Note: Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).

Description

[0001] The present invention relates to food colouring substances useful, for example in the manufacture of food products, sweets and pharmaceutical products.

[0002] Colouring substances containing natural or synthetic colouring substances are commonly used in the manufacturing of food products and pharmaceutical products. A wide range of synthetic colouring substances are commercially available making it possible for the manufacturer of food products, sweets and pharmaceutical products, where a particular colour tone is desired, to select a single colouring substance having the desired colour or a mixture of colouring substances, which in appropriate combination impart the desired colour to the product.

[0003] Due to consumer pressure there is a trend to replace the synthetic colouring substances with natural ones. However, the use of natural colouring substances implies various problems such as lack of blue colour, acceptable in food substances, unpleasant taste and odour and bleeding, (i.e. diffusion of colour from the food into the environment). These three problems will in the following be presented in more detail and a coherent solution will be disclosed.

[0004] Firstly, one problem is that most natural colouring substances used in food products are red, orange or yellow and not blue. There are presently no natural blue colouring substances that are legally approvable for use in foodstuffs marketed in Europe and the USA. The same problem applies to some extent to green colours. Copper chlorophyll and copper chlorophyllin are efficient and relatively stable green colouring substances but in some countries they are not considered "natural" from a legislation point of view. If a satisfactory natural blue colouring substance could be produced, one might produce a natural green by blending it with a natural yellow colour substance like e.g. turmeric.

[0005] It is known from the prior art that some anthocyanins, for example those found in red cabbage leaves, give a blue colour in alkaline solution. Thus, a bright blue colour is normally obtainable at high pHs (almost 8 and above) which is inappropriate for food usage, e.g. Grube, O. et al. "The pigment of red cabbage as an indicator in the pH range 8.5-10.", Chem. Ztg., 67, 34, 1943. However, in this range of pH anthocyanins and other food ingredients are often unstable.

[0006] The existence and preparation of blue complexes with aluminium and magnesium from anthocyanins derived from petals and sepals from the flowers of hydrangea and Chinese bellflower is known from the prior art.

[0007] Chenery revealed in "The problem of the blue hydrangea" J. Roy. Hort. Soc., 62, 304 (1937) noted that hydrangea hortensis petals would turn blue if its soil was watered with aluminium salts and that aluminium would accumulate in the petals. No such effect on anthocyanins present in or derived from other parts of plants such as e.g. red cabbage leaves or purple carrots was mentioned.

[0008] Susumu Maekawa et al. found in "Effect of Aluminium Ions on the bluing of Petal Color in Cut Chinese Bellflower, *Platycodon grandiflorum*", Plant & Cell Physiol. 24(4) : 759-764 (1983) that petal colour of Chinese bellflower changed from blue-violet to blue after cut flowers were placed in a solution containing aluminium ions. This was also observed when aluminium ions were added to a solution of anthocyanins extracted from petals from this flower. No such effect on anthocyanins present in or derived from other parts of plants such as e.g. red cabbage leaves or purple carrots was mentioned.

[0009] Asen and Siegelman : "Effect of Aluminium on Absorption Spectra of the Anthocyanin and Flavonols from Sepals of Hydrangea macrophylla var. Merveille", Proc. Am. Soc. Hort. Sci. 70, 478 (1957) found that addition of aluminium to a solution of anthocyanins extracted from Hydrangea macrophylla var. Merveille could change the colour of the solution from red to blue. No such effect on anthocyanins present in or derived from other parts of plants such as e.g. red cabbage leaves or purple carrots was mentioned.

[0010] Kosaku Takeda et al. : "Blueing of sepal colour of Hydrangea macrophylla", Phytochemistry, vol. 24, No. 10, pp. 2251-2254, 1985 found that the blue colour of Hydrangea macrophylla sepals was mainly due to a blue anthocyanin-aluminium complex.

[0011] No reference was made to anthocyanins present in or derived from other parts of plants such as e.g. red cabbage leaves or purple carrots.

[0012] EP 0 873 680 A1 describes a method of changing the colours of petals containing anthocyanin in a more bluish direction by the addition of a Lewis acid or aluminium salts, but without mentioning any such effect on anthocyanins present in or derived from other parts of plants such as e.g. red cabbage leaves or purple carrots.

[0013] A major difference between the anthocyanins from these flowers and the ones from red cabbage is that the anthocyanins from the flowers mainly consist of delphinidin derivatives and the anthocyanin from red cabbage mainly consists of cyanidin-3-glucosides. (Jurd and Asen (1966), and Takeda et al. (1990)

[0014] Jurd & Asen (1966) and Takeda (1990) have published a few in vitro studies on metal, including aluminium, complexes with purified anthocyanins, including cyanidin-3-glucoside.

[0015] Jurd and Asen (1966) added quercitrin and chlorogenic acid to solutions of purified cyanidin-3-glucoside and aluminium at pH 5.5. With quercitrin a cerise complex formed. With chlorogenic acid an insoluble, almost blue, extremely insoluble precipitate formed.

