with the exception of the compounds having the following formulae:

pyrazolo[1,5-a]pyrimidine-3-carboxamide, 7-(difluoromethyl)-N-[3-(4-morphonilinylsulfonyl)phenyl]-5-phenyl]; and
pyrazolo[1,5-a]pyrimidine-3-carboxamide, 7-(difluoromethyl)-5-(4-methoxyphenyl)-N-[3-(4-morpholinylsulphonyl)phenyl].

The three compounds disclaimed from the scope for formula I are known from chemical libraries. Said three compounds were never disclosed in relation with metabotropic glutamate receptors.

It has surprisingly been found that the compounds of general formula I are metabotropic glutamate receptor antagonists. Compounds of formula I are distinguished by valuable therapeutic properties.

In the central nervous system (CNS) the transmission of stimuli takes place by the interaction of a neurotransmitter, which is sent out by a neuron, with a neuroreceptor.

L-glutamic acid, the most commonly occurring neurotransmitter in the CNS, plays a critical role in a large number of physiological processes. The glutamate-dependent stimulus receptors are divided into two main groups. The first main group forms ligand-controlled ion channels. The metabotropic glutamate receptors (mGluR) form the second main group and, furthermore, belong to the family of G-protein-coupled receptors.

At present, eight different members of these mGluR are known and of these some even have sub-types. On the basis of structural parameters, the different influences on the synthesis of secondary metabolites and the different affinity to low-molecular weight chemical compounds, these eight receptors can be sub-divided into three sub-groups: mGluR1 and mGluR5 belong to group I, mGluR2 and mGluR3 belong to group II and mGluR4, mGluR6, mGluR7 and mGluR8 belong to group III.

Ligands of metabotropic glutamate receptors belonging to the group II can be used for the treatment or prevention of acute and/or chronic neurological disorders such as psychosis, schizophrenia, Alzheimer's disease, cognitive disorders and memory deficits.
Other treatable indications in this connection are restricted brain function caused by bypass operations or transplants, poor blood supply to the brain, spinal cord injuries, head injuries, hypoxia caused by pregnancy, cardiac arrest and hypoglycaemia. Further treatable indications are chronic and acute pain, Huntington's chorea, amyotrophic lateral sclerosis (ALS), dementia caused by AIDS, eye injuries, retinopathy, idiopathic parkinsonism or parkinsonism caused by medicaments as well as conditions which lead to glutamate-deficiency functions, such as e.g. muscle spasms, convulsions, migraine, urinary incontinence, nicotine addiction, opiate addiction, anxiety, vomiting, dyskinesia depressions and glioma since mGluR2 antagonists have been found to reduce cell proliferation in human glioma cells (J. Neurochem. March 2003, 84(6): 1288-95).

Objects of the present invention are compounds of formula I and their pharmaceutically acceptable salts per se and as pharmaceutically active substances, their manufacture, medicaments based on a compound in accordance with the invention and their production, as well as the use of the compounds in accordance with the invention in the control or prevention of illnesses of the aforementioned kind, and, respectively, for the production of corresponding medicaments.

The compounds of formula I can also be used in form of their prodrugs. Examples are esters, N-oxides, phosphate esters, glycoamide esters, glyceride conjugates and the like. The prodrugs may add to the value of the present compounds advantages in absorption, pharmacokinetics in distribution and transport to the brain.

The invention also relates to the use of the compound of formula I according to the invention, including the compounds having the following formulae:
pyrazolo[1,5-a]pyrimidine-3-carboxamide, 7-(difluoromethyl)-5-(4-methylphenyl)-N-[3-(4-morpholinyl)sulfonyl]phenyl; pyrazolo[1,5-a]pyrimidine-3-carboxamide, 7-(difluoromethyl)-N-[3-(4-morpholinyl)sulfonyl]phenyl)-5-phenyl]; and pyrazolo[1,5-a]pyrimidine-3-carboxamide, 7-(difluoromethyl)-5-(4-methoxyphenyl)-N-[3-(4-morpholinyl)sulphonyl]phenyl]; as well as pharmaceutically acceptable salts thereof; for the treatment or prevention of a disease of the aforementioned kind as well as their use for the production of corresponding medicaments.

