(I)

(57) Abstract: The present invention provides a compound of formula (I), or a pharmaceutically acceptable salt thereof wherein R<sup>1</sup> is C<sub>1-4</sub>alkyl, optionally substituted with a fluoro atom, or R<sup>1</sup> is a cyclopropyl or cyclopropylmethyl; and R<sup>2</sup> is methyl or ethyl. 7-FLUORO-1,3-DIHYDRO-INDOL-2-ONE OXAZOLIDINONES AS ANTIBACTERIAL  
AGENTS

FIELD OF INVENTION

5 The present invention relates to 7-fluoro-1,3-dihydro-indol-2-one oxazolidinone derivatives, their use as antibacterial agent, to pharmaceutical compositions containing these compounds and to methods for their preparations.

BACKGROUND OF THE INVENTION

10 Antibacterial resistance is a global clinical and public health problem that has emerged with alarming rapidity in recent years and undoubtedly will increase in the near future. Resistance is a problem in the community as well as in health care settings, where transmission of bacteria is greatly amplified. Because multiple drug resistance is a growing problem, physicians are now confronted with infections for which there is no effective  
15 therapy. As result, structurally novel antibacterials with a new mode of action have become increasingly important in the treatment of bacterial infections.

Among newer antibacterial agents, oxazolidinone compounds are the most recent synthetic class of antimicrobials. This invention provides 7-fluoro-1,3-dihydro-indol-2-one oxazolidinone derivatives as inhibitors of bacterial protein synthesis for the treatment of  
20 serious infections caused by a number of human and veterinary pathogens, including multiple resistant strains of bacteria.

In another aspect, the present invention also provides:

pharmaceutical compositions which comprise a pharmaceutically acceptable carrier and a compound of formula I, methods for treating microbial infections in a mammal by administering to a mammal in need a therapeutically effective amount of a compound of formula I, or a pharmaceutically acceptable salt thereof, and a use of a compound of formula I or a pharmaceutically acceptable salt thereof to prepare a medicament for treating microbial infections.

## DETAILED DESCRIPTION OF THE INVENTION

Unless otherwise stated, the following terms used in the specification and claims  
have the meanings given below:

The carbon atom content of various hydrocarbon-containing moieties is indicated by a prefix designating the minimum and maximum number of carbon atoms in the moiety, i.e., the prefix  $C_{i-j}$  indicates a moiety of the integer “i” to the integer “j” carbon atoms, inclusive. Thus, for example,  $C_{1-6}$  alkyl refers to alkyl of one to seven carbon atoms, inclusive.

25 The term alkyl refers to both straight and branched groups, but reference to an individual radical such as “propyl” embraces only the straight chain radical, a branched chain isomer such as “isopropyl” being specifically referred to.

The term "C<sub>3-5</sub>cycloalkyl" refers to a cyclic saturated monovalent hydrocarbon group of three to five carbon atoms, e.g., cyclopropyl, and the like.

30 The term "pharmaceutically acceptable carrier" means a carrier that is useful in preparing a pharmaceutical composition that is generally safe, non-toxic and neither biologically nor otherwise undesirable, and includes a carrier that is acceptable for veterinary use as well as human pharmaceutical use. "A pharmaceutically acceptable carrier" as used in the specification and claims includes both one and more than one such carrier.

The term "mammal" refers to a human or warm-blooded animals including livestock and companion animals. Livestock refers to animals suitable for human meat consumption. Examples include pigs, cattle, chickens, fish, turkeys, rabbits, etc. Companion animals refer to animals kept as pets such as dogs, cats, etc.

5 The term "optional" or "optionally" means that the subsequently described event or circumstance may, but need not, occur, and that the description includes instances where the event or circumstance occurs and instances in which it does not.

10 The term "treating" or "treatment" of a disease includes: (1) preventing the disease, i.e. causing the clinical symptoms of the disease not to develop in a mammal that may be exposed to or predisposed to the disease but does not yet experience or display symptoms of the disease; (2) inhibiting the disease, i.e., arresting or reducing the development of the disease or its clinical symptoms; or (3) relieving the disease, i.e., causing regression of the disease or its clinical symptoms.