[0016] Takeda et al. (1990) added 3-p-coumaroylquinic acid to solutions of purified cyanidin-3-glucoside and aluminium at pH 3.7. Increasing levels of 3-p-coumaroylquinic acid gave a more bluish - purple colour hue.

[0017] According to the present invention an anthocyanin-aluminium lake is prepared by a different procedure, whereby an aluminium containing compound is combined with the food colouring substance, followed by adjustment of the pH to a value of from 5 to 9, preferably from 6 to 8, to cause precipitation of the lake.

[0018] Secondly, another problem by using natural colouring substances for obtaining a blue colour is that extracts containing anthocyanins, especially red cabbage extract, are typically associated with unpleasant tastes and odours when applied in food products, sweets and pharmaceutical products which is a disadvantage. Prior art such as Sapers, G.M. "Deodorization of a colorant prepared from red cabbage.", J.Food Sci., 46, 105, 1981 discloses methods for solving this problem through purification steps. However, these methods suffer from being insufficient as the unpleasant tastes and odours often develop after the purification of the anthocyanin has been performed. In conclusion it has so far been technically impossible to permanently remove the organoleptical problems associated with extracts from vegetables such as red cabbage and purple carrot. According to the present invention, a lasting masking of the unpleasant tastes and odours is obtained, which will be described in detail below.

[0019] Thirdly, yet an additional problem by using natural colouring substances for obtaining a blue colour, is that as anthocyanins are more or less water soluble, they will leak and "bleed" if in an aqueous environment. This is particular a visible problem if used in a multi-compartment food system where the different compartments have different colours. According to the present invention, a food colour is transformed from being water soluble into being water insoluble, where leaking and bleeding problems are circumvented.

[0020] The above three problems associated with the use of natural colouring substances have been presented and it is obvious that the problems concentrate mainly on lack of availability of legal and technical requirements.

[0021] It has now surprisingly been found by the inventors that the three problems described above can all be solved or circumvented by preparation of an aluminium lake of the natural colouring substances. The aluminium lake may be prepared by combining an aluminium containing compound and the food colouring substance, followed by adjustment of the pH to a value of from 5 to 9, preferably from 6 to 8, to cause precipitation of the lake.

[0022] The preparation of aluminium lakes of dyes is well-described for a lot of dyes, especially synthetic dyes. However, no aluminium lakes of anthocyanins or blue lakes of other natural colouring substances have been described hitherto, that are legally acceptable in food substances.

[0023] US 833602 teaches a laking process involving acid colouring materials and alkaline aluminium salts. However, only lakes of synthetic colouring materials are described.

[0024] US 2,053,208 teaches a laking process for synthetic dyes using aluminium sulphate and sodium aluminate. However, sodium aluminate is not allowed as a process aid for manufacturing of colouring aids for foods according to food legislation in the EU.

[0025] W.A.Blumenthal gives in "American Dyestuff Reporter", Nov. 18 1946, vol. 23, pp 529-545 a review on colour lakes. He mostly deals with lakes of synthetic colours but he also briefly describes lakes of some natural dyes: cochineal, lac-dye, alkermes, Indian yellow, purple snail, logwood, fustet, quercitron, indigo, redwood. None of these lakes based upon natural dyes contain anthocyanins to any significant degree.

[0026] US 3,909,284 describes a method of making dry edible non-toxic colour lakes approvable for food and drug use by reacting synthetic colouring substances with sodium hydrogen carbonate and aluminium chloride under very specific conditions. However, only laking with synthetic colouring substances is described.

[0027] EP 0 025 637 A1 teaches methods of producing different metal lakes of the natural colouring substance curcumin which is very different from anthocyanins.

[0028] US 4,475,919 describes a method of providing lakes of natural colouring substances for foods with starch or cellulose. No aluminium lakes of anthocyanins are mentioned or obvious.

[0029] None of the above references disclose any solution or circumvention to firstly the desire of providing natural blue colouring substances that are legally approvable for use in foodstuffs and are blue at normal food pH values, and secondly the market need of providing a lasting removal of the organoleptical problems associated with extracts from vegetables such as e.g. red cabbage and purple carrot.

[0030] Surprisingly, it has been found by the inventors that the desire and need mentioned above can be met by preparation of an aluminium lake of the food colorant. Accordingly in a first aspect of the invention a process for modifying the taste and/or odour properties of a food colouring substance, wherein the food colouring substance is an anthocyanin compound of the formula:

[0031] Wherein R^1 and R^2 are each independently H, OH or OCH_3 , and R^3 , R^4 and R^5 are each independently H, a sugar residue or an acylated sugar residue, and which process comprises treating the food colouring substance with an aluminium compound, and adjusting the pH to a value of from 5 to 9, to produce an aluminium lake comprising said anthocyanin compound, wherein the taste and/or odour properties of the lake are organoleptically masked in comparison with those of said substance.

[0032] The aluminium lake may be prepared by combining an aluminium containing compound with the food colouring substance, followed by adjustment of the pH to a value of from 5 to 9, preferably from 6 to 8, to cause precipitation of the lake. These pH ranges include values of from 5 to 9 and from 6 to 8, respectively, for all embodiments of the invention. In accordance with a preferred embodiment of the invention the food colouring substance comprises anthocyanins originating from other parts of plants than flower petals.

