(54) Title: SELECTIVE TRANSMISSION OF POWER HEADROOM REPORTS

FIG. 6A

(57) Abstract: Disclosed are techniques for wireless communication. In an aspect, a UE determines determining whether to perform a power headroom report (PHR) function for a pathloss reference signal (PL-RS). Based on the determination, the UE performs a PHR function or one or more pathloss measurements for the PL-RS based on the determination. In some aspects, the determination is based on a PL-RS type or cell type associated with the PL-RS. In other aspects, the determination is based on an indication (e.g., explicit or implicit indication) associated with the PL-RS that is received from a serving cell of the UE.

SELECTIVE TRANSMISSION OF POWER HEADROOM REPORTS

CROSS-REFERENCE TO RELATED APPLICATIONS

[0001] The present Application for Patent claims the benefit of U.S. Provisional Application No. 62/972,141, entitled “SELECTIVE TRANSMISSION OF POWER HEADROOM REPORTS”, filed February 10, 2020, and U.S. Non-Provisional Application No. 17/168,922, entitled “SELECTIVE TRANSMISSION OF POWER HEADROOM REPORTS”, filed February 5, 2021, both of which are assigned to the assignee hereof and hereby expressly incorporated by reference herein in their entirety.

BACKGROUND OF THE DISCLOSURE

1. *Field of the Disclosure*

[0002] Aspects of the disclosure relate generally to wireless communications, and more particularly to selective transmission of power headroom reports (PHRs).

2. *Description of the Related Art*

[0003] Wireless communication systems have developed through various generations, including a first-generation analog wireless phone service (1G), a second-generation (2G) digital wireless phone service (including interim 2.5G networks), a third-generation (3G) high speed data, Internet-capable wireless service and a fourth-generation (4G) service (e.g., LTE or WiMax). There are presently many different types of wireless communication systems in use, including cellular and personal communications service (PCS) systems. Examples of known cellular systems include the cellular analog advanced mobile phone system (AMPS), and digital cellular systems based on code division multiple access (CDMA), frequency division multiple access (FDMA), time division multiple access (TDMA), the Global System for Mobile access (GSM) variation of TDMA, etc.

[0004] A fifth generation (5G) wireless standard, referred to as New Radio (NR), enables higher data transfer speeds, greater numbers of connections, and better coverage, among other improvements. The 5G standard, according to the Next Generation Mobile Networks Alliance, is designed to provide data rates of several tens of megabits per second to each of tens of thousands of users, with 1 gigabit per second to tens of workers on an office floor. Several hundreds of thousands of simultaneous connections should be

supported in order to support large wireless sensor deployments. Consequently, the spectral efficiency of 5G mobile communications should be significantly enhanced compared to the current 4G standard. Furthermore, signaling efficiencies should be enhanced and latency should be substantially reduced compared to current standards.

SUMMARY

[0005] The following presents a simplified summary relating to one or more aspects disclosed herein. Thus, the following summary should not be considered an extensive overview relating to all contemplated aspects, nor should the following summary be considered to identify key or critical elements relating to all contemplated aspects or to delineate the scope associated with any particular aspect. Accordingly, the following summary has the sole purpose to present certain concepts relating to one or more aspects relating to the mechanisms disclosed herein in a simplified form to precede the detailed description presented below.

[0006] An aspect is directed to a method of operating a user equipment (UE), comprising determining whether to perform a power headroom report (PHR) function for a pathloss reference signal (PL-RS) based on a PL-RS type or cell type associated with the PL-RS, and performing a PHR function or one or more pathloss measurements for the PL-RS based on the determination.

[0007] Another aspect is directed to a method of operating a user equipment (UE), comprising determining whether to perform a power headroom report (PHR) function for a pathloss reference signal (PL-RS) based on an indication associated with the PL-RS that is received from a serving cell of the UE, and performing a PHR function or one or more pathloss measurements for the PL-RS based on the determination.

[0008] Another aspect is directed to a user equipment (UE), comprising a memory, at least one transceiver, and at least one processor communicatively coupled to the memory and the at least one transceiver, the at least one processor configured to determine whether to perform a power headroom report (PHR) function for a pathloss reference signal (PL-RS) based on a PL-RS type or cell type associated with the PL-RS, and perform a PHR function or one or more pathloss measurements for the PL-RS based on the determination.

[0009] Another aspect is directed to a user equipment (UE), comprising a memory, at least one transceiver, and at least one processor communicatively coupled to the memory and the at least one transceiver, the at least one processor configured to determine whether

to perform a power headroom report (PHR) function for a pathloss reference signal (PL-RS) based on an indication associated with the PL-RS that is received from a serving cell of the UE, and perform a PHR function or one or more pathloss measurements for the PL-RS based on the determination.

[0010] Another aspect is directed to a user equipment (UE), comprising means for determining whether to perform a power headroom report (PHR) function for a pathloss reference signal (PL-RS) based on a PL-RS type or cell type associated with the PL-RS, and means for performing a PHR function or one or more pathloss measurements for the PL-RS based on the determination.

[0011] Another aspect is directed to a user equipment (UE), comprising means for determining whether to perform a power headroom report (PHR) function for a pathloss reference signal (PL-RS) based on an indication associated with the PL-RS that is received from a serving cell of the UE, and means for performing a PHR function or one or more pathloss measurements for the PL-RS based on the determination.

[0012] Another aspect is directed to a non-transitory computer-readable medium storing computer-executable instructions, the computer-executable instructions comprising at least one instruction instructing a user equipment (UE) to determine whether to perform a power headroom report (PHR) function for a pathloss reference signal (PL-RS) based on a PL-RS type or cell type associated with the PL-RS, and at least one instruction instructing the UE to perform a PHR function or one or more pathloss measurements for the PL-RS based on the determination.

[0013] Another aspect is directed to a non-transitory computer-readable medium storing computer-executable instructions, the computer-executable instructions comprising at least one instruction instructing a user equipment (UE) to determine whether to perform a power headroom report (PHR) function for a pathloss reference signal (PL-RS) based on an indication associated with the PL-RS that is received from a serving cell of the UE, and at least one instruction instructing the UE to perform a PHR function or one or more pathloss measurements for the PL-RS based on the determination.

[0014] Other objects and advantages associated with the aspects disclosed herein will be apparent to those skilled in the art based on the accompanying drawings and detailed description.

BRIEF DESCRIPTION OF THE DRAWINGS

[0015] The accompanying drawings are presented to aid in the description of various aspects of the disclosure and are provided solely for illustration of the aspects and not limitation thereof.

[0016] FIG. 1 illustrates an exemplary wireless communications system, according to various aspects.

[0017] FIGS. 2A and 2B illustrate example wireless network structures, according to various aspects.

[0018] FIGS. 3A to 3C are simplified block diagrams of several sample aspects of components that may be employed in wireless communication nodes and configured to support communication as taught herein.

[0019] FIGS. 4A and 4B are diagrams illustrating examples of frame structures and channels within the frame structures, according to aspects of the disclosure.

[0020] FIG. 5 illustrates an exemplary PRS configuration for a cell supported by a wireless node.

[0021] FIG. 6A illustrates an exemplary process of wireless communication, according to aspects of the disclosure.

[0022] FIG. 6B illustrates an exemplary process of wireless communication, according to other aspects of the disclosure.

DETAILED DESCRIPTION

[0023] Aspects of the disclosure are provided in the following description and related drawings directed to various examples provided for illustration purposes. Alternate aspects may be devised without departing from the scope of the disclosure. Additionally, well-known elements of the disclosure will not be described in detail or will be omitted so as not to obscure the relevant details of the disclosure.

[0024] The words “exemplary” and/or “example” are used herein to mean “serving as an example, instance, or illustration.” Any aspect described herein as “exemplary” and/or “example” is not necessarily to be construed as preferred or advantageous over other aspects. Likewise, the term “aspects of the disclosure” does not require that all aspects of the disclosure include the discussed feature, advantage or mode of operation.

[0025] Those of skill in the art will appreciate that the information and signals described below may be represented using any of a variety of different technologies and techniques. For example, data, instructions, commands, information, signals, bits, symbols, and chips

that may be referenced throughout the description below may be represented by voltages, currents, electromagnetic waves, magnetic fields or particles, optical fields or particles, or any combination thereof, depending in part on the particular application, in part on the desired design, in part on the corresponding technology, etc.

[0026] Further, many aspects are described in terms of sequences of actions to be performed by, for example, elements of a computing device. It will be recognized that various actions described herein can be performed by specific circuits (e.g., application specific integrated circuits (ASICs)), by program instructions being executed by one or more processors, or by a combination of both. Additionally, the sequence(s) of actions described herein can be considered to be embodied entirely within any form of non-transitory computer-readable storage medium having stored therein a corresponding set of computer instructions that, upon execution, would cause or instruct an associated processor of a device to perform the functionality described herein. Thus, the various aspects of the disclosure may be embodied in a number of different forms, all of which have been contemplated to be within the scope of the claimed subject matter. In addition, for each of the aspects described herein, the corresponding form of any such aspects may be described herein as, for example, “logic configured to” perform the described action.

[0027] As used herein, the terms “user equipment” (UE) and “base station” are not intended to be specific or otherwise limited to any particular radio access technology (RAT), unless otherwise noted. In general, a UE may be any wireless communication device (e.g., a mobile phone, router, tablet computer, laptop computer, tracking device, wearable (e.g., smartwatch, glasses, augmented reality (AR) / virtual reality (VR) headset, etc.), vehicle (e.g., automobile, motorcycle, bicycle, etc.), Internet of Things (IoT) device, etc.) used by a user to communicate over a wireless communications network. A UE may be mobile or may (e.g., at certain times) be stationary, and may communicate with a radio access network (RAN). As used herein, the term “UE” may be referred to interchangeably as an “access terminal” or “AT,” a “client device,” a “wireless device,” a “subscriber device,” a “subscriber terminal,” a “subscriber station,” a “user terminal” or UT, a “mobile terminal,” a “mobile station,” or variations thereof. Generally, UEs can communicate with a core network via a RAN, and through the core network the UEs can be connected with external networks such as the Internet and with other UEs. Of course, other mechanisms of connecting to the core network and/or the Internet are also possible

for the UEs, such as over wired access networks, wireless local area network (WLAN) networks (e.g., based on IEEE 802.11, etc.) and so on.

[0028] A base station may operate according to one of several RATs in communication with UEs depending on the network in which it is deployed, and may be alternatively referred to as an access point (AP), a network node, a NodeB, an evolved NodeB (eNB), a New Radio (NR) Node B (also referred to as a gNB or gNodeB), etc. In addition, in some systems a base station may provide purely edge node signaling functions while in other systems it may provide additional control and/or network management functions. A communication link through which UEs can send signals to a base station is called an uplink (UL) channel (e.g., a reverse traffic channel, a reverse control channel, an access channel, etc.). A communication link through which the base station can send signals to UEs is called a downlink (DL) or forward link channel (e.g., a paging channel, a control channel, a broadcast channel, a forward traffic channel, etc.). As used herein the term traffic channel (TCH) can refer to either an UL / reverse or DL / forward traffic channel.

[0029] The term “base station” may refer to a single physical transmission-reception point (TRP) or to multiple physical TRPs that may or may not be co-located. For example, where the term “base station” refers to a single physical TRP, the physical TRP may be an antenna of the base station corresponding to a cell of the base station. Where the term “base station” refers to multiple co-located physical TRPs, the physical TRPs may be an array of antennas (e.g., as in a multiple-input multiple-output (MIMO) system or where the base station employs beamforming) of the base station. Where the term “base station” refers to multiple non-co-located physical TRPs, the physical TRPs may be a distributed antenna system (DAS) (a network of spatially separated antennas connected to a common source via a transport medium) or a remote radio head (RRH) (a remote base station connected to a serving base station). Alternatively, the non-co-located physical TRPs may be the serving base station receiving the measurement report from the UE and a neighbor base station whose reference RF signals the UE is measuring. Because a TRP is the point from which a base station transmits and receives wireless signals, as used herein, references to transmission from or reception at a base station are to be understood as referring to a particular TRP of the base station.