15 The term "therapeutically effective amount" means the amount of a compound that, when administered to a mammal for treating a disease, is sufficient to effect such treatment for the disease. The "therapeutically effective amount" will vary depending on the compound, the disease and its severity and the age, weight, etc., of the mammal to be treated.

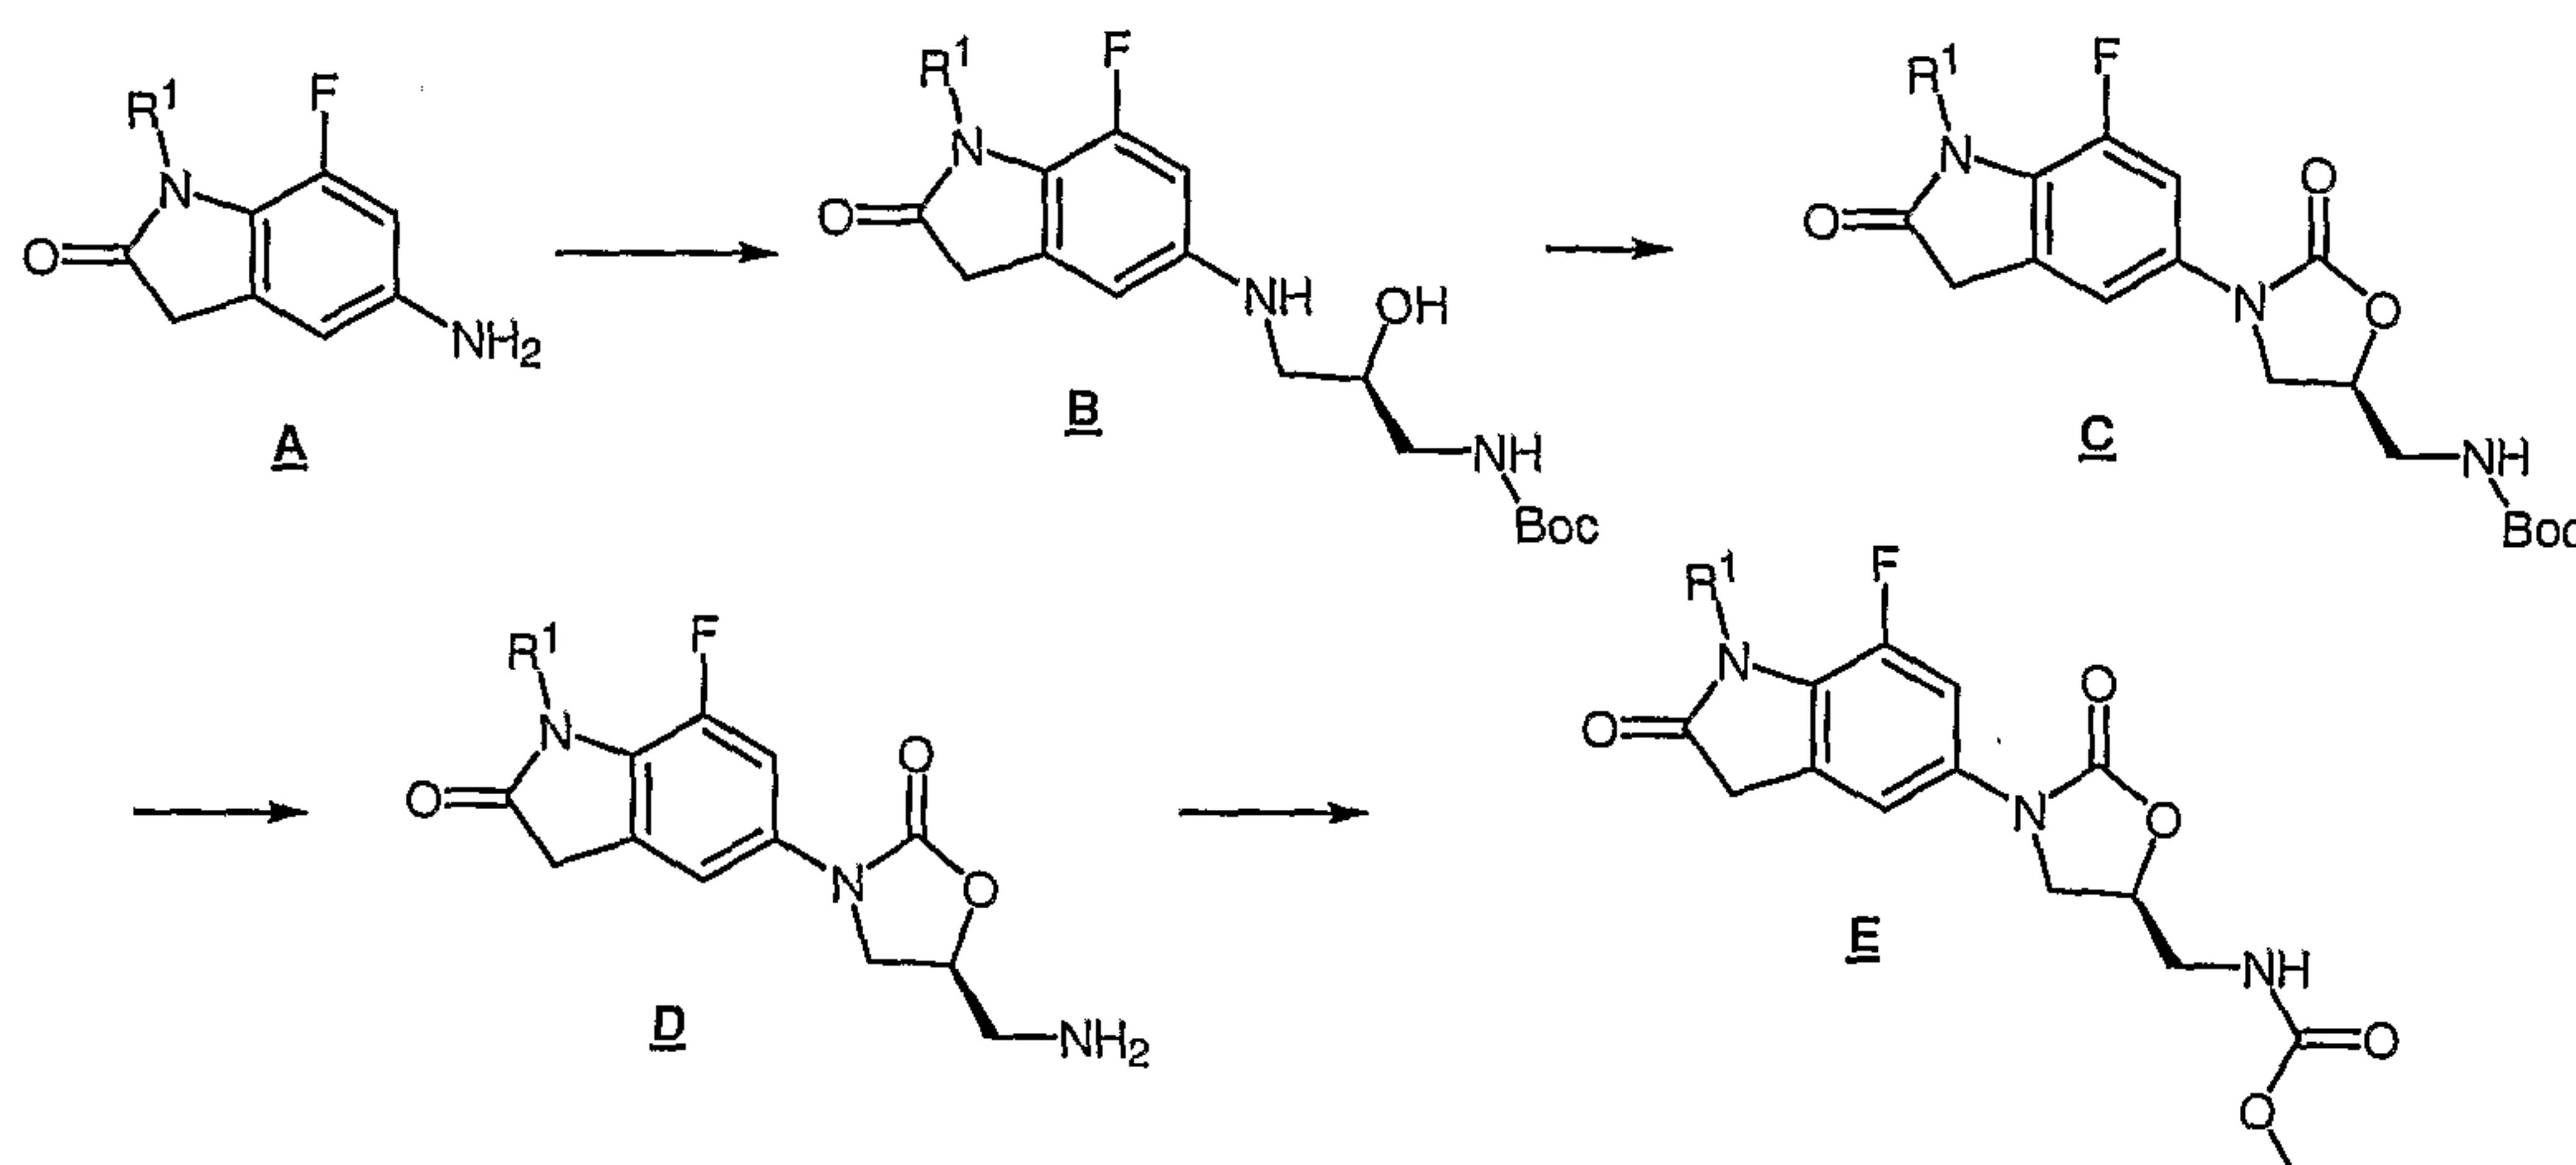

20 Compounds that have the same molecular formula but differ in the nature or sequence of bonding of their atoms or the arrangement of their atoms in space are termed "isomers". Isomers that differ in the arrangement of their atoms in space are termed "stereoisomers".

25 It will be appreciated by those skilled in the art that compounds of the invention having a chiral center and may be isolated in optically active and racemic forms. It may also exhibit polymorphism. It is to be understood that the present invention encompasses any racemic, optically-active, polymorphic, tautomeric, or stereoisomeric form, or mixture thereof, of a compound of the invention, which possesses the useful properties described herein, it being well known in the art how to prepare optically active forms (for example, by resolution of the racemic form by recrystallization techniques, by synthesis from optically-active starting materials, by chiral synthesis, or by chromatographic separation using a chiral stationary phase) and how to determine antiviral activity using the standard tests described herein, or using other similar tests which are well known in the art.

30 The compounds of the present invention are generally named according to the IUPAC or CAS nomenclature system. Abbreviations, which are well known to one of ordinary skill in the art, may be used (e.g. "Ph" for phenyl, "Me" for methyl, "Et" for ethyl, "h" for an hour or hours and "rt" for room temperature).

Schemes I and II describe the preparation of compounds of the present invention. The starting materials are prepared by procedures described in these schemes or by procedures known to one of ordinary skill in the art.