[0033] In a particularly preferred embodiment, the food colouring substance is an extract of purple carrot or most preferably a red cabbage extract.

[0034] In the present context, food colouring substances are interchangeable used with food colorants and is to be understood as substances which may be added to food products, sweets, confectionary, beverages, pharmaceuticals and similar other products to be ingested orally.

[0035] Likewise, food products in the present context is to be understood as any edible product comprising nutrients, sweets, confectionary, beverages and pharmaceuticals.

[0036] The present invention provides a process for modification of the taste and/or odour properties of a colouring substance for foods, sweets and pharmaceuticals. Surprisingly it has been found by the inventors that this process implies masking of previous unpleasant taste and/or odour properties.

[0037] A further aspect of the invention provides a process for producing a food colouring substance (e.g. a food colouring substance), having a blue colour at a pH in the range of from 5 to 9, which process comprises treating a food colouring substance which is contains an anthocyanin compound with an aluminium compound, and adjusting the pH to a value of from 5 to 9, to produce an aluminium lake comprising the anthocyanin compound.

[0038] In a preferred embodiment, the product may be encapsulated, using conventional microencapsulation techniques suitable for food products, for example as described in WO 97/26803, for example by encapsulation in gum arabic. The product with or without encapsulation may be used as it is or it may be collected for example by filtration. The filtrate may be dried or used as a wet precipitate without drying. A further aspect of the invention is a natural colouring composition for foods, sweets and pharmaceuticals, comprising an food colouring substance having unpleasant taste and/or odour properties, combined with an aluminium-containing compound, to form an aluminium lake, wherein the unpleasantness of the taste and/or odour of the colouring material is reduced by said combination with the aluminium-containing compound.

[0039] Said food colouring substance characterised by having unpleasant taste and/or odour properties is preferably an anthocyanin, in particular, an anthocyanin of the general formula:

wherein R^1 and R^2 are each independently H, OH or OCH_3 , and R^3 , R^4 and R^5 are each independently H, a sugar residue or an acylated sugar residue. The sugar residues are most commonly residues derived from glucose, galactose, xylose, arabinose and rhamnose; substitution with disaccharides also occurs e.g. rutinose, sophorose, sambubiose, and gentiobiose. These residues are examples only and are not to be understood as a complete list.

[0040] Another aspect of the invention is a food colouring composition, having a blue colour at a pH in the range of from 5 to 9, which comprises a food colouring substance which is an anthocyanin compound of formula:

[0041] Wherein R^1 and R^2 are each independently H, OH or OCH_3 , and R^3 , R^4 and R^5 are each independently H, a sugar residue or an acylated sugar residue, combined with an aluminium compound to produce an aluminium lake.

[0042] A particularly advantageous feature of the anthocyanin-based products of the present invention is that the blue colour of the anthocyanin colourant is retained at pHs of 8 or less, for example at pHs in the range 6 to 8.

[0043] An even further aspect of the invention is the use of a composition according to the invention for the manufacturing of a food product. A particular preferred embodiment is the use of a composition where the food product belongs to the group of sweets and confectionary.

Another particular embodiment is the use of a composition where the food product is a pharmaceutical product.

[0044] A number of preferred embodiments of the invention is described in the following examples:

[0045] In the examples 1, 2, 3 and 8 below, spray dried red cabbage or purple carrot extracts, were used, which were diluted with maltodextrine to give a standardised "colour content", expressed in Colour Units.

[0046] The colour content is measured as follows :

P grams of the standardised spray dried extract are dissolved in 100 ml 0.1 M citrate-HCl buffer at pH 3.0. This solution should have a concentration such as to give an optical density in the range of from 0.5 to 1.0 (with a distilled water blank).

[0047] Colour content measured in Colour Units is defined by the formula:

Optical density(OD) at lambda max*

P (grams)

*lambda max = wavelength between 500 nm and 550 nm giving the highest OD value.

[0048] Other inert materials like sugars and salts could have been used as well for standardisation of the spray dried extracts without any significant changes of the results obtained below. In examples 4, 5, 6 and 7 a red cabbage extract was used, that was standardised to a colour content of 15.8 Colour Units per gram with deionised water.

[0049] In all examples where aluminium sulphate was applied the compound with 18 moles of water of crystallization per mole (Merck Aluminiumsulfat-18-hydrat, Stucke reinst, Ph Eur, BP) was used.

Example 1

This example discloses an example of preparation of blue Al-anthocyanin lakes with spray-dried red cabbage extract ratio aluminium sulfate : red cabbage extract = 2:1

[0050] An amount of 10 grams of a spray-dried red cabbage extract, standardised with maltodextrin to a colour content of 30 Colour units per gram, were dissolved in 100 ml of demineralised water. 20 grams of aluminium sulphate were dissolved in 100 mL of demineralised water. The two solutions were mixed. The pH of the mixed solution was 3.0. pH was raised to 7.9 by the addition of 5 % ammonia (J. Baker, Ammonium Hydroxide 25 %). A blue precipitate was formed, and was collected by vacuum filtration. The filtrate was only weakly coloured (greenish), indicating almost complete laking of the colour. The blue precipitate was dried overnight at 40 degrees C.