[0030] An “RF signal” comprises an electromagnetic wave of a given frequency that transports information through the space between a transmitter and a receiver. As used herein, a transmitter may transmit a single “RF signal” or multiple “RF signals” to a

receiver. However, the receiver may receive multiple “RF signals” corresponding to each transmitted RF signal due to the propagation characteristics of RF signals through multipath channels. The same transmitted RF signal on different paths between the transmitter and receiver may be referred to as a “multipath” RF signal.

[0031] According to various aspects, **FIG. 1** illustrates an exemplary wireless communications system 100. The wireless communications system 100 (which may also be referred to as a wireless wide area network (WWAN)) may include various base stations 102 and various UEs 104. The base stations 102 may include macro cell base stations (high power cellular base stations) and/or small cell base stations (low power cellular base stations). In an aspect, the macro cell base station may include eNBs where the wireless communications system 100 corresponds to an LTE network, or gNBs where the wireless communications system 100 corresponds to a NR network, or a combination of both, and the small cell base stations may include femtocells, picocells, microcells, etc.

[0032] The base stations 102 may collectively form a RAN and interface with a core network 170 (e.g., an evolved packet core (EPC) or next generation core (NGC)) through backhaul links 122, and through the core network 170 to one or more location servers 172. In addition to other functions, the base stations 102 may perform functions that relate to one or more of transferring user data, radio channel ciphering and deciphering, integrity protection, header compression, mobility control functions (e.g., handover, dual connectivity), inter-cell interference coordination, connection setup and release, load balancing, distribution for non-access stratum (NAS) messages, NAS node selection, synchronization, RAN sharing, multimedia broadcast multicast service (MBMS), subscriber and equipment trace, RAN information management (RIM), paging, positioning, and delivery of warning messages. The base stations 102 may communicate with each other directly or indirectly (e.g., through the EPC / NGC) over backhaul links 134, which may be wired or wireless.

[0033] The base stations 102 may wirelessly communicate with the UEs 104. Each of the base stations 102 may provide communication coverage for a respective geographic coverage area 110. In an aspect, one or more cells may be supported by a base station 102 in each coverage area 110. A “cell” is a logical communication entity used for communication with a base station (e.g., over some frequency resource, referred to as a carrier frequency, component carrier, carrier, band, or the like), and may be associated with an identifier (e.g., a physical cell identifier (PCI), a virtual cell identifier (VCI)) for

distinguishing cells operating via the same or a different carrier frequency. In some cases, different cells may be configured according to different protocol types (e.g., machine-type communication (MTC), narrowband IoT (NB-IoT), enhanced mobile broadband (eMBB), or others) that may provide access for different types of UEs. Because a cell is supported by a specific base station, the term “cell” may refer to either or both the logical communication entity and the base station that supports it, depending on the context. In some cases, the term “cell” may also refer to a geographic coverage area of a base station (e.g., a sector), insofar as a carrier frequency can be detected and used for communication within some portion of geographic coverage areas 110.

[0034] While neighboring macro cell base station 102 geographic coverage areas 110 may partially overlap (e.g., in a handover region), some of the geographic coverage areas 110 may be substantially overlapped by a larger geographic coverage area 110. For example, a small cell base station 102' may have a coverage area 110' that substantially overlaps with the coverage area 110 of one or more macro cell base stations 102. A network that includes both small cell and macro cell base stations may be known as a heterogeneous network. A heterogeneous network may also include home eNBs (HeNBs), which may provide service to a restricted group known as a closed subscriber group (CSG).

[0035] The communication links 120 between the base stations 102 and the UEs 104 may include UL (also referred to as reverse link) transmissions from a UE 104 to a base station 102 and/or downlink (DL) (also referred to as forward link) transmissions from a base station 102 to a UE 104. The communication links 120 may use MIMO antenna technology, including spatial multiplexing, beamforming, and/or transmit diversity. The communication links 120 may be through one or more carrier frequencies. Allocation of carriers may be asymmetric with respect to DL and UL (e.g., more or less carriers may be allocated for DL than for UL).

[0036] The wireless communications system 100 may further include a wireless local area network (WLAN) access point (AP) 150 in communication with WLAN stations (STAs) 152 via communication links 154 in an unlicensed frequency spectrum (e.g., 5 GHz). When communicating in an unlicensed frequency spectrum, the WLAN STAs 152 and/or the WLAN AP 150 may perform a clear channel assessment (CCA) or listen before talk (LBT) procedure prior to communicating in order to determine whether the channel is available.

[0037] The small cell base station 102' may operate in a licensed and/or an unlicensed frequency spectrum. When operating in an unlicensed frequency spectrum, the small cell base station 102' may employ LTE or NR technology and use the same 5 GHz unlicensed frequency spectrum as used by the WLAN AP 150. The small cell base station 102', employing LTE / 5G in an unlicensed frequency spectrum, may boost coverage to and/or increase capacity of the access network. NR in unlicensed spectrum may be referred to as NR-U. LTE in an unlicensed spectrum may be referred to as LTE-U, licensed assisted access (LAA), or MulteFire.

[0038] The wireless communications system 100 may further include a millimeter wave (mmW) base station 180 that may operate in mmW frequencies and/or near mmW frequencies in communication with a UE 182. Extremely high frequency (EHF) is part of the RF in the electromagnetic spectrum. EHF has a range of 30 GHz to 300 GHz and a wavelength between 1 millimeter and 10 millimeters. Radio waves in this band may be referred to as a millimeter wave. Near mmW may extend down to a frequency of 3 GHz with a wavelength of 100 millimeters. The super high frequency (SHF) band extends between 3 GHz and 30 GHz, also referred to as centimeter wave. Communications using the mmW/near mmW radio frequency band have high path loss and a relatively short range. The mmW base station 180 and the UE 182 may utilize beamforming (transmit and/or receive) over a mmW communication link 184 to compensate for the extremely high path loss and short range. Further, it will be appreciated that in alternative configurations, one or more base stations 102 may also transmit using mmW or near mmW and beamforming. Accordingly, it will be appreciated that the foregoing illustrations are merely examples and should not be construed to limit the various aspects disclosed herein.

[0039] Transmit beamforming is a technique for focusing an RF signal in a specific direction. Traditionally, when a network node (e.g., a base station) broadcasts an RF signal, it broadcasts the signal in all directions (omni-directionally). With transmit beamforming, the network node determines where a given target device (e.g., a UE) is located (relative to the transmitting network node) and projects a stronger downlink RF signal in that specific direction, thereby providing a faster (in terms of data rate) and stronger RF signal for the receiving device(s). To change the directionality of the RF signal when transmitting, a network node can control the phase and relative amplitude of the RF signal at each of the one or more transmitters that are broadcasting the RF signal.

For example, a network node may use an array of antennas (referred to as a “phased array” or an “antenna array”) that creates a beam of RF waves that can be “steered” to point in different directions, without actually moving the antennas. Specifically, the RF current from the transmitter is fed to the individual antennas with the correct phase relationship so that the radio waves from the separate antennas add together to increase the radiation in a desired direction, while cancelling to suppress radiation in undesired directions.

[0040] Transmit beams may be quasi-collocated, meaning that they appear to the receiver (e.g., a UE) as having the same parameters, regardless of whether or not the transmitting antennas of the network node themselves are physically collocated. In NR, there are four types of quasi-collocation (QCL) relations. Specifically, a QCL relation of a given type means that certain parameters about a second reference RF signal on a second beam can be derived from information about a source reference RF signal on a source beam. Thus, if the source reference RF signal is QCL Type A, the receiver can use the source reference RF signal to estimate the Doppler shift, Doppler spread, average delay, and delay spread of a second reference RF signal transmitted on the same channel. If the source reference RF signal is QCL Type B, the receiver can use the source reference RF signal to estimate the Doppler shift and Doppler spread of a second reference RF signal transmitted on the same channel. If the source reference RF signal is QCL Type C, the receiver can use the source reference RF signal to estimate the Doppler shift and average delay of a second reference RF signal transmitted on the same channel. If the source reference RF signal is QCL Type D, the receiver can use the source reference RF signal to estimate the spatial receive parameter of a second reference RF signal transmitted on the same channel.

[0041] In receive beamforming, the receiver uses a receive beam to amplify RF signals detected on a given channel. For example, the receiver can increase the gain setting and/or adjust the phase setting of an array of antennas in a particular direction to amplify (e.g., to increase the gain level of) the RF signals received from that direction. Thus, when a receiver is said to beamform in a certain direction, it means the beam gain in that direction is high relative to the beam gain along other directions, or the beam gain in that direction is the highest compared to the beam gain in that direction of all other receive beams available to the receiver. This results in a stronger received signal strength (e.g., reference signal received power (RSRP), reference signal received quality (RSRQ), signal-to-interference-plus-noise ratio (SINR), etc.) of the RF signals received from that direction.

[0042] Receive beams may be spatially related. A spatial relation means that parameters for a transmit beam for a second reference signal can be derived from information about a receive beam for a first reference signal. For example, a UE may use a particular receive beam to receive a reference downlink reference signal (e.g., synchronization signal block (SSB)) from a base station. The UE can then form a transmit beam for sending an uplink reference signal (e.g., sounding reference signal (SRS)) to that base station based on the parameters of the receive beam.

[0043] Note that a “downlink” beam may be either a transmit beam or a receive beam, depending on the entity forming it. For example, if a base station is forming the downlink beam to transmit a reference signal to a UE, the downlink beam is a transmit beam. If the UE is forming the downlink beam, however, it is a receive beam to receive the downlink reference signal. Similarly, an “uplink” beam may be either a transmit beam or a receive beam, depending on the entity forming it. For example, if a base station is forming the uplink beam, it is an uplink receive beam, and if a UE is forming the uplink beam, it is an uplink transmit beam.

[0044] In 5G, the frequency spectrum in which wireless nodes (e.g., base stations 102/180, UEs 104/182) operate is divided into multiple frequency ranges, FR1 (from 450 to 6000 MHz), FR2 (from 24250 to 52600 MHz), FR3 (above 52600 MHz), and FR4 (between FR1 and FR2). In a multi-carrier system, such as 5G, one of the carrier frequencies is referred to as the “primary carrier” or “anchor carrier” or “primary serving cell” or “PCell,” and the remaining carrier frequencies are referred to as “secondary carriers” or “secondary serving cells” or “SCells.” In carrier aggregation, the anchor carrier is the carrier operating on the primary frequency (e.g., FR1) utilized by a UE 104/182 and the cell in which the UE 104/182 either performs the initial radio resource control (RRC) connection establishment procedure or initiates the RRC connection re-establishment procedure. The primary carrier carries all common and UE-specific control channels, and may be a carrier in a licensed frequency (however, this is not always the case). A secondary carrier is a carrier operating on a second frequency (e.g., FR2) that may be configured once the RRC connection is established between the UE 104 and the anchor carrier and that may be used to provide additional radio resources. In some cases, the secondary carrier may be a carrier in an unlicensed frequency. The secondary carrier may contain only necessary signaling information and signals, for example, those that are UE-specific may not be present in the secondary carrier, since both primary uplink and

downlink carriers are typically UE-specific. This means that different UEs 104/182 in a cell may have different downlink primary carriers. The same is true for the uplink primary carriers. The network is able to change the primary carrier of any UE 104/182 at any time. This is done, for example, to balance the load on different carriers. Because a “serving cell” (whether a PCell or an SCell) corresponds to a carrier frequency / component carrier over which some base station is communicating, the term “cell,” “serving cell,” “component carrier,” “carrier frequency,” and the like can be used interchangeably.