The compounds of the invention may be prepared according to a process comprising reacting a compound of formula VI

![VI](image)

with a compound of formula VII
wherein R₁, R₂, R₃, R₄, R₅ and p are as defined in formula I above; to obtain the compound of formula I, and if desired converting the compound of formula I into its pharmaceutically acceptable addition salt.

The pharmaceutically acceptable addition salts can be manufactured readily according to methods known per se and taking into consideration the nature of the compound to be converted into a salt. Inorganic or organic acids such as, for example, hydrochloric acid, hydrobromic acid, sulphuric acid, nitric acid, phosphoric acid or citric acid, formic acid, fumaric acid, maleic acid, acetic acid, succinic acid, tartaric acid, methanesulphonic acid, p-toluenesulphonic acid and the like are suitable for the formation of pharmaceutically acceptable salts of basic compounds of formula I.

The synthesis of the intermediate compounds of formula (VI) above may be carried out in accordance with the following general procedures I and/or Ia which procedures are outlined below in scheme 1 and scheme 1a. The procedure given in scheme 1 is convenient for intermediate compounds VI wherein R⁴ is CF₃ or CHF₂, whereas for intermediate compounds VI wherein R⁴ is linear C₁₋₃ alkyl or cyclopropyl, the procedure outlined in scheme 1a is the preferred one.

As for the reaction of the compound of formula (VII) with a compound of formula (VI), it may be for example carried out in accordance with the following general procedure II which procedure is outlined below in scheme 2. In these schemes (I, Ia, and II), R¹, R₂, R₃, R⁴, R₅ and p are as defined hereinabove. Procedures I/ Ia and II are applicable for the preparation of all the compounds according to formula I.

To a stirred solution of compound of formula (III) in an organic solvent (e.g. tert.-butylmethyl-ether) is added at room temperature a solution of sodium methoxide in methanol followed by a solution of compound of formula (II) in an organic solvent (e.g. tert.-butylmethyl-ether). The reaction mixture is stirred at room temperature for about 19 h, cooled, acidified and extracted (e.g. with diethyl ether). The combined organic layers are washed and dried (e.g. with MgSO₄) and evaporated to give crude compound of formula (IV) which can be used without further purification.

**Step 1.2:**

A stirred mixture of commercially available 3-amino-4-ethoxycarbonyl-pyrazole (compound of formula (V)) and compound of formula (IV) in an organic acid (e.g. acetic acid) is heated under reflux conditions for about 1.5 h. The reaction mixture is evaporated and the crude product is dissolved in a mixture of a concentrated base (e.g. KOH in methanol and water). The reaction mixture is stirred at about 60 °C for about 1.5 h, cooled, acidified and concentrated. The precipitate is collected by filtration and further purified (e.g. by crystallization from diethal ether/methanol) to give the compound of formula (VI).

5 **Step 1a.1:**

To a suspension of sodium hydride in toluene are added subsequently diethyl carbonate and a compound of formula (II). The solution is slowly warmed up to 100 °C during which process hydrogen gas is produced. The mixture is stirred at reflux temperature for 6 to 15 h. After cooling the mixture to 10 °C, acetic acid acid is added followed by ice-water and conc. HCl. The mixture was extracted (e.g. with ethyl acetate). The organic layer is successively washed with aqueous NaHCO₃ solution, water and brine, dried (e.g. with Na₂SO₄), and evaporated. The remaining crude product of formula (IX) can be used directly in the next step or, optionally, is purified, e.g. by distillation.