Example 2

This example discloses an example of preparation of blue Al-anthocyanin lakes with spray-dried red cabbage extract, ratio aluminium sulfate : red cabbage extract = 1:1

[0051] An amount of 4 grams of a spray dried red cabbage extract, standardised with maltodextrine to a colour content of 30 Colour units per gram, were dissolved in 180 ml of demineralised water. An amount of 4 grams of aluminium sulphate were dissolved in 20 mL of demineralised water. The two solutions were mixed. The pH of the mixed solution was 3.0. pH was raised to 7.9 by the addition of 5 % ammonia (J. Baker, Ammonium Hydroxide 25 . %). The blue precipitate was collected by vacuum filtration. The filtrate was strongly coloured (blue), indicating incomplete laking of the colour. The blue precipitate was dried overnight at 40 degrees C.

Example 3

This example discloses an example of preparation of a blue Al-anthocyanin lakes with spray-dried red cabbage extract, ratio aluminium sulfate : red cabbage extract =3:1

[0052] An amount of 10 grams of a spray dried red cabbage extract, standardised with maltodextrine to a colour content of 30 Colour units per gram, were dissolved in 100 ml of demineralised water. An amount of 30 grams of aluminium sulphate were dissolved in 100 mL of demineralised water. The two solutions were mixed. The pH of the mixed solution was 3.0. pH was raised to 7.9 by the addition of 5 % ammonia (J. Baker, Ammonium Hydroxide 25 %). The blue precipitate was collected by vacuum filtration. The filtrate was only weakly coloured (greenish), indicating almost complete laking of the colour. The blue precipitate was dried overnight at 40 degrees C.

Example 4

This example demonstrates a method for preparation of microencapsulated blue Al-anthocyanin lakes with red cabbage extract

[0053] An amount of 145,2 g red cabbage extract was added to 300 g of sugar syrup (Hvid Sirup, Danisco) and 300 g dem. water, 150 g aluminium sulphate and 150,0 g gum Arabic (Instant Soluble Gum Arabic, Alland & Robert) were added and left to dissolve. After dissolution pH was measured to be 1,7 and the temperature was measured to be 42 degrees C. pH was increased to 7,5 by the addition of 113,1 g of a solution (J. Baker, Ammonium Hydroxide 25 %) of

ammonia in water. 144,4 g dem. water was added. The suspension was milled in a Dynamill type KDL ball mill, as described in patent application WO 97/26803. A beadlet size of 0,6-0,8 mm was applied in the mill. The suspension was allowed to pass the mill three times. The milled suspension was characterized in a Malvern Mastersizer. The mean particle diameter of the colour lake particles was 0.48 micrometer after the milling.

To 700 g of the milled suspension 124 g of propylene glycol (Lyondell, France) was added.

Example 5

This example provides an example of a procedure for comparison of the organoleptical properties of microencapsulated lakes with those of untreated red cabbage extract when applied in sweets.

[0054] The microencapsulated preparation produced according to Example 4 was compared to a standard red cabbage extract in a panning test where chocolate pastilles were coated with coloured sugar syrups as follows:

Materials and methods: .

[0055] A sugar syrup was made of 444 g sucrose, 200 g dem. water and 13 g of glucose syrup (DE 42, 80 % glucose). An amount of 300 grams of chocolate pastilles were coated in each trial. In the first trial a syrup containing 8 % of the microencapsulated preparation produced according to example 4, was used for the coating. A total of 47.7 grams of coloured syrup was applied. In the second trial a syrup containing 2 % of the red cabbage extract used in example 4 and adjusted to pH 7.5 was used. A total of 34.2 grams of coloured syrup was applied.

Results of characterisation of colour:

[0056] The coated pastilles produced using the microencapsulated preparation according to Example 4 had a blue colour (similar to Royal Horticultural Society colour chart 92 B) while the ones coated with the red cabbage extract had a purple colour (similar to Royal Horticultural Society colour chart 98 B)

Results of characterisation of taste:

[0057] The coated pastilles produced using the microencapsulated preparation according to Example 4 did not have any "cabbage taste" whereas the ones coated with the red cabbage extract had a strong "cabbage taste".

[0058] It appears clearly that the use of the microencapsulated lakes according to the invention renders a more bluish colour hue and a masking of the unpleasant "cabbage taste".

Example 6

This example provides a comparison of colour hues of microencapsulated lakes with those of untreated red cabbage extract at different pH-values.

[0059] The microencapsulated preparation produced according to example 4 was compared to red cabbage extract in water-sugar blends (fondants) at different concentration levels and pH values. Two different concentration levels were measured at four different pH-values with regard to colour hue and visual appearance.

