2-ACYLAMINOTHIAZOLEs FOR THE TREATMENT OF CANCER

CROSS-REFERENCE TO RELATED APPLICATION

The present invention relates to 2-acylaminothiazole derivatives having ALK kinase inhibitory activity and to their pharmaceutical uses.

Such inhibitors can be used for the treatment of hyperproliferative diseases such as cancer, in particular for the treatment of ALK fusion protein positive cancers, such as anaplastic large cell lymphoma (ALCL), diffuse large B cell lymphoma, inflammatory myofibroblastic tumours, non-small cell lung cancer (NSCLC), oesophageal squamous cell carcinoma, renal medullary carcinoma, myeloid leukaemia, breast cancer and colorectal carcinoma.

BACKGROUND OF THE INVENTION

Cancer results from the subversion of processes that control the normal growth, location and mortality of cells. This loss of normal control mechanisms arises from the acquisition of mutations that lead to the oncogenic activation of proteins that are involved in the normal regulation of such processes.

Protein kinases are enzymes that catalyse the transfer of phosphate from adenosine-5′-triphosphate (ATP) to specific amino acid residues in many proteins. Generally, the phosphorylation of a protein changes its functionality, from inactive to active in some cases, and from active to inactive in others. Protein kinases are thus involved in the regulation of many aspects of cell function, as most of the signal transduction pathways controlling cell growth, survival, differentiation and motility are mediated by phosphorylation. Abnormal activity of protein kinases has been implicated in many cancers as well as in other diseases. The human genome encodes at least 518 kinases, of which approximately 90 specifically phosphorylate the phenolic hydroxyl of tyrosine residues. Tyrosine kinases are particularly involved in cell proliferation and survival processes, and their aberrant activation most often leads to oncogenic transformation.

For example, structural alterations in ALK produced by the chromosomal rearrangement t(2q23;5q35) generatates the NPM/ALK oncogenic fusion protein associated with ALCL (Rabbitts, T. H. Nature, 1994;372, 145.)

Large cell lymphomas represent about 25% of all non-Hodgkin’s lymphomas; about one-third of these tumors are anaplastic large cell lymphoma (ALCL). In turn, the majority of ALCL patients (60-80%) possess a chromosomal translocation that leads to the in-frame juxtaposition of the 5′ portion of the nucleophosmin (NPM) gene with the sequence encoding for the catalytic domain of ALK kinase. The resulting chimaeric gene, under the control of the strong NPM promoter, drives the expression of the NPM/ALK oncogenic fusion protein. An additional 10% of ALCL patients carry other ALK fusion proteins. To date, 11 ALK fusions have been described. In all cases, the ALK kinase domain sequence is fused to an aminoterminal protein-protein interaction domain of a protein that is highly expressed in the target cell. Thus, the fusion partner provides constitutive expression (through its promoter) and activation (via oligomerisation). In addition, ALK fusion proteins show anomalous cellular localization. For example, NPM/ALK is mainly found in the cytoplasm and the nucleus. By contrast, wild-type ALK is a tightly regulated, integral membrane protein that is only activated in the presence of a specific extracellular ligand.

About 5-8% of NSCLC patients carry the EML4/ALK fusion. As with NPM/ALK, the 5′ fusion partner EML4 provides high expression and constitutive activation of the ALK kinase. The population of ALK+NSCLC patients, although representing a minority of all NSCLC patients, is estimated to be about 50-70,000 new cases worldwide each year. In addition to fusion proteins, activating point mutants of ALK have been described and validated in familial (90% of cases) and sporadic (~10%) neuroblastoma and in anaplastic thyroid carcinoma (10% of patients).

ALK is normally expressed in the nervous system during embryonic development and is strongly down-regulated at birth, resulting in barely detectable levels in adult tissues. It has been extensively demonstrated that constitutively active NPM/ALK is a potent oncogene with transforming and tumorigenic properties (Morris et al., Science, 1994; 263, 1281-1284).

Moreover, rearrangement of ALK kinase is a very early event in tumour formation and is necessary for survival of transformed cells. The high level of expression of NPM/ALK and other ALK fusion protein variants in lymphoma cells and their direct role in lymphomagenesis, combined with the fact that normal ALK is expressed at low levels in the human body, suggests that ALK could potentially be an ideal target for therapy.