Scheme I

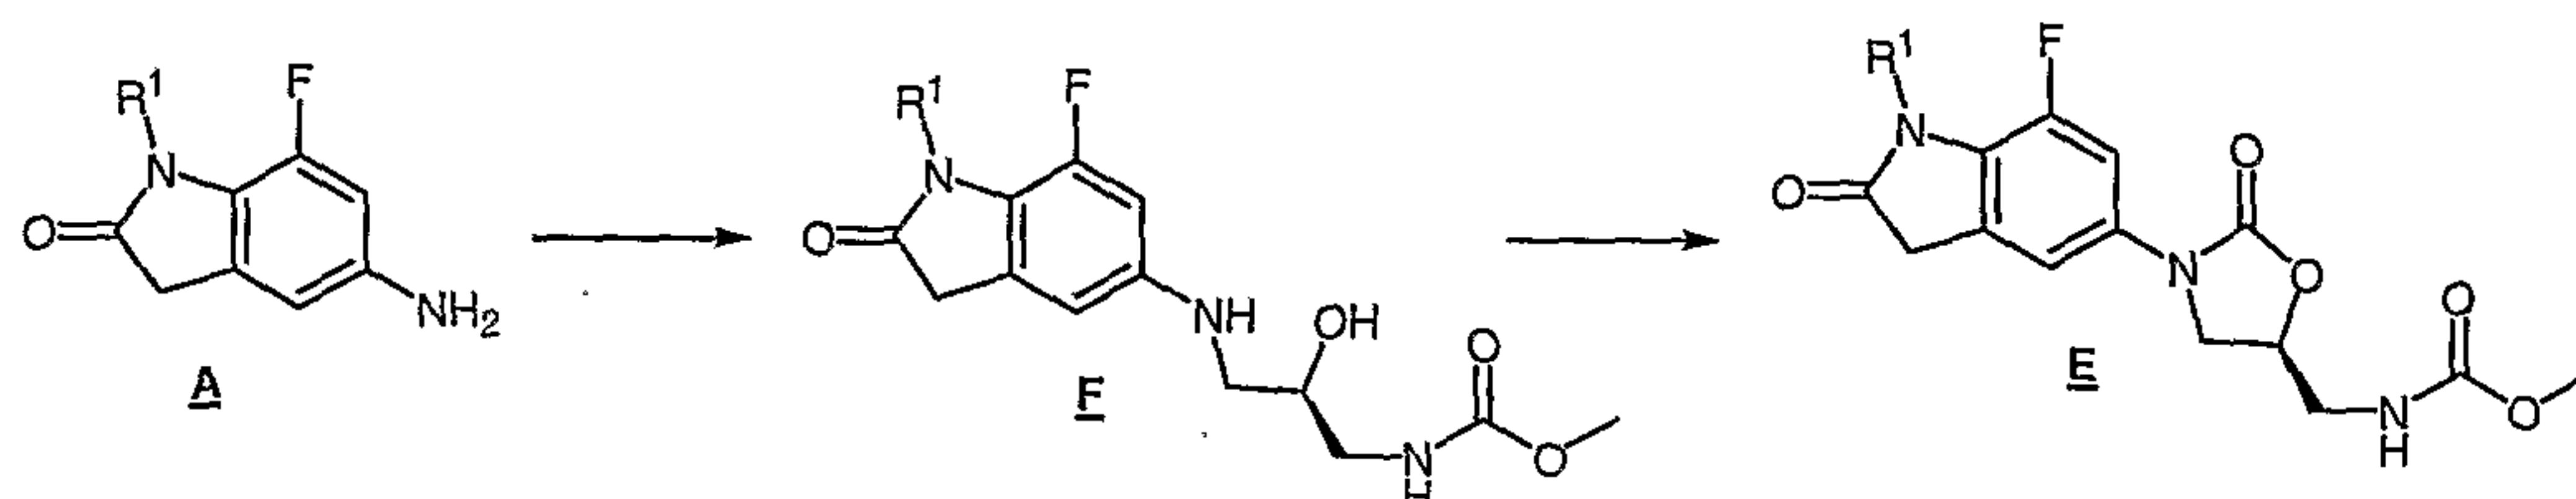

5

According to Scheme I, the N-substituted 5-amino-7-fluoro-1,3-dihydroindol-2-one (A) is reacted with (S)-oxiranylmethyl-carbamic acid tert-butyl ester in the presence of a Lewis acid such as lithium trifluoromethanesulfonate in a suitable solvent such as acetonitrile at a suitable temperature. (S)-oxiranylmethyl-carbamic acid tert-butyl ester can be 10 conveniently prepared following methods described in WO 02/32857 and WO 02/85849. The amino alcohol (B) can then be ring closed using 1,1-carbonylimidazole in solvents such as acetonitrile or tetrahydrofuran at an appropriate temperature or using phosgene in solvent such as methylene chloride or toluene at an appropriate temperature. Boc group in (C) can 15 be deprotected under acid conditions (using acids such as trifluoroacetic acid or hydrochloric acid; Reference: T. W. Greene and P.G.M. Wuts in *Protective Groups in Organic Synthesis*, 1999, John Wiley & Sons) in a suitable solvent such as methylene chloride or dioxane. The amine in (D) further could be converted to the corresponding methyl carbamate by treating with methyl chloroformate or dimethyl carbonate in the presence of suitable bases such as triethylamine or pyridine to compound (E).