[0060] Buffer solutions were prepared from 0.1 M NaOH and 0.1 M KH_2PO_4 solutions. Both microencapsulated preparation produced, according to Example 4, and red cabbage extract were tested in two concentration levels at pH 6.5, 7.0, 7.5 and 8.0. pHs were measured after mixing of colour solutions and buffer solutions. For red cabbage extract two levels were tested: 0.10 grams and 0.50 grams of extract per 25 ml of colour solution which in tables 1 and 3 is stated as low concentration level and high concentration levels, respectively. For the microencapsulated preparation produced according to Example 4, two levels were tested: 1.07 grams and 5.35 grams per 25 ml of colour solution which in tables 2 and 4 is stated as low concentration level and high concentration levels, respectively.

[0061] Fondants were prepared from 10 mL colour solution and 50 grams of icing sugar (Danisco), which were intensively mixed.

[0062] The colours of the coloured fondants were characterized in a Minolta 300 colour tester. The Minolta characterises the colour shade by measuring the hue angle, measured in degrees, where pure red : 360, pure yellow : 90, pure green : 180, pure blue : 270). Purple shades will have values between 360 and 270, the more bluish, the closer to 270.

[0063] Results:

Table 1: red cabbage extract, low concentration level

pH of colour solution	6.5	7	7.5	7.9
Colour hue of sugar fondant, measured on Minolta 300	314.3	305.6	293.7	283.8
Visual appearance	purple	bluish purple	bluish purple	blue

Table 2: microencapsulated preparation produced according to Example 4, low concentration level

pH of colour solution	6.5	7.1 1	7.7	8.1 1
Colour hue of sugar fondant, measured on Minolta 300	278.7	271.5	263.6	259.4
Visual appearance	bluish purple	blue	blue	blue

Table 3: red cabbage extract, high concentration level

pH of colour solution	6.4	6.9	7.6	8.2
Colour hue of sugar fondant, measured on Minolta 300	323,0	317.4	310.2	302.6
Visual appearance	purple	purple	bluish purple	blue

Table 4: microencapsulated preparation produced according to Example 4, high concentration level

pH of colour solution	6.6	7.1 1	7.6	8
Colour hue of sugar fondant, measured on Minolta 300	276	276.7	270	265.1
Visual appearance	blue	blue	blue	blue

[0064] By comparison of Table 1 with Table 2 and Table 3 with Table 4 it appears that for the same pH-value a more bluish colour hue is obtained by using the microencapsulated colour lake according to the invention than obtained with the untreated cabbage extract.

Example 7

This example provides a comparison of colour hues of microencapsulated lakes with those of untreated red cabbage extract at different pH-values.

[0065] The microencapsulated preparation produced according to Example 4 was compared to a standard red cabbage extract in water-sugar blends (fondants) at different levels and pHs in stronger buffer solutions.

Materials and methods:

[0066] Buffer solutions were prepared from 1.0 M NaOH and 1.0 M KH_2PO_4 solutions. Both microencapsulated preparations produced according to Example 4 and red cabbage extract were tested in two concentration levels at pH 8.5, 7.0, 6.5 and 6.0.

[0067] pHs were measured after mixing of colour solutions and buffer solutions. For red cabbage extract two concentration levels were tested: 0.10 gram and 0.50 gram of extract per 25 ml of colour solution as described in Example 6. The two concentration levels are designated low and high in tables 1 and 3 below. For the microencapsulated preparation produced according to example 4 the following two levels were tested: 1.07 grams and 5.35 grams per 25 ml of colour solution, which were designated low and high concentration level, respectively.

[0068] Fondants were prepared as described in Example 6.

[0069] The colours of the coloured fondants were characterised in a Minolta 300 as described in Example 6.

[0070] Results:

Table 1: red cabbage extract, low concentration level

pH of colour solution	6.0	6.5	7.0	8.5
Colour hue of sugar fondant, measured on Minolta 300	317.5	309.6	292.8	251.7
Visual appearance	purple	purple	bluish blue	blue

Table 2: microencapsulated preparation produced according to Example 4, low concentration level

pH of colour solution	6.0	6.5	7.0	8.5
Colour hue of sugar fondant, measured on Minolta 300	314.4	293.4	271.0	244.2
Visual appearance	purple	bluish purple	blue	blue

Table 3: red cabbage extract, high concentration level

pH of colour solution	6.0	6.5	7.0	8.5
Colour hue of sugar fondant, measured on Minolta 300	318.6	310.0	300.5	279.9
Visual appearance	purple	purple	bluish purple	blue

Table 4: microencapsulated preparation produced according to Example 4, high concentration level

pH of colour solution	6.0	6.5	7.0	8.5
Colour hue of sugar fondant, measured on Minolta 300	296.5	296.6	257.3	229.7
Visual appearance	bluish purple	bluish purple	blue	blue

[0071] By comparison of Table 1 with Table 2 and Table 3 with Table 4 it appears that for the same pH-value a more bluish colour hue is obtained by using the microencapsulated colour lake according to the invention than obtained with the untreated cabbage extract.

Example 8

This example discloses an example of preparation of blue Al-anthocyanin lakes with spray-dried purple carrot extract

Preparation of solution 1:

[0072] Solution 1 was prepared by dissolving 10 grams of a spray dried purple carrot extract, standardised with maltodextrin to a colour content of 12 Colour units per gram, in 100 ml of demineralised water.