[0045] For example, still referring to FIG. 1, one of the frequencies utilized by the macro cell base stations 102 may be an anchor carrier (or “PCell”) and other frequencies utilized by the macro cell base stations 102 and/or the mmW base station 180 may be secondary carriers (“SCells”). The simultaneous transmission and/or reception of multiple carriers enables the UE 104/182 to significantly increase its data transmission and/or reception rates. For example, two 20 MHz aggregated carriers in a multi-carrier system would theoretically lead to a two-fold increase in data rate (i.e., 40 MHz), compared to that attained by a single 20 MHz carrier.

[0046] The wireless communications system 100 may further include one or more UEs, such as UE 190, that connects indirectly to one or more communication networks via one or more device-to-device (D2D) peer-to-peer (P2P) links. In the example of FIG. 1, UE 190 has a D2D P2P link 192 with one of the UEs 104 connected to one of the base stations 102 (e.g., through which UE 190 may indirectly obtain cellular connectivity) and a D2D P2P link 194 with WLAN STA 152 connected to the WLAN AP 150 (through which UE 190 may indirectly obtain WLAN-based Internet connectivity). In an example, the D2D P2P links 192 and 194 may be supported with any well-known D2D RAT, such as LTE Direct (LTE-D), WiFi Direct (WiFi-D), Bluetooth®, and so on.

[0047] The wireless communications system 100 may further include a UE 164 that may communicate with a macro cell base station 102 over a communication link 120 and/or the mmW base station 180 over a mmW communication link 184. For example, the macro cell base station 102 may support a PCell and one or more SCells for the UE 164 and the mmW base station 180 may support one or more SCells for the UE 164.

[0048] According to various aspects, **FIG. 2A** illustrates an example wireless network structure 200. For example, an NGC 210 (also referred to as a “5GC”) can be viewed functionally as control plane functions 214 (e.g., UE registration, authentication, network access, gateway selection, etc.) and user plane functions 212, (e.g., UE gateway function,

access to data networks, IP routing, etc.) which operate cooperatively to form the core network. User plane interface (NG-U) 213 and control plane interface (NG-C) 215 connect the gNB 222 to the NGC 210 and specifically to the control plane functions 214 and user plane functions 212. In an additional configuration, an eNB 224 may also be connected to the NGC 210 via NG-C 215 to the control plane functions 214 and NG-U 213 to user plane functions 212. Further, eNB 224 may directly communicate with gNB 222 via a backhaul connection 223. In some configurations, the New RAN 220 may only have one or more gNBs 222, while other configurations include one or more of both eNBs 224 and gNBs 222. Either gNB 222 or eNB 224 may communicate with UEs 204 (e.g., any of the UEs depicted in FIG. 1). Another optional aspect may include location server 230, which may be in communication with the NGC 210 to provide location assistance for UEs 204. The location server 230 can be implemented as a plurality of separate servers (e.g., physically separate servers, different software modules on a single server, different software modules spread across multiple physical servers, etc.), or alternately may each correspond to a single server. The location server 230 can be configured to support one or more location services for UEs 204 that can connect to the location server 230 via the core network, NGC 210, and/or via the Internet (not illustrated). Further, the location server 230 may be integrated into a component of the core network, or alternatively may be external to the core network.

[0049] According to various aspects, **FIG. 2B** illustrates another example wireless network structure 250. For example, an NGC 260 (also referred to as a “5GC”) can be viewed functionally as control plane functions, provided by an access and mobility management function (AMF) / user plane function (UPF) 264, and user plane functions, provided by a session management function (SMF) 262, which operate cooperatively to form the core network (i.e., NGC 260). User plane interface 263 and control plane interface 265 connect the eNB 224 to the NGC 260 and specifically to SMF 262 and AMF/UPF 264, respectively. In an additional configuration, a gNB 222 may also be connected to the NGC 260 via control plane interface 265 to AMF/UPF 264 and user plane interface 263 to SMF 262. Further, eNB 224 may directly communicate with gNB 222 via the backhaul connection 223, with or without gNB direct connectivity to the NGC 260. In some configurations, the New RAN 220 may only have one or more gNBs 222, while other configurations include one or more of both eNBs 224 and gNBs 222. Either gNB 222 or eNB 224 may communicate with UEs 204 (e.g., any of the UEs depicted in

FIG. 1). The base stations of the New RAN 220 communicate with the AMF-side of the AMF/UPF 264 over the N2 interface and the UPF-side of the AMF/UPF 264 over the N3 interface.

[0050] The functions of the AMF include registration management, connection management, reachability management, mobility management, lawful interception, transport for session management (SM) messages between the UE 204 and the SMF 262, transparent proxy services for routing SM messages, access authentication and access authorization, transport for short message service (SMS) messages between the UE 204 and the short message service function (SMSF) (not shown), and security anchor functionality (SEAF). The AMF also interacts with the authentication server function (AUSF) (not shown) and the UE 204, and receives the intermediate key that was established as a result of the UE 204 authentication process. In the case of authentication based on a UMTS (universal mobile telecommunications system) subscriber identity module (USIM), the AMF retrieves the security material from the AUSF. The functions of the AMF also include security context management (SCM). The SCM receives a key from the SEAF that it uses to derive access-network specific keys. The functionality of the AMF also includes location services management for regulatory services, transport for location services messages between the UE 204 and the location management function (LMF) 270, as well as between the New RAN 220 and the LMF 270, evolved packet system (EPS) bearer identifier allocation for interworking with the EPS, and UE 204 mobility event notification. In addition, the AMF also supports functionalities for non-3GPP access networks.

[0051] Functions of the UPF include acting as an anchor point for intra-/inter-RAT mobility (when applicable), acting as an external protocol data unit (PDU) session point of interconnect to the data network (not shown), providing packet routing and forwarding, packet inspection, user plane policy rule enforcement (e.g., gating, redirection, traffic steering), lawful interception (user plane collection), traffic usage reporting, quality of service (QoS) handling for the user plane (e.g., UL/DL rate enforcement, reflective QoS marking in the DL), UL traffic verification (service data flow (SDF) to QoS flow mapping), transport level packet marking in the UL and DL, DL packet buffering and DL data notification triggering, and sending and forwarding of one or more “end markers” to the source RAN node.

[0052] The functions of the SMF 262 include session management, UE Internet protocol (IP) address allocation and management, selection and control of user plane functions, configuration of traffic steering at the UPF to route traffic to the proper destination, control of part of policy enforcement and QoS, and downlink data notification. The interface over which the SMF 262 communicates with the AMF-side of the AMF/UPF 264 is referred to as the N11 interface.

[0053] Another optional aspect may include a LMF 270, which may be in communication with the NGC 260 to provide location assistance for UEs 204. The LMF 270 can be implemented as a plurality of separate servers (e.g., physically separate servers, different software modules on a single server, different software modules spread across multiple physical servers, etc.), or alternately may each correspond to a single server. The LMF 270 can be configured to support one or more location services for UEs 204 that can connect to the LMF 270 via the core network, NGC 260, and/or via the Internet (not illustrated).

[0054] **FIGS. 3A, 3B, and 3C** illustrate several sample components (represented by corresponding blocks) that may be incorporated into a UE 302 (which may correspond to any of the UEs described herein), a base station 304 (which may correspond to any of the base stations described herein), and a network entity 306 (which may correspond to or embody any of the network functions described herein, including the location server 230 and the LMF 270) to support the file transmission operations as taught herein. It will be appreciated that these components may be implemented in different types of apparatuses in different implementations (e.g., in an ASIC, in a system-on-chip (SoC), etc.). The illustrated components may also be incorporated into other apparatuses in a communication system. For example, other apparatuses in a system may include components similar to those described to provide similar functionality. Also, a given apparatus may contain one or more of the components. For example, an apparatus may include multiple transceiver components that enable the apparatus to operate on multiple carriers and/or communicate via different technologies.

[0055] The UE 302 and the base station 304 each include wireless wide area network (WWAN) transceiver 310 and 350, respectively, configured to communicate via one or more wireless communication networks (not shown), such as an NR network, an LTE network, a GSM network, and/or the like. The WWAN transceivers 310 and 350 may be connected to one or more antennas 316 and 356, respectively, for communicating with

other network nodes, such as other UEs, access points, base stations (e.g., eNBs, gNBs), etc., via at least one designated RAT (e.g., NR, LTE, GSM, etc.) over a wireless communication medium of interest (e.g., some set of time/frequency resources in a particular frequency spectrum). The WWAN transceivers 310 and 350 may be variously configured for transmitting and encoding signals 318 and 358 (e.g., messages, indications, information, and so on), respectively, and, conversely, for receiving and decoding signals 318 and 358 (e.g., messages, indications, information, pilots, and so on), respectively, in accordance with the designated RAT. Specifically, the transceivers 310 and 350 include one or more transmitters 314 and 354, respectively, for transmitting and encoding signals 318 and 358, respectively, and one or more receivers 312 and 352, respectively, for receiving and decoding signals 318 and 358, respectively.

[0056] The UE 302 and the base station 304 also include, at least in some cases, wireless local area network (WLAN) transceivers 320 and 360, respectively. The WLAN transceivers 320 and 360 may be connected to one or more antennas 326 and 366, respectively, for communicating with other network nodes, such as other UEs, access points, base stations, etc., via at least one designated RAT (e.g., WiFi, LTE-D, Bluetooth®, etc.) over a wireless communication medium of interest. The WLAN transceivers 320 and 360 may be variously configured for transmitting and encoding signals 328 and 368 (e.g., messages, indications, information, and so on), respectively, and, conversely, for receiving and decoding signals 328 and 368 (e.g., messages, indications, information, pilots, and so on), respectively, in accordance with the designated RAT. Specifically, the transceivers 320 and 360 include one or more transmitters 324 and 364, respectively, for transmitting and encoding signals 328 and 368, respectively, and one or more receivers 322 and 362, respectively, for receiving and decoding signals 328 and 368, respectively.

[0057] Transceiver circuitry including a transmitter and a receiver may comprise an integrated device (e.g., embodied as a transmitter circuit and a receiver circuit of a single communication device) in some implementations, may comprise a separate transmitter device and a separate receiver device in some implementations, or may be embodied in other ways in other implementations. In an aspect, a transmitter may include or be coupled to a plurality of antennas (e.g., antennas 316, 336, and 376), such as an antenna array, that permits the respective apparatus to perform transmit “beamforming,” as described herein. Similarly, a receiver may include or be coupled to a plurality of

antennas (e.g., antennas 316, 336, and 376), such as an antenna array, that permits the respective apparatus to perform receive beamforming, as described herein. In an aspect, the transmitter and receiver may share the same plurality of antennas (e.g., antennas 316, 336, and 376), such that the respective apparatus can only receive or transmit at a given time, not both at the same time. A wireless communication device (e.g., one or both of the transceivers 310 and 320 and/or 350 and 360) of the apparatuses 302 and/or 304 may also comprise a network listen module (NLM) or the like for performing various measurements.

[0058] The apparatuses 302 and 304 also include, at least in some cases, satellite positioning systems (SPS) receivers 330 and 370. The SPS receivers 330 and 370 may be connected to one or more antennas 336 and 376, respectively, for receiving SPS signals 338 and 378, respectively, such as global positioning system (GPS) signals, global navigation satellite system (GLONASS) signals, Galileo signals, Beidou signals, Indian Regional Navigation Satellite System (NAVIC), Quasi-Zenith Satellite System (QZSS), etc. The SPS receivers 330 and 370 may comprise any suitable hardware and/or software for receiving and processing SPS signals 338 and 378, respectively. The SPS receivers 330 and 370 request information and operations as appropriate from the other systems, and performs calculations necessary to determine the apparatus' 302 and 304 positions using measurements obtained by any suitable SPS algorithm.