There is currently only one drug clinically available for the treatment of ALK-positive cancer. Crizotinib is a dual MET/ALK inhibitor recently approved for ALK+ NSCLC. It potently inhibits ALK phosphorylation and induces apoptosis in ALK+ cancer cells. Initial clinical trials showed excellent activity and tolerability in advanced NSCLC patients (Shaw et al., Lancet Oncol 2011; 12: 1004-12). However, clinical resistance develops in a significant fraction of patients (Choi et al., N Engl J Med 2010; 363: 1734-9). At least half of the patients show either amplification of ALK gene or acquisition of a secondary mutation that renders ALK insensitive to Crizotinib. In particular, the gatekeeper mutant L1196M showed high resistance to Crizotinib. Therefore, there is urgent need for second-generation compounds, with higher potency and selectivity to inhibit Crizotinib-resistant mutants and to circumvent clinical resistance. Moreover, it would be desirable to develop compounds which are non-ATP competitive.

DETAILED DESCRIPTION OF THE INVENTION

This invention provides compounds of formula (I)
Wherein:

−R<sub>i</sub> is

Rx and Rx' can be the same or different and are a C<sub>i</sub>-C<sub>j</sub> linear or branched alkyl;

X is either oxygen or NRy;

Ry is a C<sub>i</sub>-C<sub>j</sub> linear or branched alkyl or propargyl;

Alternatively, and imperatively when —R is

such compounds may be obtained by insertion of the R₂ or R₃ ethynyl derivative via a Sonogashira coupling as a first step, as depicted in scheme 2 below.

Scheme 2

When both —R₂ and —R₃ are —C—C—R₄ and —R₂ and —R₃ are the same, the compounds of this invention may be obtained similarly to those depicted in scheme 1 and 2 above, but starting from a di-halo derivative and by inserting both R₂ and R₃ via the Sonogashira reaction as depicted in schemes 3 and 4 below.

Scheme 3
When both —R₂ and —R₃ are —C≡C—R₄ and they are not the same, such groups may be inserted sequentially into the above depicted di-halo precursor via a Sonogashira coupling, either by inserting the first group at the bromide-substituted carbon via a Sonogashira reaction under the Buchwald conditions using 1 equivalent of alkyne—which however may lead to the formation of a portion of unwanted substituted compound—and then performing a second Sonogashira coupling with the same conditions at the chlorine substituted atom, or by inserting the first group at the bromine-substituted carbon via a controlled copper and Pd(PPh₃)₄-catalysed Sonogashira reaction and the second group via a Sonogashira reaction at the chlorine atom under the Buchwald conditions.

**BIOLOGICAL EVALUATION**

The compounds of the invention may be tested in a relevant animal model or in the following assays.

**ELISA-Based in vitro Kinase Assay**

GST-tagged recombinant wild-type or L1196M mutated ALK kinase (rALK) was expressed in S9 insect cells using the pBacPAK baculovirus vector system (Clontech) and purified using Glutathione Sepharose 4B affinity beads (GE Healthcare). Recombinant 3C protease was used to remove the GST tag. Purified ALK was used to screen inhibitors in the ELISA-based kinase assay, as follows: Nunc-Immuno 96-well plates were incubated overnight at 30°C with coating solution containing 2 µg of a specific ALK peptide substrate (ARDYRASFRKGCAMLPRVK) in PBS. Wells were then washed with 200 µL of wash buffer (PBS-Tween 0.05%) and incubated with 4% BSA in PBS for at least 2 h at 30°C. The kinase reaction was performed in the presence of 50 mM Tris pH 7.5, 5 mM MnCl₂, 5 mM MgCl₂, 0.3 mM ATP, and purified rALK in a total volume of 100 µL/well at 30°C for 15 min. For inhibitor testing the reaction mix was preincubated with inhibitor or vehicle for 10 min at room temperature before transferring to the ELISA plate. After the reaction, the wells were washed 5 times with 200 µL of wash buffer. Phosphorylated peptide was detected using 100 µL/well of a mouse monoclonal anti-phosphotyrosine antibody (clone 4G10 UpstateBiotech Ltd) diluted 1:2000 in PBS+4% BSA. After 30 min incubation at room temperature the antibody was removed and wells were washed as described above. 100 µL of a secondary antibody (anti-mouse IgG, Horseradish Peroxidase linked whole antibody, Amersham Pharmacia Biotech) diluted 1:10000 in PBS+4% BSA was added to each well and the plate was incubated again for 30 min at room temperature before washing as above. The plate was developed using 100 µL/well TMB Substrate Solution (Pierce) and the reaction was stopped by adding an equal volume of 1M H₂SO₄. Finally, the absorbance was read at 450 nm using an ELISA plate reader (Bio-Rad). The concentration of inhibitor showing 50% inhibition as compared with the control was expressed as IC₅₀ (µM).

