NOVEL COMPOUNDS AND COMPOSITIONS FOR TREATING DISEASES ASSOCIATED WITH TRYPITASE ACTIVITY

This application claims the benefit of U.S. Provisional Application No. 60/023,139, filed July 30, 1996.

Field of the Invention:

This invention relates to novel methods and compositions for treating diseases associated with tryptase activity by administration of novel tryptase inhibitors.

Description of the Field:

Tryptase, the predominant protease secreted from human mast cells, is thought to be involved in neuropeptide processing and tissue inflammation. Tryptase concentrations are elevated in the bloodstream for several hours following anaphylaxis (Schwartz et al. (1987) N. Eng. J. Med. 316:1622-1626), are increased in nasal and lung lavage fluid from atopic subjects following specific antigen challenge (Castells et al. (1988) J. Allerg. Clin. Immunol. 141:563-568) and are elevated in lung lavage fluid of atopic asthmatics after endobronchial allergen challenge. Smokers often have striking elevations of bronchoalveolar lavage fluid tryptase levels, a finding that provides some support for the hypothesis that release of proteinase from activated mast cells could contribute to lung destruction in smoker’s emphysema. (Celenteron et al. (1988) Chest 94:119-123). In addition, tryptase has been shown to be a potent mitogen for fibroblasts, suggesting that it is involved in pulmonary fibrosis and interstitial lung disease (Ross et al. (1991) J. Clin. Invest. 88:493-499).

Asthma is recognized as an inflammatory disorder (Hood et al. (1984) In: Benjamin-Cummings, ed. Immunology 2nd ed.) and frequently is characterized by progressive development of hyper responsiveness of the trachea and bronchi to both immunospecific allergens and generalized chemical or physical stimuli. The disease involves multiple biochemical mediators in both its acute and chronic stages. The hyper responsiveness of asthmatic bronchiolar tissue is believed to be the result of chronic inflammatory reactions, which irritate and damage the epithelium lining the airway wall and promote pathological thickening of
the underlying tissue. Bronchial biopsies in patients with only mild asthma have features of inflammation in the airway wall.

Allergic responses to inhaled allergens can initiate the inflammatory sequence. For example, allergens can activate mast cells and basophils, which are present in the epithelium and underlying smooth muscle tissue by binding IgE located on the cell surface. Activated mast cells release a number of preformed or primary chemical mediators (e.g., histamine) of the inflammatory response and generate numerous other secondary mediators of inflammation (e.g., superoxide, lipid derived mediators, etc.) in situ. In addition, several large molecules (e.g., proteoglycans, tryptase, chymase, etc.) are released by degranulation of mast cells.

The release of these preformed mediators from mast cells probably accounts for the early bronchiolar constriction in the asthmatic reaction to air borne allergens. The early phase of the asthmatic reaction peaks approximately fifteen minutes after exposure to allergen and is generally followed by recovery over the ensuing one to two hours. Twenty five to thirty five percent of the patient population experience a further decline in respiratory function which maximizes six to twelve hours after exposure. This late reaction phase is accompanied by a marked increase in the number of inflammatory cells (e.g., eosinophils, neutrophils, lymphocytes, etc.) infiltrating the bronchiolar tissue. The infiltrating cells are attracted to the site by release of mast cell derived chemotactic agents and then become activated during the late reaction phase. The late asthmatic response is believed to be a secondary inflammatory reaction mediated in part by the secretory activity of granulocytes.

Tryptase is implicated in the degradation of vasodilating and bronchoconstricting neuropeptides (Caughey et al. (1988) J. Pharmacol. Exp. Ther. 244:133-137; Franconi et al. (1988) J. Pharmacol. Exp. Ther. 248:947-951; and Tam et al. (1990) Am. J. Respir. Cell Mol. Biol. 3:27-32) and modulation of bronchial responsiveness to histamine (Sekizawa et al. (1989) J. Clin. Invest. 83:175-179). These findings suggest that tryptase may increase bronchoconstriction in asthma by destroying bronchodilating peptides. Tryptase cleaves fibrinogen α-chains and high molecular weight kinninogen, which suggests that tryptase plays a role with heparin as a local anticoagulant. Tryptase activates prostromelysin (pro-MMP-3) and procollagenase (pro-MMP-1) via MMP-3, which suggests that tryptase is involved in tissue inflammation and remodeling and joint destruction in rheumatoid arthritis. Further,

Acceptable excipients are non-toxic, aid administration, and do not adversely affect the therapeutic benefit of the active ingredient. Such excipient may be any solid, liquid, semisolid or, in the case of an aerosol composition, gaseous excipient that is generally available to one of skill in the art.