[0059] The base station 304 and the network entity 306 each include at least one network interfaces 380 and 390 for communicating with other network entities. For example, the network interfaces 380 and 390 (e.g., one or more network access ports) may be configured to communicate with one or more network entities via a wire-based or wireless backhaul connection. In some aspects, the network interfaces 380 and 390 may be implemented as transceivers configured to support wire-based or wireless signal communication. This communication may involve, for example, sending and receiving: messages, parameters, or other types of information.

[0060] The apparatuses 302, 304, and 306 also include other components that may be used in conjunction with the operations as disclosed herein. The UE 302 includes processor circuitry implementing a processing system 332 for providing functionality relating to, for example, false base station (FBS) detection as disclosed herein and for providing other processing functionality. The base station 304 includes a processing system 384 for providing functionality relating to, for example, FBS detection as

disclosed herein and for providing other processing functionality. The network entity 306 includes a processing system 394 for providing functionality relating to, for example, FBS detection as disclosed herein and for providing other processing functionality. In an aspect, the processing systems 332, 384, and 394 may include, for example, one or more general purpose processors, multi-core processors, ASICs, digital signal processors (DSPs), field programmable gate arrays (FPGA), or other programmable logic devices or processing circuitry.

[0061] The apparatuses 302, 304, and 306 include memory circuitry implementing memory components 340, 386, and 396 (e.g., each including a memory device), respectively, for maintaining information (e.g., information indicative of reserved resources, thresholds, parameters, and so on). In some cases, the apparatus 302 may include power headroom report (PHR) module 342. The PHR module 342 may comprise a hardware circuit that is part of or coupled to the processing system 332, that, when executed, cause the apparatus 302, to perform the functionality described herein. In other aspects, the PHR module 342 may be external to the processing system 332 (e.g., part of a modem processing system, integrated with another processing system, etc.). Alternatively, the PHR module 342 may be a memory module (as shown in FIGS. 3A) stored in the memory component 340, that, when executed by the processing system 332 (e.g., or a modem processing system, another processing system, etc.), cause the apparatus 302 to perform the functionality described herein.

[0062] The UE 302 may include one or more sensors 344 coupled to the processing system 332 to provide movement and/or orientation information that is independent of motion data derived from signals received by the WWAN transceiver 310, the WLAN transceiver 320, and/or the SPS receiver 330. By way of example, the sensor(s) 344 may include an accelerometer (e.g., a micro-electrical mechanical systems (MEMS) device), a gyroscope, a geomagnetic sensor (e.g., a compass), an altimeter (e.g., a barometric pressure altimeter), and/or any other type of movement detection sensor. Moreover, the sensor(s) 344 may include a plurality of different types of devices and combine their outputs in order to provide motion information. For example, the sensor(s) 344 may use a combination of a multi-axis accelerometer and orientation sensors to provide the ability to compute positions in 2D and/or 3D coordinate systems.

[0063] In addition, the UE 302 includes a user interface 346 for providing indications (e.g., audible and/or visual indications) to a user and/or for receiving user input (e.g., upon

user actuation of a sensing device such a keypad, a touch screen, a microphone, and so on). Although not shown, the apparatuses 304 and 306 may also include user interfaces.

[0064] Referring to the processing system 384 in more detail, in the downlink, IP packets from the network entity 306 may be provided to the processing system 384. The processing system 384 may implement functionality for an RRC layer, a packet data convergence protocol (PDCP) layer, a radio link control (RLC) layer, and a medium access control (MAC) layer. The processing system 384 may provide RRC layer functionality associated with broadcasting of system information (e.g., master information block (MIB), system information blocks (SIBs)), RRC connection control (e.g., RRC connection paging, RRC connection establishment, RRC connection modification, and RRC connection release), inter-RAT mobility, and measurement configuration for UE measurement reporting; PDCP layer functionality associated with header compression/decompression, security (ciphering, deciphering, integrity protection, integrity verification), and handover support functions; RLC layer functionality associated with the transfer of upper layer packet data units (PDUs), error correction through ARQ, concatenation, segmentation, and reassembly of RLC service data units (SDUs), re-segmentation of RLC data PDUs, and reordering of RLC data PDUs; and MAC layer functionality associated with mapping between logical channels and transport channels, scheduling information reporting, error correction, priority handling, and logical channel prioritization.

[0065] The transmitter 354 and the receiver 352 may implement Layer-1 functionality associated with various signal processing functions. Layer-1, which includes a physical (PHY) layer, may include error detection on the transport channels, forward error correction (FEC) coding/decoding of the transport channels, interleaving, rate matching, mapping onto physical channels, modulation/demodulation of physical channels, and MIMO antenna processing. The transmitter 354 handles mapping to signal constellations based on various modulation schemes (e.g., binary phase-shift keying (BPSK), quadrature phase-shift keying (QPSK), M-phase-shift keying (M-PSK), M-quadrature amplitude modulation (M-QAM)). The coded and modulated symbols may then be split into parallel streams. Each stream may then be mapped to an orthogonal frequency division multiplexing (OFDM) subcarrier, multiplexed with a reference signal (e.g., pilot) in the time and/or frequency domain, and then combined together using an Inverse Fast Fourier Transform (IFFT) to produce a physical channel carrying a time domain OFDM symbol

stream. The OFDM stream is spatially precoded to produce multiple spatial streams. Channel estimates from a channel estimator may be used to determine the coding and modulation scheme, as well as for spatial processing. The channel estimate may be derived from a reference signal and/or channel condition feedback transmitted by the UE 302. Each spatial stream may then be provided to one or more different antennas 356. The transmitter 354 may modulate an RF carrier with a respective spatial stream for transmission.

[0066] At the UE 302, the receiver 312 receives a signal through its respective antenna(s) 316. The receiver 312 recovers information modulated onto an RF carrier and provides the information to the processing system 332. The transmitter 314 and the receiver 312 implement Layer-1 functionality associated with various signal processing functions. The receiver 312 may perform spatial processing on the information to recover any spatial streams destined for the UE 302. If multiple spatial streams are destined for the UE 302, they may be combined by the receiver 312 into a single OFDM symbol stream. The receiver 312 then converts the OFDM symbol stream from the time-domain to the frequency domain using a fast Fourier transform (FFT). The frequency domain signal comprises a separate OFDM symbol stream for each subcarrier of the OFDM signal. The symbols on each subcarrier, and the reference signal, are recovered and demodulated by determining the most likely signal constellation points transmitted by the base station 304. These soft decisions may be based on channel estimates computed by a channel estimator. The soft decisions are then decoded and de-interleaved to recover the data and control signals that were originally transmitted by the base station 304 on the physical channel. The data and control signals are then provided to the processing system 332, which implements Layer-3 and Layer-2 functionality.

[0067] In the UL, the processing system 332 provides demultiplexing between transport and logical channels, packet reassembly, deciphering, header decompression, and control signal processing to recover IP packets from the core network. The processing system 332 is also responsible for error detection.

[0068] Similar to the functionality described in connection with the DL transmission by the base station 304, the processing system 332 provides RRC layer functionality associated with system information (e.g., MIB, SIBs) acquisition, RRC connections, and measurement reporting; PDCP layer functionality associated with header compression/decompression, and security (ciphering, deciphering, integrity protection,

integrity verification); RLC layer functionality associated with the transfer of upper layer PDUs, error correction through ARQ, concatenation, segmentation, and reassembly of RLC SDUs, re-segmentation of RLC data PDUs, and reordering of RLC data PDUs; and MAC layer functionality associated with mapping between logical channels and transport channels, multiplexing of MAC SDUs onto transport blocks (TBs), demultiplexing of MAC SDUs from TBs, scheduling information reporting, error correction through HARQ, priority handling, and logical channel prioritization.

[0069] Channel estimates derived by the channel estimator from a reference signal or feedback transmitted by the base station 304 may be used by the transmitter 314 to select the appropriate coding and modulation schemes, and to facilitate spatial processing. The spatial streams generated by the transmitter 314 may be provided to different antenna(s) 316. The transmitter 314 may modulate an RF carrier with a respective spatial stream for transmission.

[0070] The UL transmission is processed at the base station 304 in a manner similar to that described in connection with the receiver function at the UE 302. The receiver 352 receives a signal through its respective antenna(s) 356. The receiver 352 recovers information modulated onto an RF carrier and provides the information to the processing system 384.

[0071] In the UL, the processing system 384 provides demultiplexing between transport and logical channels, packet reassembly, deciphering, header decompression, control signal processing to recover IP packets from the UE 302. IP packets from the processing system 384 may be provided to the core network. The processing system 384 is also responsible for error detection.

[0072] For convenience, the apparatuses 302, 304, and/or 306 are shown in FIGS. 3A-C as including various components that may be configured according to the various examples described herein. It will be appreciated, however, that the illustrated blocks may have different functionality in different designs.

[0073] The various components of the apparatuses 302, 304, and 306 may communicate with each other over data buses 334, 382, and 392, respectively. The components of FIGS. 3A-C may be implemented in various ways. In some implementations, the components of FIGS. 3A-C may be implemented in one or more circuits such as, for example, one or more processors and/or one or more ASICs (which may include one or more processors). Here, each circuit may use and/or incorporate at least one memory

component for storing information or executable code used by the circuit to provide this functionality. For example, some or all of the functionality represented by blocks 310 to 346 may be implemented by processor and memory component(s) of the UE 302 (e.g., by execution of appropriate code and/or by appropriate configuration of processor components). Similarly, some or all of the functionality represented by blocks 350 to 386 may be implemented by processor and memory component(s) of the base station 304 (e.g., by execution of appropriate code and/or by appropriate configuration of processor components). Also, some or all of the functionality represented by blocks 390 to 396 may be implemented by processor and memory component(s) of the network entity 306 (e.g., by execution of appropriate code and/or by appropriate configuration of processor components). For simplicity, various operations, acts, and/or functions are described herein as being performed “by a UE,” “by a base station,” “by a positioning entity,” etc. However, as will be appreciated, such operations, acts, and/or functions may actually be performed by specific components or combinations of components of the UE, base station, positioning entity, etc., such as the processing systems 332, 384, 394, the transceivers 310, 320, 350, and 360, the memory components 340, 386, and 396, the PHR module 342, etc.

[0074] **FIG. 4A** is a diagram 400 illustrating an example of a DL frame structure, according to aspects of the disclosure. **FIG. 4B** is a diagram 430 illustrating an example of channels within the DL frame structure, according to aspects of the disclosure. Other wireless communications technologies may have a different frame structures and/or different channels.

[0075] LTE, and in some cases NR, utilizes OFDM on the downlink and single-carrier frequency division multiplexing (SC-FDM) on the uplink. Unlike LTE, however, NR has an option to use OFDM on the uplink as well. OFDM and SC-FDM partition the system bandwidth into multiple (K) orthogonal subcarriers, which are also commonly referred to as tones, bins, etc. Each subcarrier may be modulated with data. In general, modulation symbols are sent in the frequency domain with OFDM and in the time domain with SC-FDM. The spacing between adjacent subcarriers may be fixed, and the total number of subcarriers (K) may be dependent on the system bandwidth. For example, the spacing of the subcarriers may be 15 kHz and the minimum resource allocation (resource block) may be 12 subcarriers (or 180 kHz). Consequently, the nominal FFT size may be equal to 128, 256, 512, 1024, or 2048 for system bandwidth of 1.25, 2.5, 5, 10, or 20 megahertz (MHz),

respectively. The system bandwidth may also be partitioned into subbands. For example, a subband may cover 1.08 MHz (i.e., 6 resource blocks), and there may be 1, 2, 4, 8, or 16 subbands for system bandwidth of 1.25, 2.5, 5, 10, or 20 MHz, respectively.