**Tritiated Thymidine Uptake Cell Proliferation Assay**

The following procedure uses parental untransformed BaF3 cells, BaF3 cells transformed with the oncogenic fusion protein NPM/ALK, BaF3 cells transformed with the mutated oncogenic fusion protein NPM/ALK carrying the substitution L1196M, human NPM/ALK-positive SUDHL-1 and Karpas-299 cells, human ALK-negative U937 and HL-60 leukemic cells. The parent untransformed BaF3 cells and ALK-negative cells are used as controls. Cells are seeded in U-bottomed 96-well plates at 10 000 cells/well in a volume of 100 µL in supplemented medium. In the case of the parent untransformed BaF3 cells, the medium is supplemented with IL-3. Serial dilutions of inhibitors are added to the appropriate wells and volumes adjusted to 200 µL. Controls were treated with the equivalent volume of vehicle, DMSO, alone. Plates are incubated at 37°C for 72 h. [³H]-thymidine (1 µCi/µL) is added for the last 8 h of incubation. Cells are harvested on to paper filters and [³H]-thymidine incorporation is measured using a β scintillation counter (1430 MicroBeta, Wallac, Turku, Finland). The 50% inhibitory concentration (IC₅₀) is defined.
as the concentration of inhibitor, expressed in micromolar, that give a 50% decrease in [3H]-thymidine uptake compared with controls.

FORMULATION AND ADMINISTRATION

Compounds under formula I are formulated preferably in admixture with a pharmaceutically acceptable carrier, excipient or the like. In general, it is preferable to administer the pharmaceutical composition in orally-administrable form, but certain formulations may be administered via a parenteral, intravenous, intramuscular, transdermal, buccal, subcutaneous, suppository, nasal or other route. One of ordinary skill in the art may modify the formulations within the teachings of the specification to provide numerous formulations for a particular route of administration without rendering the compositions of the present invention unstable or compromising their therapeutic activity. In particular, the modification of the present compositions to render them more soluble in water or other vehicle, for example, may be easily accomplished by minor modifications (salt formulation, esterification, etc.) which are well within the ordinary skill in the art. It is also well within the routine’s skill to modify the route of administration and dosage regimen of a particular compound in order to manage the pharmacokinetics of the present compounds for maximum beneficial effect in patients. In certain pharmaceutical dosage forms, the prodrug form of the compounds, especially including ester and ether derivatives, as well as various salt forms of the present compounds, are preferred. One of ordinary skill in the art will recognize how to readily modify the present compounds to pro-drug forms to facilitate delivery of active compounds to a targeted site within the host organism or patient. The routine also will take advantage of favourable pharmacokinetic parameters of the pro-drug forms, where applicable, in delivering the present compounds to a targeted site within the host organism or patient to maximize the intended effect of the compound. Actual methods of preparing such dosage forms are known, or will be apparent, to those skilled in this art; for example, see Remington’s Pharmaceutical Sciences, Mack Publishing Company, Easton, Pa., 15th Edition, 1975. The composition or formulation to be administered will, in any event, contain a quantity of the active compound in an amount effective to alleviate the symptoms of the subject being treated. While human dosage levels have yet to be optimized for the compounds of the invention, generally, a daily dose is from about 0.05 mg/kg to about 100 mg/kg of body weight. The amount of active compound administered will, of course, be dependent on the subject and disease state being treated, the severity of the affliction, the manner and schedule of administration and the judgment of the prescribing physician. For purposes of the present invention, a prophylactically or preventative effective amount of the compositions according to the present invention (i.e., an amount which substantially reduces the risk that a patient will either succumb to a disease state or condition or that the disease state or condition will worsen) falls within the same concentration range as set forth above for therapeutically effective amounts and is usually the same as a therapeutically effective amount. In some embodiments of the present invention, one or more compounds of formula (I) are administered in combination with one or more other pharmaceutically active agents. The phrase “in combination”, as used herein, refers to agents that are simultaneously administered to a subject. It will be appreciated that two or more agents are considered to be administered “in combination” whenever a subject is simultaneously exposed to both (or more) of the agents. Each of the two or more agents may be administered according to a different schedule; it is not required that individual doses of different agents be administered at the same time, or in the same composition. Rather, so long as both (or more) agents remain in the subject's body, they are considered to be administered “in combination”.

