Title: HIGHLY DURABLE SUPERHYDROPHOBIC, OLEOPHOBIC AND ANTI-ICING COATINGS AND METHODS AND COMPOSITIONS FOR THEIR PREPARATION

Abstract: Highly durable hydrophobic, oleophobic, and anti-icing coatings and methods of their preparation and use are described herein.
Highly Durable Superhydrophobic, Oleophobic And Anti-Icing Coatings And Methods And Compositions For Their Preparation

This application claims the benefit of U.S. Provisional Application 61/103,295, filed on October 7, 2008, which is hereby incorporated by reference in its entirety.

BACKGROUND

Consumer and industrial products are made from a variety of materials including: metals and alloys, wood, glass, ceramics, cement and other masonry products, fabrics, plastics, paper, and composites. Composites of such materials can be composed of, for example, metals, masonry, or polymer based products. In all cases, surfaces of the products that are exposed to the environment may come into contact with a variety of agents, including dust, moisture, water, and oils. In industrial applications, surfaces may be exposed to a variety of agents such as water, aqueous salt solutions, solutions of aqueous acid or base, and chemicals that may be dissolved or suspended in aqueous compositions or other liquids that are used in manufacturing processes. Not only are product surfaces exposed to a variety of agents, but the temperatures to which surfaces are exposed can also affect their performance. For example, freezing liquids, such as water, can result in frozen deposits tightly attached to the surfaces exposed to the liquids, preventing access to the surface and preventing proper operation of equipment bound by the frozen liquids. In addition, elevated temperatures can accelerate processes such as corrosion or preferential surface leaching effects.

SUMMARY

Highly durable coatings and surface treatments are provide having a variety of surface properties including, but not limited to: hydrophobicity/superhydrophobicity, oleophobicity, resistance to ice formation and/or ice deposition (adherence). Compositions that are hydrophobic and/or oleophobic and/or anti-icing ("HP/OP") may be applied to a surface using single-step or multiple steps (e.g., two-step coating processes). Methods of applying such coatings and surface treatments also are provided, together with compositions for applying such coatings and surface treatments, and objects comprising coated and treated surfaces.

BRIEF DESCRIPTION OF THE DRAWINGS

Figure 1 shows two types of coatings on glass plates. Shown in Fig. 1 (perspective vertically down) are three glass plates. Panel A depicts the plates in the absence of liquid and Panel B depicts the plates in the presence of liquid. Plate ")(A) is a "control" glass plate without any spill-resistant border; plate ")(B) is a glass plate bearing a spill-
resistant HP/OP border prepared by applying a coating to the border region; and plate 
"(C)" is a glass plate bearing a spill-resistant HP/OP border prepared by applying a 
tape bearing a HP/OP coating to the border region.

Figure 2 depicts five different surfaces with regions (stippled) that have a lower 
hydrophobicity and/or lower oleophobicity than the spill-resistant border and spill-
resistant borders as unmarked (white) regions. In (A), a surface with a spill resistant 
border in the form of an edge (at its edge) is depicted. (B) shows a surface with a 
spill resistant border in the form of a spill-resistant edge along with two diagonal spill 
resistant barriers. The diagonal barriers may retain liquids at the same height as the 
spill-resistant edge or optionally may have a lesser ability to retain liquids than the 
border at the edge (i.e., the barrier lines optionally may retain liquids to lower heights 
than the border at the edge). (C) shows a surface with a spill resistant border in the 
form of a spill-resistant edge along with a series of spill resistant barriers in the form 
of a grid, where the barrier lines optionally may have a lesser ability to retain liquids 
than the edge. (D) depicts a surface with a spill resistant border in the form of a spill-
resistant edge along with a series of partial spill resistant barriers, that optionally may 
have a lesser ability to retain liquids and which may be used to channel liquids 
toward a drain (or drains), or a site where one or more drain tube(s) are connected 
(black oval). The barrier lines in such an embodiment may extend to the drain. (E) 
shows a surface with a spill resistant border in the form of a spill-resistant edge along 
with two diagonal spill resistant barriers that terminate at a drain (black oval). The 
diagonal barriers lines optionally may have a lesser ability to retain liquids than the 
edge and can be used to channel or direct liquids to the drain. Where drains are 
atached to a surface, the surface may be inclined or depressed so that the opening of 
the drain is lower than the edge of the surface, channeling liquids to the drain.

Figure 3 shows resistance to abrasion measured by the number of abrasion cycles in a Taber 
test for different concentrations and amounts of M5silica treated with the silanizing 
agent SIT8174 applied to a base coat on aluminum plates.

Figure 4 shows resistance to abrasion measured by the number of abrasion cycles in a Taber 
test for different concentrations and amounts of M5silica treated with the SiCl4 
followed the silanizing agent SIT8174 applied to a base coat on aluminum plates.

Figure 5 graphs contact data for water measured at 18°-22°C on plates treated with a HP/OP 
coating before Taber testing plotted as a function of the amount of treated silica (M5
fumed silica treated with either the silanizing agent SIT8174 or SiCl$_4$ followed the silanizing agent SIT8174) applied to a base coating during plate preparation. Figures 6 and 7 show plots of the abrasion resistance as measured by Tabor abrasion cycles plotted as a function of the amount of treated silica (M5 fumed silica treated with either the silanizing agent SIT8174 or SiCl$_4$ followed the silanizing agent SIT8174) for the plates described in Figure 3. The end of hydrophobicity is assessed by the propensity of water droplets to remain on plates inclined at a 6° (Fig. 4), or a 9° (Fig. 5) from level.

Figures 8 and 9 show plots of the water contact angle measured at 18°C-22°C after abrasion testing, plotted as a function of the amount of treated silica applied to the plates described in Figure 3. The end of hydrophobicity is assessed the propensity of water droplets to remain on plates inclined at 6° (Fig. 4), or 9° (Fig. 5) from level.

Figure 10 (Panels 10a and 10b) are plots of the variation in abrasion resistance (measured by Taber cycle) as a function of first particle content on a percent weight basis; S60 second particles in Panel 10a (see Table 10b), or 512 Black second particles in Panel 10b (see Table 10d).

Figure 11 panels (a) and (b) show the results of testing plates A and B at various water flow speeds covering both laminar and turbulent flows. Three plates are tested: a control, which has a smooth reference surface with no coating; Plate A (indicated as plate 1 in the figure); and Plate B (indicated as plate 2 in the figure) describe in Example 19.

Figure 12: Panel (a) is a plot of total drag measured at varying water speeds and Panel (b) is a plot of drag reduction produced by HP/OP coatings for the plates described in Example 19, compared to an uncoated aluminum plate that is otherwise identical to the coated plates.

**DETAILED DESCRIPTION**

Coating methods and compositions/treatments are provided that impart a variety of desirable characteristics to objects and their surfaces, including hydrophobicity (e.g., superhydrophobicity), oleophobicity and anti-icing. Those characteristics can result in objects and surfaces with a variety of desirable properties including, but not limited to, resistance to: wetting, corrosion, swelling, rotting, cracking or warping, exfoliation, fouling, dust and/or dirt accumulation on surfaces (self cleaning), and surface ice formation adherence and accumulation. The coating compositions and treatments not only provide hydrophobicity
and/or oleophobicity and/or anti-icing properties, but are durable in that they resist mechanical abrasion while retaining those properties.

The coatings may be applied using a variety of techniques that can be grouped into three categories: one-step processes; two-step processes; and thermal deposition processes, which may in some instances be considered a special case of one-step or two-step processes. Within each of those categories numerous variations and embodiments are provided.

In some embodiments, the coatings may be applied using a one-step method, where a binder, first particles, and second particles are mixed to provide a coating composition that is then applied to the surface.

For example, a one-step method of applying a coating to a substrate may apply a coating composition to a substrate where the components include: i) a binder; ii) first particles having a size of about 30 microns to about 225 microns; and iii) second particles having a size of about 1 nanometer to 25 microns. Optionally, one or more independently selected alkyl, haloalkyl, or perfluoroalkyl groups may be covalently bound, either directly or indirectly, to the second particles. The composition optionally may contain 5% to 10% of a block copolymer on a weight basis. The composition may also contain any necessary solvents/liquids to assist in the application process.

Particles suitable for use in these compositions are described in detail below.

Where second particles are not HP/OP (e.g., untreated with a silanizing agent) prior to their incorporation into a coatings formed in one or two step processes, the coatings formed in those processes may be treated to apply chemical moieties (groups) such alkyl, haloalkyl, fluoroalkyl or perfluoroalkyl groups to the second particles at the surface of the coating (e.g., treating with silanizing agents such as compounds of formula (I), SIT71 84.0 and the like).

In some embodiments, the coatings may be applied using two-step methods, where, in a first step, a binder and first particles are mixed to form a coating composition, which does not contain the second particles prior to the application of the coating composition to the surface. Once applied, the coating composition is termed a "substrate coating" or a "base coat." Following the application of that coating composition, a composition comprising second particles is applied in a second step to the surface over the coating composition.

In some embodiments a two-step method of applying a coating to a substrate comprises:
a) applying to the substrate a coating composition comprising i) a binder and ii) first particles having a size of about 30 microns to about 225 microns, to provide a base coating; and

b) applying to this base coating a composition containing second particles having a size of about 1 nanometer to 25 microns. The second particles may have one or more independently selected alkyl, haloalkyl or perfluoroalkyl groups (e.g., polydimethylsiloxane) covalently bound, either directly or indirectly, to the second particles.

The composition may also contain any necessary solvents/liquids to assist in the application process.

In some embodiments of a two-step application method, the base coating is treated with the composition containing second particles after drying and curing the base coating at room temperatures (about 18-22°C) or elevated temperatures (e.g., about 93°C). In other embodiments, solvent used to apply the base coat is allowed to evaporate until the coating is no longer liquid and cannot be removed by contact; however, the base coating is not cured, when treated with the composition containing second particles. In still other embodiments, the composition comprising second particles may be applied directly to the base coat before solvents used in the application of the base coating have evaporated fully, substantially or even partly.

In one embodiment where HP/OP coatings are prepared using thermal spray processes, the process is a two step process. In such processes the metals and other materials applied to a substrate by thermal spray processes may be considered as binders for first particles added to the composition sprayed in the first step (e.g., Al2O3, silica or other metal oxides, or metal oxides). Alternatively the materials applied to the substrate may be considered as a binder for materials formed in the spraying process (e.g., metal or metalloid oxides formed in the spray process with oxidizing fuel). In addition to applying first particles, thermal spraying processes can also apply second particles and materials formed in the spraying process (e.g., metal oxides or metalloid oxides from the spraying composition). In each of those instances, following thermal spray treatment, the surface will contain materials (e.g., metal oxides) that can bind the materials or react with reagents that will enhance or impart HP/OP properties to the substrate's surface. Alternatively, the materials applied as a base coating, which form a rough surface, may be considered to comprise first particles formed from the materials applied in the partly melted and fused
coating composition. In either case, following thermal spray deposition the surface is subject to a second treatment to enhance or impart HP/OP properties to the surface.

In one embodiment a method for thermal deposition of a coating to a surface may include the steps of:

a) applying to the substrate by a thermal spray process a base coating spray composition optionally comprising one or more independently selected first particles having a size of about 1 micron to about 100 microns, to provide a base coating; and

b) applying to this base coating one or more of: i) a composition comprising one or more independently selected second particles having a size of about 1 nanometer to 25 microns that optionally comprise one or more independently selected alkyl, haloalkyl, fluoroalkyl, or perfluoroalkyl groups covalently bound, either directly or indirectly, to the second particles; ii) a composition comprising one or more independently selected silanizing agents or iii) a composition comprising a silicon-containing reagent that will increase the number of Si-OH sites, followed by a composition containing a silanizing agent.

Diverse binders, first particles, second particles and block copolymers may be employed in the methods and compositions described herein. In some embodiments, first particles may be considered filler particles. Similarly, in some embodiments second particles may be considered nanoparticles. In each instance, those materials are described more fully below.

A skilled artisan will understand that the selection of first particles and second particles needs to consider not only the desired properties of the coating and the ultimate conditions to which the coating will be subject in use, but also the process used to prepare the coating. Where, for example, particles must withstand elevated temperatures or specific solvents in the coating process, they need to be suitable for use in the required temperature ranges or in the required solvents. For example, in those embodiments where first and/or second particles are used with a thermoplastic binder, the particles need to be compatible with the elevated temperatures that are required to cure thermoplastic binders. In other embodiments where, for example, first particles or second particles are applied as part of a thermal spray composition, the particles need to withstand the high temperatures associated with those processes.

The one-step and two-step methods described herein can in some embodiments be used to produce coatings where the coating has (i) a surface in contact with said substrate and (ii) an exposed surface that is not in contact with the substrate where these surfaces
bear different amounts of first particles, second particles, or both first and second particles. In such embodiments the exposed surface can have a greater amount of second and/or first particles on, at, or adjacent to the exposed surface, compared to the amount of first and/or second particles at or adjacent to the surface of the coating that is in contact with the substrate.

In other embodiments, the one-step and two-step methods described herein can be used to produce coatings where the coating has (i) a surface in contact with said substrate, (ii) an exposed surface that is not in contact with the substrate and a (iii) central portion of the coating that is between these surfaces. In such embodiments the exposed surface can have a greater amount of second and/or first particles on, at, or adjacent to the exposed surface, compared to the amount of first and/or second particles in the central region of the coating.

In embodiments where a greater amount of first and/or second particles may be present at the exposed surface, the coatings may be considered composite coatings. Such composite coatings may be formed using either one- or two-step application processes.

In one-step coating processes the incorporation of a block copolymer in a range selected from: about 35 to about 15%; from about 4% to about 13%; from about 5% to about 10% or 4% to about 7% (by weight of the final cured coating) can result in the movement of first or second particles to the surface of the coating. Without wishing to be bound by any theory, it is believed that block copolymers may form aggregates in the binder composition, which can cause localization of at least second particles, and may also cause localization of first particles as well.

In two step processes, composite coatings with a greater amount of first and/or second particles may be present at the surface as a result of their being applied to the exposed surface of the base coating. Furthermore, where the base coating composition comprises a block copolymer in the ranges listed above for one step applications, first and/or second particles present in the base coating may move to the surface, which will also create an unequal distribution of particles in the coating.

The amount of particles in any portion of a coating may be assessed by any means known in the art including, but not limited to, microscopy or electron microscopy. Using those techniques and cross or oblique sections of coatings, the amount (e.g., the number) of particles can be determined. In addition, where it is possible to remove coatings, or where the substrate permits (e.g., it is transparent), the surfaces can be examined directly using microscopy or electron microscopy to determine the amount of particles present at the surface adjacent to the coating.
The coatings described herein are durable and resistant to the loss of OH/OP properties as a result of abrasion. Resistance to abrasion may be measured using any method known in the art including assessment with a Taber abrasion testing instrument (e.g., a Taber "Abraser"). For the purpose of this application, wherever Taber testing results are recited, the tests were conducted on a Taber Model: 503 instrument using CS-10 wheels with 250 g or 500 g loads as indicated. Abrasion may also be measured using manual tests as described in Example 1. To provide an end point for the loss of hydrophobicity (and also oleophobicity and anti-icing properties) as a result of abrasion testing, surfaces are tested for their propensity to shed water droplets at an indicated angle of incline. Typically, twenty droplets are placed on the surface to be assessed, which is then inclined at the desired angle. End of life is indicated when more than half (ten or more drops) stay in place. While such measurements provide a consistent end point, a skilled artisan will understand that even after abrasion testing the abraded surfaces may still be quite hydrophobic, having water contact angles greater than 130 or 140° in many instances.

In addition to resistance to loss of OH/HP properties from abrasion, the compositions provided herein also provide durability in the form of resistance to other conditions. The coatings, which employ diverse binder systems, also display durability in:

- Submerged water durability testing (the duration of a coating to resist wetting at different depths in water);
- Mechanical durability testing under high pressure impingement of water (the resistance of coating or surface treatment to the impact of high-pressure water);
- Chemical durability testing (the resistance of the coatings and treatments to liquids other than water, such as acids, alkalis, salts, and organic solvents such as alcohols, acetone, toluene, xylene, etc.);
- UV radiation resistance testing;
- Tests for resistance to boiling water; and
- Ice formation and/or adherence testing.

In addition to their other properties, the HP/OP coating described herein can be described by their characteristic roughness that may be measured by any means known in the art. In some embodiments the surface roughness is measured using a Mahr PocketSurf PSI (Mahr Federal Inc., Providence, RI). The roughness can be expressed using a variety of mathematical expressions including, but not limited to, the Arithmetical Mean Roughness and Ten-Point Mean Roughness, which are described in Scheme I below.
The coatings, resulting from the application of the compositions provided for herein, have in some embodiments a surface with an arithmetical mean roughness in a range selected from: greater than about 3 microns to about 4 microns; from about 4 microns to about 6 microns; from about 4 microns to about 8 microns; from about 4 microns to about 12 microns; from about 4 microns to about 20 microns; from about 5 microns to about 10 microns; from about 5 microns to about 20 microns; from about 6 microns to about 10 microns; or from about 6 microns to about 14 microns.

In other embodiments, the coatings, resulting from the application of the compositions provided for herein, have in some embodiments a surface with a ten point mean roughness selected from: greater than about 7 microns to about 60 microns; from about 7 microns to about 70 microns; from about 7 microns to about 80 microns; from about 7 microns to about 100 microns; from about 8 microns to about 60 microns; from about 8 microns to about 80 microns; from about 8 microns to about 100 microns; from about 12 microns to about 60 microns; from about 12 microns to about 100 microns; from about 15 microns to about 60 microns; or from about 15 microns to about 100 microns.

In some embodiments the coating surface has projections due to the presence of the first particles, with a maximum height above the level of the binder in a range selected from: from about 10 to about 180 microns; from about 15 to about 150 micron; from about 20 to
about 100 microns; from 30 to 120 microns; from about 40 to 140 microns; from about 50 to about 150 microns, or from about 20 to about 80 microns.

A more complete discussion of the compositions and methods of their application and surface treatments follow. A skilled artisan will understand that the following description and examples are provided as guidance, and are not limiting to the scope of the methods and compositions described herein.

1.0 Definitions

For the purposes of this disclosure a hydrophobic border or surface is one that results in a water droplet forming a surface contact angle exceeding about 90° and less than about 150° at room temperature (about 18 to about 23°C). Similarly, for the purposes of this disclosure a superhydrophobic border or surface is one that results in a water droplet forming a surface contact angle exceeding about 150° but less than the theoretical maximum contact angle of about 180° at room temperature. Some authors further categorize hydrophobic behavior and employ the term "ultrahydrophobic." Since for the purposes of this disclosure, a superhydrophobic surface has contact angles of about 150° to about 180°, superhydrophobic behavior is considered to include ultrahydrophobic behavior. For the purpose of this disclosure the term hydrophobic shall include superhydrophobic unless stated otherwise.