Preparation of solution 2 :

[0073] Solution 2 was prepared by dissolving 20 grams of aluminium sulphate in 100 mL of demineralised water.

[0074] Solutions 1 and 2 were mixed. The pH of the mixed solution was measured to be 3.0. pH was raised to 7.9 by the addition of 5 % ammonia (J. Baker, Ammonium Hydroxide 25 %). A blue precipitate was formed, and it was collected by vacuum filtration. The filtrate was only weakly coloured (greenish), indicating almost complete laking of the colour. The blue precipitate was dried overnight at 40 degrees C.

Example 9

This example discloses the result of the lake preparation method described in Examples 1 2. 3 and 8 when applied to spray-dried sweet potato extract.

[0075] An amount of 33 grams of a spray dried sweet potato extract, standardised with maltodextrin to a colour content of 3,2 Colour units per gram, and 20 grams of aluminium sulphate were dissolved in 300 mL of demineralised water. The pH of the mixed solution was 2.0. The colour of the solution was red. pH was raised to 7.9 by the addition of 5 % ammonia (J. Baker, Ammonium Hydroxide 25 %). However, the colour remained red and no precipitate formed.

Example 10

Black currant extract.

[0076] An amount of 20 grams of a spray dried blackcurrant extract, standardised with maltodextrin to a colour content of 6.82 Colour units per gram, and 10 grams of aluminium sulphate were dissolved in 300 mL of demineralised water. The pH of the mixed solution was 3.0. The colour of the solution was red. pH was raised to 7.9 by the addition of 5 % ammonia (J. Baker, Ammonium Hydroxide 25 %). A blackish-blue precipitate formed.

Example 11

Elderberry extract.

[0077] An amount of 33 grams of a spray dried elderberry extract, standardised with maltodextrin to a colour content of 4.17 Colour units per gram, and 10 grams of aluminium sulphate were dissolved in 300 mL of demineralised water. The pH of the mixed solution was 2.2. The colour of the solution was red. pH was raised to 8.0 by the addition of 5 % ammonia (J. Baker, Ammonium Hydroxide 25 %). A blackish-blue colour but almost no precipitate formed.

Claims

1. A process for modifying the taste and/or odour properties of a food colouring substance having unpleasant taste and/or odour properties, wherein the food colouring substance is an anthocyanin compound of the formula:

Wherein R^1 and R^2 are each independently H, OH or OCH_3 , and R^3 , R^4 and R^5 are each independently H, a sugar residue or an acylated sugar residue, and which process comprises treating the food colouring substance with an aluminium compound, and adjusting the pH to a value of from 5 to 9, to produce an aluminium lake comprising said anthocyanin compound, wherein the taste and/or odour properties of the lake are organoleptically masked in comparison with those of said substance.

2. A process for producing a food colouring substance, having a blue colour at a pH in the range of from 5 to 9, which process comprises treating a food colouring substance which is an anthocyanin compound of the formula:

Wherein R^1 and R^2 are each independently H, OH or OCH_3 , and R^3 , R^4 and R^5 are each independently H, a sugar residue or an acylated sugar residue with an aluminium compound, and adjusting the pH to a value of from 5 to 9, to produce an aluminium lake comprising the anthocyanin compound.

3. A process as claimed in Claim 2, wherein the anthocyanin originates from plant parts other than petals or sepals.
4. A process as claimed in any one of the preceding claims, wherein the food colouring substance is an extract of red cabbage or purple carrot.
5. A process as claimed in any one of the preceding claims, in which the food colouring substance is combined with a solution or suspension of an aluminium compound, and the pH is then raised to a value of from 5 to 9.
6. A process as claimed in Claim 5, wherein the pH is raised to a value of from 6 to 8.
7. A process as claimed in any one of the preceding claims, in which the aluminium compound is aluminium sulphate.
8. A process as claimed in any one of the preceding claims, including a step of micro encapsulating the product.
9. A process as claimed in any one of the preceding claims, including a step of filtering the product.

10. A process as claimed in any one of the preceding claims, including a step of drying the product.

11. A colouring composition, comprising a food colouring substance, wherein the food colouring substance is an anthocyanin compound of formula:

Wherein R^1 and R^2 are each independently H, OH or OCH_3 , and R^3 , R^4 and R^5 are each independently H, a sugar residue or an acylated sugar residue, and having unpleasant taste and/or odour properties, combined with an aluminium-containing compound, to form an aluminium lake, wherein the unpleasantness of the taste and/or odour of the colouring composition is masked by the said combination with the aluminium-containing compound.

12. A food colouring composition, having a blue colour at a pH in the range of from 5 to 9, which comprises a food colouring substance which is an anthocyanin compound of formula:

Wherein R^1 and R^2 are each independently H, OH or OCH_3 , and R^3 , R^4 and R^5 are each independently H, a sugar residue or an acylated sugar residue, combined with an aluminium compound to produce an aluminium lake.

13. A composition as claimed in any one of claims 11 and 12, wherein the food colouring substance comprises an extract of red cabbage or purple carrot.