EXAMPLES

Examples 1 to 50 below represent individual embodiments of this invention

General procedure D for Sonogashira coupling with PdCl₂(CH₂CN)₂

At room temperature and under an inert atmosphere, the bromo moiety (1 eq.) was placed in a Schlenk tube, followed by the addition of PdCl₂(CH₂CN)₂ (0.08 eq.), 2-dicyclohexylphosphino-2',4',6'-trisopropylbiphenyl (0.16 eq.) and Cs₂CO₃ (2.6 eq.). The tube was evacuated and back-filled with argon (this was repeated three additional times). Acetonitrile (1 mL) was added and then the alkyne (2 eq.) was injected. The reaction mixture was allowed to stir at 90° C. overnight. Then the reaction mixture was cooled to room temperature. The mixture was diluted with DCM, filtered through Celite and washed with DCM. The organic layer was evaporated under reduced pressure.

General procedure E for Sonogashira coupling with PdCl₂(CH₂CN)₂

At room temperature and under an inert atmosphere, the bromo moiety (1 eq.) was placed in a Schlenk tube, followed by the addition of PdCl₂(CH₂CN)₂ (0.16 eq.), 2-dicyclohexylphosphino-2',4',6'-dimethoxybiphenyl (0.32 eq.) and Cs₂CO₃ (5.2 eq.). The tube was evacuated and back-filled with argon (this was repeated three additional times). Acetonitrile (1 mL) was added and then the alkyne (2 eq.) was injected. The reaction mixture was allowed to stir at 90° C. overnight. Then the reaction mixture was cooled to room temperature. The mixture was diluted with DCM, filtered through Celite and washed with DCM. The organic layer was evaporated under reduced pressure.

General procedure F for Sonogashira coupling with Pd(PP₃)₄

At room temperature and under an inert atmosphere, the bromo moiety (1 eq.) was placed in a Schlenk tube, followed by the addition of Pd(PP₃)₄ (0.05 equiv.), CuI (0.1 equiv.) and K₂PO₃ (1.1 equiv.). The tube was evacuated and back-filled with argon (this was repeated three additional times). THF (1 mL) was added and then the alkyne (2 equiv.) was injected. The reaction mixture was allowed to stir at 70° C. overnight. Then the reaction mixture was cooled to room temperature. The mixture was diluted with DCM, filtered through Celite and washed with DCM. The organic layer was evaporated under reduced pressure.

General procedure G for Sonogashira coupling with PdCl₂(CH₂CN)₂

At room temperature and under an inert atmosphere, the bromo moiety (1 eq.) was placed in a Schlenk tube, followed by the addition of PdCl₂(CH₂CN)₂ (0.08 eq.), 2-dicyclohexylphosphino-2',4',6'-trisopropylbiphenyl (0.16 eq.) and K₂CO₃ (2 eq.). The tube was evacuated and back-filled with argon (this was repeated three additional times). Acetonitrile (1 mL) was added and then the alkyne (2 eq.) was injected. The reaction mixture was allowed to stir at 90° C. overnight. Then the reaction mixture was cooled to room temperature. The mixture was diluted with DCM, filtered through Celite and washed with DCM. The organic layer was evaporated under reduced pressure.

Intermediates and Precursors

When not commercially available or readily obtainable by the skilled man in the art, the intermediates and precursors to the compounds of this invention were synthesised as follows:

tert-Butyl 1-piperazinecarboxylate

A solution of di-tert-butyl dicarbonate (6.32 g, 29 mmol) in MeOH (62 mL) was slowly added to a stirring solution of piperazine (5 g, 58 mmol) in MeOH (62 mL) at 0°C. The mixture was then stirred for 18 h at room temperature, and the solvent removed in vacuum. The crude solid was dissolved in diethyl ether with warming, and the white precipitate left was filtered off. The product was extracted from the mother liquor with 1M citric acid solution, and the aqueous layer was washed with Et₂OAc, basified with Na₂CO₃ (pH 11), and extracted with Et₂OAc. The organic layer was dried over Na₂SO₄ and evaporated in vacuum to give tert-butyl 1-piperazinecarboxylate as a waxy white solid (4 g, 57%). ¹H NMR (300 MHz, CDCl₃) δ 1.46 (s, 9H, 3x(CH₃)), δ 2.11 (s, 1H, NH), δ 2.85 (t, 4H, J=5.5 Hz, 2xCH₂), δ 3.41 (t, 4H, J=5.1 Hz, 2xCH₂). ¹³C NMR (75 MHz, CDCl₃) δ 155.1 (C), δ 79.8 (C), δ 46.2 (4xCH₂), δ 28.7 (3xCH₃). MS (ESI) [M+H]⁺ 187. mp = 53-54°C.