For the purposes of this disclosure an oleophobic material or surface is one that results in a droplet of light mineral oil forming a surface contact angle exceeding about 25° and less than the theoretical maximum contact angle of about 180° at room temperature.

Anti-icing (AI) surfaces are surfaces that are resistant to ice formation or prevent ice that forms from adhering to the surface (i.e., ice that forms can be removed with a minimum of force).

For the purpose of this disclosure HP/OP denotes hydrophobic (including superhydrophobic) and/or oleophobic behavior or properties as well as anti-icing properties. Durability, unless stated otherwise, refers to the resistance to loss of hydrophobic properties due to mechanical abrasion.

Alkyl as used herein denotes a linear or branched alkyl radical. Alkyl groups may be independently selected from C₁ to C₆ alkyl, C₂ to C₆₀ alkyl, C₄ to C₆₀ alkyl, C₆ to C₁₈ alkyl, C₆ to C₁₆ alkyl, or C₆ to C₂₀ alkyl. Unless otherwise indicated, alkyl does not include cycloalkyl. Cycloalkyl groups may be independently selected from: C₄ to C₂₀ alkyl comprising one or two C₄ to C₈ cycloalkyl functionalities; C₄ to C₂₀ alkyl comprising one or two C₄ to C₈ cycloalkyl functionalities; C₆ to C₂₀ alkyl comprising one or two C₄ to C₈
cycloalkyl functionalities; C\textsubscript{6} to C\textsubscript{18} alkyl comprising one or two C\textsubscript{4} to C\textsubscript{8} cycloalkyl functionalities; C\textsubscript{6} to C\textsubscript{8} alkyl comprising one or two C\textsubscript{4} to C\textsubscript{8} cycloalkyl functionalities. One or more hydrogen atoms of the alkyl groups may be replaced by fluorine atoms.

Haloalkyl as used herein denotes an alkyl group in which some or all of the hydrogen atoms present in an alkyl group have been replaced by halogen atoms. Halogen atoms may be limited to chlorine or fluorine atoms in haloalkyl groups.

Fluoroalkyl as used herein denotes an alkyl group in which some or all of the hydrogen atoms present in an alkyl group have been replaced by fluorine atoms.

Perfluoroalkyl as used herein denotes an alkyl group in which fluorine atoms have been substituted for each hydrogen atom present in the alkyl group.

For the purpose of this disclosure, when content is indicated as being present on a "weight basis" the content is measured as the percentage of the weight of components indicated, relative to the total weight of the binder system. When a liquid component such as a commercial binder product is used, the weight of the liquid component is used to calculate the weight basis, without regard to the relative amounts of solute and solvent that might be present in the commercial product. Thus, for example, when Polane is used as a binder, the weight basis is calculated using the weight of the Polane prepared as instructed by the manufacturer, without regard to the proportions of polyurethane solute and organic solvents. Optional solvents that are separately added to a composition merely to, for example, dilute the composition to a thickness suitable for spraying, are not included in the calculation of content on a weight basis.

2.0 Binders

Binders used to prepare durable superhydrophobic coatings may have a variety of compositions. Virtually any binder may be employed that is capable of adhering to the surface to be coated and retaining the desired first and second particles, both of which are described below. In some embodiments the binders employed are hydrophobic or superhydrophobic as applied in the absence of any added first or second particles, which can be advantageous in the preparation of durable HP/OP coatings.

In some embodiments the binders may be selected from lacquers, polyurethanes, fluoropolymers, epoxies, or powder coatings (thermoplastics). In other embodiments the binders may be selected from lacquers, polyurethanes, fluoropolymers, or thermoplastics. Binders may be hydrophilic, hydrophobic or superhydrophobic "as applied." For the purposes of this disclosure, when binders or their properties are described "as applied," it is understood that the binder(s) and properties are being described in the absence of the first and
second particles described herein that alter the durability, hydrophobic/superhydrophobic and oleophobic properties of binder.

In one- or two-step processes, where the binders employed are hydrophilic, the coating will generally be given an application of a silanizing agent after it has been applied to the substrate.

In some instances, the binders are not comprised of materials (e.g., monomers or oligomers) that polymerize when exposed to UV light to form polymers. In another embodiment, the binders are not comprised of thermoset polymeric materials.

Regardless of what type of binder is employed, one consideration in choosing a suitable binder is the compatibility between the surface to be coated and any solvent(s) used to apply the binder. Other considerations are the environment to which the coating will be exposed after it is applied. Binders of the present disclosure provide resistance to a broad variety of chemical and ultraviolet light exposure (e.g., fluoropolymers such as in the LUMIFLON family of coatings are resistant to UV and light exposure from sunlight).

Durable HP/OP coatings formed with binders can have a broad range of thicknesses. In some embodiments the coatings will have a thickness in a range selected from about 10 microns to about 225 microns; about 15 microns to about 200 microns; about 20 microns to about 150 microns; about 30 microns to about 175 microns; or about 50 microns to about 200 microns.

2.1 Lacquer Binders

Lacquer binders typically are polymeric materials that are suspended or dissolved in carrier solvents and which dry to a hard finish, at least in part, by evaporation of the carrier solvents used to apply them. The polymeric binders present in lacquers include, but are not limited to, nitrocellulose and acrylic lacquers; each of which are suitable for use in preparing durable hydrophobic coatings.

In an embodiment, hydrophilic lacquers may be employed as binders; particularly where the coating will be given an application of a silanizing agent after it has been applied to the substrate. In another embodiment, lacquers that are hydrophobic or superhydrophobic as applied in the absence of first or second particles described below may be employed to prepare the coatings described herein.

In addition to the polymeric materials and solvents present in lacquers, a variety of other materials that enhance the properties of lacquers may be present. Such materials can provide not only color but also increased adhesion between the lacquer and the substance upon which it is applied.
A variety of commercial lacquer preparation may be used to prepare the durable coatings described herein. Among the commercial acrylic lacquers that may be employed are "Self-Etching Primer" (Eastwood Co. Pottstown, PA); Dupont VariPrime 615S (Dupont Performance Coatings, Wilmington, DE) and Nason 491-17 Etch Primer (Dupont Performance Coatings Wilmington, DE)

Lacquers may be used on a variety of surfaces and are particularly useful in forming coatings on plastics, woods and metals, including, but not limited to, steel, stainless steel, and aluminum.

2.2 Polyurethane Binders

Polyurethanes are polymers consisting of a chain of organic units joined by urethane (carbamate) linkages. Polyurethane polymers are typically formed through polymerization of at least one type of monomer containing at least two isocyanate functional groups with at least one other monomer containing at least two hydroxyl (alcohol) groups. A catalyst may be employed to speed the polymerization reaction. Other components may be present in the polyurethane coating compositions including, but not limited to, surfactants and other additives that bring about the carbamate forming reaction(s) yielding a coating of the desired properties in a desired cure time.

In some embodiments, the polyurethane employed in the durable coatings may be formed from a polyisocyanate and a mixture of -OH (hydroxyl) and NH (amine) terminated monomers. In such systems the polyisocyanate can be a trimer or homopolymer of hexamethylene diisocyanate.

Some solvents compatible with such systems include n-butyl acetate, toluene, xylene, ethyl benzene, cyclohexanone, isopropyl acetate, and methyl isobutyl ketone and mixtures thereof.

A wide variety of polyurethanes may be used to prepare the durable HP/OP coatings described herein. In some embodiments, polyurethanes that are hydrophobic or superhydrophobic as applied in the absence of first or second particles described below may
be employed to prepare the coatings described herein. Among the commercial polyurethanes that may be employed are the POLANE® family of polyurethanes from Sherwin Williams (Cleveland, OH).

Polyurethanes may come as a single component ready to apply composition or as a two or three part (component) system, as is the case with POLANE products. For example POLANE B can be prepared by mixing POLANE® B (typically six parts), to catalyst (e.g., typically one part of V66V27 or V66V29 from Sherwin Williams), and a reducer (typically 25-33% of R7K84 from Sherwin Williams). The "pot life" of mixed POLANE® B prepared in that manner is typically 6-8 h.

Polyurethane coatings are compatible with, and show good adhesion to, a wide variety of surfaces. Using polyurethane binders durable HP/OP coatings may be formed on virtually any surface, including but not limited to, those of metals, glass, ceramics, concrete, wood, and plastics.

2.3 Fluoropolymer Binders

Fluoropolymers are polymers comprising one or more fluoroalkyl groups. In some embodiments, the fluoropolymers employed in the durable coatings may be formed from Fluoroethylene/vinyl ether copolymer (FEVE).

A wide variety of fluoropolymer coatings may be used to prepare the durable HP/OP coatings described herein. Fluoropolymers that are hydrophobic or superhydrophobic as applied in the absence of first or second particles, which are described further below, may be employed to prepare the coatings described herein. Among the commercial fluoropolymers that may be employed to prepare HP/OP coatings are LUMIFLON® family polymers (Asahi Glass Co., Toyko, Japan).

Fluoropolymers that may be employed as binders typically come as a two or three component system, as is the case with LUMIFLON® products. For example LUMIFLON® LF can be prepared by mixing 58 parts of LUMIFLON® LF-200, 6.5 parts of DESMODUR® N3300A, (Bayer Material Sciences,) 2.5 parts of catalyst (DABCO T12 (1/10,000 part), DABCO (1,4-diazabicyclo[2.2.2]octane, 1/10,000 part), 1 part xylene), with 33 parts xylene. Unless otherwise noted, references to LUMIFLON®, particularly in the Examples, refer to LUMIFLON® LF.

Fluoropolymer coatings such as LUMIFLON® can be applied to a variety of surfaces including wood, metal and concrete. Many fluoropolymers offer resistance to UV light and can therefore be used in exterior applications where the coatings are exposed to the potentially damaging effects of sunlight.
2.4 Powder Coatings

Powder coatings typically are thermoplastic or thermoset coatings that are applied on surfaces (often metal) to give a variety of desirable characteristics (e.g., colorful and slick appearance and functionalities such as corrosion protection, etc.). Powder coatings can be applied by a variety of means, including electrostatic spraying of thermoplastic or thermoset powders onto substrate surfaces. Once applied to the surface, the powder coats are subject to thermal treatment at nominal temperatures (about 400°F or 200°C), which melt the polymers, permitting their polymerization. The melting and solidification occur quickly, resulting in the formation of a very tenacious and durable continuous coating. Powder coat materials can be used as binders for the formation of superhydrophobic, hydrophobic, or oleophobic coatings.

In some embodiments the powder coating is mixed with first particles, at the time the coating is applied to the substrate. First particles may be present in a range that is about 5% to 40%, or 10% to 30%, 10% to 35%, 15% to 30%, or 20% to 40% by weight. In one embodiment, the first particles mixed with the powder coat are Extendospheres (P.A. Industries, Inc., Chatanooga, TN), which may be used at 10% to 30% by weight.

2.5 Binders and Durable Hydrophobic, Superhydrophobic and Oleophobic Compositions applied by Thermal Spray Processes

In addition to the preparation of durable HP/OP coatings using polymeric binders to form attachments between substrates and second particles (e.g., fumed silica nanoparticles) that are capable of forming linkages to moieties that impart one or more of hydrophobic, oleophobic or anti-icing properties (e.g., alkyl, fluoroalkyl, or perfluoroalkyl moieties), it is possible to prepare durable HP/OP coatings using thermal spray processes.

Thermal spray processes permit the formation of durable HP/OP coatings in which it is possible to immobilize materials capable of directly or indirectly forming linkages to chemical groups imparting HP/OP behavior to the surface (e.g., silica or alumina particles capable of binding alkyl, fluoroalkyl, or perfluoro alkyl moieties upon silanization). In an embodiment, particles impregnated into the surface with thermal spray coating can be particles of carbides, metal oxides, or oxides of metalloids (e.g., B, Si, Sb, Te and Ge) such as silicates (e.g., fumed silica). The particles may be directly impregnated into the surface by employing thermal spray processes.

In addition, thermal spray processes also permit the formation and immobilization of materials that can be modified to give the surface OH/OP properties (e.g., the formation of metal oxides bound to, or incorporated into, the surface of a coating applied by an oxidizing thermal spray process). By way of example, thermal spray processes include High-Velocity
OxyFuel (HVOF), thermal spray, and Twin-Arc spray (e.g., methods using a ROKIDE® ceramic spray systems). In each case, it is the thermal energy that either bonds particles of metals, alloys, oxide, carbides or nitrides, or a combination of them to metallic substrates. When metals and alloys are sprayed by thermal processes, because of the high temperatures involved and the presence of air or oxygen in the environment, the top layer of the deposited metals and alloys typically is oxidized. The oxidized materials (e.g., metals) may be used to attach moieties providing HP/OP properties (e.g., by reaction with silanizing agents such as compounds of formula (I), SIT8 174.0 and the like).

3.0 First Particles

While durable coatings employ binders as a means of immobilizing second particles (e.g., nanoparticles) bearing hydrophobic moieties to the surfaces, first particles may advantageously be added to the binder composition to, among other things, improve the durability of the hydrophobic coatings. A wide variety of first particles (also known as extenders or fillers) may be added to the binder to alter the properties and improve coating durability over coating compositions made in their absence. First particles that may be employed in the durable SP/OP coatings include, but are not limited to, particles comprising: wood (e.g., wood dust), glass, metals (e.g., iron, titanium, nickel, zinc, tin), alloys of metals, metal oxides, metalloid oxides (e.g., silica), plastics (e.g., thermoplastics), carbides, nitrides, borides, spinels, diamond, and fibers (e.g., glass fibers). Some commercially available first particles that may be employed in the formation of the durable HP/OP coatings described herein include those in the accompanying Table 1.
In addition to the chemical nature of the first particles, other variables may be considered in the selection of first particles. These variables include, but are not limited to, the effect the first particle is expected to have on coatings, their hardness, their compatibility
with the binder, the expected resistance of the first particle to the environment in which coating will be employed, and the environment the first particles must endure in the coating process, including resistance to temperature and solvent conditions. For example, where a first particle is applied in a thermoplastic binder that requires heating to cure the coating, the first particle must be capable of withstanding the temperatures required to cure the coating. In another example, where particles are applied to surfaces using a thermal spray process, the particles must be capable of withstanding the temperatures and environment presented in that process.

In an embodiment, first particles have an average size in a range selected from: greater than about 5 microns (µm) to about 250 µm; about 10 µm to about 100 µm; about 20 µm to about 200 µm; about 30 µm to about 100 µm; about 50 µm to about 200 µm; about 75 µm to about 200 µm; about 100 µm to about 225 µm; about 125 µm to about 225 µm; or about 100 µm to about 250 µm.

In another embodiment, first particles have an average size in a range selected from: about 30 µm to about 225 µm (microns); about 30 µm to about 50 µm; about 30 µm to about 100 µm; about 30 µm to about 200 µm; about 50 µm to about 100 µm; about 50 µm to about 200 µm; about 75 µm to about 150 µm; about 75 µm to about 200 µm; about 100 µm to about 225 µm; about 100 µm to about 225 µm or about 100 µm to about 250 µm.

First particles may be incorporated into binders at various ratios depending on the binder composition and the first particle's properties. In some embodiments, the first particles may have a content range selected from: about 1% to about 50%; from about 2% to about 40%; from about 4% to about 30%; from about 5% to about 25%; from about 5% to about 35%; from about 10% to about 25%; from about 10% to about 30%; from about 10% to about 40%; from about 10% to about 45%; from about 15% to about 25%; from about 15% to about 35%; from about 15% to about 45%; from about 20% to about 30%; from about 20% to about 35%; from about 20% to about 40%; from about 20% to about 45%; from about 20% to about 55%; from about 25% to about 40%; from about 25% to about 45%; from about 25% to about 55%; from about 30% to about 40%; from about 30% to about 45%; from about 30% to about 55%; from about 30% to about 60%; from about 35% to about 45%; from about 35% to about 50%; from about 35% to about 60%; or from about 40% to about 60% on a weight basis.

In some embodiments, where the first particles comprises or consist of glass spheres, the first particles may be present in a content range selected from: about 30% to about 40%;
from about 30% to about 45%; from about 35% to about 45%; or from about 35% to about 50% on a weight basis. In other embodiments where the first particles are a polyethylene or modified polyethylene, the particle may be present in a content range selected from: 35% to about 45%; from about 35% to about 50%; or from 35% to about 50% on a weight basis.

First particles may have a size range selected from: about 1 µm to about 225 µm (microns); 30 µm to about 225 µm (microns); about 25 µm to about 50 µm; about 30 µm to about 50 µm; about 10 µm to about 100 µm; about 200 µm; about 200 µm; about 30 µm to about 200 µm; about 50 µm to about 200 µm; about 50 µm to about 200 µm; about 50 µm to about 200 µm; about 75 µm to about 150 µm; about 75 µm to about 200 µm; or about 100 µm to about 225 µm.

In one embodiment first particles have an average size in a range selected from: about 1 µm to about 225 µm (microns); greater than about 5 µm to about 50 µm; about 10 µm to about 100 µm; about 10 µm to about 200 µm; about 200 µm; about 200 µm; about 30 µm to about 200 µm; about 50 µm to about 100 µm; about 50 µm to about 200 µm; about 50 µm to about 200 µm; about 75 µm to about 150 µm; about 75 µm to about 200 µm; about 100 µm to about 225 µm; or about 125 µm to about 225 µm. In another embodiment, the coatings may contain first particles in the above-mentioned ranges subject to either the proviso that the coatings do not contain only particles (e.g., first or second particles) with a size of 25 microns or less, or the proviso that the coatings do not contain particles with a size of 25 microns or less.

In another embodiment, first particles have an average size greater than 30 microns and less than 250 microns, and do not contain non-trivial amounts of particles (e.g., first and second particles) with a size of 30 microns or less. And in still another embodiment, the coatings do not contain only particles (e.g., first and second particles) with a size of 50 microns or less, or particles with an average size of 50 microns or less in non-trivial amounts.

The incorporation of first particles can lead to a surface that is textured due to the presence of the first particles. In such embodiments, the presence of the first particles results in a surface texture that has elevations on the level of the coating formed. The height of the elevations due to the presence of the first particles can be from 0 (where the first particle is just below the line of the binders surface) to a point where the first particles are almost completely above the level of the binder coating (although they may still be coated with binder). Thus, the presence of first particles can result in a textured surface wherein the first particles cause elevations in the binder that have maximum heights in a range selected from:
from about 10 to about 80 microns; from about 15 to about 80 microns; from about 20 to about 100 microns; from 30 to 70 microns; or from about 1 to 50 microns.

The surface texture of coatings may also be assessed using the arithmetical mean roughness (Ra) or the ten point mean roughness (Rz) as measure of the surface texture. In an embodiment, a coating described herein has an arithmetical mean roughness (Ra) in a range selected from: about 0.2 microns to about 20 microns; from about 0.3 microns to about 18 microns; from about 0.2 microns to about 8 microns; from about 8 microns to about 20 microns; or from about 0.5 microns to about 15 microns. In another embodiment, a coating as described herein has a ten point mean roughness (Rz) in a range selected from: about 1 micron to about 90 microns; from about 2 microns to about 80 microns; from about 3 microns to about 70 microns; from about 1 micron to about 40 microns; from about 40 microns to about 80 microns; from about 10 microns to about 65 microns; or from about 20 microns to about 60 microns.