[0076] LTE supports a single numerology (subcarrier spacing, symbol length, etc.). In contrast NR may support multiple numerologies, for example, subcarrier spacing of 15 kHz, 30 kHz, 60 kHz, 120 kHz and 204 kHz or greater may be available. Table 1 provided below lists some various parameters for different NR numerologies.

Subcarrier spacing (kHz)	Symbols / slot	slots / subframe	slots / frame	slot (ms)	Symbol duration (μ s)	Max. nominal system BW (MHz) with 4K FFT size
15	14	1	10	1	66.7	50
30	14	2	20	0.5	33.3	100
60	14	4	40	0.25	16.7	100
120	14	8	80	0.125	8.33	400
240	14	16	160	0.0625	4.17	800

Table 1

[0077] In the examples of FIGS. 4A and 4B, a numerology of 15 kHz is used. Thus, in the time domain, a frame (e.g., 10 ms) is divided into 10 equally sized subframes of 1 ms each, and each subframe includes one time slot. In FIGS. 4A and 4B, time is represented horizontally (e.g., on the X axis) with time increasing from left to right, while frequency is represented vertically (e.g., on the Y axis) with frequency increasing (or decreasing) from bottom to top.

[0078] A resource grid may be used to represent time slots, each time slot including one or more time concurrent resource blocks (RBs) (also referred to as physical RBs (PRBs)) in the frequency domain. The resource grid is further divided into multiple resource elements (REs). An RE may correspond to one symbol length in the time domain and one subcarrier in the frequency domain. In the numerology of FIGS. 4A and 4B, for a normal cyclic prefix, an RB may contain 12 consecutive subcarriers in the frequency domain and 7 consecutive symbols (for DL, OFDM symbols; for UL, SC-FDMA symbols) in the time domain, for a total of 84 REs. For an extended cyclic prefix, an RB may contain 12 consecutive subcarriers in the frequency domain and 6 consecutive

symbols in the time domain, for a total of 72 REs. The number of bits carried by each RE depends on the modulation scheme.

[0079] As illustrated in FIG. 4A, some of the REs carry DL reference (pilot) signals (DL-RS) for channel estimation at the UE. The DL-RS may include demodulation reference signals (DMRS) and channel state information reference signals (CSI-RS), exemplary locations of which are labeled “R” in FIG. 4A.

[0080] FIG. 4B illustrates an example of various channels within a DL subframe of a frame. The physical downlink control channel (PDCCH) carries DL control information (DCI) within one or more control channel elements (CCEs), each CCE including nine RE groups (REGs), each REG including four consecutive REs in an OFDM symbol. The DCI carries information about UL resource allocation (persistent and non-persistent) and descriptions about DL data transmitted to the UE. Multiple (e.g., up to 8) DCIs can be configured in the PDCCH, and these DCIs can have one of multiple formats. For example, there are different DCI formats for UL scheduling, for non-MIMO DL scheduling, for MIMO DL scheduling, and for UL power control.

[0081] A primary synchronization signal (PSS) is used by a UE to determine subframe/symbol timing and a physical layer identity. A secondary synchronization signal (SSS) is used by a UE to determine a physical layer cell identity group number and radio frame timing. Based on the physical layer identity and the physical layer cell identity group number, the UE can determine a PCI. Based on the PCI, the UE can determine the locations of the aforementioned DL-RS. The physical broadcast channel (PBCH), which carries an MIB, may be logically grouped with the PSS and SSS to form an SSB (also referred to as an SS/PBCH). The MIB provides a number of RBs in the DL system bandwidth and a system frame number (SFN). The physical downlink shared channel (PDSCH) carries user data, broadcast system information not transmitted through the PBCH such as system information blocks (SIBs), and paging messages.

[0082] In some cases, the DL RS illustrated in FIG. 4A may be positioning reference signals (PRS). FIG. 5 illustrates an exemplary PRS configuration 500 for a cell supported by a wireless node (such as a base station 102). FIG. 5 shows how PRS positioning occasions are determined by a system frame number (SFN), a cell specific subframe offset (Δ_{PRS}) 552, and the PRS periodicity (T_{PRS}) 520. Typically, the cell specific PRS subframe configuration is defined by a “PRS Configuration Index” I_{PRS} included in observed time difference of arrival (OTDOA) assistance data. The PRS periodicity (T_{PRS}) 520 and the

cell specific subframe offset (Δ_{PRS}) are defined based on the PRS configuration index I_{PRS} , as illustrated in Table 2 below.

PRS configuration Index I_{PRS}	PRS periodicity T_{PRS} (subframes)	PRS subframe offset Δ_{PRS} (subframes)
0 – 159	160	I_{PRS}
160 – 479	320	$I_{\text{PRS}} - 160$
480 – 1119	640	$I_{\text{PRS}} - 480$
1120 – 2399	1280	$I_{\text{PRS}} - 1120$
2400 – 2404	5	$I_{\text{PRS}} - 2400$
2405 – 2414	10	$I_{\text{PRS}} - 2405$
2415 – 2434	20	$I_{\text{PRS}} - 2415$
2435 – 2474	40	$I_{\text{PRS}} - 2435$
2475 – 2554	80	$I_{\text{PRS}} - 2475$
2555-4095	Reserved	

Table 2

[0083] A PRS configuration is defined with reference to the SFN of a cell that transmits PRS. PRS instances, for the first subframe of the N_{PRS} downlink subframes comprising a first PRS positioning occasion, may satisfy:

$$(10 \times n_f + \lfloor n_s / 2 \rfloor - \Delta_{\text{PRS}}) \bmod T_{\text{PRS}} = 0,$$

where n_f is the SFN with $0 \leq n_f \leq 1023$, n_s is the slot number within the radio frame defined by n_f with $0 \leq n_s \leq 19$, T_{PRS} is the PRS periodicity 520, and Δ_{PRS} is the cell-specific subframe offset 552.

[0084] As shown in FIG. 5, the cell specific subframe offset Δ_{PRS} 552 may be defined in terms of the number of subframes transmitted starting from system frame number 0 (Slot ‘Number 0’, marked as slot 550) to the start of the first (subsequent) PRS positioning occasion. In the example in FIG. 5, the number of consecutive positioning subframes (N_{PRS}) in each of the consecutive PRS positioning occasions 518a, 518b, and 518c equals 4. That is, each shaded block representing PRS positioning occasions 518a, 518b, and 518c represents four subframes.

[0085] In some aspects, when a UE receives a PRS configuration index I_{PRS} in the OTDOA assistance data for a particular cell, the UE may determine the PRS periodicity T_{PRS} 520 and PRS subframe offset Δ_{PRS} using Table 2. The UE may then determine the radio frame, subframe, and slot when a PRS is scheduled in the cell (e.g., using equation

(1)). The OTDOA assistance data may be determined by, for example, the location server (e.g., location server 230, LMF 270), and includes assistance data for a reference cell, and a number of neighbor cells supported by various base stations.

[0086] Typically, PRS occasions from all cells in a network that use the same frequency are aligned in time and may have a fixed known time offset (e.g., cell-specific subframe offset 552) relative to other cells in the network that use a different frequency. In SFN-synchronous networks, all wireless nodes (e.g., base stations 102) may be aligned on both frame boundary and system frame number. Therefore, in SFN-synchronous networks, all cells supported by the various wireless nodes may use the same PRS configuration index for any particular frequency of PRS transmission. On the other hand, in SFN-asynchronous networks, the various wireless nodes may be aligned on a frame boundary, but not system frame number. Thus, in SFN-asynchronous networks the PRS configuration index for each cell may be configured separately by the network so that PRS occasions align in time.

[0087] A UE may determine the timing of the PRS occasions of the reference and neighbor cells for OTDOA positioning, if the UE can obtain the cell timing (e.g., SFN) of at least one of the cells, e.g., the reference cell or a serving cell. The timing of the other cells may then be derived by the UE based, for example, on the assumption that PRS occasions from different cells overlap.

[0088] 3GPP Rel. 15 introduced the power headroom report (PHR) as a MAC Control Element (CE). The PHR reports the headroom between the current UE transmit power (estimated power) and the nominal power. For example, the serving cell may use the PHR to estimate how much uplink bandwidth the UE is permitted to use for a particular subframe. The PHR may be triggered by PHR functional configuration or reconfiguration, cell activation, periodically, or by variation in pathloss or a power-backoff ($P-MPR_c$) prior to a next periodic trigger for PHR. As one specific example, with regard to the pathloss PHR trigger, TS 38.321 Section 5.4.6 of 3GPP Rel. 15 specifies that the pathloss variation for one cell assessed above is between the pathloss measured at present time on the current pathloss reference signal (PL-RS) and the pathloss measured at the transmission time of the last PHR transmission on the PL-RS in use at that time, irrespective of whether the PL-RS has changed in between PL-RS. The PL-RS may be SSB or CSI-RS, and the UE can maintain up to four (4) PL-RSs per serving cell for all UL transmissions (e.g., Physical

Uplink Control Channel (PUCCH), Physical Uplink Shared Channel (PUSCH), SRS, etc.).

[0089] 3GPP Rel. 16 expanded upon the number of PL-RSs that may trigger PHRs. For example, in 3GPP Rel. 16, a UL SRS for positioning (which may be characterized as a UL PRS) can be associated with SSB or DL PRS as PL-RS. Up to N PL-RSs may be used across all UL PRS sets in addition to the 4 PL RSs per serving cell as in 3GPP Rel. 15. N is configurable as a UE capability (e.g., via RRC signaling), and may be equal to 0, 4, 8 or 16. SSB may be from serving or neighboring cell (e.g., cell ID is indicated). Similarly, DL PRS may be from any TRP (e.g., TRP is indicated). SSB and PRS transmit power is also indicated.

[0090] Applying the pathloss-based PHR triggers associated with the 4 legacy PL-RSs from 3GPP Rel. 15 to the new PL-RSs introduced in 3GPP Rel. 16 increases the overall PHR activity, which adds to interference in the system while also increasing power consumption at the respective UEs. One or more embodiments of the disclosure are directed to implementing a PHR function (e.g., monitoring one or more conditions associated with a PL-RS for selectively triggering a PHR) in a selective manner.

[0091] FIG. 6A illustrates an exemplary process 600 of wireless communication, according to aspects of the disclosure. In an aspect, the process 600 may be performed by a UE.

[0092] At 610, the UE determines whether to perform a power headroom report (PHR) function for a pathloss reference signal (PL-RS) based on a PL-RS type or cell type associated with the PL-RS. In an example, the determination of 610 may be based upon at least one rule associated with PHRs for PL-RSs. In an example, the at least one rule may be pre-defined (e.g., defined in the relevant standard). In another example, the at least one rule may be dynamically configured (e.g., via DCI or MAC-CE in some designs, via higher-layer signaling in other designs, such as RRC signaling). In an aspect, operation 610 may be performed by receiver(s) 312, WWAN transceiver 310, processing system 332, memory 340, PHR module 342, etc.