14. A composition as claimed in any one of claims 11, 12 and 13, wherein the composition has a blue colour at a pH in the range of 6 to 8.

15. Use of a composition as claimed in any of the claims 1-14 for the manufacturing of a food product.

16. Use as claimed in claim 15 where the food product belongs to the group of sweets and confectionary.

17. Use as claimed in claim 15 where the food product is a pharmaceutical product.

Patentansprüche

1. Verfahren zum Verändern des Geschmacks und/oder des Geruchs eines Lebensmittelfarbstoffs mit unangenehmem Geschmack und/oder Geruch, wobei der Lebensmittelfarbstoff eine Anthocyaninverbindung mit folgender Formel ist:

Wobei R^1 und R^2 jeweils unabhängig voneinander H, OH oder OCH_3 sind und R^3 , R^4 und R^5 jeweils unabhängig voneinander H, ein Zuckerrückstand oder ein acylierter Zuckerrückstand sind, und wobei das Verfahren die Behandlung des Lebensmittelfarbstoffs mit einer Aluminiumverbindung umfasst und die Einstellung des pH-Werts auf einem Wert von 5 bis 9, um ein Aluminiumpigment mit besagter Anthocyaninverbindung zu erzeugen, wobei der Geschmack und/oder Geruch des Pigments organoleptisch verdeckt im Vergleich zu dem der besagten Substanz ist.

2. Verfahren zur Herstellung eines Lebensmittelfarbstoffs, mit blauer Farbe bei einem pH im Bereich von 5 bis 9, wobei das Verfahren die Behandlung eines Lebensmittelfarbstoffs umfasst, der eine Anthocyaninverbindung mit folgender Formel ist:

Wobei R^1 und R^2 jeweils unabhängig voneinander H, OH oder OCH_3 sind und R^3 , R^4 und R^5 jeweils unabhängig voneinander H, ein Zuckerrückstand oder ein acylierter Zuckerrückstand mit einer Aluminiumverbindung sind, und die Einstellung des pH-Werts auf einen Wert von 5 bis 9, um ein Aluminiumpigment mit der Anthocyaninverbindung zu erzeugen.

3. Verfahren nach Anspruch 2, wobei das Anthocyanin von Pflanzenteilen stammt, aber nicht Blütenblätter oder Kelchblätter.
4. Verfahren nach einem der vorigen Patentansprüche, wobei der Lebensmittelfarbstoff ein Extrakt aus Rotkohl oder schwarzer Karotte ist.
5. Verfahren nach einem der vorigen Patentansprüche, wobei das Lebensmittelfarbstoff mit einer Lösung oder Suspension einer Aluminiumverbindung kombiniert ist, und der pH-Wert wird dann auf einen Wert von 5 bis 9 angehoben.

6. Verfahren nach Anspruch 5, wobei der pH-Wert auf einen Wert von 6 bis 8 angehoben wird.
7. Verfahren nach einem der vorigen Patentansprüche, wobei die Aluminiumverbindung Aluminiumsulfat ist.
8. Verfahren nach einem der vorigen Patentansprüche, einschließlich einer Phase der Mikroinkapselung des Produkts.
9. Verfahren nach einem der vorigen Patentansprüche, einschließlich einer Phase der Filterung des Produkts.
10. Verfahren nach einem der vorigen Patentansprüche, einschließlich einer Phase der Trocknung des Produkts.
11. Färbzusammensetzung, mit einem Lebensmittelfarbstoff, wobei der Lebensmittelfarbstoff eine Anthocyaninverbindung mit folgender Formel ist:

Wobei R^1 und R^2 jeweils unabhängig voneinander H, OH oder OCH_3 sind und R^3 , R^4 und R^5 jeweils unabhängig voneinander H, ein Zuckerrückstand oder ein acylierter Zuckerrückstand sind, mit unangenehmem Geschmack und/oder Geruch, mit einer aluminiumhaltigen Verbindung kombiniert, um ein Aluminiumpigment zu bilden, wobei die Unliebsamkeit des Geschmacks und/oder Geruchs der Färbungszusammensetzung durch die besagte Kombination mit der aluminiumhaltigen Verbindung verdeckt wird.

12. Lebensmittel-Färbzusammensetzung, mit blauer Farbe bei einem pH im Bereich von 5 bis 9, die einen Lebensmittelfarbstoff umfasst, der eine Anthocyaninverbindung mit folgender Formel ist:

Wobei R^1 und R^2 jeweils unabhängig voneinander H, OH oder OCH_3 sind und R^3 , R^4 und R^5 jeweils unabhängig voneinander H, ein Zuckerrückstand oder ein acylierter Zuckerrückstand sind, mit einer Aluminiumverbindung kombiniert, um ein Aluminiumpigment zu erzeugen.

13. Zusammensetzung nach einem beliebigen der Ansprüche 11 und 12, wobei der Lebensmittelfarbstoff einen Extrakt

aus Rotkohl oder schwarzer Karotte umfasst.