First particles may optionally comprise moieties that make them hydrophobic or superhydrophobic and/or oleophobic. Where it is desirable to introduce such moieties the particles may be reacted with reagents that covalently bind moieties that make them hydrophobic, superhydrophobic, or oleophobic. In some embodiments, the reagents may be silanizing agents, such as those that introduce alkyl, haloalkyl, fluoroalkyl or perfluoroalkyl moieties (functionalities). In some embodiments the silanizing agents are compounds of formula (I) (i.e., \( R_{x_1} Si-X_{y_1} \)), and the various embodiments of compounds of formula (I) described below for the treatment of second particles. The surface of many types of first particles can be activated to react with silanizing agents by various treatments including exposure to acids, bases, plasma, and the like, where necessary to achieve functionalization of the particles.

In any embodiment described herein, first particles may be employed that do not contain functional groups that impart one or more of hydrophobic, superhydrophobic, and/or oleophobic properties to the particles (e.g., properties beyond the properties inherent to the composition forming the particles). In one such embodiment, first particles do not contain covalently bound alkyl, haloalkyl, fluoroalkyl or perfluoroalkyl functionalities (moieties). In another such embodiment the first particles are not treated with a silanizing agent (e.g., a compound of formula (I)).
4.0 Second Particles

A variety of second particles can be used to prepare the durable coatings displaying HP/OP properties. Suitable second particles have a size from about 1 nanometers (nm) to 25 microns and are capable of binding covalently to one or more chemical groups (moieties) that provide the second particles, and the coatings into which they are incorporated, one or more of hydrophobic, oleophobic and anti-icing properties.

In some embodiments the second particles may have an average size in a range selected from about 1 nm to about 100 nm; about 10 nm to about 200 nm; about 20 nm to about 400 nm; about 10 nm to 500 nm; about 40 nm to about 800 nm; about 100 nm to about 1 micron; about 200 nm to about 1.5 microns; about 500 nm to about 2 microns; about 500 nm to about 2.5 microns; about 1.0 micron to about 10 microns; about 2.0 microns to about 20 microns; about 2.5 microns to about 25 microns; about 500 nm to about 25 microns; about 400 nm to about 20 microns; or about 100 nm to about 15 microns.

In one embodiments, such as where the second particles are prepared by fuming (e.g., fumed silica or fumed zinc oxide), the second particles may have an average size in a range selected from about 1 nm to about 50 nm; about 1 nm to about 100 nm; about 1 nm to about 400 nm; about 1 nm to about 500 nm; about 2 nm to about 120 nm; about 5 nm to about 150 nm; about 5 nm to about 400 nm; about 10 nm to about 300 nm; or about 20 nm to 400 nm.

Second particles having a wide variety of compositions may be employed in the durable coatings described herein. In some embodiments the second particles will be particles of metal oxides (e.g., aluminum oxides, zinc oxides, nickel oxide, zirconium oxides, iron oxides, or titanium dioxide) such as alumina, or oxides of metalloids (e.g., oxides of B, Si, Sb, Te and Ge) such as silicates (e.g., fumed silica) or particles comprising one or more metal oxides, oxides of metalloids or combination thereof, such as second particles of glasses. The particles are treated to introduce one or more moiety (group) that imparts HP/OP properties to the particles either prior to incorporation into the compositions that will be used to apply coatings or after they are incorporated into the coatings. In one embodiment, second particles are treated with silanizing agents to incorporate groups that will give the particles HP/OP properties.

In one embodiment second particles are silica (silicates), alumina (e.g., Al₂O₃), a titanium oxide, or zinc oxide, that are optionally treated with a silanizing agent.

In another embodiment, the second particles are comprised of fumed silica; and in a further embodiment, the second particles are comprised of fumed silica and have an average
size in the range of 1 nm to 100 nm or 2 nm to 200 nm; wherein the silica is optionally treated with a silanizing agent.

In yet another embodiment second particles are comprised of one or more metals, metal oxides (e.g., zinc oxide, titanium dioxide, Al₂O₃), metalloids (e.g., B, Si, Sb, Te and Ge), oxides of a metalloid (e.g., SiO₂ and silicates), or glasses. In such an embodiment the one or more independently selected second particles have average sizes in ranges independently (separately) selected from about 1 nm to about 100 nm; about 10 nm to about 200 nm; about 20 nm to about 400 nm; about 10 nm to about 500 nm; about 40 nm to about 800 nm; about 100 nm to about 1 micron; about 200 nm to about 1.5 microns; about 500 nm to about 2 microns; about 500 nm to about 2.5 microns; about 1.0 micron to about 10 microns; about 2.0 microns to about 20 microns; about 2.5 microns to about 25 microns; about 500 nm to about 25 microns; about 400 nm to about 20 microns; or about 100 nm to about 15 microns. Second particles in such an embodiment may be employed in coatings prepared using thermal spray processes.

In any of the above-mentioned embodiments, the lower size of second particles may be limited to particles greater than 20 nm, 25nm, 30 nm, 35nm, 40nm, 45nm, 50nm, or 60nm. Similarly, in any of the above-mentioned embodiments, the upper size of second particles may be limited to particles less than 20, 10, 5, 1, 0.8, 0.6, 0.5, 0.4, 0.3 or 0.2 microns.

Limitation on the upper and lower size of second particles may be used alone or in combination with any of the above-recited size limits on particle composition, percent composition in the coatings, etc.

4.1 Hydrophobic and Oleophobic Components of Second particles

Second particles employed in the preparation of the durable coatings described herein comprise one or more independently selected chemical groups (moieties or functionalies) that impart HP/OP properties to provide the second particles, and the coatings into which they are incorporated. Second particles typically will be treated with agents that introduce such moieties before being incorporated into the durable coatings described herein, however, it is also possible to treat the coating after it is applied to a surface with agents that modify the second particles and introduce or more of hydrophobic, superhydrophobic or oleophobic properties. In such circumstances, other components of the coating (e.g., the binder or first particles) may also become modified by the agent.

In some embodiments, the second particles will be treated with an agent that introduces one or more hydrophobic, superhydrophobic or oleophobic properties.
In another embodiment the second particles will bear one or more alkyl, haloalkyl, fluoroalkyl, and perfluoroalkyl moieties. Such moieties can be covalently bound directly or indirectly bound to the second particle, such as through one or more intervening silicon or oxygen atoms.

In still another embodiment the second particles will bear one or more alkyl, fluoroalkyl, and perfluoroalkyl moieties of the formula R₄-n Si-, where n is from 1-3, that are directly or indirectly bound (e.g., covalently bound) to the second particle, such as through one or more intervening atoms.

4.1.1 The Use of Silanizing Agents

A variety of silanizing agents can be employed to introduce R₄-n Si-, moieties into second particles prior or subsequent to their introduction into the durable coatings described herein. Suitable silanizing agents have both leaving groups and terminal functionalities. Terminal functionalities are groups that are not displaced by reaction of a silanizing agent with silica second particles (e.g., R groups of compounds of the formula (I)). Leaving groups are those groups that are displaced from silanizing agents upon reaction to form bonds with the second particles.

Prior to reacting first or second particles with silanizing agents, the particles may be treated with an agent that will increase the number of sites available for reaction with the silanizing agent (e.g., SiCl₄, SiCl₄, Si(OEt)₄, Si(OMe)₄, Si(OEt)₄, SiCl₅CH₃, SiCl₅CH₂SiCl₃, SiCl₅CH₂CH₂SiCl₃, Si(OEt)₅CH₂Si(OEt)₃, or Si(OEt)₅CH₂CH₂Si(OEt)₃ and the like). Treatment with such agents is conducted with a 1% to 5% solution of the agent in a suitable solvent (e.g., hexane), although higher concentrations may be employed (e.g., 5% to 10%). Subsequent reaction with silanizing agents is typically conducted using a silanizing agent at in the range of 1% - 2% w/v, although concentrations in the range of 2% - 5% w/v may also be used. Depending on the reagents employed, the reaction, which can be conducted at room temperature, can are typically conducted for 1 hour to 6 hours, although reaction for as long as 24 hours may be desirable in some instances.

In one embodiment, silanizing agents are compounds of the formula (I):

\[ R_{4-n} Si-X_n (I) \]

where n is an integer from 1-3;

each R is independently selected from
(i) alkyl or cycloalkyl group optionally substituted with one or more fluorine atoms,
(ii) C<sub>1</sub> to <sub>2</sub> alkyl optionally substituted with one or more independently selected substituents selected from fluorine atoms and C<sub>6</sub> to <sub>14</sub> aryl groups, which aryl groups are optionally substituted with one or more independently selected halo, C<sub>1</sub> to <sub>10</sub> alkyl, C<sub>1</sub> to <sub>10</sub> haloalkyl, C<sub>1</sub> to <sub>10</sub> alkoxy, or C<sub>1</sub> to <sub>10</sub> haloalkoxy substituents,
(iii) C<sub>6</sub> to <sub>20</sub> alkyl ether optionally substituted with one or more substituents independently selected from fluorine and C<sub>6</sub> to <sub>14</sub> aryl groups, which aryl groups are optionally substituted with one or more independently selected halo, C<sub>1</sub> to <sub>10</sub> alkyl, C<sub>1</sub> to <sub>10</sub> haloalkyl, C<sub>1</sub> to <sub>10</sub> alkoxy, or C<sub>1</sub> to <sub>10</sub> haloalkoxy substituents,
(iv) C<sub>6</sub> to <sub>14</sub> aryl, optionally substituted with one or more substituents independently selected from halo or alkoxy, and haloalkoxy substituents;
(v) C<sub>4</sub> to <sub>10</sub> alkenyl or C<sub>4</sub> to <sub>20</sub> alkynyl, optionally substituted with one or more substituents independently selected from halo, alkoxy, or haloalkoxy; and
(vi) -Z-(CF<sub>2</sub><sup>q</sup>)(CF<sub>3</sub>)<sup>r</sup>, wherein Z is a C<sub>1</sub> to <sub>12</sub> divalent alkane radical or a C<sub>2</sub> to <sub>12</sub> divalent alkene or alkyne radical, q is an integer from 1 to 12, and r is an integer from 1 to 4;

each X is independently selected from -H, -Cl, -I, -Br, -OH, -OR, -NHR, or -N(R)<sub>3</sub>;<n
each R<sub>2</sub> is independently selected C<sub>1</sub> to <sub>10</sub> alkyl or haloalkyl group; and
each R<sub>3</sub> is independently an independently selected H, C<sub>1</sub> to <sub>10</sub> alkyl or haloalkyl group.

In one embodiment, R is an alkyl or fluoroalkyl group having from 6 to 20 carbon atoms.
In another embodiment, R is an alkyl or fluoroalkyl group having from 8 to 20 carbon atoms.
In another embodiment, R is an alkyl or fluoroalkyl group having from 10 to 20 carbon atoms.
In another embodiment, R is an alkyl or fluoroalkyl group having from 6 to 20 carbon atoms and n is 3
In another embodiment, R is an alkyl or fluoroalkyl group having from 8 to 20 carbon atoms and n is 3
In another embodiment, R is an alkyl or fluoroalkyl group having from 10 to 20 carbon atoms and n is 3.
In another embodiment, R has the form \(-\text{Z-}((\text{CF}_2)_q(\text{CF}_3)_r\), wherein Z is a C$_{1-12}$
divalent alkane radical or a C$_{2-12}$ divalent alkene or alkyne radical, q is an integer from 1 to
12, and r is an integer from 1-4.

In any of the previously mentioned embodiments of compounds of formula (I) the
value of n may be varied such that 1, 2 or 3 independently selected terminal functionalities
are present in compounds of formula (I). In one embodiment, n is 3. In another embodiment, n is 2, and in still another embodiment n is 1.

In any of the previously mentioned embodiments of compounds of formula (I), all halogen atoms present in any one or more R groups may be fluorine atoms in some
embodiments.

In any of the previously mentioned embodiments of compounds of formula (I), X may
be independently selected from H, Cl, -OR$^2$, -NHR$^3$, -N(R$^3$)$_2$, or combinations thereof in
some embodiments. In another, embodiment, X may be selected from Cl, -OR$^2$, -NHR$^3$, -N(R$^3$)$_2$, or combinations thereof. In still another embodiment, X may be selected from, Cl, -NHR$^3$, -N(R$^3$)$_2$, or combinations thereof.

Any durable coating described herein may be prepared with one, two, three, four or
more compounds of formula (I) employed alone or in combination to modify the first or
second particle, and or other components of the coating (e.g., first particles and binder).

The use of silanizing agents of formula (I) to modify first or second particles or any of
the other components of the coatings or coating compositions will introduce one or more R$_3$$_n$X$_n$Si-, groups (e.g., R$_3$Si-, R$_2$XiSi-, or RX$_2$Si- groups) where R and X are as defined for a
compound of formula (I), n is 0, 1, or 2 (due to the displacement of at least one "X"
substituent and formation of a bond between the particle and the Si atom), and the bond with
the particle is the silicon atom is indicated by a dash "-" (e.g., R$_3$Si-, R$_2$X$_1$Si-, or RX$_2$Si-
groups).

In another embodiment, specific reagents that can be employed to prepare first or
second particles with hydrophobic, superhydrophobic, or oleophobic properties include
silanizing agents (e.g., compounds that are commercially available from Gelest, Inc.,
Morrisville, PA). Such silanizing agents include, but are not limited to, the following
compounds, which are identified by their chemical name followed by the commercial
supplier reference number (e.g., their Gelest reference in parentheses): (tridecafluoro-1, 1,2,2-
tetrahydrooctyl)trimethoxysilane (SIT8 173.0); (tridecafluoro-1,1,2,2-tetrahydroctyl) trichlorosilane (SIT8 174.0); (tridecafluoro-1,1,2,2-tetrahydroctyl)triethoxysilane (SIT8 175.0);
(tridecafluoro-1,1,2,2-tetrahydroctyl)trimethoxysilane (SIT8 176.0); (heptadecafluoro-
1,1,2,2-tetrahydrodecyl)dimethyl(dimethylamino)silane (S1H5840.5); (heptadecafluoro-1,1,2,2-tetrahydrodecyl)tris(dimethylamino)silane (S1H5841.7); n-octadecyltrimethoxysilane (SIO6645.0); n-octyltrimethoxysilane (SIO6715.0); and nonafluorohexyl(dimethylamino)silane (SIN6597.4).

The two attributes of silanizing agents important for the purposes of forming suitable first or second particles are the leaving group (e.g., X groups of compounds of the formula (I)) and the terminal functionality (e.g., R groups of compounds of the formula (I)). Silanizing agent leaving groups determine the reactivity of the agent with the first or second particle. Where, the first or second particles are a silicate (e.g., fumed silica) the leaving group can be displaced to form Si-O-Si bonds. The terminal functionality determines the level of hydrophobicity that results from application of the silane to the surface. Leaving group effectiveness is ranked in the decreasing order as chloro > methoxy > hydro (H) > ethoxy (measured as trichloro > trimethoxy > trihydro > triethoxy). This ranking of the leaving groups is consistent with their bond dissociation energy.

In addition to the silanizing agents recited above, a variety of other silanizing agents can be used to alter the properties of first or second particles and to provide hydrophobic, superhydrophobic or oleophobic properties. In some embodiments second particles may be treated with an agent selected from dimethylidichlorosilane, hexamethyldisilazane, octyltrimethoxysilane, polydimethylsiloxane, or tridecafluoro-1,1,2,2-tetrahydrooctyl trichlorosilane. In further embodiments, the first or second particles are silica second particles. Silica second particles treated with such agents may have an average size in a range selected from: about 1 nm to about 50 nm; about 1 nm to about 100 nm; about 1 nm to about 400 nm; about 1 nm to about 500 nm; about 2 nm to about 120 nm; about 5 nm to about 150 nm; about 5 nm to about 400 nm; about 10 nm to about 300 nm; about 20 nm to 400 nm; or about 50 nm to 250 nm.

In addition to the silanizing agents recited above, which can be used to modify any one or more components of coatings (e.g., first and/or second particles) other silanizing agents can be employed including, but not limited to, one or more of: gamma-aminopropyltriethoxysilane, Dynasylan® A (tetraethylorthosilicate), hexamethyldisilazane, and Dynasylan® F 8263 (fluoroalkysilane), any one or more of which may be used alone or in combination with any other silanizing agent recited herein.

A variety of agents can be employed to introduce hydrophobic or oleophobic behavior into the coatings described herein. However, the use of agents to introduce alkyl functionalities (e.g., silanizing agents) does not generally prove as effective as their
fluorinated or perfluorinated counterparts. The introduction of fluorinated or perfluorinated functionalities typically produce surfaces with the highest hydrophobicity.

4.1.3 Use of Compounds Other Than Silanizing Agents

Other agents can be used to introduce hydrophobic, superhydrophobic or oleophobic moieties into second particles. The choice of such agents will depend on the functionalities available for forming chemical (covalent) linkages between hydrophobic/oleophobic component and the functional groups present on the second particles surface. For example, where second particle surfaces have, or can be modified to have, hydroxyl or amino groups, then acid anhydrides and acid chlorides of alkyl, fluoroalkyl, and perfluoroalkyl compounds may be employed (e.g., the acid chlorides: Cl-C(O)(CH₂)₄-i₈CH₃; Cl-C(0)(CH₂)₄-io(CF₂)₂-i₄CF₃; Cl-C(O)(CF₂)₄-i₈CF₃ or the anhydrides of those acids).

4.1.4 Preparation of Surfaces with Oleophobic Properties.

In addition to the hydrophobicity displayed against aqueous based solutions, suspension, and emulsions, and the anti-icing properties of the coatings described herein, the coatings described herein also have the ability to display oleophobic behavior. This is true particularly where the coatings comprise fluorinated or perfluorinated alkyl groups (e.g., where the terminal functionality, that is the R group(s) of a silane of the formula R₄-nSi-Xₙ are fluorinated alkyl or perfluoroalkyl. Coatings comprising fluorinated or perfluorinated alkyl groups (e.g., as functionalities on second particles) can also be used to form spill-resistant borders that display the ability to retain oils, lipids and the like.

4.1.5 Sources of Second Particles

Second particles such as fumed silica may be purchased from a variety of suppliers, including but not limited to: Cabot Corp., Billerica, MA (e.g., Nanogel TLD201, CAB-O-SIL® TS-720, and M5 (untreated silica)); Evonik Industries, Essen, Germany (e.g., ACEMATT® silica such as untreated HK400, AEROXIDE® TiO₂ titanium dioxide, AEROXIDE® Alu alumina).