[0093] At 620, the UE performing a PHR function or one or more pathloss measurements for the PL-RS based on the determination. In some designs, the performing of operation 620 performs the PHR function and the one or more pathloss measurements for the PL-RS (e.g., if the determination of 610 is to perform the PHR function). In other designs, the performing performs only the one or more pathloss measurements for the PL-RS (e.g.,

if the determination of 610 is not to perform the PHR function). In an example, the PHR function may comprise monitoring one or more conditions associated with a respective PL-RS for selectively triggering a PHR. As described above, these PHR triggering condition(s) may comprise PHR functional configuration or reconfiguration, cell activation, periodically, or by variation in pathloss or a power-backoff ($P-MPR_c$) prior to a next periodic trigger for PHR. In an aspect, operation 620 may be performed by transmitter(s) 314, WWAN transceiver 310, processing system 332, memory 340, PHR module 342, etc.

[0094] Referring to operations 610-620, if the determination of 610 is not to perform the PHR function for the PL-RS, the UE can be characterized as ‘refraining’ from performing the PHR function for that PL-RS, which may be interpreted as the UE refraining from generating and/or transmitting a PHR, irrespective of whether one or more PHR triggering condition(s) are satisfied. So, the at least one rule effectively overrides the PHR triggering condition(s) such that a PHR is not reported in a scenario where a PHR would have been transmitted if the determination at 610 determines to perform the PHR function.

[0095] Referring to 620 of FIG. 6A, irrespective of whether the PHR function is performed with respect to the PL-RS, in some designs, the UE performs one or more pathloss measurements on the PL-RS in association with one or more UL PRSs. The UE further optionally performs power control for the UL PRS(s) based on the one or more pathloss measurements at 620. In this case, if the determination of 610 is not to perform the PHR function, then the one or more pathloss measurements are ignored for PHR-related consideration for the PL-RS. Alternatively, one or more of these optional pathloss measurement(s) may be used to selectively trigger a PHR if the determination of 610 is to perform the PHR function.

[0096] In an example, PL-RSs for which the determination of 610 is to perform the PHR function may correspond to a first set of PL-RSs, and PL-RSs for which the determination of 610 is not to perform the PHR function may correspond to a second set of PL-RSs. In this case, the UL PRSs may or may not include the cell(s) associated with the first set of PL-RS, and limiting pathloss on the second set of PL-RSs may be unnecessary (e.g., redundant with the pathloss management performed for the first set of PL-RSs is the same cell(s) are involved), in which case the optional pathloss measurements may not be performed for the second set of PL-RSs. In some designs, the first set of PL-RSs is used

to selectively trigger the PHR, whereas both the first and second sets of PL-RSs are used for the UL-PRSs.

[0097] Referring to FIG. 6A, by way of example, excluding certain PL-RS(s) from the PHR function provides one or more technical advantages (e.g., relative to simply performing the PHR function on all PL-RSs), such as reduced power consumption at the UE, reduced system overhead and/or interference, scalability (e.g., more PL-RSs can be supported without experiencing PHR-related bottlenecks), and so on.

[0098] Various rules that may be used to sort PL-RSs as part of the first set of PL-RSs or the second set of PL-RSs will now be described. One or more of the aforementioned rules may be used as part of the determination at 610 of FIG. 6A. In particular, the rules below are described with respect to first and second sets of PL-RSs, whereby PL-RSs for which the determination of 610 is to perform the PHR function may correspond to the first set of PL-RSs, and PL-RSs for which the determination of 610 is not to perform the PHR function may correspond to the second set of PL-RSs.

[0099] Referring to FIG. 6A, in a first rule example, the least one rule may be to characterize the 4 legacy 3GPP Rel. 15 PL-RSs as part of the first set of PL-RSs, while characterizing any other PL-RSs as part of the second set of PL-RSs. In this case, the inclusion of additional PL-RSs will have no impact to PHR.

[00100] Referring to FIG. 6A, in a second rule example, the at least one rule may comprise excluding, from participation in the PHR function, any RS serving as a PL-RS for a UL PRS. As used herein, exclusion of a PL-RS from the PHR function implies characterization of that excluded PL-RS as part of the second set of PL-RSs. Further, as used herein, an “UL PRS” may be any combination of an SRS explicitly identified as an ‘SRS for positioning’ (or equivalent), or a subset of such SRSs (e.g., SRS that are for positioning while further satisfying minimum and/or maximum bandwidth thresholds, comb-density, duration, a comb-staggering condition such as whether comb-staggering is enabled/disabled, etc.).

[00101] Referring to FIG. 6A, in a third rule example, the at least one rule may comprise excluding, from participation in the PHR function, any RS serving as a PL-RS for only a UL PRS. For example, a first PL-RS that is common to a UL PRS as well as other UL channel(s) may be part of the first set (i.e., included for PHR function), whereas a second PL-RS that is specific to a UL PRS and is not associated with other UL channel(s) may be part of the second set (i.e., excluded for PHR function),

[00102] Referring to FIG. 6A, in a fourth rule example, the at least one rule may comprise excluding, from participation in the PHR function, any DL PRS serving as RS. In an example, one DL-PRS serving as a PL-RS for a UL-PRS may be excluded in a more selective manner, e.g., based on TRP-ID (e.g., DL PRSs associated with certain TRPs are part of the first set, and DL PRSs associated with other TRPs are part of the second set). In a more specific implementation, the at least one rule may comprise excluding, from participation in the PHR function, any DL PRS associated with a non-serving cell (e.g., determined based on TRP-ID). In this case, a first PL for a DL PRS that is associated with a serving cell may be part of the first set (i.e., included for PHR function), whereas a second PL for a DL PRS that is associated with a non-serving cell may be part of the second set (i.e., excluded for PHR function).

[00103] Referring to FIG. 6A, in a fifth rule example, the at least one rule may comprise excluding, from participation in the PHR function, any RS serving as a PL-RS for any DL RS associated with a non-serving cell. In an example, the non-serving cell may be identified based on an associated TRP-ID.

[00104] Referring to FIG. 6A, in a sixth rule example, the at least one rule may comprise multiple rules, such as any of the rules noted above, implemented in combination. In this case, there may be multiple rules by which PL-RSs are excluded from (or included in) participation in the PHR function. For example, the at least one rule may comprise excluding, from participation in the PHR function any RS serving as a PL-RS for an UL PRS, any RS serving as a PL-RS for only a UL PRS, any DL-PRS serving as PL-RS for UL-PRS, any RS serving as a PL-RS for a DL PRS associated with a non-serving cell, any RS serving as a PL-RS for any DL RS associated with a non-serving cell, or any combination thereof.

[00105] Referring to FIG. 6A, in some designs, the path loss variation for one cell is between the pathloss measured at present time on the current pathloss reference and the pathloss measured at the transmission time of the last transmission of PHR on the pathloss reference in use at that time, irrespective of whether the pathloss reference has changed in between. In some designs, the current pathloss reference for this purpose does not include any pathloss reference configured using *pathlossReferenceRS-Pos*.

[00106] FIG. 6B illustrates an exemplary process 650 of wireless communication, according to aspects of the disclosure. In an aspect, the process 650 may be performed by a UE.

[00107] At 660, the UE determines whether to perform a power headroom report (PHR) function for a pathloss reference signal (PL-RS) based on an indication associated with the PL-RS that is received from a serving cell of the UE. In an example, the determination of 660 may be based upon at least one rule associated with PHRs for PL-RSs. In an example, the at least one rule may be pre-defined (e.g., defined in the relevant standard). In another example, the at least one rule may be dynamically configured (e.g., via DCI or MAC-CE in some designs, via higher-layer signaling in other designs, such as RRC signaling). In an aspect, operation 660 may be performed by receiver(s) 312, WWAN transceiver 310, processing system 332, memory 340, PHR module 342, etc.

[00108] At 670, the UE performing a PHR function or one or more pathloss measurements for the PL-RS based on the determination. In some designs, the performing of operation 670 performs the PHR function and the one or more pathloss measurements for the PL-RS (e.g., if the determination of 660 is to perform the PHR function). In other designs, the performing performs only the one or more pathloss measurements for the PL-RS (e.g., if the determination of 660 is not to perform the PHR function). In an example, the PHR function may comprise monitoring one or more conditions associated with a respective PL-RS for selectively triggering a PHR. As described above, these PHR triggering condition(s) may comprise PHR functional configuration or reconfiguration, cell activation, periodically, or by variation in pathloss or a power-backoff ($P-MPR_c$) prior to a next periodic trigger for PHR. In an aspect, operation 670 may be performed by transmitter(s) 314, WWAN transceiver 310, processing system 332, memory 340, PHR module 342, etc.

[00109] Referring to operations 660-670, if the determination of 660 is not to perform the PHR function for the PL-RS, the UE can be characterized as 'refraining' from performing the PHR function for that PL-RS, which may be interpreted as the UE refraining from generating and/or transmitting a PHR, irrespective of whether one or more PHR triggering condition(s) are satisfied. So, the at least one rule effectively overrides the PHR triggering condition(s) such that a PHR is not reported in a scenario where a PHR would have been transmitted if the determination at 660 determines to perform the PHR function.

[00110] Referring to 670 of FIG. 6B, irrespective of whether the PHR function is performed with respect to the PL-RS, in some designs, the UE performs one or more pathloss measurements on the PL-RS in association with one or more UL PRSs. The UE further optionally performs power control for the UL PRS(s) based on the one or more

pathloss measurements at 670. In this case, if the determination of 660 is not to perform the PHR function, then the one or more pathloss measurements are ignored for PHR-related consideration for the PL-RS. Alternatively, one or more of these optional pathloss measurement(s) may be used to selectively trigger a PHR if the determination of 660 is to perform the PHR function.

[00111] In an example, PL-RSs for which the determination of 660 is to perform the PHR function may correspond to a first set of PL-RSs, and PL-RSs for which the determination of 660 is not to perform the PHR function may correspond to a second set of PL-RSs. In this case, the UL PRSs may or may not include the cell(s) associated with the first set of PL-RS, and limiting pathloss on the second set of PL-RSs may be unnecessary (e.g., redundant with the pathloss management performed for the first set of PL-RSs is the same cell(s) are involved), in which case the optional pathloss measurements may not be performed for the second set of PL-RSs. In some designs, the first set of PL-RSs is used to selectively trigger the PHR, whereas both the first and second sets of PL-RSs are used for the UL-PRSs.

[00112] Referring to FIG. 6B, by way of example, excluding certain PL-RS(s) from the PHR function provides one or more technical advantages (e.g., relative to simply performing the PHR function on all PL-RSs), such as reduced power consumption at the UE, reduced system overhead and/or interference, scalability (e.g., more PL-RSs can be supported without experiencing PHR-related bottlenecks), and so on.

[00113] Various rules that may be used to sort PL-RSs as part of the first set of PL-RSs or the second set of PL-RSs will now be described. One or more of the aforementioned rules may be used as part of the determination at 660 of FIG. 6B. In particular, the rules below are described with respect to first and second sets of PL-RSs, whereby PL-RSs for which the determination of 660 is to perform the PHR function may correspond to the first set of PL-RSs, and PL-RSs for which the determination of 660 is not to perform the PHR function may correspond to the second set of PL-RSs.

[00114] Referring to FIG. 6B, in a first rule example, the at least one rule may comprise excluding, from participation in the PHR function, any RS serving as a PL-RS for which an explicit indication is provided that indicates PHR function exclusion (e.g., an explicit 'opt-out' rule). As an alternative, the at least one rule may comprise excluding, from participation in the PHR function, any RS serving as a PL-RS for which no explicit indication is provided that indicates PHR function inclusion (e.g., an explicit 'opt-in'

rule). In some designs, the explicit opt-in rule or explicit opt-out rule may be implemented for particular RS types, such as RSs that serve as PL-RS for at least one UL PRS, or that only serve as PL-RS for UL PRS (e.g., as opposed to a common PL-RS that is associated with both UL PRS and other channel type(s)). In some designs, the explicit opt-in rule or explicit opt-out rule may apply to one or more of the 4 legacy 3GPP Rel. 15 PL-RSs.