Solid pharmaceutical excipients include starch, cellulose, talc, glucose, lactose, sucrose,
gelatin, malt, rice, flour, chalk, silica gel, magnesium stearate, sodium stearate, glycerol monostearate, sodium chloride, dried skim milk, and the like. Liquid and semisolid excipients may be selected from water, ethanol, glycerol, propylene glycol and various oils, including those of petroleum, animal, vegetable or synthetic origin (e.g., peanut oil, soybean oil, mineral oil, sesame oil, etc.). Preferred liquid carriers, particularly for injectable solutions, include water, saline, aqueous dextrose and glycols.

Compressed gases may be used to disperse the active ingredient in aerosol form. Inert gases suitable for this purpose are nitrogen, carbon dioxide, nitrous oxide, etc. Other suitable pharmaceutical carriers and their formulations are described in A.R. Alfonso Remington's Pharmaceutical Sciences 1985, 17th ed. Easton, Pa.: Mack Publishing Company.

The amount of a compound of Formula I in the composition may vary widely depending upon the type of formulation, size of a unit dosage, kind of excipients and other factors known to those of skill in the art of pharmaceutical sciences. In general, a composition of a compound of Formula I for treating asthma will comprise from 0.01%w to 10%w, preferably 0.3%w to 1%w, of active ingredient with the remainder being the excipient or excipients. Preferably the pharmaceutical composition is administered in a single unit dosage form for continuous treatment or in a single unit dosage form ad libitum when relief of symptoms is specifically required. Representative pharmaceutical formulations containing a compound of Formula I are described in Example 34.

The acylation reactions described above can be carried out by reacting together an activated ester (e.g., an acid chloride derivative) and an appropriate nucleophile in the presence of a suitable organic base (e.g., N,N-diisopropylethylamine (DIEA), N-methylmorpholine, etc. preferably DIEA) and suitable solvent (e.g., N,N-dimethylformamide (DMF), tetrahydrofuran (THF), dichloromethane, etc.) at 20 to 30°C, typically at approximately 23°C, for several minutes to 24 hours. Alternatively, the acylation can be effected by reacting together an appropriate carboxylic acid and nucleophile in the presence of a suitable coupling reagent (e.g., 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide, etc.) and a suitable solvent (e.g., DMF, etc.) at 20 to 30°C, typically at approximately 23°C, for several hours to several days. The reactions described above for the preparation of compounds of Formula I and the conditions for effecting the reactions are illustrative and one of ordinary skill in the art will recognize that other reaction conditions can be applied and different starting materials can be used to prepare the compounds of the invention.

Deprotection can be effected by any means which removes the protective group and gives the desired product in reasonable yield. A detailed description of the techniques applicable to the creation of protective groups and their removal can be found in T.W. Greene, *Protective Groups in Organic Synthesis*, John Wiley & Sons, Inc. 1981.
Generally, the starting materials useful in preparing the compounds of Formula I and the intermediates useful in preparing the compounds of Formula I are commercially available or can be readily prepared by those of ordinary skill in the art. For example, intermediates useful in preparing the compounds of Formula I are conveniently prepared by the acylation reactions described above. When necessary suitable protection chemistry is employed to direct the reaction to the desired reactive site when multiple reactive sites are present in the starting materials.

A convenient starting material for preparing compounds of Formula I in which X³ and X⁷ each are -C(O)O- is a compound of Formula 7:

\[
\begin{align*}
\text{LC(O)-O-X^4} & \\
\text{LC(O)-O-X^6} & \\
\end{align*}
\]

in which each X⁴, X³ and X⁶ are as defined in the Summary of the Invention. For example, compounds of Formula 6 in which L is chloro can be prepared by reacting a corresponding diol (e.g., cis-1,5-cyclooctanediol, trans-1,4-cyclohexylendimethanol, 1,4-phenylenedimethanol, etc.) with triphosgene (for further details see Example 5, infra.).