Some commercially available second particles are set forth in Scheme II.
As purchased the second particles may be untreated (e.g., M5 silica) and may not possess any HP/OP properties. Such untreated particles can be treated to covalently attach one or more groups or moieties to the particles that give them HP/OP properties with, for example, silanizing agents discussed above.

5.0 Substrates

Durable hydrophobic/superhydrophobic coatings can be applied to any surface to which a binder can adhere. The surfaces may be flexible or rigid. In some embodiments the surface can be made from a material selected from glass, metal, metalloid, ceramic, wood, plastic, resin, rubber, stone, concrete or a combination thereof. In another embodiment the surface may be made from a material selected from the group consisting of glass, ceramic and a combination thereof. In other embodiments, the surfaces may be comprised of metalloids (e.g., B, Si, Sb, Te and Ge).

Any glass can be employed as a substrate for durable hydrophobic or superhydrophobic coatings including, without limitation: soda lime glass, borosilicate glass, sodium borosilicate glass, aluminosilicate glass, aluminoborosilicate glass, optical glasses, lead crystal glass, fused silica glass, germania glasses, and germanium selenide glasses, and combinations thereof.

²Data from Cabot Corp. website.
Any metal can be employed as a substrate for durable hydrophobic or superhydrophobic coatings including, without limitation: iron, nickel, chrome, copper, tin, zinc, lead, magnesium, manganese, aluminum, titanium, silver, gold, and platinum or combinations thereof, or alloys comprising those metals. In one embodiment, the metal forming the surface comprises steel or stainless steel. In another embodiment, the metal used for the surface is chromium, is plated with chromium, or comprises chromium or a chromium coating.

Any ceramic can be employed as a substrate for durable hydrophobic or superhydrophobic coatings including, without limitation: earthenware (typically quartz and feldspar), porcelain (e.g., made from kaolin), bone china, alumina, zirconia, and terracotta. For the purpose of this disclosure, a glazing on a ceramic may be considered either as a ceramic or a glass.

Any wood can be employed as a substrate for durable hydrophobic or superhydrophobic coatings including, without limitation, hard and soft woods. In some embodiments, woods may be selected from alder, poplar, oak, maple, cherry apple, walnut, holly, boxwood, mahogany, ebony teak, luan, and elm. In other embodiments, woods may be selected from ash, birch, pine, spruce, fir, cedar, and yew.

Any plastic or resin can be employed as a substrate for durable hydrophobic or superhydrophobic coatings including, without limitation polyolefins (such as a polypropylene and polyethylene), a polyvinylchloride plastics, a polyamides, a polyimides, a polyamideimides, a polyesters, aromatic polyesters, polycarbonates, polystyrenes, polysulfides, polysulfones, polyethersulfones, polyphenylenesulfides, a phenolic resins, polyurethanes, epoxy resins, a silicon resins, acrylonitrile butadiene styrene resin/plastic , methacrylic resins/plastics, acrylate resins , polyacetals, polyphenylene oxides, polymethylenpentenes, melamines, alkyd resins, polyesters or unsaturated polyesters, polybutylene terephthalates, combinations thereof, and the like.

Any rubber can be employed as a substrate for durable hydrophobic or superhydrophobic coatings including, without limitation: styrene-butadiene rubber, butyl rubber, nitrile rubber, chloroprene rubber, polyurethane rubber, silicon rubber, and the like.

Any type of stone, concrete, or combination thereof can be employed as a substrate for durable hydrophobic or superhydrophobic coatings including, without limitation, igneous, sedimentary and metamorphic stone (rock). In one embodiment, the stone is selected from granite, marble, limestone, hydroxylapatite, quartz, quartzite, obsidian and combinations thereof. Stone may also be used in the form of a conglomerate with other components such
as concrete and/or epoxy to form an aggregate that may be used as a surface upon which a
durable hydrophobic coating may be applied.

6.0 Application of Coatings to Substrates

The coatings described herein can be applied to surfaces using any means known in
the art, including but not limited to, brushing, painting, printing, stamping, rolling, dipping,
spin-coating, spraying, or electrostatic spraying. Generally, the surfaces will be rigid or
semi-rigid, but the surfaces can also be flexible, for example in the instance of wire and tapes
or ribbons.

The coatings described herein can be applied to virtually any substrate to provide
HP/OP properties. The choice of coatings and coating process that will be used may be
affected by the compatibility of the substrate and its surface to the coating process and the
component of the coating compositions. Among the considerations are the compatibility of
the substrate and its surface with any solvents that may be employed in the application of the
coatings and the ability of a desired coating to adhere to the substrate's surface. In addition,
where the coating process will expose the substrate, and especially its surface, to heating
(e.g., where binders are thermoplastics, thermoset plastics, or where thermal spraying is
employed) the ability to withstand the effects of temperature are considerations that must be
taken into account.

Coatings may take any desired shape or form, limited only by the manner and patterns
in which they can be applied. In some embodiments, the coating will completely cover a
surface. In other embodiments the coatings will cover only a portion of a surface, such as
one or more of a top, side or bottom of an object. In one embodiment, a coating is applied as
a line or strip on a substantially flat or planar surface. In such an embodiment the line or strip
may form a spill-resistant border (see e.g., Example 18).

The shape, dimensions and placement of coatings on surfaces can be controlled by a
variety of means including the use of masks which can control not only the portions of a
surface that will receive a coating, but also the portions of a surface that may receive prior
treatments such as the application of a primer layer or cleaning by abrasion or solvents. For
example, where sand blasting or a chemical treatment is used to prepare a portion of a surface
for coating, a mask resistant to those treatments would be selected (e.g., a mask such as a
rigid or flexible plastic, resin, or rubber/rubberized material). Masking may be attached to
the surface through the use of adhesives, which may be applied to the mask agent, the
surface, or both.
In another embodiment a coatings applied to a ribbon, tape or sheet that may then be applied to a substrate by any suitable means including adhesive applied to the substrate, the ribbon or tape, or both.Ribbons, tapes and sheets bearing a superhydrophobic coating may be employed in a variety of application, including forming spill proof barriers on surfaces (see e.g., Example 18). Ribbons, tapes, and sheets of coated material may be made from any flexible substrate. Ribbons, tapes, and sheets are generally formed of a substantially flat (planar) flexible material where one side (the top) is made hydrophobic or superhydrophobic. This includes metal tapes such as aluminum tape or other tapes (e.g., metal adhesive tape, plastic adhesive tape, paper adhesive tape, fiber glass adhesive tapes), wherein one side is coated with an HP/OP coating and adhesive on the other side. Such ribbons, tapes, and sheets can be applied to any type of surface including metal, ceramic, glass, plastic, or wood surfaces, for a variety of purposes.

To improve the adherence of coatings to a surface, the surface may be treated or primed such as by abrasion, cleaning with solvents or the application of one or more undercoatings of primers. In some embodiments where metals can be applied to surfaces (e.g., by electroplating, vapor deposition, or dipping) and it is deemed advantageous, surfaces maybe coated with metals prior to the application of a coating described herein.

6.1 One-Step Coating Applications
In some embodiments, the coatings may be applied using methods wherein binder, first particles, and second particles are mixed prior to the application of the coating composition to the surface. For the purpose of this disclosure, such methods are termed one-step methods or processes.

In one embodiment, a one-step process of applying a coating to a substrate may comprise:

applying to the substrate a coating composition comprising (i) a binder; (ii) first particles having a size of about 30 microns to about 225 microns; and (iii) second particles having a size of about 1 nanometer to 25 microns and optionally comprising one or more independently selected alkyl, haloalkyl, fluoroalkyl, or perfluoroalkyl groups covalently bound, either directly or indirectly, to said second particles; wherein said composition optionally contains 5% to 10% of a block copolymer on a weight basis.

In one-step methods the binders, first particles, second particles and silanizing agents described above may be employed. First particles may be less than 30 microns, and may be particles with an average size in the range of about 1 µm to about 225 µm as described above.
In one embodiment, coatings are prepared in a one step process with fumed silica second particles (TS-720), where the second particles are present in the range of 10-15% on a weight basis in the coating. In another embodiment, coatings are prepared in a one step process with fumed silica second particles treated with SIT8174), where the second particles are present in the range of 10-15% on a weight basis in the coating. In such embodiments, prior to treatment with silanizing agents such as SIT8174, the silica may be treated with SiCl₄, SiCl₄, Si(OMe)₄, Si(OEt)₄, SiCl₃CH₃, SiCl₃CH₂SiCl₃, SiCl₃CH₂CH₂SiCl₃, Si(OMe)₃CH₂Si(OMe)₃, Si(OMe)₃CH₂CH₂Si(OMe)₃, Si(OEt)₃CH₂Si(OEt)₃, or Si(OEt)₃CH₂CH₂Si(OEt)₃ to increase the modification by the silanizing agent,

Although coatings applied by one-step processes do not necessarily require subsequent treatments in order to create coatings with the HP/OP properties described herein, they may be subject to subsequent treatments. Such treatments may enhance, for example, one or more of the hydrophobicity, superhydrophobicity, oleophobicity or anti-icing properties, and may be made either before or after curing (e.g., by heating) the coatings applied using a one-step process.

In one embodiment, a one-step process may further comprise applying a composition comprising a silanizing agent (e.g. a compound of formula (I)). In another embodiment, a one-step process may further comprise applying a composition comprising a silicon containing reagent that can increase the number of site that can react with silanizing agents, followed by a composition containing a silanizing agent. Reagents that will increase the number of sites on silica particles and other components of coatings that can react with silanizing agents include, but are not limited to: SiCl₄, SiCl₄, Si(OMe)₄, Si(OEt)₄, SiCl₃CH₃, SiCl₃CH₂SiCl₃, SiCl₃CH₂CH₂SiCl₃, Si(OMe)₃CH₂Si(OMe)₃, Si(OMe)₃CH₂CH₂Si(OMe)₃, Si(OEt)₃CH₂Si(OEt)₃, or Si(OEt)₃CH₂CH₂Si(OEt)₃. Where those reagents contain chlorine, they may react with water or moisture to convert residual Cl, bound to Si atoms that is not displaced in the reaction with the coating components, into SiOH groups, which in addition to other groups, may also subsequently react with a silanizing agent.

In another embodiment, a one-step process may further comprise applying a composition comprising one or more second particles over the coating formed in the one step process. In such embodiments, the second particles can be applied to the coating formed in the one step process in a suitable binder compatible solvent (e.g., hexane in many instances). The second particles (e.g., TS-720 or TLD-720, or TLD201) may be suspended in a suitable
solvent in a concentration range (e.g., 2% to 10%; 4% to 12%; 5% -15%, or 5% to 20% w/v) for application to the coating.

In an embodiment where the coating applied to a substrate in a one-step process did not contain second particles treated so that they are hydrophobic, superhydrophobic, or oleophobic (i.e., have HP/OP properties), the one step process can further comprise applying a composition comprising either: a silanizing agent; or a composition comprising a silicon containing reagent that will increase the number of sites that can react with silanizing agents, followed by a composition containing a silanizing agent.

In another embodiment, where the coating applied in a one-step process does not contain second particles treated so that they are hydrophobic, superhydrophobic, oleophobic, the one step process can further comprise applying one or more second particles treated so that they are hydrophobic, superhydrophobic, or oleophobic. In such an embodiment, the second particles may comprise one or more independently selected alkyl, haloalkyl, or perfluoroalkyl groups.

6.1.1 Block Copolymers

A wide variety of block copolymers may be employed in the one and two step coating systems described herein. Where they are employed, they are typically present in a range selected from: of 1% to 15%, 1% to 3%, 1% to 5%, 6%-10%-5, or 11% to 15% by weight. The block copolymers may be one or more of hydrophobic block copolymers, diblock copolymers, triblock copolymers, tetrablock copolymers and combinations thereof.

Block copolymers may be prepared or purchased from a variety of sources. For example Kraton® D series block copolymers are available from Shell Chemical Company (Houston, Tex.), Europrene® Sol T block copolymers are available from EniChem (Houston, Tex.), Vector® block copolymers are available from Exxon (Dexco) (Houston, Tex.), and Solprene® block copolymers from Housmex® (Houston, Tex.).

6.2 Two Step Coating Processes

In some embodiments, the coatings may be applied using methods where, in a first step, a binder and first particles are mixed to form a coating composition, which does not contain the second particles, prior to the application of the coating composition to the surface. Following the application of that coating composition, a second step is conducted wherein a composition comprising second particles is applied to the surface over the coating composition. For the purpose of this disclosure, such methods are termed two-step method or processes.
The second step may be conducted either before or after curing the coating composition applied in the first step. In one embodiment, the composition comprising second particles is applied after any solvents in the coating composition have evaporated, but before the composition has been cured. In another embodiment, the composition comprising second particles is applied after the coating composition has been cured.

In one embodiment, a two-step process of applying a coating to a substrate may comprise the steps:

a) applying to said substrate a coating composition comprising (i) a binder and (ii) first particles having a size of about 30 microns to about 225 microns, to provide a substrate coating; and

b) applying to said substrate coating a composition comprising second particles having a size of about 1 nanometer to 25 microns that optionally comprise one or more independently selected alkyl, haloalkyl or perfluoroalkyl groups covalently bound, either directly or indirectly, to said second particles.

In two-step methods the binders, first particles, second particles and silanizing agents described above may be employed. First particles may be less than 30 microns, and may be particles with an average size in the range of about 1 µm to about 225 µm as described above.

Although coatings applied by two-step processes do not necessarily need to undergo subsequent treatments in order to create coatings with the HP/OP properties described herein, they may be subject to subsequent treatments. Such treatments may enhance, for example, one or more of the hydrophobicity, superhydrophobicity, oleophobicity or anti-icing properties, and may be made either before or after curing (e.g., by heating) the coatings applied using a two-step process.

In one embodiment, a two-step process may further comprise applying: a composition comprising either: a silanizing agent (e.g. a compound of formula (I)). In another embodiment, a two-step process may further comprise applying a composition comprising a silicon-containing reagent that will increase the sites that can react with silanizing agents, followed by a composition containing a silanizing agent. Reagents that will increase the number of sites on silica particles and other components of coatings that can react with silanizing agents include, but are not limited to: SiCl₄, SiCl₄, Si(OMe)₄, Si(Oct)₄, SiCl₂CH₃, SiCl₂CH₂SiCl₃, SiCl₂CH₂CH₂SiCl₃, Si(OMe)₂CH₂Si(OMe)₃, Si(OMe)₂CH₂CH₂Si(OMe)₃, Si(Oct)₃CH₂Si(Oct)₃, or Si(Oct)₂CH₂CH₂Si(Oct)₃.

Where the coating applied in a two-step process does not contain second particles treated so that they are hydrophobic, superhydrophobic, or oleophobic (i.e., have HP/OP
properties), the two-step process can further comprise applying a composition comprising either a silanizing agent or a composition comprising silicon containing reagent that will increase the number of sites that can react with silanizing agents followed by a composition containing a silanizing agent.

6.3 Thermal Deposition Processes.

Thermal spray processes including Plasma Spraying, Warm Spraying Wire Arc Spraying, High Velocity Oxyfuel (HOVF), Rockide® process, and Twin-Arc spraying may be employed to prepare coatings that have one or more of hydrophobic, superhydrophobic, oleophobic, or anti-icing characteristics. Thermal spray coating processes as used herein are a form of a two-step coating process in which a base coat material is applied to the substrate, alone or in combination with a second particle.

In one embodiment, a thermal deposition process for applying a coating to a substrate may comprise the steps:

a) applying to said substrate by a thermal spray process a base coating spray composition optionally comprising first particles having a size of about 1 micron to about 100 microns, to provide a base coating; and

b) applying to said base coating one or more of: (i) a composition comprising one or more second particles having a size of about 1 nanometer to 25 microns that optionally comprise one or more independently selected alkyl, haloalkyl or perfluoroalkyl groups covalently bound, either directly or indirectly, to said second particles; (ii) a composition comprising one or more silanizing agents, or (iii) a composition comprising a silicon-containing reagent that increases the number of sites on silica particles or other components of thermal spray coatings that can react with silanizing agents, followed by a composition comprising a silanizing agent.

Due to the high temperature, oxidizing conditions, and the composition of the base coating spray composition, the base coating will contain a variety of functionalities that may be modified to impart HP/OP characteristics to the coating. The base coat can be treated as in step (b) to produce surfaces with water contact angles measured at room temperature of about 120° to about 170°. In some embodiment the contact angle of the surface with water will be in a range selected from about 120° to about 140°, about 130° to about 150°, about 140° to about 160°, or about 150° to about 170°.

In one embodiment the thermal spray process is selected from High Velocity OxyFuel (HOVF) and Twin-Arc spray. The size of the first particles that may be applied in a
base coating spray composition varies depending on the thermal spray process employed. For HVOF, first particles have a size in a range selected from: about 1 to about 75 microns, or about 5 to about 50 microns, or about 25 microns to 70 microns, or about 10 to about 40 microns. For plasma spray processes the particles are typically in the range of about 15 microns to about 45 microns, and for combustion processes, the range is from about 45 microns to about 100 microns. Thermal spraying using the Rockide® process, where particles to be sprayed are prepared in the form of ceramic rods and thermal spraying employing Twin-Arc Processes, which spray metallic materials feed in the form of a wire are less sensitive to the starting particle sizes.

In one embodiment the base coating spray composition comprises one or more metals, metal alloys, metal oxides, metalloids, metalloid oxides, carbides (e.g., SiC) or nitrides (e.g., Si₃N₄). In another embodiment, the base coating spray composition comprises one or more metals in combination with one or more metal oxides, metalloid oxides or carbides. In an embodiment, the base coating spray composition comprises one or more of: zirconia, Al₂O₃, Ni-Cr (e.g., 80%-20%), stainless steel (e.g., a 316 stainless), tungsten carbide/cobalt, chromium carbide/nickel and nickel/aluminum.

In an embodiment, one or more independently selected carbides, silicates, metal oxides or metalloid oxides can be bonded to, or impregnated into, the surface of a substrate using thermal spray processes as a base coat. In another embodiment, one or more independently selected compositions comprising: a silicate (e.g., silica); zirconia (ZrO₂), alumina (Al₂O₃), 80%-20% Ni-Cr, 316 Stainless Steel, tungsten carbide/cobalt, chromium oxide, chromium carbide/nickel, and nickel aluminide (IC-50) and the like can be bonded to, or impregnated into, the surface of a substrate to form a base coat using thermal spray deposition. In another embodiment the base coating comprises one or more metals, metal alloys, metal oxides, metalloids, metalloid oxides, carbides or nitrides, in combination with one or more metal oxides, metalloid oxides, or one or more alloys formed by thermal spray deposition. Such base coat compositions may optionally comprise one or more second particles.

Where base coating spray compositions comprise one or more independently selected second particles, the particles need to be compatible with the thermal spray process conditions (e.g., the high temperature). In an embodiment, the second particles are comprised of one or more materials independently selected from metals, metal oxides, metalloids, oxides of a metalloid, silicates, or a glass (e.g., silica or alumina).