10 **Step 1a.2:**

A mixture of a compound of formula (IX) and 3-amino-4-ethoxycarbonyl-pyrazole (compound of formula (V)) is heated, either neat with stirring to about 150 °C for 2 to 6 h, or preferably in a solvent (such as e.g. acetic acid) for 8 to 20 h. The product of formula (X) can be isolated by a conventional work-up procedure, e.g. by precipitation of the product with water or partitioning of the reaction mixture between water and an organic solvent, such as dichloromethane, and the crude product may be further purified, e.g. by crystallization.

15 **Step 1a.3:**
A compound of formula (X) is heated with stirring with POCl₃ to 80 to 100 °C for 1 to 15 h, preferably in the presence of a basic catalyst (e.g. dimethyl aniline). The mixture is cooled and evaporated in vacuo. The residue is partitioned between water and an organic solvent (e.g. dichloromethane or ethyl acetate), the organic layers are washed with water and brine, dried (e.g. with Na₂SO₄), and evaporated. The remaining crude product of formula (XI) can be used directly in the next step or, preferably, is purified, e.g. by crystallization.

**Step 1a.4:**

For the preparation of a compound (XIII), wherein R⁴ represents linear C₁₋₃-alkyl or cyclopropyl, a solution of a compound of formula (XIII), a reagent R⁴ZnCl (XII) or Zn(R⁴)₂ (XIIb), and a Pd(0) catalyst (e.g. Pd(PPh₃)₄ in THF is heated to 40 to 70 °C for 0.5 to 6 h. To the cooled reaction mixture is added saturated aqueous ammonium chloride. The mixture is extracted with ethyl acetate and the organic layers are washed with water and brine, dried (e.g. with Na₂SO₄), and evaporated. The crude product can be used directly in the next step, or firstly be purified by chromatography and/or crystallisation.

For the preparation of a compound (XIII), wherein R⁴ represents hydrogen, a solution of a compound of formula (XIII) in a solvent (e.g. in ethanol) is stirred in an atmosphere of hydrogen in the presence of palladium on charcoal and of a base (e.g. triethylamine) at 20 °C for 0.1-0.3 h. The mixture is filtered and the solvent is evaporated to afford a compound of formula (XIII) wherein R⁴ is hydrogen.

**Step 1a.5:**

An intermediate compound VI, wherein R⁴ is linear C₁₋₃ alkyl or cyclopropyl, can be prepared by subjecting an intermediate compound (XIII) to conventional procedures used to hydrolyze ethyl esters, e.g. by treatment with an aqueous base, such as 2N sodium hydroxide solution, optionally in the presence of a co-solvent, such as methanol, at 20-70 °C.

**Step 2.1**

1) oxalyl chloride
2) pyridine/DMAP

\[ \text{(I)} \]

**Step 2.1:**

To a stirred solution of compound of formula (VI) in a solvent (e.g. THF) is added at room temperature DMF, the solution is cooled to about 0 °C and oxalyl chloride is added. The reaction mixture is stirred at room temperature for about 3 h and evaporated to dryness. The precipitate is dissolved in pyridine and, while stirring at room temperature, 4-dimethylamino-pyridine and a compound of formula (VII) are added. The reaction mixture is allowed to stir at room temperature for about 16 h, evaporated to dryness and the crude product is purified (e.g. by flash chromatography on silica gel) to yield the product, which can be further purified (e.g. by crystallization from methanol/hexane).
The compounds of formula I and their pharmaceutically acceptable salts are metabolotropic glutamate receptor antagonists and can be used for the treatment or prevention of acute and/or chronic neurological disorders, such as psychosis, schizophrenia, Alzheimer’s disease, cognitive disorders and memory deficits. Other treatable indications are restricted brain function caused by bypass operations or transplants, poor blood supply to the brain, spinal cord injuries, head injuries, hypoxia caused by pregnancy, cardiac arrest and hypoglycaemia. Further treatable indications are acute and chronic pain, Huntington’s chorea, ALS, dementia caused by AIDS, eye injuries, retinopathy, idiopathic parkinsonism or parkinsonism caused by medicaments as well as conditions which lead to glutamate-deficient functions, such as e.g. muscle spasms, convulsions, migraine, urinary incontinence, nicotine addiction, psychoses, opiate addiction, anxiety, vomiting, dyskinesia depression and glioma since mGluR2 antagonists have been found to reduce cell proliferation in human glioma cells (J. Neurochem. March 2003, 84(6): 1288-95).