20

Scheme II

In an alternate Scheme (Scheme II) compound (A) may be reacted with (S)-oxiranylmethyl-carbamic acid methyl ester (WO 99/52855; US 6417403) as described in EP 25 99/00097. The amino alcohol (F) can then be ring closed to give oxazolidinones (E) using

1,1-carbonylimidazole in solvents such as acetonitrile or tetrahydrofuran at an appropriate temperature or using phosgene in solvent such as methylene chloride or toluene at an appropriate temperature.

5 N-Substituted -5-amino-1,3-dihydroindol-2-one (A) intermediates may be prepared using any of the synthetic procedures described in J.A. Joule, *Science of Synthesis*, 2001, 10.13, 361 – 653pp.

The invention may also provide novel intermediates and novel processes that are useful for preparing compounds of formula I.

10 Medical and Veterinary Uses

It is known that as a chemical compound class, oxazolidinones generically inhibit monoamine oxidase (MAO), the enzyme responsible for preventing acute blood pressure elevation by the endogenous and dietary amine, tyramine. Accordingly, there is a demand to discover oxazolidinone antibiotics, which possess minimum MAO inhibitory activity to 15 lower risk of potential drug-drug interactions. It has been discovered that, compounds of the present invention have unexceptionally weak MAO inhibitory activity, which indicates it possess the capacity to minimize or eliminate potential drug-drug interactions since strong inhibition of monoamine oxidase can result in altered clearance rates for other compounds normally metabolized by it, including several pharmaceuticals.

20 The compounds of the present invention may be used for the treatment of infectious, Gram-positive bacterial infections caused by a variety of bacterial organisms, including those that require long-term therapy (>28 days).

Examples of the bacterial organisms include gram-positive bacteria such as multiple 25 resistant staphylococci, for example *S. aureus* and *S. epidermidis*; multiple resistant streptococci, for example *S. pneumoniae* and *S. pyogenes*; and multiple resistant Enterococci, for example *E. faecalis*; gram negative aerobic bacteria such as Haemophilus, for example *H. influenzae* and Moraxella, for example *M. catarrhalis*; as well as anaerobic organisms such as bacteroides and clostridia species, and acid-fast organisms such as Mycobacteria, for example *M. tuberculosis*; and/or *Mycobacterium avium*. Other examples include 30 *Escherichia*, for example *E. coli*. intercellular microbes, for example Chlamydia and Rickettsiae.

Examples of infections that may be treated with the compounds of the present invention include central nervous system infections, external ear infections, infections of the middle ear, such as acute otitis media, infections of the cranial sinuses, eye infections, 35 infections of the oral cavity, such as infections of the teeth, gums and mucosa, upper respiratory tract infections, lower respiratory tract infections, genitourinary infections,

gastrointestinal infections, gynecological infections, septicemia, bone and joint infections, skin and skin structure infections, bacterial endocarditis, burns, antibacterial prophylaxis of surgery, and antibacterial prophylaxis in immunosuppressed patients, such as patients receiving cancer chemotherapy, or organ transplant patients. Specifically, infectious diseases 5 that may be treated with the compounds of the present invention are gram-positive infections such as osteomyelitis, endocarditis and diabetic foot.