In an embodiment, the second particles have an average size in a range selected from: about 100 nm to about 50 microns; about 500 nm to about 50 microns; about 500 nm to about 25 microns; about 1 micron to about 50 microns; about 1 micron to about 25 microns; about 5 microns to about 25 microns; about 5 microns to about 50 microns; about 10 microns to about 25 microns; about 10 microns to about 35 microns, or about 10 microns to about 50 microns.

In a further embodiment the second particles are particles of silica or alumina.

Once bonded to the substrate, groups present on the surface (including groups on the surface of first or second particles) that are capable of binding functionalities imparting OH/OP properties (e.g., metal or metalloid oxides on the substrate's surface) can subsequently be modified by the application of reagents (e.g., silanizing agents) that alter the surface properties. In an embodiment, metal or metalloid oxides bound via the thermally bonded materials are modified with silanizing reagents bearing one or more alkyl, haloalkyl, fluoroalkyl, or perfluoroalkyl functionalities to the surface of the coating. Additionally, coatings applied by thermal spray processes may also be modified to increase their HP/OP properties by treatment with second particles bearing one or more functionalities that provide HP/OP properties (e.g., silica particles treated with a silanizing agent such as SIT81 74 or polydimethylsiloxane treated fumed silica such as TS-720). It is also possible to use a combination of a silanizing agent and a second particle (e.g., fumed silica second particles untreated or treated with a silanizing agent) to treat the coatings applied by thermal spray processes.
In one embodiment, the silanizing agents are compounds of formula (I) and embodiments thereof describe above.

In another embodiment, the silanizing reagent is selected from tridecafluoro-1,1,2,2-tetrahydrooctyl)trichlorosilane (SIT8173.0); (tridecafluoro-1,1,2,2-tetrahydrooctyl)trimethoxysilane (SIT8176.0); (tridecafluoro-1,1,2,2-tetrahydrodecyl)dimethyl(dimethylamino)silane (S1H5840.5); (heptadecafluoro-1,1,2,2-tetrahydrodecyl)tris(dimethylamino)silane (S1H5841.7); n-octadecyltrimethoxysilane (SIO6645.0); n-octyltriethoxysilane (SIO6715.0); and nonafluorohexyldimethyl(dimethylamino)silane (SIN6597.4).

In another embodiment, the silanizing reagent may be selected from dimethyldichlorosilane, hexamethyldisilazane, octyltrimethoxysilane, polydimethylsiloxane, or tridecafluoro-1,1,2,2-tetrahydrooctyl)trichlorosilane.

In another embodiment the silanizing agent comprises (tridecafluoro-1,1,2,2-tetrahydrooctyl)trichlorosilane (SIT8174.0).

In another embodiment, the second particles applied to thermal spray coated surfaces are treated with one or more agents that provide HP/OP properties. In an embodiment, the agents are selected from compositions comprising one or more silanizing agents of formula 1. In other embodiments, the agents are compositions comprising one or more of tridecafluoro-1,1,2,2-tetrahydrooctyl)trichlorosilane (SIT8173.0); (tridecafluoro-1,1,2,2-tetrahydrooctyl)trimethoxysilane (SIT8175.0); (tridecafluoro-1,1,2,2-tetrahydrooctyl)triethoxysilane (SIT8176.0); (heptadecafluoro-1,1,2,2-tetrahydrodecyl)dimethyl(dimethylamino)silane (SIH5840.5); (heptadecafluoro-1,1,2,2-tetrahydrodecyl)tris(dimethylamino)silane (S1H5841.7); n-octadecyltrimethoxysilane (SIO6645.0); n-octyltriethoxysilane (SIO6715.0); and nonafluorohexyldimethyl(dimethylamino)silane (SIN6597.4). In an embodiment, the second particles applied in step (b) are treated with hexamethyldisilazane, octyltrimethoxysilane, polydimethylsiloxane, or tridecafluoro-1,1,2,2-tetrahydrooctyl)trichlorosilane. In another embodiment, the second particles applied in step (b) are comprised of silica and treated with one or more of hexamethyldisilazane, octyltrimethoxysilane, polydimethylsiloxane, or tridecafluoro-1,1,2,2-tetrahydrooctyl)trichlorosilane. In some embodiments the silane is tridecafluoro-1,1,2,2-tetrahydrooctyl)trichlorosilane which may also be used to treat second particles, such as silica particles, and any metal oxides formed in the thermal spray process.
Prior to the application of silanizing agents it is possible to modify the coatings applied by thermal spray processes using a composition comprising a silicon containing reagent that increases the number of sites on silica particles or other components of thermal spray coatings that can react with silanizing agents. In one embodiment silicon containing reagents that increases the number of sites on silica particles comprise one or more of: SiCl\(_4\), SiCl\(_4\), Si(OEt)\(_4\), Si(OEt)\(_4\), SiCl\(_2\)CH\(_3\), SiCl\(_2\)CH\(_2\)SiCl\(_3\), SiCl\(_3\)CH\(_2\)CH\(_2\)SiCl\(_3\), Si(OEt)\(_3\)Si(OEt)\(_3\), Si(OEt)\(_3\)Si(OEt)\(_3\), Si(OEt)\(_3\)Si(OEt)\(_3\), Si(OEt)\(_3\)Si(OEt)\(_3\). The number of sites on silica particles or other components of thermal spray coatings that can react with silanizing agents can also be increased by other treatments including, but not limited to: etching the surfaces with acids such as HF, HCl, H\(_2\)SO\(_4\) and by electropolishing.

Following application of either or both of a silanizing agent or second particles, the coatings are cured. Curing may be accomplished at room temperature (about 18 to about 22°C) for 24 hours; however, it may be desirable to use elevated temperatures and/or to adjust the curing time depending on the silane or second particles employed.

Thermal deposition process for applying a coating may be applied to a variety of substrates. Such substrates include, but are not limited to, metals, metalloids, ceramics, and glasses. In some embodiments the surfaces will be in the form of metal plates, metal sheets or metal ribbons.

Depending on the coating composition employed and the application process, deposits formed will have different thicknesses and widths. The material deposited by thermal spray deposition, which consist of flattened splatters or lamellae, are formed by flattening of the liquid droplets andean have a wide range of dimensions. Individual lamellae often have thickness in the range from a 1 or 2 microns to 40, 60, 80 or even 100 microns. The same lamellae may have widths that range from a 10 microns to 1,000 microns or more.

7.0 Performances

The performance of coatings described herein may be measured by any of a variety of means, which are relevant to a coating's ability to perform under a variety of circumstances.

The coatings described herein provide high levels of hydrophobicity, easily reaching into the range of superhydrophobicity as assessed by the contact angle of water with the surface. In addition, the coatings also display oleophobicity, which is most pronounced when fluoroalkly moieties (groups) are employed to introduce hydrophobicity into the coatings.
Coatings described herein have the ability to resist the loss of hydrophobicity when challenged in a mechanical abrasion test. The mechanical durability of the coatings described herein may be assessed in either manual or automated tests (e.g., Taber Abraser testing). Overall, the coatings offer high resistance to the loss of HP/OP properties in manual tests and in tests on a Taber apparatus, with two step application processes using polymeric binder systems out performing one-step processes. Two-step coatings are capable of withstanding more than 5,000 cycles in manual abrasion tests, as compared to several hundred for one-step process and thermal spray processes. Polyurethane compositions with glass second particles (e.g., POLANE binders with glass spheres used as base coat, with a top coating of silica gel(silica nano tubes) treated with SiCl₄ and silanized with SIT 8174.0) offer some of the highest resistance to mechanical abrasion-induced loss of HP/OP properties. Mechanical abrasion tests show that such coatings can withstand more than 700 cycles of Taber abrasion testing.

The coating compositions described herein are compatible with a wide variety of surfaces. Moreover, the diversity of the binder systems (e.g., thermal spray, polymeric binders, thermoplastic binders) offers a wide range of properties in addition to hydrophobicity that may be advantageously employed. For example, coatings such a fluoropolymers not only show high resistance to the loss of HP/OP properties in mechanical abrasion tests, but those coating compositions tend to be UV resistant due the stability of the fluoropolymers employed.

The coatings described herein are also stable to environmental conditions including low temperatures, wetting, salt resistance, ice formation and the like, indicating they can be employed, in a variety of harsh environments for purposes such as the prevention of ice formation and accumulation.

In addition to the other forms of compatibility the coating described herein are flexible, which permits coating materials such as cables (e.g., high voltage electric transmission lines), and flexible tapes that can be used in a variety of applications, including rapidly forming spill-resistant barriers on a diversity of surfaces. The coatings are resistant to separation from their substrates even upon repeated heating and cooling or on exposure to liquid nitrogen. Moreover, the coatings also display a significant ability to remain attached to surfaces even when they are bent at temperatures well below freezing (O°C).

The combination of the durable hydrophobicity, stability under a variety of conditions including exposure to salt water solution, good surface adherence and flexibility, and the ability to reduce drag, demonstrates the suitability of the coatings for high
performance coatings on boat hulls. Water droplet contact angle hysteresis measurements suggest the coatings maintain a significant air fraction associated with their surfaces when submerged, which lead to the reduction in drag.

Water droplet hysteresis data, along with the air bubble observed on surfaces subject to drag measurements, typically 0.1-0.3 mm in size, suggest the use of bubblor systems to maintain the surface air associated with the coatings to obtain the maximum drag reduction by the coatings, particularly when applied to boat hulls.

8.0 Exemplary Applications of HP/OP surfaces

The HP/OP properties of the coatings described herein give rise to numerous diverse applications for the coatings, some of which are set forth in the exemplary applications recited below. Applications in addition to those set forth below will be immediately apparent, and as such, the exemplary applications of the coatings are in no way intended to be limiting on the scope of the uses envisioned for the coatings.

The HP/OP properties of the coatings, and particularly their ability to resist the formation and/or adherence of ice to surfaces, gives rise to a variety of uses including, but not limited to:

- Electrical transmission wires/cables that are resistant to ice formation and/or accumulation that can increase the weight of the overhead transmission lines and cause sagging or even breakage;
- Aircraft wings and air surfaces that are resistant to ice formation and/or accumulation that can restrict the movement wing components (flaps etc.) and other air surfaces, and which can reduce the need for expensive and time-consuming deicing operations;
- Helicopter blades that are resistant to ice formation and/or accumulation which can reduce the need to use deicing heaters which can consume fuel and the failure of which requires refurbishing or replacing of the helicopter blades;
- Valves used to Control Water Flow at Hydro Dams that are resistant to freezing in position as the result of ice formation and/or accumulation, and which minimize the need to heat valves when necessary for their operation, (e.g., with gas torches);
- Road and Highway Bridges and Bypasses resistant to ice formation and/or accumulation in subfreezing conditions;
- Firefighters hats and equipment that is resistant to ice formation and/or accumulation that can occur when the equipment is used in severe cold temperatures, and exposed to water; and
Ice formation and/or accumulation resistant decks, railings, masts, antennas, and other exposed surfaces of boats, ships, lighthouses, and buoys, which are operated in cold weather.

The HO/OP properties of the coatings described herein, which resist the wetting of surfaces to which they are applied, can be used to reduce the friction at the water/substrate interface. The use of the coatings described herein to reduce of friction at the water/substrate interface has a variety of uses including, but not limited to:

- Pumps with improved efficiency due to reduction of friction, including friction at pump impellers;
- Boat, ship, and barge hulls with reduced drag due to the reduced friction between the hull and water; resulting in more efficient use of fuel;
- Windmill blades with increased efficiency due to a reduction in the friction between moist air and/or the effects of rain and water accumulation on the blades surface.

The HO/OP properties of the coatings described herein, which resist the wetting of surfaces to which they are applied, can be used to reduce the corrosion of materials, particularly metals. The use of the coatings described herein in corrosion reduction has a variety of uses, including but not limited to:

- Bridges resistant to corrosion from water, including salt water, e.g., from salt sprays used during the winter;
- Corrosion resistant guard railings used on roads and highways, and railings used along walks and stairs, public parks, railing is both galvanized steel and tubing;
- Corrosion resistant coatings for industrial equipment, particularly metals (e.g., ferrous metals) exposed the weather.

Due to the HO/OP properties of the coatings described herein, the coatings may be used to prevent water penetration into the wood, which causes swelling that can be exaggerated under subzero conditions, warping, exfoliation, which can lead to rotting. The use of the coatings described herein in corrosion reduction finds a variety of uses, including but not limited to, wood and particle board resistant to the damaging effects of water.

Other uses of the HO/OP coatings described herein include a variety of applications, that include, but are not limited to:

- Glasses and ceramics that are self cleaning, where the coatings described herein may be employed, for example, as arc-resistant coatings on insulators used in electrical transmission systems where dirt or salt deposits, alone or in combination with water, can allow arcing with significant electrical energy losses;
Cement and Masonry Products and surfaces resistant to damage in freezing weather from water that has penetrated the surfaces:

Paper Products and Fabric resistant to water and moisture, including, but not limited to: paper and fabric moisture barriers used for insulation and under shingles or roofing; cardboard tubes/pipes, are used to cast concrete pillars (water penetrating the seams of the tubes can leave seams and other defects in the pillars that need to be fixed by grinding operation; water resistant paper and cardboard packing;

Composites including, but not limited to HP/OP roofing shingles resistant to (1) the loss of aggregate particles, (2) ice formation, which can damages the shingles and the supporting roof structure and (3) stains that develop on shingles over time, presumably, from wetting.

8.1 Spill Resistant Borders

A spill-resistant border is a portion of a surface forming a perimeter around an area of a surface that has a lower hydrophobicity and/or lower oleophobicity than the border. Spill-resistant borders can prevent water and other liquids from spreading or flowing beyond the position of a border on a planar or substantially planar surface that is placed in a substantially level horizontal position (see Figure 1.) Such borders can prevent the spread of an aqueous liquid until it exceeds a level that is about 4.5 mm higher than the surface. In some instances the liquids can be aqueous solutions, suspensions or emulsions. In other instances, the liquids can be lipids or oils that are prevented from spreading beyond a border until the level of the oil or lipid exceeds about 2 mm above the surface on which the border is formed. In other instances the liquid can be an alcohol (e.g., methanol, ethanol, a propanol, a butanol, or a pentanol) or a liquid comprising an alcohol (e.g., water and alcohol combination including alcoholic beverages such as beer, wine and distilled liquors).

The HP/OP coatings described herein may be used to prepare spill resistant borders either by directly applying an HP/OP coating to a portion of a surface (with or without the use of a mask) or by applying a tape or ribbon to the surface where one surface of the tape or ribbon is treated with an HP/OP coating.

Where the surface, or a portion of the surface, is substantially planar, the spill-resistant border may be placed at or near the edges of the planar surface or near the edge of the portion that is substantially planar, such that the spill-resistant border surrounds a region of the surface that has a lower hydrophobicity or lower oleophobicity than the spill-resistant border. Alternatively, the border may be placed so as to form a boundary encompassing one
or more portions of the surface that have a lower hydrophobicity or oleophobicity than the border. Thus, borders may, in some cases, be placed at the edges of (e.g., at or near the edges of the treated surface) or form one or more barriers separating regions of a surface that have lower hydrophobicity than the borders or barriers.

One embodiment provides surfaces comprising a hydrophobic and/or oleophobic spill-resistant border, wherein the border forms a perimeter around at least one area of the surface that has a lower hydrophobicity and/or lower oleophobicity than the border. In another embodiment, the surface may comprise a hydrophobic and/or oleophobic spill-resistant border, wherein said border forms a perimeter around at least two, or at least three, or at least four, areas of the surface that have a lower hydrophobicity and/or lower oleophobicity than the border.

In some embodiments a border may be placed at the edge of a surface, in which case it may be referred to as an "edge." In other embodiments a border may be placed near an edge of a surface, such as in the form of a strip parallel or substantially parallel to one or more edges of a surface. In some embodiments a border may be placed on a surface at a position that is not the edge such that the border forms a perimeter around one or more areas that have a lower hydrophobicity and/or lower oleophobicity than the border.

Where a border is not placed at the edge it may be termed a "barrier." Barriers may divide a surface into several regions that have a lower hydrophobicity and/or lower oleophobicity than the border. Each area having a barrier as a perimeter will separately prevent the spreading of liquid between different areas of the surface. The regions separated by barriers may be in variety of forms. For example, the regions may be in the form of a series of concentric circles or a series of regular quadrilaterals (e.g., squares or rectangles, hexagons, or triangles). Barriers may retain liquids at the same height as a spill-resistant border placed at an edge or optionally may have a lesser ability to retain liquids than the border at the edge.

In some embodiments a border in the form of an edge, or a border located at or near the edge of the surface, may be employed with borders in the form of barriers. In such an embodiment the surface will not only prevent the spread of liquids between regions separated by barriers, but also may prevent or stop liquids from flowing off the surface by blocking passage of the liquid over the border at the edge. Where the barriers have a lesser ability to retain liquids than the border, a spill that overwhelms a barrier will spread to the next area before overflowing the edge. Some examples of spill-resistant borders, including those with edges and barriers, and combinations thereof, may be seen in Figure 2.
Spill-resistant borders (including borders in the form of edges and barriers), regardless of the pattern in which they are formed, are substantially 2-dimensional structures. The width of the HP/OP regions of a surface forming spill-resistant borders can vary depending on the specific application in which the borders are intended to be used. In some embodiments, the borders may be from about 0.2 to about 2 inches in width, or alternatively, about 0.2, 0.25, 0.3, 0.4, 0.5, 0.6, 0.7, 0.8, 0.9, 1.0, 1.1, 1.2, 1.25, 1.3, 1.4, 1.5, 1.75 or 2.0 inches (about 5 mm to 50 mm) in width. In one embodiment, where the borders are intended for use on food preparation or storage surfaces, (e.g., cutting boards, glass shelving for refrigerators, or countertops) the borders in the range of 0.2 to 2.0 inches. In other embodiments, such as where the spill-resistant borders are intended for use on food preparation or storage surfaces, the borders can be about 0.4 to 1 inch wide, or alternatively, about 0.4, 0.5, 0.6, 0.7, 0.75, 0.8, 0.9, or 1.0 inches wide. Border width does not have to be uniform, and where borders on a surface comprise an edge and barriers, the edge and barriers may be of different widths or even varying widths on the same surface.

Where a combination of a border, such as a border in the form of an edge, and a barrier are used, the hydrophobicity of the barrier and edge may be controlled such that liquids will be prevented from spreading between different areas of the surface, but the highest resistance to liquid spreading (the highest height of liquid retained) will be at the edge. Thus, in the case of a spill that overflows an area surrounded by a barrier, the spill would flow to an adjacent area, rather than over the edge.