Intermediates useful in preparing compounds of Formula I in which such intermediate contains a amidino group can be prepared by treating a corresponding nitrile with hydrogen chloride in ethanol and then reacting with ammonia.

Additional Processes for Preparing Compounds of Formula I:

Compounds of Formula I in which R⁴ is guanidino can be prepared by reacting a corresponding compound of Formula I in which R⁴ is amino with cyanamide. The reaction is carried out by treating the amine with hydrogen chloride and then reacting neat with an excess of cyanamide at approximately 65°C for about two hours (for further details see Example 15, infra.).

Compounds of Formula I may be prepared as pharmaceutically acceptable acid addition
salts by reacting the free base forms of a compound of Formula I with a pharmaceutically acceptable inorganic or organic acid. Alternatively, the pharmaceutically acceptable base

addition salts of compounds of Formula I may be prepared by reacting the free acid forms of compounds of Formula I with pharmaceutically acceptable inorganic or organic bases. Inorganic and organic acids and bases suitable for the preparation of the pharmaceutically acceptable salts of compounds of Formula I are set forth in the definitions section of this application.

Alternatively, the salt forms of the compounds of Formula I may be prepared using salts of the starting materials or intermediates.

The free acid or free base forms of the compounds of Formula I can be prepared from the corresponding base addition salt or acid addition salt form. For example, compounds of Formula I in an acid addition salt form may be converted to the corresponding free base by treating with a suitable base (e.g., ammonium hydroxide solution, sodium hydroxide, etc.). Compounds of Formula I in a base addition salt form may be converted to the corresponding free acid by treating with a suitable acid (e.g., hydrochloric acid, etc).

The N-oxides of compounds of Formula I can be prepared by methods known to those of ordinary skill in the art. For example, N-oxides can be prepared by treating an unoxidized form of the compound of Formula I with an oxidizing agent (e.g., trifluoroperacetic acid, permaleic acid, perbenzoic acid, peracetic acid, meta-chloroperoxybenzoic acid, etc.) in a suitable inert organic solvent (e.g., a halogenated hydrocarbon such as methylene chloride) at approximately 0°C. Alternatively, the N-oxides of the compounds of Formula I can be prepared from the N-oxide of an appropriate starting material.

Compounds of Formula I in unoxidized form can be prepared from N-oxides of compounds of Formula I by treating with a reducing agent (e.g., sulfur, sulfur dioxide, triphenyl phosphine, lithium borohydride, sodium borohydride, phosphorus trichloride, tribromide, etc.) in an suitable inert organic solvent (e.g., acetonitrile, ethanol, aqueous dioxane, etc.) at 0 to 80°C.

Prodrug derivatives of the compounds of Formula I can be prepared by methods known to those of ordinary skill in the art (e.g., for further details see Saulnier et al. (1994), Bioorganic and Medicinal Chemistry Letters. 4:1985). For example, appropriate prodrugs can be prepared by reacting a non-derivatized compound of Formula I with a suitable carbamylating agent (e.g., 1,1-acyloxyalkylcarbonochloridate, para-nitrophenyl carbonate, etc.).
Protected derivatives of the compounds of Formula 1 can be made by means known to those of ordinary skill in the art. A detailed description of the techniques applicable to the creation of protective groups and their removal can be found in T.W. Greene, *Protective Groups in Organic Synthesis*, John Wiley & Sons, Inc. 1981.

The suspension was warmed to room temperature and stirred 12 hours and then ether (1 L) was added. The suspension was filtered free of insoluble salts and concentrated. Recrystallization of the residue from hexane gave cis-1,5-cyclooctylene di(chloroformate) as a colorless crystalline solid. Further purification can be effected with silica gel flash chromatography using hexane:ethyl ether (10:1) as eluent; 

$^1$H-NMR (300MHz, CDCl$_3$): 5.00-4.85 (m, 2H), 2.20-1.60 (m, 12H).