[00115] Referring to FIG. 6B, in a second rule example, the at least one rule may comprise excluding, from participation in the PHR function, any RS serving as a PL-RS for which an implicit indication is provided that indicates PHR function exclusion (e.g., an implicit ‘opt-out’ rule). As an alternative, the at least one rule may comprise excluding, from participation in the PHR function, any RS serving as a PL-RS for which no implicit indication is provided that indicates PHR function inclusion (e.g., an implicit ‘opt-in’ rule). In some designs, the implicit opt-in rule or implicit opt-out rule may be implemented for particular RS types, such as RSs that serve as PL-RS for at least one UL PRS, or that only serve as PL-RS for UL PRS (e.g., as opposed to a common PL-RS that is associated with both UL PRS and other channel type(s)). In some designs, the implicit opt-in rule or implicit opt-out rule may apply to one or more of the 4 legacy 3GPP Rel. 15 PL-RSs.

[00116] Referring to FIG. 6B, in a third rule example, the at least one rule may comprise multiple rules, such as any of the rules noted above, implemented in combination. In this case, there may be multiple rules by which PL-RSs are excluded from (or included in) participation in the PHR function. For example, the at least one rule may comprise excluding, from participation in the PHR function, any RS serving as a PL-RS for which an explicit indication is provided that indicates PHR function exclusion, excluding, from participation in the PHR function, any RS serving as a PL-RS for which no explicit indication is provided that indicates PHR function inclusion, excluding, from participation in the PHR function, any RS serving as a PL-RS for which an implicit indication is provided that indicates PHR function exclusion, excluding, from participation in the PHR function, any RS serving as a PL-RS for which no implicit indication is provided that indicates PHR function inclusion, or any combination thereof.

[00117] In the detailed description above it can be seen that different features are grouped together in examples. This manner of disclosure should not be understood as an intention that the example clauses have more features than are explicitly mentioned in each clause. Rather, the various aspects of the disclosure may include fewer than all features of an

individual example clause disclosed. Therefore, the following clauses should hereby be deemed to be incorporated in the description, wherein each clause by itself can stand as a separate example. Although each dependent clause can refer in the clauses to a specific combination with one of the other clauses, the aspect(s) of that dependent clause are not limited to the specific combination. It will be appreciated that other example clauses can also include a combination of the dependent clause aspect(s) with the subject matter of any other dependent clause or independent clause or a combination of any feature with other dependent and independent clauses. The various aspects disclosed herein expressly include these combinations, unless it is explicitly expressed or can be readily inferred that a specific combination is not intended (e.g., contradictory aspects, such as defining an element as both an insulator and a conductor). Furthermore, it is also intended that aspects of a clause can be included in any other independent clause, even if the clause is not directly dependent on the independent clause.

[00118] Referring to FIG. 6A, in some designs, the pathloss variation for a particular cell may be measured or calculated between the pathloss measured at a current time on a current pathloss reference (e.g., *pathlossReferenceRS-Pos* in TS 38.331) and the pathloss measured at the transmission time of the last transmission of PHR on the pathloss reference (e.g., *pathlossReferenceRS-Pos* in TS 38.331) in use at that time, irrespective of whether the pathloss reference has changed in between.

[00119] Implementation examples are described in the following numbered clauses:

[00120] Clause 1. A method of operating a user equipment (UE), comprising: determining whether to perform a power headroom report (PHR) function for a pathloss reference signal (PL-RS) based on a PL-RS type or cell type associated with the PL-RS; and performing a PHR function or one or more pathloss measurements for the PL-RS based on the determination.

[00121] Clause 2. The method of clause 1, wherein the performing performs the PHR function and the one or more pathloss measurements for the PL-RS, or wherein the performing performs only the one or more pathloss measurements for the PL-RS.

[00122] Clause 3. The method of any of clauses 1 to 2, wherein the determining is based on at least one rule that includes excluding, from participation in the PHR function, any RS serving as a PL-RS for an uplink (UL) positioning reference signal (PRS).

[00123] Clause 4. The method of any of clauses 1 to 3, wherein the determining is based on at least one rule that includes excluding, from participation in the PHR function, any

RS serving as a PL-RS for only an uplink (UL) positioning reference signal (PRS),

[00124] Clause 5. The method of any of clauses 1 to 4, wherein the determining is based on at least one rule that includes excluding, from participation in the PHR function, any downlink (DL) positioning reference signal (PRS) serving as RS.

[00125] Clause 6. The method of any of clauses 1 to 5, wherein the determining is based on at least one rule that includes excluding, from participation in the PHR function, any downlink (DL) positioning reference signal (PRS) serving as RS for an uplink (UL)-PRS associated with a non-serving cell.

[00126] Clause 7. The method of any of clauses 1 to 6, wherein the at determining is based on at least one rule that includes excluding, from participation in the PHR function, any RS serving as a PL-RS for any DL RS associated with a non-serving cell.

[00127] Clause 8. The method of any of clauses 1 to 7, wherein the determining is based on at least one rule that includes excluding, from participation in the PHR function: any RS serving as a PL-RS for an uplink (UL) positioning reference signal (PRS), any RS serving as a PL-RS for only a UL PRS, any downlink (DL) PRS serving as RS, any DL PRS serving as RS for an UL-PRS associated with a non-serving cell, any RS serving as a PL-RS for any DL RS associated with a non-serving cell, or any combination thereof.

[00128] Clause 9. The method of any of clauses 1 to 8, wherein the one or more pathloss measurements are associated with one or more uplink (UL) positioning reference signals (PRSs), further comprising: performing power control for the UL PRSs based on the one or more pathloss measurements.

[00129] Clause 10. A method of operating a user equipment (UE), comprising: determining whether to perform a power headroom report (PHR) function for a pathloss reference signal (PL-RS) based on an indication associated with the PL-RS that is received from a serving cell of the UE; and performing a PHR function or one or more pathloss measurements for the PL-RS based on the determination.

[00130] Clause 11. The method of clause 10, wherein the performing performs the PHR function and the one or more pathloss measurements for the PL-RS, or wherein the performing performs only the one or more pathloss measurements for the PL-RS.

[00131] Clause 12. The method of any of clauses 10 to 11, wherein the determining is based on at least one rule that includes excluding, from participation in the PHR function, any RS serving as a PL-RS for which an explicit indication is provided that indicates PHR function exclusion, or wherein the determining is based on at least one rule that includes

excluding, from participation in the PHR function, any RS serving as a PL-RS for which no explicit indication is provided that indicates PHR function inclusion.

[00132] Clause 13. The method of any of clauses 10 to 12, wherein the determining is based on at least one rule that includes excluding, from participation in the PHR function, any RS serving as a PL-RS for which an implicit indication is provided that indicates PHR function exclusion, or wherein the determining is based on at least one rule that includes excluding, from participation in the PHR function, any RS serving as a PL-RS for which no implicit indication is provided that indicates PHR function inclusion.

[00133] Clause 14. The method of any of clauses 10 to 13, wherein the determining is based on at least one rule that includes excluding, from participation in the PHR function: excluding, from participation in the PHR function, any RS serving as a PL-RS for which an explicit indication is provided that indicates PHR function exclusion, excluding, from participation in the PHR function, any RS serving as a PL-RS for which no explicit indication is provided that indicates PHR function inclusion, excluding, from participation in the PHR function, any RS serving as a PL-RS for which an implicit indication is provided that indicates PHR function exclusion, excluding, from participation in the PHR function, any RS serving as a PL-RS for which no implicit indication is provided that indicates PHR function inclusion, or any combination thereof.

[00134] Clause 15. The method of any of clauses 10 to 14, wherein the one or more pathloss measurements are associated with one or more uplink (UL) positioning reference signals (PRSs), further comprising: performing power control for the UL PRSs based on the one or more pathloss measurements.

[00135] Clause 16. An apparatus comprising a memory and at least one processor communicatively coupled to the memory, the memory and the at least one processor configured to perform a method according to any of clauses 1 to 15.

[00136] Clause 17. An apparatus comprising means for performing a method according to any of clauses 1 to 15.

[00137] Clause 18. A non-transitory computer-readable medium storing computer-executable instructions, the computer-executable comprising at least one instruction for causing a computer or processor to perform a method according to any of clauses 1 to 15.

[00138] Those of skill in the art will appreciate that information and signals may be represented using any of a variety of different technologies and techniques. For example, data, instructions, commands, information, signals, bits, symbols, and chips that may be

referenced throughout the above description may be represented by voltages, currents, electromagnetic waves, magnetic fields or particles, optical fields or particles, or any combination thereof.

[00139] Further, those of skill in the art will appreciate that the various illustrative logical blocks, modules, circuits, and algorithm steps described in connection with the aspects disclosed herein may be implemented as electronic hardware, computer software, or combinations of both. To clearly illustrate this interchangeability of hardware and software, various illustrative components, blocks, modules, circuits, and steps have been described above generally in terms of their functionality. Whether such functionality is implemented as hardware or software depends upon the particular application and design constraints imposed on the overall system. Skilled artisans may implement the described functionality in varying ways for each particular application, but such implementation decisions should not be interpreted as causing a departure from the scope of the present disclosure.

[00140] The various illustrative logical blocks, modules, and circuits described in connection with the aspects disclosed herein may be implemented or performed with a general purpose processor, a DSP, an ASIC, an FPGA, or other programmable logic device, discrete gate or transistor logic, discrete hardware components, or any combination thereof designed to perform the functions described herein. A general purpose processor may be a microprocessor, but in the alternative, the processor may be any conventional processor, controller, microcontroller, or state machine. A processor may also be implemented as a combination of computing devices, e.g., a combination of a DSP and a microprocessor, a plurality of microprocessors, one or more microprocessors in conjunction with a DSP core, or any other such configuration.

[00141] The methods, sequences and/or algorithms described in connection with the aspects disclosed herein may be embodied directly in hardware, in a software module executed by a processor, or in a combination of the two. A software module may reside in random access memory (RAM), flash memory, read-only memory (ROM), erasable programmable ROM (EPROM), electrically erasable programmable ROM (EEPROM), registers, hard disk, a removable disk, a CD-ROM, or any other form of storage medium known in the art. An exemplary storage medium is coupled to the processor such that the processor can read information from, and write information to, the storage medium. In the alternative, the storage medium may be integral to the processor. The processor and

the storage medium may reside in an ASIC. The ASIC may reside in a user terminal (e.g., UE). In the alternative, the processor and the storage medium may reside as discrete components in a user terminal.

[00142] In one or more exemplary aspects, the functions described may be implemented in hardware, software, firmware, or any combination thereof. If implemented in software, the functions may be stored on or transmitted over as one or more instructions or code on a computer-readable medium. Computer-readable media includes both computer storage media and communication media including any medium that facilitates transfer of a computer program from one place to another. A storage media may be any available media that can be accessed by a computer. By way of example, and not limitation, such computer-readable media can comprise RAM, ROM, EEPROM, CD-ROM or other optical disk storage, magnetic disk storage or other magnetic storage devices, or any other medium that can be used to carry or store desired program code in the form of instructions or data structures and that can be accessed by a computer. Also, any connection is properly termed a computer-readable medium. For example, if the software is transmitted from a website, server, or other remote source using a coaxial cable, fiber optic cable, twisted pair, digital subscriber line (DSL), or wireless technologies such as infrared, radio, and microwave, then the coaxial cable, fiber optic cable, twisted pair, DSL, or wireless technologies such as infrared, radio, and microwave are included in the definition of medium. Disk and disc, as used herein, includes compact disc (CD), laser disc, optical disc, digital versatile disc (DVD), floppy disk and Blu-ray disc where disks usually reproduce data magnetically, while discs reproduce data optically with lasers. Combinations of the above should also be included within the scope of computer-readable media.