Spill-resistant borders and barriers may be used to direct liquid toward one or more drains in a surface and can be arranged to channel spilled liquids toward a drain (see e.g., Figure 2 panels D and E). Borders in the forms of edges and/or barriers may be also combined with drains in a surface so as to direct liquids to a drain or collection site/container. Drains may be in the form of an opening, depression or trough (e.g., slot, hole, or groove) in the surface bearing the border. Openings, depressions, or troughs may be connected to tubing or pipes that will permit liquid to be collected or channeled to a desired location (e.g., a collection container or sewer waste line). Barrier lines that form incomplete perimeters around areas of a surface may also be used to channel liquids towards a drain (see Figure 2, Panel D); particularly where the barrier lines form a complete perimeter except at the point where they end at or near a drain (see Figure 2, Panel E). In one embodiment, one or more drains may be placed at the edge of surface so that the border forms a continuous perimeter around an area of the surface up to the point where the drain is located, with the drain completing the perimeter formed by the border.
In an embodiment, a spill resistant border can be formed on a surface that has a contact angle with water at room temperature that is less than about 10, 15, 20, 30, 40, 50, 60, 70, 80, 90, 100, 110, or 120 degrees, and where the border has a contact angle with water at room temperature that is greater than the contact angle of water with the surface on which it is formed by about 7, 8, 9, 10, 20, 30, 40, 50, or 60 degrees measured at room temperature (about 68°-72° F).

Spill-resistant borders, may be employed for a variety of purposes, including, but not limited to, glass shelving for refrigerators, or countertops, laboratory work benches, or cutting boards.

The tapes and ribbons (and sheet) described above may be made from a variety of materials including, but not limited to, metal (e.g., aluminum), plastic, paper, fiber glass and the like. Such tapes and ribbons may be employed for variety of other purposes than preparing spill resistant borders, including but not limited to, their use as anti-icing tapes, and to provide corrosion resistance.
Example 1: Superhydrophobic and Oleophobic Surface Coatings formed with Three Binder Systems without added First Particles

Three 4-inch x 4-inch aluminum plates (0.062-in.thick) are cleaned with acetone. Each plate is spray-coated with a base coat (2 ml) of one of the following binders: Self-Etching Primer (a lacquer based primer from Eastwood Co., Pottstown, PA); POLANE® B (a polyurethane based binder from Sherwin Williams, Harrisburg, PA) or LUMIFLON® (a solvent soluble fluoropolymer from Asahi Glass Co., Exton, PA).

Following application of the binder base coat, and before the base coat dries, each of the plates was top-coated with CAB-O-SIL TS-720 (Cabot Corp., Billerica, MA) fumed silica second particles (e.g., second particles) having a nominal BET surface area of 200 m$^2$/g treated with polydimethylsiloxane. The plate coated with Self-Etching Primer was top coated with 2 ml of a TS-720 suspension (4.2 g TS-720 per 100 ml of ethanol). Plates coated with POLANE® B or LUMIFLON® are top coated with 2 ml of TS-720 suspension (4 g per 100 ml of hexane). Plates coated with Self-Etching Primer are cured for 30 min, at 200°F, and plates coated with the other two binders are cured for 1.5 h at 200°F in an electric oven.

Coatings are assessed for their hydrophobicity (contact angel with water), submerged water durability, mechanical durability and chemical durability.

The hydrophobicity of the coatings is assessed by measuring the contact angle of water with the coating. Measurements are made using a T200 Theta Optical Tensiometer on newly prepared coatings and after durability testing using a Taber unit (see below).

Mechanical durability can be assessed by a variety of methods, including manual abrasion with preset weights or on commercial apparatus such as those available from Taber Industries (North Tonawanda, New York).

For the purpose of this disclosure manual abrasion testing (hand rub method) is conducted using a cylindrical 800-g weight with a flat bottom (about 1.75 pounds) having a base diameter of about 4.45 cm (1.75 inches) covered with a 50:50 cotton/polyester fabric. Testing is conducted by moving the weight with a reciprocating motion (1 rub or abrasion cycle is equivalent to 1 pass of the weight across the surface). The roll-off angle for water is checked at incline angles of 3°, 6°, and/or 9° by placing 20 water droplets on the portion of the surface (e.g., the portion subjected to manual abrasion testing). The end of life of the coating determined by manual abrasion testing is considered the point when most (more than 10) of the 20 droplets do not roll off the surface at the indicated degree of incline.

Abrasion testing is also conducted using a Taber Rotary Platform Abraser (Abrader), which employs two "wheels" to abrade a surface under 250-gm loads or 500-gm loads on
each wheel. Each cycle counted by the instrument is equivalent to two rubs, one each from each of the wheels. The end of life for coatings subjected to Taber testing is measured using run-off angle as described for manual abrasion.

Results for the analysis of three different coatings are summarized in Table 1. In addition to the measurements describe above, plates are also assessed for their loss of coatings by directly measuring their change in weight following assessment.

After Taber testing with 250 g load using 9° roll-off to determine end of life.

Data from the analysis of the three coatings indicates that as prepared each coating has superhydrophobic properties (the water contact angle exceeds 150°). The lacquer based Self-Etching Primer as a binder produced slight more durable coatings than either the polyurethane or fluoro polymer binder in manual abrasion testing at 3, 6 and 9° inclines. In contrast, abrasion analysis using the Taber instrument indicates that fluoro polymer binders give slightly more durable coatings.

Example 2: Superhydrophobic and Oleophobic Surface Coatings Prepared With First Particles

Aluminum plates (4-inch × 4-inch 0.062-in.thick) are cleaned with acetone and are coated in a two step process comprising applying a base coat followed by application of a top-coat (second coat). Each plate is spray-coated with a base coat (2 ml) of one Self-Etching Primer (SEP) (Eastwood Co., Pottstown, PA) containing the indicated amount of the first particles listed below. After drying in air, this base coat is top-coated with 2 ml of TS-720 treated with polydimethylsiloxane suspended in ethanol (4.2 g/100 ml). After drying in air, the coated plates are dried in air and cured at 200°F for 30 minutes ("min") in an electric oven. Manual abrasion testing is conducted as described in Example 1. Data from the plates is shown in Tables 2a-2f.
Example 2a. Coatings Prepared with Filler 512

The filler 512 black, (Xiom Corp., West Babylon, NY) a thermoplastic powder is added to SEP at 0% to 40% weight to volume. The mixture was sprayed on as the base coat and top coated with TS-720 treated with polydimethylsiloxane as described above. Manual abrasion data is shown in Table 2a.

Example 2b. Coatings Prepared with Filler Nulok 390

The filler Nulok 390 (Kamin LLC, Macon, GA) is added to SEP at 0% to 40% weight to volume. The mixture was sprayed on as the base coat and top coated with TS-720 treated with polydimethylsiloxane as described above. Manual abrasion data is shown in Table 2b. The maximum abrasion cycles tolerated with a 17% addition of Nulok 390 were about four times the number of cycle achieved in the absence of that filler.

Example 2c. Coatings Prepared with Filler XT-Series
First particles in the XT family (XT-600, XT-700, XT-750, and XT-765) (Xiom Coφ, West Babylon, NY) are added at 30% or 35% weight to volume. The mixture was sprayed on as the base coat and top coated with TS-720 as described above. Manual abrasion data is shown in Table 2c. The maximum number of abrasion cycles tolerated with additions of XT first particles to SEP are about five times that achieved without any filler addition.

It can be stated from the thermoplastic filler study that all of them resulted in a positive effect and improvement varied somewhat, which is obviously dependent on filler size and to some extent on filler chemistry.
Example 2e. Coatings Prepared with Wood Particles as First particles

Wood powder of the indicated size is added to SEP at 10% or 15% weight to volume. The mixture is sprayed on as the base coat and top coated with TS-720 treated with polydimethylsiloxane as described above. Manual abrasion data is shown in Table 2e. The maximum abrasion cycles tolerated by coatings with 15% of 53 micron wood dust is over 4 times that of the coating in the absence of filler.

Example 2f. Coatings Prepared with Metal Powder First Particles

Aluminum powder of the indicated size (100 or 325 mesh) or (149 or 44 microns respectively) is added to SEP at 30% or 40% weight to volume. The mixture is applied as the base coat by spraying and top coated with TS-720 treated with polydimethylsiloxane as described above. Manual abrasion data is shown in Table 2f. The maximum abrasion cycles tolerated by coatings with the addition of 100 mesh aluminum filler is over three times that number of abrasion cycles tolerated by the coatings in the absence of any filler.

Example 2g. Coatings Prepared with Metal and/or Metalloid Oxide Powder First Particles

MULLITE, which is a spinal oxide of Al₂O₃ and SiO₂ (powder -325 mesh or 44 microns mean diameter,) is added to SEP at 10% to 40% weight to volume. The mixture is sprayed on as the base coat and top coated with TS-720 treated with polydimethylsiloxane as described above. Manual abrasion data is shown in Table 2g. The maximum abrasion cycles
tolerated by coatings with the addition of MULLITE is about three and a half times the number of abrasion cycles tolerated by the coatings in the absence of any filler.

Example 3: Performance of a Thermoplastic Filler in a Lacquer Based Binder

Aluminum plates (4-inch x 4-inch x 0.062-in.thick) are cleaned with acetone and coated in a two step process comprising applying a base coat (2 ml) of Self-Etching Primer (SEP, Eastwood Co., Pottstown, PA) containing 30% weight to volume of Filler 512 White (the counter part of the 512 black filler used in Example 2). After drying in air, this base coat is top-coated with (2, 3, 4, 5 or 6 ml) of TS-720 treated with polydimethylsiloxane suspended in ethanol (4.2 g/100 ml) or suspended in hexane at 4.2g/100ml. After drying in air, the coated plates are dried in air and cured at 200°F for 30 min in an electric oven. Manual abrasion testing is conducted as described in Example 1. Data from the plates is shown in Table 3.

This table clearly demonstrates that with 30% 512 filler, the rub resistance can be increased to over 500 rubs with the top layer consisting of 5 ml/plate. Ethanol and hexane are equally effective in preparing the top coat of TS-720.

\(^a\)All plates were cured at 200°F for 30 min

The data table demonstrates that with 30% 512 filler, it is possible to reach 500 abrasion cycles in the manual test with a top coat of 5 ml/plate of TS-720 treated with polydimethylsiloxane (about 2 mg of polydimethylsiloxane treated TS-720 per cm² of surface).

Example 4: Durability Performance of First Particles in Polyurethane-Based Binders

Triplicate aluminum plates (4-inch x 4-inch x 0.062-in.thick) are cleaned and coated in a two step process comprising applying a base coat (2 ml) of POLANE® containing 20% weight to volume of: S60 glass bubbles (3M™, St. Paul, MN); Filler 512 Black (Xiom Corp, West Babylon, NY), or Corvel Black (Rohm & Haas, Philadelphia, PA). After drying in air, this base coat is top-coated with 5 ml of polydimethylsiloxane treated TS-720 suspended in hexane at 4.2 g/100 ml. After drying in air, the coated plates are dried in air and cured at 200°F for 90 min in an electric oven. Manual abrasion testing is conducted as described in Example 1. Data from the plates is shown in Table 4.

1. In all cases first particles added to polyurethane binders increased the durability of the superhydrophobic/oleophobic coatings by about three to seven fold.

Example 5: Durability of Coatings Prepared with Second Particle-Silicate Materials Top Coats With and Without Additional Top Coat Treatments

Aluminum plates (4-inch x 4-inch x 0.062-in.thick) are cleaned and a base coat (5 ml) of POLANE® B containing 20% weight to volume of Filler 512 Black (Xiom Corp, West Babylon, NY) is applied to each plate in preparation for top coating. Top coatings of a second particle selected from (1) polydimethylsiloxane treated TS-720, (2) untreated M-5 fumed silica, or (3) hexamethyldisiloxane treated Nanogel TLD201 (Cabot Corp, Billerica, MA) are applied immediately after the base coating (e.g., after the bulk of solvent had evaporated).

Top coats of polydimethylsiloxane treated TS-720 (5 ml of 4.2 % w/v) are applied in ethanol.

Top coats of M5 are applied by spraying 10-15 ml a 1.5% M-5 (w/v) suspension in hexane.

Top coats of Nanogel TLD201 are applied by spraying 10-15 ml of a 1.5% or 2% TLD201 suspension in hexane as indicated in the data.

In all cases, the plates were cured at 200°F for 90 min in an electric oven. For the top coat of TS-720 the plates are ready for testing after a 90-min curing. Plates treated with For M-5 coated plates, are treated by one of two methods (method (A) or (B)) to produce superhydrophobic behavior.

Method A - a 1% solution of (tridecafluoro-1,1,2,2-tetrahydrooctyl) trichlorosilane ("SIT8174" from Gelest, Pottstown, PA) in hexane is applied as a top coat in the amount
indicated in Table 5b. Plates treated with SIT8174 are given a second and final cure at 200°F for 30-60 min in an electric oven.

**Method B** - 3.5 ml of a 3-5% solution of SiCl₄ in hexane is applied to plates that are exposed to atmospheric moisture. Water in the atmosphere is sufficient to convert at least some Si-Cl groups into Si-OH groups, thereby increasing the number of Si-OH sites on M-5 second particles, prior to treatment with SIT8174. After treatment with SiCl₄, SIT8174 is applied and the coating cured as in Method A.

In some instances Nanogel TLD201 treated plates are also treated with SIT8174 or SiCl₄ + SIT8174 using Method (A) or Method (B) as described above for M-5 coated plates and the amounts of the Nanogel and SIT8174 indicated in Table 5.

Data for manual abrasion testing of plates bearing the coatings from each treatment is given in Table 5 along with a control comparison. The rub data on all of the samples discussed above are summarized in Table 15.

**Example 6: Filler and Top Coat Study**

Aluminum plates (4-inch x 4-inch x 0.062-in.thick) are cleaned and a base coat (3-5 ml) of POLANE® B containing 20% weight to volume of the indicted filler. Top coatings of second particles of polydimethylsiloxane treated TS-720 or untreated M-5 fumed silica (Cabot Corp, Billerica, MA) are applied after the base coating in the indicted solvents. Plates were dried and cured at 200°F. Where indicted, coatings were treated with Gelest silane
S1T8174 or SiC14 followed by treatment with SIT8174 using methods A or B described in Example 5. Table 6a sows the data with S60 filler (3M™, St. Paul, MN) and Table 6b for Corvel Black.

Plates coated with SIT8174 are both superhydrophobic and oleophobic, and perform show increased durability when pretreated with SiCl4.

**EXAMPLE 7: Superhydrophobic and Oleophobic Coating Resistance to Boiling Water Exposure**

Two 4 inch x 4 inch aluminum plates with coatings having superhydrophobic and oleophobic behavior are prepared by the procedures in Examples 5 and 6.

Plate #1: Base Coat of 20% Filler 512 in POLANE® B and top coat of M-5 silica treated with SiCl4 followed by treatment with SIT8174

Plate #2: Base Coat of 20% S60 Glass beads (spheres) in POLANE® B and a top coat with M-5 silica treated with SiCl4 followed by treatment with SIT8174.

After curing, both plates are checked for superhydrophobic performance and then placed in a boiling water bath. The water contact angle of the coatings is checked at periodically after removing the plates from the bath and cooling to room temperature. The plates are returned to the boiling water bath after each measurement. After hours in boiling
water both plates are found to show superhydrophobic performance. A final measurement on the plates shows that they also show oleophobic behavior as well.

**Example 8: Optimization of M5 Top Coat**

**Example 8a.** Aluminum plates measuring 4 inches by 4 inches are coated with POLANE® B containing 20% 512 Black as filler. These plates are top-coated with untreated fumed M5 silica (Cabot Corp., Billerica, MA) suspended in hexane at 0.5, 1.0, 1.5, or 2% weight/volume. At higher percentages of M5 dispersed in hexane it becomes difficult to spray the mixture. The amount of each M5 suspension applied as top coat was also monitored by the volume applied to plate (ml/plate). The amounts applied are varied in increments of 5 ml/plate from 5 to 20 ml/plate. After the top coat is applied, the plates are cured for 90 min at 200°F. Following curing, half of the plates are treated with silane SIT8174 and the other half with SiCl₄, followed by SIT8174, thereby converting the untreated M5 silica into hydrophobic/superhydrophobic and/or oleophobic particles. Following treatment with SIT8174 or SiCl₄ + SIT8174 plates are cured for 30-60 min at 200°F and subjected to assessment of water contact angle and Taber testing. Taber testing is conducted with a 250g weight on the wheels. The end of superhydrophobic behavior was measured at roll-off angles of 6° and 9° as shown in Table 8a.

The contact angle data for before and after Taber testing is shown in Table 8b. Data for 6° water roll-off angle tests (see Example 1) after the indicated number of abrasion cycles on the Taber Abraser is plotted in Figures 3 and 4 for plates receiving 5, 10, 15, or 20 ml of M5 silica at the indicated M5 to hexane weight to volume ratios. The data suggest that fillers increase the durability of the coatings.

Example 8b. Initial water contact angle and Tabor Abraser durability measurements are conducted on 4inch x 4 inch aluminum plates base coated with POLANE® B and top coated with M5 silica suspended at a concentrations of 0.5 or 2% w/v. After curing the plates are treated with either SIT8174 or SiCl₄ + SIT8174 (SIT8174 10% solution in hexane and SiCl₄ 1% solution in hexane using 1 to 2 ml per 4X4 plate) as described above in Example 8a. Contact angle data for the plates with water droplets before Taber testing (250 g load) is plotted in Figure 5. Each of the coatings has a contact angles greater than 150°, indicating that they display superhydrophobicity. Results for 6° and 9° roll-off angle analysis following Taber abrasion measurements are plotted in Figures 6 and 7 as a function of the volume of M5 suspension applied to the plates (ml/plates). Figures 8 and 9 plot the contact angle after Taber testing. For Taber testing using a 6° roll-off angle to assess the end of superhydrophobicity, the contact angle of water with the surface drops by about 15-20° at the point where the plate's performance is no longer considered superhydrophobic (test angles are < about 150°). Although, the plates are no longer considered superhydrophobic at the end of Taber testing (typical contact angles are between 140-148°), with angles greater than 120°, the Taber-tested coatings are still quite hydrophobic.

Example 9: Durable Superhydrophobic and Oleophobic Coatings Formed in a Single Step (One-Step) Process

Coatings displaying superhydrophobic and oleophobic behavior can applied to surfaces in a single step process. Such processes may employ a binder to which second particles bearing an alkyl or haloalkyl group (covalently attached directly or indirectly, such as through a Si atom or a series of bonds through oxygen and silicon atoms) are added to the binder in the presence of about 5% of a block copolymer described below and an optional first particle (e.g., filler). Such compositions typically require thinning with a binder compatible solvent for spray application.