EXAMPLE 6

The following is the preparation of a compound of Formula I in which R¹ and R² each are 4-guanidinobenzyl, X¹ and X⁰ each are -NHC(O)-, X² and X⁴ each are 1,4-piperazinylene, X³ and X⁷ each are -C(O)O- and X⁴-X⁵-X⁶-X⁴ together are 1,5-pentamethylene.

tert-Butyl 4-(4-guanidinobenzylcarbamoyl)-1-piperazinecarboxylate trifluoroacetate

(306 mg, 0.62 mmol.) was treated with neat trifluoroacetic acid (1 mL) at room temperature over ten minutes to give a colorless homogeneous solution. The liquid was concentrated and the oily
residue triturated with diethyl ether (3x 10mL) followed by drying in vacuo to a colorless foam. The deprotected piperazine salt was then taken into DMF (2.5 mL) followed by addition of diisoproplylethylamine (0.5 mL, 3.1 mmol.) and 1,5-pentylene di(chloroformate) (70 mg, 0.31 mmol.) and the mixture was allowed to stir for one hour at room temperature. The reaction mixture was concentrated and the residue was triturated with diethyl ether (3x 10mL) followed by drying in vacuo. The crude material was taken into water (5 mL) and purified by preparative reverse phase HPLC and lyophilization to give 1,5-pentylene di[4-(4-guanidinobenzylcarbamoyl)-1-piperazinecarboxylate] as a colorless amorphous solid; Electrospray LRMS: Calculated for C_{33}H_{46}N_{12}O_{6}: MH⁺: 709.8, Found: MH⁺: 709.3.

EXAMPLE 32

In Vitro Assay of Tryptase Inhibition

Mixtures of human tryptase (15 μg/mL) and test compound (varying concentrations) in
Tris buffer (comprising: NaCl, 100 mM; Tris, 50 mM; 2-[N-morpholine]ethane sulfonic acid,
2.5 mM, CaCl₂, 0.5 mM; DMSO, 10%; glycerol, 5%; polyoxyethylenesorbitan monolaurate
(Tween-20), 0.05%; heparin, 25 ng/mL; and pH 8.2) were incubated for 1 hour at room
temperature and then Tosyl-Gly-Pro-Lys-para-nitroanilide was added such that the final
concentration of the assay mixture was 0.5 mM. Hydrolysis of the substrate was followed
spectrophotometrically at 405 nm for 5 minutes. Apparent inhibition constants (K_i) were
calculated from the enzyme progress curves using standard mathematical models.

Human tryptase can be purified from human lung and skin tissue samples (e.g., see

**EXAMPLE 33**

*In Vivo* Assay of Asthma

Allergic sheep characterized as dual responders (i.e., displaying early and late phases of bronchoconstriction) are challenged with antigen (e.g., *Ascaris suum*). The sheep are administered test compound or vehicle by aerosol inhalation at 0.5 hours before and at 4 and 24 hours post antigen challenge. Specific lung resistance ($SR_i$) is monitored via an esophageal balloon catheter just prior to the first test compound or vehicle treatment and every 0.5 to 1 hour thereafter.

In addition, airway responsiveness is monitored 1 to 2 days prior to antigen challenge and just subsequent to administration of test compound or vehicle at 24 hours post antigen challenge. For the purposes of this application, airway responsiveness is defined as the cumulative dose of carbachol required to increase $SR_i$ by 400% ($PC_{400}$). The $PC_{400}$ values are obtained by
administering 0 to 30 breath units of 1% carbachol (10 mg in 1 mL of PBS) by aerosol inhalation until SRₜ was increased by 400%.

Sheep treated with vehicle exhibit early phase bronchoconstriction from 0 to 4 hours post antigen challenge and late phase bronchoconstriction from 4 to greater than 8 hours post antigen challenge. In addition, vehicle treated sheep exhibit hyper responsiveness to carbachol (i.e., a 60% decrease in PC₄₀₀ is observed).

Sheep treated with tryptase inhibitors do not exhibit late phase bronchoconstriction (i.e., at 4 to 8 hours post antigen challenge, SRₜ remained at basal levels). Further, sheep treated with tryptase inhibitors do not exhibit any hyper responsiveness to carbachol.

INTERNATIONAL SEARCH REPORT

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. X Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:
   
   see FURTHER INFORMATION sheet PCT/ISA/210

2. ☐ Claims Nos.: because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:

3. ☐ Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.

2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:

4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

☐ The additional search fees were accompanied by the applicant’s protest.

☐ No protest accompanied the payment of additional search fees.

Form PCT/ISA/210 (continuation of first sheet (1)) (July 1992)
Remark: Although claims 15-22, 36-43 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition. ed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