Antibacterial and Monoamine Oxidase Inhibition Activities

The *in vitro* antibacterial activity of the compounds of the present invention may be assessed by following procedures recommended in (1) National Committee for Clinical 10 Laboratory Standards (Jan. 2003), *Methods for dilution antimicrobial tests for bacteria that grow aerobically*, Approved Standard (6<sup>th</sup> ed), M7-A6, NCCLS, Wayne, PA; (2) National Committee for Clinical Laboratory Standards (Mar. 2001), *Methods for antimicrobial susceptibility testing of anaerobic bacteria*, Approved Standard (5<sup>th</sup> ed), M11-A4, NCCLS, Wayne, PA; (3) National Committee for Clinical Laboratory Standards (Jan. 2003), *MIC testing supplemental tables*, M100-S13 (for use with M7-A6), NCCLS, Wayne, PA; and (4) 15 Murray PR, Baron EJ, Jorgensen JH, et al. *Manual of Clinical Microbiology* (8<sup>th</sup> ed) Washington, DC: American Society for Microbiology Press, 2003. The antibacterial activity can be presented in the form of MIC value. The MIC value is the lowest concentration of drug which prevented macroscopically visible growth under the conditions of the test.

20 Following procedure may assess monoamine oxidase inhibition activity of the compounds of the present invention:

MAO-A and B inhibition were analyzed by measuring the inhibition of conversion of an MAO substrate, 1-methyl-4-(1-methyl-2-pyrrolyl)-1,2,3,6-tetrahydropyridine, to its dihydropyridinium metabolite ( $\lambda=421$  nm). The substrate concentration was equal to the  $K_m$  25 (64  $\mu$ M for MAO-A and 43  $\mu$ M for MAO-B). The MAO-A concentration was 0.01 mg/mL, and the MAO-B concentration was 0.008 mg/mL. Each inhibitor was tested at seven concentrations. Percent inhibition at each concentration was established relative to the uninhibited control rate, and the  $IC_{50}$  and  $K_i$  values were calculated. A low  $K_i$  value indicates that the tested inhibitor possesses a tight binding ability to MAO enzyme, thus, it is 30 a strong MAO inhibitor.

Results of the antibacterial and monoamine oxidase inhibition activities testing for Examples 1 and 2 are shown in Table 1. The antibacterial activities are shown in Table 2.

15 Pharmaceutical compositions for use in accordance with the present invention may be formulated in conventional manner using one or more physiologically acceptable carriers comprising excipients and auxiliaries, which facilitate processing of the active compounds into preparations, which can be used pharmaceutically. Proper formulation is dependent upon the route of administration chosen.

20 For oral administration, the compounds can be formulated by combining the active compounds with pharmaceutically acceptable carriers well known in the art. Such carriers enable the compounds of the invention to be formulated as tablets, pills, lozenges, dragees, capsules, liquids, solutions, emulsions, gels, syrups, slurries, suspensions and the like, for oral ingestion by a patient. A carrier can be at least one substance, which may also function as a diluent, flavoring agent, solubilizer, lubricant, suspending agent, binder, tablet 25 disintegrating agent, and encapsulating agent. Examples of such carriers or excipients include, but are not limited to, magnesium carbonate, magnesium stearate, talc, sugar, lactose, sucrose, pectin, dextrin, mannitol, sorbitol, starches, gelatin, cellulosic materials, low melting wax, cocoa butter or powder, polymers such as polyethylene glycols and other pharmaceutical acceptable materials.

30 Dragee cores are provided with suitable coatings. For this purpose, concentrated sugar solutions may be used which may optionally contain gum arabic, talc, polyvinyl pyrrolidone, carbopol gel, polyethylene glycol, and/or titanium dioxide, lacquer solutions, and suitable organic solvents or solvent mixtures. Dyestuffs or pigments may be added to the tablets or dragee coatings for identification or to characterize different combinations of active 35 compound doses.

The push-fit capsules can contain the active ingredients in a mixture with filler such as lactose, a binder such as starch, and/or a lubricant such as talc or magnesium stearate and, optionally, stabilizers. In soft capsules, the active compounds may be dissolved or suspended in suitable liquids, such as fatty oils, liquid paraffin, liquid 5 polyethylene glycols, cremophor, capmul, medium or long chain mono-, di- or triglycerides. Stabilizers may be added in these formulations, also.

For example, there may be provided solutions of the compounds of this invention dissolved in water and water-propylene glycol and water-polyethylene glycol systems, optionally 10 containing suitable conventional coloring agents, flavoring agents, stabilizers and thickening agents.