For this example, a block copolymer is prepared by reacting 3.13 g styrene, 1.92 g butyl acrylate, 12.32 g butyl methacrylate, 4.25 g glycidyl methacrylate, and 100 ml toluene in a reaction flask with stirring at 85°C. A solution of 0.2 g AIBN in 2.5 ml toluene is added into the flask and mixture is maintained at 85°C for 3 hours. A second amount of AIBN in toluene is added and the reaction is continued for another 3 hours. The reaction mixture is cooled at room temperature and the resulting acrylic polymer is precipitated with hexane, filtered, and dried under vacuum at 40°C for 24 hr prior to use.
Example 9a One Step coatings prepared with TS-720 fumed silica and Nanogel TLD201

Specific details of exemplary durable superhydrophobic/oleophobic coatings prepared on 4 inch by 4 inch aluminum plates employing a one-step process using the components given in Table 9a-1. Two plates employ fumed silica second particles (TS-720) treated with polydimethylsiloxane, two employ Nanogel TLD201, which is treated with hexamethyldisiloxane, and two employ Nanogel TLD201 and S60 glass particles as a filler. All plates are cured at 200°F for 90-120 min after air drying.

*All plates were cured for 90-120 min at 200°F in an electric oven.

All plates are tested for their durability and water contact angle. The durability is tested with the manual abrasion method (see Example 1) and also with a Taber machine employing a 250-g load. Data are summarized in Table 9a-2.

The durability data were taken for three roll-off angles of 3°, 6°, and 9°. The contact angle was measured before and after durability assessment with a Taber "Abraser". The contact angle before abrasion testing for all six plates is between 161°-163°, implying that all of them are superhydrophobic as the contact angle with water exceeds 150° at room temperature. The coatings substantially retained their water repellant nature after abrasion, which was measured in in two areas of the plates (left and right) before and after Taber abrasion testing.

Example 9b. One Step coatings prepared with HK400, HK400T and TLD201 Nanogel

Coatings displaying superhydrophobic and oleophobic behavior are prepared with a urethane binder (POLANE® B) to which are added the indicated second particles and a filler as described below. The compositions are thinned as required with a binder compatible solvent for spray applications.

HK400T nanoparticles (second particles) are prepared by treating ACEMATT® HK400 nanoparticles (Evonick Industries, distributed by The Cary Co., Addison, IL) with Gelest silanizing agent SIT8174.0 (tridecafluoro-1,1,2,3-tetrahydrooctyl) trichlorosilane. The particles (50-g) are prepared by stirring with a 400-ml of a 1% w/v solution in hexane for 6 hours. Hexane is allowed to evaporate away and residual hexane is removed by heating the mixture to 200°F for 6 hours.

HK400T particles may also be prepared by pre-treating a 50 g sample of HK400 particles with 2 grams of Gelest silanizing agent SIT8174.0 (tridecafluoro-1,1,2,3-tetrahydrooctyl) trichlorosilane by blending the materials together in a mixer for 30 seconds. An additional 2 grams of the silanizing agent is added to the mixture and it is blended for 45 seconds further. The treated powder was placed in a PYREX® dish and dried at 200°F for 12 hours.

Particles of TLD201 Nanogel, which are treated with hexamethyldisiloxane are used as purchased from Cabot Corp., Billerica, MA.

First particles are selected from 512 Black (Size microns, Xiom Corp., West Babylon, NY) and S60 glass bubbles (15-65 microns, 3M Corporation). For this Example, S60 glass bubbles are prepared by treating a 50-g batch of the glass bubbles with 1.25 ml of SIT8174.0 in 50 ml of solvent. The mixture is blended for about 1 to 2 hours followed by a baking for 3 hours at 200°F.

The details of the preparation of six 4 inch by 4 inch aluminum plates coated with a one-step process are set forth below (coatings 9b-1 to 9b-6). For each coating, the coated
plates are tested for contact angle and coating durability using both the manual abrasion method (see "hand rubs" see Example 1) and on the Taber Abraser unit with a 250-g load. Roll off angle data is obtained for both the manual abrasion and Taber sample testing at a 6° angle. Data for coatings 1-6 are summarized in Table 9b.

Coating 9b-1 - A mixture of POLANE® B (6 ml), POLANE® A (1 ml), POLANE® Reducer (5 ml), HK400T second particles treated with SIT8 174.0 (2 g) is prepared. For preparation of the mixture POLANE® B, POLANE® A and POLANE® reducer (6:1:5) is mixed thoroughly and the HK400T is mixed into the mixture. After the coating composition is mixed thoroughly, two aluminum plates are each sprayed with about 3.5 ml of the mixture and immediately cured at 200°F for 2 hours.

Coating 9b-2 - A mixture of POLANE® B (6 ml), POLANE® A (1 ml), POLANE® Reducer (8 ml), HK400T second particles treated with SIT8174.0 (1 g) and TLD201 second particles (0.75g) is prepared. For preparation of the mixture POLANE® B, POLANE® A and POLANE® reducer (6:1:8), is mixed thoroughly and the HK400T and TLD201 are subsequently added to the mixture. After the coating composition is mixed thoroughly, two aluminum plates are each sprayed with about 3.5 ml of the mixture and immediately cured at 200°F for 2 hours.

Coating 9b-3 - A mixture of POLANE® B (6 ml), POLANE® A (1 ml), POLANE® Reducer (3 ml), HK400T second particles treated with SIT8174.0 (1 g) and 512 Black filler (1 g) is prepared. For preparation of the mixture POLANE® B, POLANE® A and POLANE® reducer (6:1:3), is mixed thoroughly and the HK400T and 512 Black filler are subsequently added to the mixture. After the coating composition is mixed thoroughly, two aluminum plates are each sprayed with about 3.5 ml of the mixture and immediately cured at 200°F for 2 hours.

Coating 9b-4 - A mixture of POLANE® B (6 ml), POLANE® A (1 ml), POLANE® Reducer (3 ml), HK400T second particles treated with SIT8 174.0 (1.35 g) and S60 glass bubbles as a filler (1.35 g) is prepared. For preparation of the mixture POLANE® B, POLANE® A and POLANE® reducer (6:1:3), is mixed thoroughly and the HK400T and S60 filler are subsequently added to the mixture. After the coating composition is mixed thoroughly, two aluminum plates are each sprayed with about 3.5 ml of the mixture and immediately cured at 200°F for 2 hours.

Coating 9b-5 - A mixture of POLANE® B (6 ml), POLANE® A (1 ml), POLANE® Reducer (3 ml), HK400T second particles treated with SIT8 174.0 (1 g) and S60 glass bubbles as a filler (1 g) is prepared. For preparation of the mixture POLANE® B, POLANE® A and
POLANE® reducer (6:1:3) is mixed thoroughly and the HK400T and S60 filler are subsequently added to the mixture. After the coating composition is mixed thoroughly, two aluminum plates are each sprayed with about 3.5 ml of the mixture and immediately cured at 200°F for 2 hours.

**Coating 9b-6** - A mixture of POLANE® B (6 ml), POLANE® A (1 ml), POLANE® Reducer (2 to 3 ml), POLANE® Accelerator (3 ml), HK400T second particles treated with SIT8174.0 (1.25 g) and S60 glass bubbles as a filler (0.7 g) is prepared. For preparation of the mixture POLANE® B, POLANE® A, POLANE® reducer and POLANE® Accelerator, is mixed thoroughly and the HK400T and S60 filler are subsequently added to the mixture. After the coating composition is mixed thoroughly, two aluminum plates are each sprayed with about 3.5 ml of the mixture and immediately cured at 200°F for 2 hours.

Example 10: The effect of Filler content on the Performance of Durable Superhydrophobic Coatings (Optimizing filler effect on Superhydrophobic (SH) coating durability)

A set of 4-inch x 4 inch aluminum plates are prepared by coating with a base coat comprising a mixture of POLANE® A and POLANE® B (1:6) containing the indicated amounts of either S60 glass beads (3M™, St. Paul, MN) or XIOM-512 black (Xiom Corp, West Babylon, NY) filler (from 10% to 60% w/w). After the base coat applied to the plates had air dried, they were top coated with 10 ml per plate of untreated M5 fumed silica (particle size, Cabot Corp., Billerica, MA) as a 2% w/v suspension in hexane. The top coated plates are dried for 90 min at 93°C. After cooling, the plates are first treated with 1-2 ml of 10% SiCl₄ in hexane, and after the hexane has evaporated with 1-2 ml of the silanizing agent SIT 8174.0 (1% in hexane). All coating applications were made using an air spray gun. After all visible hexane evaporates, the plates are given a final thermal curing at 93°C for 2-8 hours.

After the final thermal cure samples are tested for durability by using a Taber Abraser with a 250g load. All samples are also tested to for end-of-life by determining the roll-off angle with a plate set a 6° incline at 25 abrasion cycle increments. End-of-life is determined by the propensity of more than half of a set of water drops (typically 20 drops per test set) to stick to the area subject to abrasion testing when the plate is set at a 6° degree angle from level.

Data for coatings prepared with S60 filler is summarized in Tables 10a and 10b. Table 10a gives the coating compositions leading to a S60 content from 10 to 60%. Table 10b sets forth the weight change as a measure of abrasion resistance obtained after the indicated number of abrasion cycles on a Taber Abraser apparatus. Data for coatings prepared with 512 Black filler is summarized in Tables 10c and 10d. Table 10c gives the coating compositions leading to a 512 Black content from 10 to 60%. Table 10d sets forth the weight change as a measure of abrasion resistance obtained after the indicated number of abrasion cycles on a Taber Abraser apparatus. Figures 10a and 10b plot the number of abrasion cycles (Taber Abraser cycles) at the end-of-life (determined by a 6° degree roll-off analysis) as a function of the percentage of S60 or 512 Black in the coating composition. The data indicate that first particles can significantly enhance the performance of coatings.
Example 11: Powder Coat Binder System for SH and OP Surfaces

Ha) Two Part Superhydrophobic and Oleophobic Powder Coatings

Aluminum plates, 4 inches by 4-inches are used as test objects for assessment of powder coating binder systems. Table 11a summarizes some results obtained from the use of two powder coatings as binders for the preparation of HP/OP coatings and surfaces; GLSS70, a clear powder from Innotek Powder Coatings LLC (Big Spring, TX) and Tiger 39/80170 Black wrinkle powder (TIGER Drylac U.S.A., Reading, PA).
In each case, dry powders are sprayed on the aluminum plates as a base coat, followed by heating until the powder coatings begin to melt (details of the application are given in Table IIA). At the melt point, a top coat comprising fumed silica treated with polydimethylsiloxane (TS-720 CAB-O-SIL TS-720, Cabot Corp., Billerica, MA) as a 4.2% or 2.1% suspension in acetone is applied to the base coat by spraying. The top-coated plates are heated to 400°F (about 200°C) for 10 min. Plates treated with Innotek powder coating resulted in superhydrophobic behavior and achieved about 325 cycles (rubs) in the manual abrasion test conducted as in Example 1. Manual abrasion testing of sample 3, which was prepared with a top coating that contained 5% TS-720 and 20% of the Innotek base coat powder by weight, resulted in similar abrasion behavior (resistance to 325 abrasion cycles in the manual test). Tiger Black wrinkle powder also produced superhydrophobic coatings with lower abrasion resistance the manual abrasion test described in Example 1 (about 50 abrasion cycles). Overall, the highest durability based on this data arises when surfaces are heated to just above the powder coat melting point prior to applying the base and top coats, and curing of the top coat at a temperature near the melting point of the powder coat for about 2-3 min.

Performance of Two Part Superhydrophobic and Oleophobic Powder Coatings

Table 11b summarizes further results with powder coatings. Again, aluminum plates, 4 inches by 4-inches are used as test objects for assessment of powder coating binder systems.
employing white Innotek powder coat G17SG101 S70, (Innotek Powder Coatings LLC, Big Spring, TX). Plates are coated with G17SG101S70 applied to a cold plate, which is heated 10 min at the indicated temperatures, followed by a top coating with suspension of 4.2% TS-720 (fumed silica treated with polydimethylsiloxane) in the indicated solvent, and a final cure of at about 400°F (see table). Manual abrasion testing conducted as in Example 1 indicated that some samples could resist over 900 abrasion cycles. When heating and cooling cycles are used prior to top coat application, some variation in the abrasion resistance can arise due to the extent of cooling the surfaces have experienced at the time of the top coat application (see e.g., samples 8 and 9).

Results of testing 90-1009R-H under similar conditions indicated that while superhydrophobic and oleophobic surfaces can be formed with that the material did not perform as well in abrasion testing. (data not shown)

**Example 12: Effects of First Particles on Hydrophobic, Superhydrophobic and/or Oleophobic Powder Coat Performance**

Aluminum plates, 4 inches by 4-inches, are coated with Innotek G17SG101S70 containing the indicated first particles as a base coating. The first particles employed are selected from (1) extend spheres SL-1 50 (3M™, St. Paul, MN), (2) S60 HS glass bubbles (3M™, St. Paul, MN), (3) R&H 90-1009 Kynar plastic (Rohm & Haas, Philadelphia, PA ), and (4) S/G extendo spheres (3M™, St. Paul, MN). The base coat was heated to 200-210°F, prior to
applying a top coat of 4.2% TS-720 (fumed silica treated with polydimethylsiloxane) suspended in hexane. Plates bearing the topcoat are given a final cure at 400°F for 6 min.

Example 13: SH and OP Effect Surface Preparation Using Thermal Deposition Processes

Aluminum or carbon steel plates 6 inches x 6 inches x 0.25 inches are sprayed with one of the materials recited in Table 13 using thermal (high-velocity oxyfuel (HVOF)) application processes. In all cases, excellent bonding of the sprayed materials to both aluminum and steel substrates is noted. The deposited surface was resistant to scratched, even when pressed with a sharp hardened metal objects (e.g., scissors). As deposited, coatings uniformly covered the surface giving rise to a sandpaper-like texture with the degree of coarseness depended on the size of the powder employed.

The surfaces prepared using the HVOF-spray process are treated by brushing on SIT8174 silane (Gelest, Inc., Pottstown, PA) as al% solution in hexane. Alternatively, the surfaces of some plates are sprayed with a suspension of polydimethylsiloxane treated fumed silica (TS-720, 4.2% w/v in hexane) as opposed to treatment with the silanizing agent SIT8174. Following application of the indicated silane or fumed silica, the plates are cured at room temperature for 24 h. After curing, all metal surfaces are found to be superhydrophobic, irrespective of the metallic or metal oxide coating applied. The surface treatment given to plates and the results from manual abrasion testing determined as in Example 1 are given in Table 13b.

Example 14: Coating Application Methods and Exemplary products

The polymer coatings described herein may be applied by spraying, brushing or dipping objects to be coated. Using such methods polymer based coatings may be applied to both simple and complex shaped surfaces;

Coatings applied to simple and complex surfaces by spray-on processes include both one step and two step coatings. The coatings can be applied to surfaces for a variety of purposes including corrosion resistance and reduced resistance to water flow (drag). The SH coating can be applied to reduce water film formation and accumulation of condensation, even on surfaces with complex shapes such as steam turbine blades. The SH coatings can also be applied where high durability and corrosion resistance is desired, such as on slip resistant flooring in demanding environments.

Coatings may also be applied by dipping object including electrical switches of the type used in food industry processing and packaging lines. Non-wetting SH coatings are particularly suitable for such facilities as they are typically cleaned by washing on a daily basis, and water seepage into switches can cause current leakages or shorts leading to unwanted production line
shutdowns. The switches may be coated in a two step process with Self-Etching Primer or POLANE® as the binders.

Where dipping is not a suitable alternative, coatings may be applied by painting or brushing coatings on the surface. One example of an object that is suited to coating by brushing or painting of coatings is heat exchanger for clothes dryers. A coating of Self-Etching Primer with a top coat of 4% of TS-720 in ethanol is applied by a two step process and is anticipated to keep lint from accumulating on the heat exchanger.

Example 15: Resistance to Ice Formation and Adherence to Coated surfaces
Aluminum plates 4 inches by 4-inches are prepared and one is coated with a superhydrophobic coating of POLANE® B containing 20% S60 glass bead filler as base coat with 4% TS-720 in hexane as top coat applied in a two step process. Both plates are cooled to about -20°C for 1 hour in a refrigerated enclosure. Water is cooled to until ice formation starts (0°C). The cooled water is dropped on to the uncoated and coated plates so that it runs down the surface to determine if the cooled surfaces permit ice formation and adherence. Significant amounts of the cooled water freeze on to the uncoated aluminum plate. In contrast, water running down the surface of the plate coated with the superhydrophobic coating has little if any ice form on it. Moreover, the ice which does form on the coated plate is not tightly bound and readily comes loose, which contrast to the results observe with the uncoated aluminum plate.

Example 16: Coating Electric Transmission Cable

16a) Individual segments (12-inches long) of 19 strand aluminum electrical transmission cables are spray coated using a two-step coating process. The first coat consisted of POLANE® A : POLANE B® (1:6 v/v) and POLANE® reducer as needed for ease of spraying) to which 20% w/v of 512 black thermoplastic filler is added. The top coat consisted of a 4% M5 (w/v) silica that is pretreated with Gelest Silane SIT8174.0 (Example 5, Method B) suspended in hexane. After coating, the cables were cured at 93°C for 60 min in an electric oven.

The coated cable segments are all superhydrophobic with contact angles exceeding 150° (visual examination).

16b) Flexibility at Ambient Temperature (23°C)
A segment of cables prepared in 16a is bent to 35° to simulated coiling operation. Bending to a 35° angle does not produce any delamination, cracking, chipping, or pealing of the coating, or degradation of superhydrophobic performance

16c) Flexibility at Freezing Temperatures (-30°C)
A segment of the coated cable prepared in 16a is cooled in the freezer to about -29°C (about -20°F) for about 1.5 hours and then bent to an angle of 48°. Bending to that angle does not produce any flaking or delamination. Bend angles exceeding 35°, however, do tend to cause the individual strands of the cable to separate, and create openings large enough for water to enter the cable.

16d) Superhydrophobicity and Thermal Cycling

An unbent (straight) segment of the coated cable is subjected to a thermal cycling test. The cable is placed on a hot plate and the cable temperature is monitored by a non-contact temperature gun. When cable surface temperature reaches 170°C, it is removed from the hot plate and cooled to room temperature (about 18° to 23°C) using an air gun. The same cycle is repeated 10 times with no loss of superhydrophobicity. Thermal cycling testing data is presented in Table 16.

Example 17: The preparation of Superhydrophobic, Hydrophobic and/or Oleophobic Tapes, Ribbons, or Sheets

Superhydrophobic, hydrophobic and/or oleophobic tapes, ribbons and sheets can be prepared using any flat, essentially two-dimensional material. In some embodiments the sheets can have an adhesive applied to one surface (see Example 17a) prior to applying the hydrophobic, superhydrophobic, or oleophobic coating, or can be coated with adhesive on the opposing surface after superhydrophobic, hydrophobic and/or oleophobic coating applications have been conducted (see Example 17b). The two dimensional materials can be in the form of sheets or narrow strips (e.g., adhesive strips that can be formed into rolls after their preparation or "tapes") or even patterns, that can be made out of any suitably flexible material including, but not limited to, metals such as aluminum or tin, fiberglass, or plastic.
The materials are treated to increase the hydrophobicity/oleophobicity of at least a portion of one (or possibly both surfaces) and even the edges, which have nominal area.