The compounds of formula I and pharmaceutically acceptable salts thereof can be used as medicaments, e.g. in the form of pharmaceutical preparations. The pharmaceutical preparations can be administered orally, e.g. in the form of tablets, coated tablets, dragées, hard and soft gelatine capsules, solutions, emulsions or suspensions. However, the administration can also be effected rectally, e.g. in the form of suppositories, or parenterally, e.g. in the form of injection solutions.

The compounds of formula I and pharmaceutically acceptable salts thereof can be processed with pharmaceutically inert, inorganic or organic carriers for the production of pharmaceutical preparations. Lactose, corn starch or derivatives thereof, talc, stearic acid or its salts and the like can be used, for example, as such carriers for tablets, coated tablets, dragées and hard gelatine capsules. Suitable carriers for soft gelatine capsules are, for example, vegetable oils, waxes, fats, semi-solid and liquid polyols and the like; depending on the nature of the active substance no carriers are, however, usually required in the case of soft gelatine capsules. Suitable carriers for the production of solutions and syrups are, for example, water, polyols, sucrose, invert sugar, glucose and the like. Adjuvants, such as alcohols, polyols, glycerol, vegetable oils and the like, can be used for aqueous injection solutions of water-soluble salts of compounds of formula I, but as a rule are not necessary. Suitable carriers for suppositories are, for example, natural or hardened oils, waxes, fats, semi-liquid or liquid polyols and the like.

In addition, the pharmaceutical preparations can contain preservatives, solubilizers, stabilizers, wetting agents, emulsifiers, sweeteners, colorants, flavorants, salts for varying
the osmotic pressure, buffers, masking agents or antioxidants. They can also contain still other therapeutically valuable substances.

As mentioned earlier, medicaments containing a compound of formula I or a pharmaceutically acceptable salt thereof and a therapeutically inert excipient are also an object of the present invention, as is a process for the production of such medicaments which comprises bringing one or more compounds of formula I or pharmaceutically acceptable salts thereof and, if desired, one or more other therapeutically valuable substances into a galenical dosage form together with one or more therapeutically inert carriers.

The dosage can vary within wide limits and will, of course, be fitted to the individual requirements in each particular case. In general, the effective dosage for oral or parenteral administration is between 0.01-20 mg/kg/day, with a dosage of 0.1-10 mg/kg/day being preferred for all of the indications described. The daily dosage for an adult human being weighing 70 kg accordingly lies between 0.7-1400 mg per day, preferably between 7 and 700 mg per day.

The present invention relates also to the use of compounds of formula I and of pharmaceutically acceptable salts thereof for the production of medicaments, especially for the control or prevention of acute and/or chronic neurological disorders of the aforementioned kind.

The compounds of the present invention are group II mGlu receptor antagonists. The compounds show activities, as measured in the assay described below, of 0.060 μM or less, typically 0.025 μM or less, and ideally of 0.010 μM or less. In the table below are described some specific Ki values of preferred compounds.

<sup>[3]H</sup>-LY354740 binding on mGlu2 transfected CHO cell membranes.