The compounds may also be formulated for parenteral administration, *e.g.*, by injections, bolus injection or continuous infusion. Formulations for parenteral administration may be presented in unit dosage form, *e.g.*, in ampoules or in multi-dose 15 containers, with an added preservative. The compositions may take such forms as suspensions, solutions or emulsions in oily or aqueous vehicles, and may contain formulating materials such as suspending, stabilizing and/or dispersing agents.

For injection, the compounds of the invention may be formulated in aqueous solution, preferably in physiologically compatible buffers or physiological saline buffer. 20 Suitable buffering agents include trisodium orthophosphate, sodium bicarbonate, sodium citrate, N-methylglucamine, L(+)-lysine and L(+)-arginine.

Parenteral administrations also include aqueous solutions of a water-soluble form, such as, without limitation, a salt, of the active compound. Suitable lipophilic vehicles 25 include fatty oils such as sesame oil, synthetic fatty acid esters such as ethyl oleate and triglycerides, or materials such as liposomes. Aqueous injection suspensions may contain substances that increase the viscosity of the suspension, such as sodium carboxymethyl cellulose, sorbitol, or dextran. Optionally, the suspension may also contain suitable stabilizers and/or agents that increase the solubility of the compounds to allow for the 30 preparation of highly concentrated solutions.

Alternatively, the active ingredient may be in powder form for constitution with a suitable vehicle, *e.g.*, sterile, pyrogen-free water, before use. For suppository administration, the compounds may also be formulated by mixing the agent with a suitable non-irritating excipient, which is solid at room temperature but liquid at rectal 35 temperature and therefore will melt in the rectum to release the drug. Such materials include cocoa butter, beeswax and other glycerides.

For administration by inhalation, compounds of the present invention can be conveniently delivered through an aerosol spray in the form of solution, dry powder, or suspensions. The aerosol may use a pressurized pack or a nebulizer and a suitable propellant. In the case of a pressurized aerosol, the dosage unit may be controlled by providing a valve to 5 deliver a metered amount. Capsules and cartridges of, for example, gelatin for use in an inhaler may be formulated containing a power base such as lactose or starch.

Sustained-release capsules may, depending on their chemical nature, 30 release the compounds for 24 hours or for up to several days.

#### Dosage

Pharmaceutical compositions suitable for use in the present invention include compositions wherein the active ingredients are contained in an amount sufficient to achieve the intended purpose, *i.e.*, the treatment or prevent of infectious diseases. More specifically, 35 a therapeutically effective amount means an amount of compound effective to prevent,

alleviate or ameliorate symptoms of disease or prolong the survival of the subject being treated.

The quantity of active component, that is the compound of this invention, in the pharmaceutical composition and unit dosage form thereof may be varied or adjusted widely depending upon the manner of administration, the potency of the particular compound and the desired concentration. Determination of a therapeutically effective amount is well within the capability of those skilled in the art. Generally, the quantity of active component will range between 0.5% to 90% by weight of the composition.

Generally, a therapeutically effective amount of dosage of active component will be in the range of about 0.1 to about 400 mg/kg of body weight/day, more preferably about 1.0 to about 50 mg/kg of body weight/day. It is to be understood that the dosages may vary depending upon the requirements of each subject and the severity of the bacterial infection being treated. In average, the effective amount of active component is about 200 mg to 800 mg and preferable 600 mg per day.

The desired dose may conveniently be presented in a single dose or as divided doses administered at appropriate intervals, for example, as two, three, four or more sub-doses per day. The sub-dose itself may be further divided, e.g., into a number of discrete loosely spaced administrations; such as multiple inhalations from an insufflator or by application of a plurality of drops into the eye.

Also, it is to be understood that the initial dosage administered may be increased beyond the above upper level in order to rapidly achieve the desired plasma concentration. On the other hand, the initial dosage may be smaller than the optimum and the daily dosage may be progressively increased during the course of treatment depending on the particular situation. If desired, the daily dose may also be divided into multiple doses for administration, e.g., two to four times per day.

In cases of local administration or selective uptake, the effective local concentration of the drug may not be related to plasma concentration and other procedures known in the art may be used to determine the desired dosage amount.