tert-Butyl 4-propargylpiperazine-1-carboxylate

4-(3-((triisopropylsilyl)ethynyl)phenyl)thiazol-2-amine (128 mg, 0.36 mmol) was diluted with toluene (1 mL) in a two necked round bottom flask equipped with a reflux condenser under an argon atmosphere. The solution was cooled down at 0°C and trimethylaluminium in toluene (176 µL, 2M) was slowly added. After 15 minutes, the ester (65 mg, 0.24 mmol) in toluene (300 µL) was added. The resulting solution was heated under reflux for two days, cooled to room temperature and slowly hydrolyzed with water to prevent foam formation. The aqueous layer was extracted four times with DCM, and the organic layers were combined and dried over Na₂SO₄. The solvent was evaporated under reduced pressure. Purification by silica gel flash chromatography (DCM/MeOH 9:1) afforded the product as a yellow viscous oil (120 mg, 84%). ¹H NMR (300 MHz, CDCl₃) δ 11.08 (bs, 1H, NH), 7.79 (bs, 1H, Har), 7.73 (d, J=8.0 Hz, 2H, Har), 7.66-7.60 (m, 1H, Har), 7.31-7.22 (m, 4H, Har), 7.21 (s, 1H, Har), 3.48 (s, 2H, CH₂), 3.30 (d, J=2.1 Hz, 2H, CH₂), 2.59 (bs, 4H, 2xCH₂), 2.46 (bs, 4H, 2xCH₂), 2.25 (s, J=2.1 Hz, 4xH, CH₃), 1.13 (s, 21H, 3x(CH₃)₂CH). ¹³C NMR (75 MHz, CDCl₃) δ 165.5 (C), 159.4 (C), 149.4 (C), 143.9 (C), 134.4 (C), 131.7 (CH), 131.0 (C), 129.7 (CH), 129.4 (2xCH), 128.8 (CH), 127.8 (2xCH), 126.1 (CH), 124.1 (C), 108.9 (CH), 107.0 (C), 91.1 (C), 79.0 (C), 73.6 (CH), 62.6 (CH₂), 53.2 (2xCH₂), 52.1 (2xCH₂), 47.0 (CH), 19.0 (3x(CH₃)₂CH). 4-(4-bromo-3-chlorophenyl)thiazol-2-amine (200 mg, 0.69 mmol) was diluted with toluene (2 mL) in a two necked round bottom flask equipped with a reflux condenser under an argon atmosphere. The solution was stirred and trimethylaluminum in heptane (327 µL, 2M) was slowly added. The solution was heated at 50° C. during 20 min and the
ester 2 (114 mg, 0.46 mmol) in toluene (700 μL) was added. The resulting solution was heated under reflux for one night, cooled to room temperature and slowly hydrolyzed with water to prevent foam formation. The aqueous layer was basified with a 1M NaOH solution (pH = 9-10). The mixture was extracted three times with DCM, and the organic layers were combined and dried over Na2SO4. The solvent was evaporated under reduced pressure. Purification by silica gel flash chromatography (DCM/MeOH 8:5) afforded the product (224.3 mg, 64%) as a yellow viscous oil. 1H NMR (300 MHz, CDCl3) δ 10.32 (s, 1H, NH), 7.95 (d, J = 2.0 Hz, 1H, Har), 7.91 (d, J = 8.3 Hz, 2H, Har), 7.55 (d, J = 8.3 Hz, 1H, Har), 7.47 (dd, J = 8.4, 2.0 Hz, 1H, Har), 7.40 (d, J = 8.2 Hz, 2H, Har), 7.21 (s, 1H, Har), 5.54 (s, 2H, CH2), 2.50 (bs, 8H, 4×CH2). 13C NMR (75 MHz, CDCl3) δ 165.1 (C), 159.2 (C), 148.1 (C), 144.5 (C), 135.2 (C), 135.1 (C), 134.1 (CH), 130.8 (C), 129.6 (2×CH), 128.1 (CH1), 127.8 (2×CH), 125.6 (CH), 122.0 (CH), 109.7 (CH), 62.7 (CH3), 55.3 (2×CH2), 53.2 (2×CH2), 46.2 (CH3). HRMS [M+H]+ C6H13NO2 found 118.0858.
To a solution of 4-(bromomethyl)-N-(4-(3-bromophenyl) thiadiazol-2-yl)benzamide (60 g, 0.13 mmol), K₂CO₃ (53 mg, 0.38 mmol) in CH₂CN at 0°C was added the 2-isopropoxy-2-oxoethanaminium chloride (22.3 mg, 0.145 mmol). The mixture was stirred two days at room temperature. The mixture was filtered through Celite pad, washed with DCM and evaporated to dryness. Purification by silica gel flash chromatography (DCM/MeOH 95:5) afforded the product (28.5 mg, 45%) as a yellow viscous oil. ¹H NMR (500 MHz, CDCl₃) δ 7.88 (dd, J = 1.7, 1.7 Hz, 1H, Har), 7.80 (d, J = 8.3 Hz, 2H, Har), 7.65 (ddd, J = 7.8, 1.5, 1.1 Hz, 1H, Har), 7.37 (ddd, J = 8.0, 1.9, 1.0 Hz, 1H, Har), 7.34 (d, J = 8.2 Hz, 2H, Har), 7.19 (s, 1H, Har), 7.18 (dd, J = 7.9, 7.9 Hz, 1H, Har), 5.10 (Hept, J = 6.3 Hz, 1H, Har), 3.85 (s, 2H, CH₂), 3.43 (s, 2H, CH₂), 1.27 (s, 3H, (CH₃)₂CHO), 1.24 (s, 3H, (CH₃)₂CHO). ¹³C NMR (75 MHz, CDCl₃) δ 171.87 (C), 165.30 (C), 159.33 (C), 148.83 (C), 144.67 (C), 136.54 (C), 131.17 (C), 131.12 (CH), 130.47 (CH), 129.43 (CH), 128.87 (2CH), 128.07 (2CH), 124.82 (CH), 121.15 (C), 109.39 (CH), 69.02 (CH₃)₂CHO), 52.97 (CH₂), 50.57 (CH₂), 22.17 (CH₃CHO). HRMS [M+H]⁺ C₃₂H₂₂BrN₂O₈S: Calcd. 488.0624 found 488.0638.