Transfection and cell culture

cDNA encoding the rat mGlu2 receptor protein in pBluescript II was subcloned into the eukaryotic expression vector pcDNA I-amp from Invitrogen Ltd (Paisley, UK). This vector construct (pcD1mGR2) was co-transfected with a psvNeo plasmid encoding the
gene for neomycin resistance, into CHO cells by a modified calcium phosphate method described by Chen & Okayama (1988). The cells were maintained in Dulbecco’s Modified Eagle medium with reduced L-glutamine (2 mM final concentration) and 10% dialysed foetal calf serum from Gibco-Invitrogen (Carlsbad, CA, USA). Selection was made in the presence of G-418 (1000 µg/ml final) and MCPP. Clones were identified by reverse transcription of 5 µg total RNA, followed by PCR using mGlu2 receptor specific primers 5'-atcactgtgctggattctggcactg-3' and 5'-agcatcactgtagctggcactgagc-3' in 60 mM Tris HCl (pH 10), 15 mM (NH4)2SO4, 2 mM MgCl2, 25 units/ml Taq Polymerase with 30 cycles annealing at 60 °C for 1 min., extension at 72 °C for 30 s, and 1 min. 95 °C denaturation.

Membrane preparation

Cells, cultured as above, were harvested and washed three times with cold PBS and frozen at –80 °C. The pellet was resuspended in cold 20 mM HEPES-NaOH buffer containing 10 mM EDTA (pH 7.4), and homogenised with a polytron (Kinematica, AG, Littau, Switzerland) for 10 s at 10 000 rpm. After centrifugation for 30 min. at 4 °C, the pellet was washed once with the same buffer, and once with cold 20 mM HEPES-NaOH buffer containing 0.1 mM EDTA, (pH 7.4). Protein content was measured using the micro BCA method from Pierce-Perbio (Rockford, IL, USA) using bovine serum albumin as standard.

[^H]-LY354740 binding

After thawing, the membranes were resuspended in cold 50 mM Tris-HCl buffer containing 2 mM MgCl2 (pH 7) (binding buffer). The final concentration of the membranes in the assays was 25 µg protein/ml. Inhibition experiments were performed with membranes incubated with 10 nM[^H]-LY354740 at room temperature, for 1 hour, in presence of various concentrations of the compound to be tested. Following the incubations, membranes were filtered onto Whatmann GF/B glass fiber filters and washed 5 times with cold binding buffer. Non specific binding was measured in the presence of 10 µM DCG IV. After transfer of the filters into plastic vials containing 10 ml of Ultima-gold scintillation fluid from Perkin-Elmer (Boston, MA, USA), the radioactivity was measured by liquid scintillation in a Tri-Carb 2500 TR counter (Packard, Zürich, Switzerland).

Data analysis.

The inhibition curves were fitted with a four parameter logistic equation giving IC50 values, and Hill coefficients.

The starting material was prepared in the following way:

7-Chloro-5-(4-chloro-phenyl)-pyrazolo[1,5-a]pyrimidine-3-carbonyl chloride

A mixture of ethyl 5-(4-chloro-phenyl)-7-hydroxy-pyrazolo[1,5-a]pyrimidine-3-carboxylate (1.59 g, 5.0 mmol) (example C.22, step a) in dimethyl sulfoxide (30 mL)/2N NaOH (10 mL) was heated to 80 °C for 1 h, a white precipitate being formed. Upon addition of water (100 mL) to the cooled mixture a clear solution was formed which was firstly washed with diethyl ether and subsequently acidified to pH 2 by the addition of 3N HCl. The white precipitate was isolated by filtration and dried to give 5-(4-chloro-phenyl)-7-hydroxy-pyrazolo[1,5-a]pyrimidine-3-carboxylic acid (1.44 g, 99%). White solid. MS (ISN) 288.0 [(M-H)]⁻; mp 258°C.

This material was heated together with phosphorous oxychloride (4.0 mL, 0.15 mol), and N,N-dimethylaniline (0.19 mL, 2 mmol) to 100°C for 2 h. The mixture was evaporated in vacuo and the residue was partitioned between water and dichloromethane. The organic phase was dried (Na₂SO₄) and evaporated in vacuo to give the crude title compound (1.6 g) as a pale-yellow solid.
