD). Serum RBP4 is measured using a validated commercial ELISA assay. Full-field ERG measurements are recorded after pupil dilation using 10% tropicamide and 30 minutes of dark adaptation at baseline and on Day 1 (approximately 6 hours), Day 2 (24–36 hours postdose), and Day 4 (highest dose cohorts only). Responses are obtained from both eyes simultaneously and include the International Society for Clinical Electrocardiography of Vision (ISCEV) standard rod response (0.03 cd/m^2-seconds) and combined response (1.5 cd/m^2-seconds) in the dark, and the 31-Hz flicker response (2.25 cd/m^2-seconds) and 1-Hz cone response (2.25 cd/m^2-seconds) in the presence of a background illumination (34 cd/m^2).

[00222] Inhibition of the visual cycle as evidenced by the delay in restoration of the ERG b-wave amplitude following the photobleach is measured. After a 10-minute exposure to a full-field bleaching light (556 cd/m^2), recovery of the ERG is measured for 60 minutes at 10-minute intervals.

[00223] Investigational Product. Compound 1 or 2 is provided as 50 mg and 200 mg capsules. Matching placebo is provided as identical looking capsules. Instructions for shipping, storage and handling is provided in the protocol. The dose levels are 50 mg, 100 mg, 150 mg, 200 mg, and 400 mg. Compound 1 or 2 is taken in the morning in the fasting state, with 4-8 ounces of water, as needed.

[00224] Statistical Analysis. All subjects who receive IP are included in the safety population. All subjects who receive IP and have at least one post-treatment sample or determination are included in the PK analysis population. Analysis is by treatment assignment. Safety is evaluated by monitoring AEs, and by change from baseline on examinations and laboratory studies. The AEs are coded using the Medical Dictionary for Regulatory Activities (MedDRA) and summarized by system organ class (SOC) and preferred term, by severity, by relationship to study drug and study procedure, and by study drug dose. ECG parameters analyzed include heart rate, PR, QRS, QT, QTcB and QTcF intervals. Analysis of other examinations are specified in the protocol.

[00225] PK parameters are summarized using descriptive statistics (mean, standard deviation, coefficient of variation [CV], median, minimum, and maximum) by treatment. Geometric means are determined for $AUC_{0\text{-inf}}$, $AUC_{0\text{-t}}$, and C_{max}. The following PK parameters are determined: maximum observed plasma concentration (C_{max}) and time of the maximum observed plasma concentration (T_{max}), obtained directly from the data without interpolation; the apparent terminal elimination rate constant (λ_Z,), determined by log-linear regression of the terminal plasma concentrations; area under the plasma concentration-time curve from time 0 to the time of the last measureable concentration ($AUC_{0\text{-t}}$), calculated by the linear trapezoidal method; apparent plasma terminal elimination half-life ($t_{1/2}$), calculated as $0.693/\lambda_Z$; area under the plasma concentration-time curve from time 0 to infinity ($AUC_{0\text{-inf}}$) where $AUC_{0\text{-inf}} = AUC_{0\text{-t}} + C_t/\lambda_z$ and C_t is the last measureable concentration; and

apparent total plasma clearance (CL/F); and apparent volume of distribution during the terminal phase (V_Z/F).

[00226] The following outcome measures are calculated for ERGs: Absolute dark adapted prebleach rod amplitude at each time point; dark adapted prebleach rod amplitude at each time point as % baseline; recovery from photobleaching -- % rod amplitude at 60 minutes recovery versus rod amplitude immediately prior to bleaching; and time to >90% recovery of rod amplitude from photobleaching.

Example 6: Treatment of NASH in Humans

[00227] 250 adults with symptoms associated with nonalcoholic steatohepatitis (NASH) are randomly assigned to receive compound 1 or 2, each at a daily dose of 50 mg, 100 mg, 150 mg, 200 mg, 400 mg, or placebo, for up to 6 months. The primary outcome is an improvement in histologic features of nonalcoholic steatohepatitis, as assessed with the use of a composite of standardized scores for one or more of steatosis, lobular inflammation, hepatocellular ballooning, cirrhosis, and fibrosis. The results are analyzed following methods well known to the skilled artisan.

Example 7: Treatment of NAFLD and NASH in Humans

[00228] Subjects with NAFLD or NASH are treated with doses of either 50 or 100 mg/day of compound 1 or 2 for 6 months. Subjects are permitted their usual other medications (e.g. antidiabetic medications such as metformin or sulfonamides) but not glitazones, PPAR agonists, OCA, or similar medications. The subjects are assessed before the study, and at intervals during the study, such as every 4 weeks during the study and 4 weeks after the last dose of compound 1 or 2, for safety and pharmacodynamic evaluations.

[00229] MRIs of the subjects' livers are taken every 4 weeks during the study and 4 weeks after completion of compound 1 or 2 dosing, to determine hepatic fat; and liver biopsies are taken before the study (to establish the diagnosis) and 4 weeks after completion of compound 1 or 2 dosing. At each visit, after a 12-hour fast, blood is drawn and urine collected; and a standard metabolic panel, complete blood count, and standard urinalysis are performed. Blood is analyzed for total cholesterol, HDL-C, LDL-C, VLDL-C, TGs, apoB, and liver transaminases. The subjects also maintain health diaries, which are reviewed at each visit. The subjects show a dose-related improvement in their disease, as manifested by, for example, MRI and liver biopsy.

Example 8: Treatment of Obesity in Humans

[00230] Overweight subjects are treated with doses of either 50 or 100 mg/day of compound 1 or 2 for 2 months. The subjects are not coffee drinkers or consumers of any other form of caffeine. The subjects are not to alter any other behavioral parameter such as diet or exercise. The subjects are assessed before the study, and at intervals during the study, such as every 2 weeks during the study

and 4 weeks after the last dose of compound 1 or 2, for safety and pharmacodynamic evaluations, and weight loss.

Example 9: Treatment of Type II Diabetes in Humans

[00231] Subjects diagnosed with type 2 diabetes mellitus are treated with doses of either 50 or 100 mg/day of compound 1 or 2 for 4 months. The subjects are not to alter any other behavioral parameter such as diet or exercise. The subjects are assessed before the study, and at intervals during the study, such as every 2 weeks during the study and 4 weeks after the last dose of compound 1 or 2, for safety and pharmacodynamic evaluations, including markers of blood glucose, interstitial glucose, and insulin.

Example 10: Treatment of Diabetic Retinopathy in Humans

[00232] Adult patients aged between 35 and 65 years suffering from diabetes mellitus (insulin dependent or not insulin-dependent) and diabetic retinopathy (non-proliferative and proliferative diabetic retinopathy) are treated with either 100 or 200 mg/day of compound 1 or 2 for 4 months. The subjects are not to alter any other behavioral parameter such as diet or exercise. Patients submitted to previous treatment of the retinopathy with laser are excluded from the test. The subjects are assessed before the study, at intervals during the study, such as every 2 weeks during the study, at the end of the treatment period, and 4 weeks after the last dose of compound 1 or 2, for safety and pharmacodynamic evaluations. The evaluations include markers of blood glucose, interstitial glucose, and insulin, as well as imaging including fundus photography, optical coherence tomography, fluoroangiographic examination, and retinography. The fluoroangiography and retinography are carried out according to the standard methods and the photograms are graduated by giving a score to the plasmatic exudation and to the hard exudates on the basis of the ERDRS Classification.