14. Zusammensetzung nach einem beliebigen der Ansprüche 11, 12 und 13, wobei die Zusammensetzung bei einem pH im Bereich von 6 bis 8 blaue Farbe hat.
15. Verwendung einer Zusammensetzung nach einem beliebigen der Ansprüche 1-14 zur Produktion eines Lebensmittels.
16. Einsatz nach Anspruch 15, wobei das Lebensmittel der Gruppe Bonbons und Konfekt angehört.
17. Einsatz nach Anspruch 15, wobei das Lebensmittel ein pharmazeutisches Produkt ist.

Revendications

1. Un procédé pour modifier les propriétés relatives au goût et/ou à l'odeur d'une substance colorante pour aliments, ayant des propriétés déplaisantes relativement au goût et/ou à l'odeur, dans lequel la substance colorante pour aliments est un composé de l'anthocyanine de la formule :

Dans laquelle R^1 et R^2 sont chacun indépendamment H, OH ou OCH_3 , et R^3 , R^4 et R^5 sont chacun indépendamment H, un résidu de sucre ou un résidu de sucre acylaté, et dont le procédé inclut le traitement de la substance colorante pour aliments avec un composant d'aluminium, et l'adaptation du pH à une valeur allant de 5 à 9, pour produire une laque d'aluminium comprenant ledit composé de l'anthocyanine, où les propriétés relatives au goût et/ou à l'odeur de la laque sont, de façon organoleptique, masquées en comparaison avec celles de ladite substance.

2. Un procédé pour produire une substance colorante pour aliments, étant de couleur bleu à un pH allant de 5 à 9, lequel procédé comprenant le traitement d'une substance colorante pour aliments qui est un composé de l'anthocyanine de la formule :

Dans laquelle R^1 et R^2 sont chacun indépendamment H, OH ou OCH_3 , et R^3 , R^4 et R^5 sont chacun indépendamment

H, un résidu de sucre ou un résidu de sucre acylaté avec un composé d'aluminium, et adaptant le pH à une valeur allant de 5 à 9, pour produire une laque d'aluminium comprenant le composé de l'anthocyanine.

3. Un procédé selon la revendication 2, dans lequel l'anthocyanine provient d'éléments végétaux autres que pétales ou sépales.
4. Un procédé comme revendiqué dans l'une quelconque des revendications précédentes, dans lequel la substance colorante pour aliments est un extrait de chou rouge ou de carotte violette.
5. Un procédé comme revendiqué dans l'une quelconque des revendications précédentes, dans lequel la substance colorante pour aliments est combinée avec une solution ou suspension d'un composé d'aluminium, et le pH est ensuite élevé à une valeur allant de 5 à 9.
6. Un procédé selon la revendication 5, dans lequel le pH est élevé à une valeur allant de 6 à 8.
7. Un procédé comme revendiqué dans l'une quelconque des revendications précédentes, dans lequel le composé d'aluminium est sulfate d'aluminium.
8. Un procédé comme revendiqué dans l'une quelconque des revendications précédentes, incluant une étape de microencapsulation du produit.
9. Un procédé comme revendiqué dans l'une quelconque des revendications précédentes, incluant une étape de filtrage du produit.
10. Un procédé comme revendiqué dans l'une quelconque des revendications précédentes, incluant une étape de séchage du produit.
11. Une composition colorante, comprenant une substance colorante pour aliments, dans laquelle la substance colorante pour aliments est un composé de l'anthocyanine de la formule

Dans laquelle R^1 et R^2 sont chacun indépendamment H, OH ou OCH_3 , et R^3 , R^4 et R^5 sont chacun indépendamment H, un résidu de sucre ou un résidu de sucre acylaté, et ayant des propriétés déplaisantes relativement au goût et/ou à l'odeur, combinés avec un composé contenant de l'aluminium, pour former une laque d'aluminium, dans laquelle la caractéristique désagréable du goût et/ou de l'odeur de la composition colorante est masquée par ladite combinaison avec le composé contenant de l'aluminium.

12. Une composition colorante, étant de couleur bleu à un pH allant de 5 à 9, comprenant une substance colorante pour aliments qui est un composé de l'anthocyanine de la formule :

Dans laquelle R' et R² sont chacun indépendamment H, OH ou OCH₃, et R³. R⁴ et R⁵ sont chacun indépendamment H, un résidu de sucre ou un résidu de sucre acylaté, combiné avec un composé d'aluminium pour produire une laque d'aluminium.

- 13.** Une composition comme revendiquée dans l'une ou l'autre des revendications 11 et 12, dans laquelle la substance colorante pour aliments comprend un extrait de chou rouge ou de carotte violette.
- 14.** Une composition comme revendiquée dans l'une ou l'autre parmi les revendications 11, 12 et 13, dans laquelle la composition est de couleur bleu à un pH allant de 6 à 8.
- 15.** Utilisation d'une composition comme revendiquée dans l'une quelconque des revendications 1 à 14 pour la fabrication d'un produit alimentaire.
- 16.** Utilisation selon la revendication 15 où le produit alimentaire appartient au groupe de sucreries et confiserie.
- 17.** Utilisation selon la revendication 15 où le produit alimentaire est un produit pharmaceutique.