**BIOLOGICAL ACTIVITY**

Biochemical and Cellular Assays

Compounds of the invention that have been tested in the above described ELISA-based in vitro kinase assay and in the Tript(dis) tyrosine uptake cell proliferation in BAF3 cells assay tabulated in the table below.

The invention claimed is:

1. The compounds of formula (I)

wherein:

- $R_1$ is

$$R_y$$ is a C$_1$-C$_3$ linear or branched alkyl or propargyl;

- $R_z$ is either hydrogen or C$_1$-C$_3$ linear or branched alkyl;

- $R_2$ and $R_3$ can be the same or different and are hydrogen, linear or branched C$_1$-C$_3$ alkyl or —C=C—R$_4$, provided that at least one of $R_2$ and $R_3$ is —C=C—R$_{40}$;

- $R_4$ is hydrogen, —CH$_2$—O—CPh$_3$, cyclohexenyl, C$_1$-C$_4$ alkyl,

- $R_t$ and $R_t'$ can be the same or different and are C$_1$-C$_3$ alkyl optionally substituted with one or more fluorine atoms, C$_1$-C$_3$ alkoxy optionally substituted with one or more fluorine atoms or F;

- $R_a$, $R_b$, and $R_c$ can be the same or different and can be phenyl or C$_1$-C$_4$ linear or branched alkyl; and pharmaceutically acceptable salts thereof.

2. The compounds of claim 1 wherein

- $R_2$ is hydrogen or linear or branched C$_1$-C$_3$ alkyl; and

3. The compounds of claim 1 wherein

- $R_2$ is —C=C—R$_4$; and

4. The compounds of claim 2, wherein $R_4$ is selected from the list of

5. The compounds of claim 2, wherein $R_4$ is selected from the list of

- $i$ equals zero, 1 or 2

$R_x$ and $R_x'$ can be the same or different and are a C$_1$-C$_3$ linear or branched alkyl;