[00143] While the foregoing disclosure shows illustrative aspects of the disclosure, it should be noted that various changes and modifications could be made herein without departing from the scope of the disclosure as defined by the appended claims. The functions, steps and/or actions of the method claims in accordance with the aspects of the disclosure described herein need not be performed in any particular order. Furthermore, although elements of the disclosure may be described or claimed in the singular, the plural is contemplated unless limitation to the singular is explicitly stated.

CLAIMS

What is claimed is:

1. A method of operating a user equipment (UE), comprising:
determining whether to perform a power headroom report (PHR) function for a pathloss reference signal (PL-RS) based on a PL-RS type or cell type associated with the PL-RS; and
performing a PHR function or one or more pathloss measurements for the PL-RS based on the determination.
2. The method of claim 1,
wherein the performing performs the PHR function and the one or more pathloss measurements for the PL-RS, or
wherein the performing performs only the one or more pathloss measurements for the PL-RS.
3. The method of claim 1, wherein the determining is based on at least one rule that includes excluding, from participation in the PHR function, any RS serving as a PL-RS for an uplink (UL) positioning reference signal (PRS).
4. The method of claim 1, wherein the determining is based on at least one rule that includes excluding, from participation in the PHR function, any RS serving as a PL-RS for only an uplink (UL) positioning reference signal (PRS).
5. The method of claim 1, wherein the determining is based on at least one rule that includes excluding, from participation in the PHR function, any downlink (DL) positioning reference signal (PRS) serving as RS.
6. The method of claim 1, wherein the determining is based on at least one rule that includes excluding, from participation in the PHR function, any downlink (DL) positioning reference signal (PRS) serving as RS for an uplink (UL)-PRS associated with a non-serving cell.

7. The method of claim 1, wherein the determining is based on at least one rule that includes excluding, from participation in the PHR function, any RS serving as a PL-RS for any DL RS associated with a non-serving cell.
8. The method of claim 1, wherein the determining is based on at least one rule that includes excluding, from participation in the PHR function:
- any RS serving as a PL-RS for an uplink (UL) positioning reference signal (PRS),
 - or
 - any RS serving as a PL-RS for only a UL PRS, or
 - any downlink (DL) PRS serving as RS, or
 - any DL PRS serving as RS for an UL-PRS, or
 - any DL PRS serving as RS for an UL-PRS associated with a non-serving cell, or
 - any RS serving as a PL-RS for any DL RS associated with a non-serving cell, or
 - any combination thereof.
9. The method of claim 1, wherein the one or more pathloss measurements are associated with one or more uplink (UL) positioning reference signals (PRSs), further comprising:
- performing power control for the UL PRSs based on the one or more pathloss measurements.
10. A method of operating a user equipment (UE), comprising:
- determining whether to perform a power headroom report (PHR) function for a pathloss reference signal (PL-RS) based on an indication associated with the PL-RS that is received from a serving cell of the UE; and
 - performing a PHR function or one or more pathloss measurements for the PL-RS based on the determination.
11. The method of claim 10,
- wherein the performing performs the PHR function and the one or more pathloss measurements for the PL-RS, or
 - wherein the performing performs only the one or more pathloss measurements for the PL-RS.

12. The method of claim 10,

wherein the determining is based on at least one rule that includes excluding, from participation in the PHR function, any RS serving as a PL-RS for which an explicit indication is provided that indicates PHR function exclusion, or

wherein the determining is based on at least one rule that includes excluding, from participation in the PHR function, any RS serving as a PL-RS for which no explicit indication is provided that indicates PHR function inclusion.

13. The method of claim 10,

wherein the determining is based on at least one rule that includes excluding, from participation in the PHR function, any RS serving as a PL-RS for which an implicit indication is provided that indicates PHR function exclusion, or

wherein the determining is based on at least one rule that includes excluding, from participation in the PHR function, any RS serving as a PL-RS for which no implicit indication is provided that indicates PHR function inclusion.

14. The method of claim 10, wherein the determining is based on at least one rule that includes excluding, from participation in the PHR function:

excluding, from participation in the PHR function, any RS serving as a PL-RS for which an explicit indication is provided that indicates PHR function exclusion, or

excluding, from participation in the PHR function, any RS serving as a PL-RS for which no explicit indication is provided that indicates PHR function inclusion, or

excluding, from participation in the PHR function, any RS serving as a PL-RS for which an implicit indication is provided that indicates PHR function exclusion, or

excluding, from participation in the PHR function, any RS serving as a PL-RS for which no implicit indication is provided that indicates PHR function inclusion, or

any combination thereof.

15. The method of claim 10, wherein the one or more pathloss measurements are associated with one or more uplink (UL) positioning reference signals (PRSs), further comprising:

performing power control for the UL PRSs based on the one or more pathloss measurements.

16. A user equipment (UE), comprising:

a memory;

at least one transceiver; and

at least one processor communicatively coupled to the memory and the at least one transceiver, the at least one processor configured to:

determine whether to perform a power headroom report (PHR) function for a pathloss reference signal (PL-RS) based on a PL-RS type or cell type associated with the PL-RS; and

perform a PHR function or one or more pathloss measurements for the PL-RS based on the determination.

17. The UE of claim 16, wherein the determination is based on at least one rule that includes excluding, from participation in the PHR function, any RS serving as a PL-RS for only an uplink (UL) positioning reference signal (PRS).

18. The UE of claim 16, wherein the determination is based on at least one rule that includes excluding, from participation in the PHR function:

any RS serving as a PL-RS for an uplink (UL) positioning reference signal (PRS),

or

any RS serving as a PL-RS for only a UL PRS, or

any downlink (DL) PRS serving as RS, or

any DL PRS serving as RS for an UL-PRS, or

any DL PRS serving as RS for an UL-PRS associated with a non-serving cell, or

any RS serving as a PL-RS for any DL RS associated with a non-serving cell, or

any combination thereof.

19. A user equipment (UE), comprising:

a memory;

at least one transceiver; and

at least one processor communicatively coupled to the memory and the at least one transceiver, the at least one processor configured to:

determine whether to perform a power headroom report (PHR) function for a pathloss reference signal (PL-RS) based on an indication associated with the PL-RS that is received from a serving cell of the UE; and

perform a PHR function or one or more pathloss measurements for the PL-RS based on the determination.

20. The UE of claim 19, wherein the determination is based on at least one rule that includes excluding, from participation in the PHR function, any RS serving as a PL-RS for only an uplink (UL) positioning reference signal (PRS).

21. The UE of claim 19, wherein the determination is based on at least one rule that includes excluding, from participation in the PHR function:

excluding, from participation in the PHR function, any RS serving as a PL-RS for which an explicit indication is provided that indicates PHR function exclusion, or

excluding, from participation in the PHR function, any RS serving as a PL-RS for which no explicit indication is provided that indicates PHR function inclusion, or

excluding, from participation in the PHR function, any RS serving as a PL-RS for which an implicit indication is provided that indicates PHR function exclusion, or

excluding, from participation in the PHR function, any RS serving as a PL-RS for which no implicit indication is provided that indicates PHR function inclusion, or

any combination thereof.

22. A user equipment (UE), comprising:

means for determining whether to perform a power headroom report (PHR) function for a pathloss reference signal (PL-RS) based on a PL-RS type or cell type associated with the PL-RS; and

means for performing a PHR function or one or more pathloss measurements for the PL-RS based on the determination.

23. The UE of claim 22, wherein the determination is based on at least one rule that includes excluding, from participation in the PHR function, any RS serving as a PL-RS for only an uplink (UL) positioning reference signal (PRS).

24. The UE of claim 22, wherein the determination is based on at least one rule that includes excluding, from participation in the PHR function:

any RS serving as a PL-RS for an uplink (UL) positioning reference signal (PRS),

or

any RS serving as a PL-RS for only a UL PRS, or

any downlink (DL) PRS serving as RS, or

any DL PRS serving as RS for an UL-PRS, or

any DL PRS serving as RS for an UL-PRS associated with a non-serving cell, or

any RS serving as a PL-RS for any DL RS associated with a non-serving cell, or

any combination thereof.

25. A user equipment (UE), comprising:

means for determining whether to perform a power headroom report (PHR) function for a pathloss reference signal (PL-RS) based on an indication associated with the PL-RS that is received from a serving cell of the UE; and

means for performing a PHR function or one or more pathloss measurements for the PL-RS based on the determination.

26. The UE of claim 25, wherein the determination is based on at least one rule that includes excluding, from participation in the PHR function, any RS serving as a PL-RS for only an uplink (UL) positioning reference signal (PRS).

27. The UE of claim 25, wherein the determination is based on at least one rule that includes excluding, from participation in the PHR function:

excluding, from participation in the PHR function, any RS serving as a PL-RS for which an explicit indication is provided that indicates PHR function exclusion, or

excluding, from participation in the PHR function, any RS serving as a PL-RS for which no explicit indication is provided that indicates PHR function inclusion, or

excluding, from participation in the PHR function, any RS serving as a PL-RS for which an implicit indication is provided that indicates PHR function exclusion, or
excluding, from participation in the PHR function, any RS serving as a PL-RS for which no implicit indication is provided that indicates PHR function inclusion, or
any combination thereof.

28. A non-transitory computer-readable medium storing computer-executable instructions, the computer-executable instructions comprising:

at least one instruction instructing a user equipment (UE) to determine whether to perform a power headroom report (PHR) function for a pathloss reference signal (PL-RS) based on a PL-RS type or cell type associated with the PL-RS; and

at least one instruction instructing the UE to perform a PHR function or one or more pathloss measurements for the PL-RS based on the determination.

29. The non-transitory computer-readable medium of claim 28, wherein the determination is based on at least one rule that includes excluding, from participation in the PHR function, any RS serving as a PL-RS for only an uplink (UL) positioning reference signal (PRS).

30. The non-transitory computer-readable medium of claim 28, wherein the determination is based on at least one rule that includes excluding, from participation in the PHR function:

any RS serving as a PL-RS for an uplink (UL) positioning reference signal (PRS),
or

any RS serving as a PL-RS for only a UL PRS, or

any downlink (DL) PRS serving as RS, or

any DL PRS serving as RS for an UL-PRS, or

any DL PRS serving as RS for an UL-PRS associated with a non-serving cell, or

any RS serving as a PL-RS for any DL RS associated with a non-serving cell, or

any combination thereof.

31. A non-transitory computer-readable medium storing computer-executable instructions, the computer-executable instructions comprising:

at least one instruction instructing a user equipment (UE) to determine whether to perform a power headroom report (PHR) function for a pathloss reference signal (PL-RS) based on an indication associated with the PL-RS that is received from a serving cell of the UE; and

at least one instruction instructing the UE to perform a PHR function or one or more pathloss measurements for the PL-RS based on the determination.

32. The non-transitory computer-readable medium of claim 31, wherein the determination is based on at least one rule that includes excluding, from participation in the PHR function:

excluding, from participation in the PHR function, any RS serving as a PL-RS for which an explicit indication is provided that indicates PHR function exclusion, or

excluding, from participation in the PHR function, any RS serving as a PL-RS for which no explicit indication is provided that indicates PHR function inclusion, or

excluding, from participation in the PHR function, any RS serving as a PL-RS for which an implicit indication is provided that indicates PHR function exclusion, or

excluding, from participation in the PHR function, any RS serving as a PL-RS for which no implicit indication is provided that indicates PHR function inclusion, or

any combination thereof.

33. The non-transitory computer-readable medium of claim 32, wherein the determination is based on at least one rule that includes excluding, from participation in the PHR function, any RS serving as a PL-RS for only an uplink (UL) positioning reference signal (PRS).