**Example 17a** - Tapes and sheets (e.g., adhesive sheets) may be prepared from materials essentially two dimensional materials that are have an adhesive coating on one side ("pre-glued"). In some embodiments the pre-glued surface is covered with paper or other film that can be peeled away to expose the adhesive.

The surface(s) of the materials not bearing the adhesive are treated to increase the hydrophobicity and/or oleophobicity. In some embodiments hydrophobicity and/or oleophobicity is increased using polymer coatings employing binders such as those described in Examples 2 through 12. In such process, tape surfaces are sprayed with polymeric binders including Self-Etching Primer, POLANE® B, LUMIFLON® using one-step or two step processes. Where two-step processes are employed, the top surface of the binder layer (base coat) is coated with either a treated fumed silica or silica nanogel (e.g., silicas such as TS-720 treated with agents that produce hydrophobic or oleophobic behavior). Where a fumed silica or silica nanogel is untreated with agents that provide hydrophobic or superhydrophobic properties, the fumed silica or silica nanogel can be treated with a reagent (e.g., silanizing agent such as SIT8174 from Gelest, Pottstown, PA) to increase the hydrophobicity and/or oleophobicity of the surface after silica application to the binder. The application of agents to increase the hydrophobicity and/or oleophobicity of untreated fumed silica or silica nanogels applied to the binder is typically conducted after 24 hours of room temperature curing of the binder/silica composite. The agents (e.g., silanizing agents such as SIT8174) may be applied by any suitable method including brushing or spraying as described above.

Where the polymer binder contains one or block copolymer polymers and particles of fumed silica or silica nanogel treated with agents that produce hydrophobic, superhydrophobic and/or oleophobic behavior (e.g., TS-720 or other silicas treated with silanizing agents bearing hydrophobic functionalities) the materials may be coated in a one-step process. In such a process the binder, block copolymer and treated silica(s) are mixed in and the entire blend is applied to the desired materials surface and cured under ambient (room temperature) conditions.

To speed the curing process the tapes, ribbons or sheets may be warmed to temperatures that do not affect the adhesive or binder (e.g., causing either the adhesive or binder to melt, flow to locations where it was not originally applied, or become brittle).

The surfaces of tapes, ribbons and sheets treated in the above-described manner will generally be hydrophobic if silanizing agents bearing alkyl functionalities are employed. The same surfaces will generally display superhydrophobic and oleophobic behavior where silanizing
agents have fluorinated alkyl groups at the end furthest from the Si atom to which they are attached.

**Example 17b** Ribbons and sheets of hydrophobic, superhydrophobic, and oleophobic materials may be prepared from essentially two dimensional materials that have an have no adhesive coating on any side prior to the application of hydrophobic, superhydrophobic and/or oleophobic coatings ("non-glued" sheets and ribbons). Ribbons and sheets may be used with out the application of adhesives or may have adhesives applied subsequent to the applications of coatings (e.g., converting ribbons into tapes). The same processes may be used for making sheets and ribbons of materials hydrophobic, superhydrophobic and/or oleophobic that are employed for the preparation of pre-glued tapes and sheets described in Example 14a can be employed. When applied, adhesives can be applied by any known means, including spraying, brushing or rolling the materials on surfaces. Surfaces having adhesives applied may be protected by the application of an easily removable material such as a separating paper applied to the adhesive coated surfaces.

**Example 18: The Use of Durable HP/OP Coatings or Tape or Ribbons Comprising a Durable HP/OP Coating to Form Spill-Resistant Borders.**

**Example 18a A Durable HP/OP Coatings As Spill Resistant Border.**

Around the outer perimeter of a 4 inch by 4 inch glass plate, a one half-inch border of Polane B containing first particles of XIOM 512 thermoplastic (10-100 microns) about 20% by weight is applied as a base coat. A top coat of TS-720 silica (Cabosil,, Billerica, MA) as a 4.5 % w/v suspension in ethanol is applied. The plate is air dried in followed by curing at 200°F for 30-60 min. The plate retains water to a height greater than 5 mm as determined by the method in part b of this example.

**Example 18b Adhesive Aluminum Tape Coated With An HP/OP Coating As A Spill Resistant Barrier.**

Aluminum tape, about one-half inch wide coated with the Polane based coating is applied around the top outside edge of a 4 inch by 4 inch square aluminum plate to form a spill-resistant border. The plate is tested for its water retaining capacity, by filing the plate at its center with water until the water overflowed the tape border. The height of water retained by the tape barrier was determined by dividing the volume of water retained by the plate by the area of the plate within the border. A water height of about 5.7 mm, can be retained on aluminum plates prepared as described. In the absence of a hydrophobic/superhydrophobic tape border, or in the presence of an untreated aluminum tape border, aluminum plates will not retain significant amounts of water.
Example 19: Hydrodynamic Drag Reduction

Two 2 4 inch x 4 8 inch x 3/8 inch aluminum plates (Plate A and Plate B) for drag reduction testing were prepared as follows:

Both Plates A and B were prepared using Self-Etching Primer as the binder with 4% w/v of 512 thermoplastic (10-100 µm) as the filler. The base coat used 18 ml of binder/filler mixture per square foot. Following the air gun spraying of the base coat, the plates were sprayed with a top coat of 4.2% of TS-720.

Plate A was heated at 400° F for 10 min in a continuous infrared oven. This plate had a brownish surface appearance.

Plate B was air dried and tested in this condition. This plate had a gray-white color after drying.

The plates are assessed for water droplet contact angle hysteresis, surface air fraction, hydrodynamic drag reduction, and related parameters.

Example 19a Contact Angle and Contact Angle Hysteresis

Water droplet contact angles and hysteresis are determined using deionized water (~5 µL in volume, ~2 mm in diameter for a spherical droplet) on both Plate A and Plate B using a KSV CAM 100 contact angle meter. Table 19a summarizes the results.

</table>

The surface morphologies of the coatings on Plates A and B are also examined using a scanning electron microscope. The surface morphology of Plate A is rougher than that of Plate B, suggesting that the higher contact angle on the Plate B is due to its higher surface roughness.
Example 19b Projected Surface Air Fraction

Projected surface air fraction was determined based upon the contact angle assessment in Example 19a by using the Cassie-Baxter equation \( \cos \theta = \cos \theta_0 - 1 + f_{SL} \), where \( \theta \) denotes an apparent contact angle on an interface of solid and gas, \( f_{SL} \) a fraction of wet surface (i.e., solid-liquid fraction), and \( \theta_0 \) a contact angle on a referential smooth rolled aluminum surface.

The estimated air (gas) fraction \( f_{LG} = 1 - f_{SL} \) on the superhydrophobic surface of Plates A and B, which is a critical factor influencing hydrodynamic drag reduction, is summarized in Table 19b. That table summarizes the expected surface air fraction of the coated plates. The surface air fractions are estimated for varying referential contact angles \( \theta_0 = 80-110^\circ \) for a smooth surface. The results suggest that higher drag reduction effect would be achieved with Plate B due to the higher air fraction.

Example 19c: Measurement of Hydrodynamic Drag of SH-Coated Flat Plates

The hydrodynamic drag reduction of plates A and B are measured in a high-speed water towing tank system employing a monorail supported, cable driven, sample support capable of speeds of 0-60 ft/s). Figure 11 panels (a) and (b) show the results of testing plates A and B at various water flow speeds covering both laminar and turbulent flows. Three plates were tested (Control: smooth reference surface with no coating, Plate A and Plate B.

The measured drag and the drag reduction observed for the plates relative to the control plate is plotted Figure 11 (b). The drag was increased on Plate A (compared to that of a smooth control surface, suggesting that the surface of the Plate A is wetted and that there is no slip effect...
due to the presence of surface air. The surface coating on Plate A creates an effective surface roughness of 0.0016, using the ITTC (International Towing Tank Conference) friction line for a standard fully turbulent friction coefficient. The superhydrophobic coating of Plate B (achieves a significant drag reduction, up to 30%, especially at low speeds where the flow is laminar. Plate B is tested twice, the first data set is by varying the water speed from a low to high. For the second set of data for Plate B was obtained by varying the water speed from high to a low. Both tests show the drag reduction at the low speed for Plate B.

Drag reduction at lower speed is tested on Plate B beginning at lower speeds than the data used in Figure 11. Figure 12 is a plot of the measured drag (Panel (a)) and the drag reduction (Panel (b)) observed for the coated Plate B with respect to a smooth control surface. As with the low speed water data plotted in Figure 8, the data which is plotted in figure 9 show significant drag reduction in the range of 30% at the low speed.

Inspection of Plates A and B following hydrodynamic drag measurements reveals the presence of air bubbles, typically 0.1-0.3 mm in size, were retained on Plate B. In contrast to Plat B, Plate A did not retain a coating of such bubbles.

**Example 20: Superhydrophobic Coating Durability Testing by Ultrasonic Technology.**

Samples are coated using a two step process. The base coat employs POLANE B® as a binder and Corvel Black as filler; and is followed by a top coat of M5 silica pretreated with Geleast silanizing agent SIT8174 (Example 5. Method B) suspended at 4% w/v in hexane. The coated sample is submerged in tetrahydrafuran (THF) and sonicated for 10 min using a UP400S Sonicator from Hielscher-Ultrasound Technology, Ringwood, NJ, (400W, 24 kHz unit run at 100% amplitude and for a single 10 min cycle). Following sonication, the coatings are dried and found to be completely intact with no loss of superhydrophobic performance (water contact angles of at least 150°).

**Example 21 Liquid Nitrogen Testing of Superhydrophobic Coatings.**

Two aluminum plates are coated using a two step process. The first plate (A) is coated with POLANE® B and S60 glass beads as base coat, followed by the application of M5 pretreated with Gelest silane SIT8174 (Example 5. Method B) suspended at 4% w/v in hexane as the top coat. A second aluminum plate (b) is coated in an identical fashion as the first substituting 512 thermoplastic beads for the S60 glass beads as the filler.
The plates are cooled in liquid nitrogen (-196°C) and subjected to a bend test in which the plates are bent several degrees at a time as rapidly as possible with repeated cooling in liquid nitrogen to reach the indicated angles. The first plate was successfully bent to an angle of 120° without noting any delamination or cracking of the coating. The second plate was successfully bent to an angle of 140° without delamination or cracking of the coating. Both plates retain their superhydrophobicity after liquid nitrogen cooling and bending.

Example 22 Superhydrophobic Coatings Applied to a Flexible Rubber Surface

As a test of the ability to coat flexible surfaces, a toilet plunger with a rubber end is coated using a two step process using POLANE® B and S60 glass beads as base coat, followed by the application of M5 pretreated with Gelest silane SIT8174 (Example 5, Method B) as the top coat. The coating is applied to the plunger's rubberized end (both inside and outside) and the adjacent portion of the handle to the extent that it will become wet in use. The coated plunger is cured at room temperature for 24 hours.

The plunger is subject to repeated cycles of plunging (50 uses) without showing any wetting or damage to the coating on the plunger head or the handle area. The coated plunger minimized or eliminated dripping and surface contamination by materials that could adhere to the plunger in use.

Example 23 Superhydrophobic Coatings Applied to Bed Pans and Bedside Commodes

A bed pan made from polypropylene is coated using a two step process using POLANE® B and S60 glass beads as base coat, followed by the application of M5 pretreated with Gelest silane SIT8174 (Example 5, Method B) as the top coat. The coating is applied both inside and outside.

A bedside commode made of high density polyethylene is coated in the same fashion as the bed pan. The coated bed pan and commode do not become wet during use and avoids the adherence of fecal matter to their surfaces. Treated pans and commodes are easier than their untreated counterparts to clean, which avoids the need for pressure washing and the spreading of bacteria from incompletely cleaned surfaces.

Example 24 Science Fun and Training Kits Application of Superhydrophobic Coating

The superhydrophobic phenomenon may not only be employed in many useful and interesting applications, but it also serves the purpose of science education and training in areas including: Second particles and nanotechnology; surface tension; contact angles and their measurement; solvents; and methods of preparing and applying superhydrophobic coatings.
Kits are assembled comprising a one-step coating composition and instructions. Alternatively, kits are assembled to comprise the materials needed to apply a superhydrophobic coating in a two-step process and instruction.

Kits may further include on or more of: applicators, such as paint brushes; mixing implements; and containers.

In addition to providing coating materials and instructions on how to apply the coating, the instructions may also include information on how to observe superhydrophobic phenomena and/or the basic scientific method.

**Example 25 Evaluation of Surface Roughness and Coating Thickness.**

A series of coatings prepared by the methods described herein are evaluated for roughness using a Mahr PocketSurf PS1 from Mahr Federal Inc. (Providence, RI 02905) and for thickness using a Positector 6000 from Delfelsko Corp. (Ogdensburg, N.Y). Both the arithmetical mean roughness (Ra) and the ten point mean roughness (Rz) are obtained. The average roughness Ra values of several coatings vary from 0.3-17.69 microns. The average roughness Rz values of several coatings vary from 1.91-78.53 microns. For each plate, both the low and high coating thickness values were measured. The low values of the coating thickness varied from 17.5-147.5 microns. The high values of thickness vary from 35-185 microns. Details are provide in Table 24.

**Example 26 BASELINE CONTACT ANGLES FOR THREE BINDER SYSTEMS**
Aluminum plates, 4 inches x 4 inches, are coated with one of three different binders in the absence of any added first or second particles. After curing at 200°F for 30-60 min, contact angle for each of the plates with water at about 18 to about 22°C is measured. The results indicate the following contact angles are found for the binders.

- **Self Etching Primer**: Contact angle varies from 80.69-83.27°.
- **Polane B**: Contact angle varies from 69.39-71.3°.
- **Lumiflon**: Contact angle varies from 75.76-80.70°.

Details are provided in Table 25.

Table 25
Plates were also tested for roll-off angle, in each case the binders have roll-off angles greater than 60 and less than 90 degrees and leave residual water on the surface.

**Example 27: Fabrics With Durable Hydrophobic Properties**

Fabric samples are treated with a silanizing agent alone, or with either SiCl$_4$ or Si(OEt)$_4$ followed by treatment with a silanizing agent, as indicated in Table 26. Two different silanizing agents were employed, (tridecafluoro-1,1,2,2-tetrahydrooctyl) trichlorosilane, which is a fluorinated silane, and n-octadecyltrichlorosilane, which is a not fluorinated. The treatment process comprised applying 10% solutions of either SiCl$_4$ or SiOEt$_4$ in hexane, or combinations thereof, to fabric samples by brushing the solutions on the fabric. Following treatment with SiCl$_4$ or SiOEt$_4$ the fabric is cured at about 93°C (about 200°F) for 60 minutes (min.). Silanes are then brushed on the fabric as a 1% solution in hexane, and the fabric samples are again cured at about 93°C (about 200°F) F for 60 min. Where acetic acid is employed it is used as a catalyst. Ten different fabrics having a variety of compositions are treated in this manner.

As an alternative to applying the agents by brushing, either the SiCl$_4$ or Si(OEt)$_4$, can also be applied by immersing the fabric in 10% solution of those agents in hexane under a pressure of 20 psi (pound per square inch) for 5 min. This step was carried out to enhance the attachment OfSiCl$_4$ or Si(OEt)$_4$ to the fabrics.

Hydrophobicity of the fabrics is observed by observing the beading and non-wetting behavior of the fabric samples. The durability of the hydrophobicity is measured by washing in soapy water until non-wetting performance ends. Four different commercial detergents, Ajax, Dawn, Tide, and Tide with 5% bleach are employed for the washing, which used the detergents in the amounts indicated by the suppliers. After each wash fabrics samples are dried at about 93°C (about 200°F) for 15 min.

CLAIMS*

1. A method of preparing a coating on a substrate comprising:
   applying to said substrate a composition comprising i) a binder; ii) one or more
   independently selected first particles having a size of about 30 microns to about 225
   microns; and iii) one or more independently selected second particles having a size of
   about 1 nanometer to 25 microns and optionally comprising one or more independently
   selected alkyl, haloalkyl, or perfluoroalkyl groups covalently bound, either directly or
   indirectly, to said second particles; wherein said composition optionally contains 5% to
   10% of a block copolymer on a weight basis.

2. The method of claim 1, wherein the composition comprises first particles in a range selected
   from: about 1% to about 50%; about 2% to about 40%; about 4% to about 30%; about 5%
   to about 25%; about 5% to about 35%; about 10% to about 25%; about 10% to about 30%;
   about 10% to about 40%; about 10% to about 45%; about 15% to about 25%; about 15%
   to about 35%; about 15% to about 45%; about 20% to about 30%; about 20% to about
   35%; about 20% to about 40%; about 20% to about 45%; about 20% to about 55%; about
   25% to about 40%; about 25% to about 45%; about 25% to about 55%; about 30% to about
   40%; about 30% to about 45%; about 30% to about 55%; about 30% to about 60%; about
   35% to about 45% or about 35% to about 50%; about 35% to about 60%, and about 40%
   to about 60% on a weight basis.

3. The method of claim 1 or claim 2, wherein the composition comprises second particles in a
   range selected from: about 1% to about 5%; about 2% to about 6%; about 4% to about
   10%; about 6% to about 12%; about 8% to about 16%; about 1% to about 16%; about 1%
   to about 20%; about 10% to about 20% and about 15% to about 20% on a weight basis.

4. A method of preparing a coating on a substrate comprising:
   a) applying to said substrate a coating composition comprising i) a binder and ii) first particles
      having a size of about 30 microns to about 225 microns, to provide a base coating; and
   b) applying to said base coating a composition comprising second particles having a size of about
      1 nanometer to 25 microns that optionally comprise one or more independently selected
      alkyl, haloalkyl or perfluoroalkyl groups covalently bound, either directly or indirectly, to
      said second particles.

5. The method of claim 4, wherein said coating composition comprises first particles in a range
   selected from: about 1% to about 50%; about 2% to about 40%; about 4% to about 30%;
   about 5% to about 25%; about 5% to about 35%; about 10% to about 25%; about 10% to about 30%;
   about 10% to about 40%; about 10% to about 45%; about 15% to about 25%;
about 15% to about 35%; about 15% to about 45%; about 20% to about 30%; about 20% to about 35%; about 20% to about 40%; about 20% to about 45%; about 20% to about 55%; about 25% to about 40%; about 25% to about 45%; about 25% to about 55%; about 30% to about 40%; about 30% to about 45%; about 30% to about 55%; about 30% to about 60%; about 35% to about 45%; about 35% to about 50%; about 35% to about 60%, and about 40% to about 60% on a weight basis.

6. The method of claim 4 or 5, wherein the composition comprising second particles comprises second in a range selected from: about 1% to about 5%; about 2% to about 6%; about 4% to about 10%; about 6% to about 12%; about 8% to about 16%; about 1% to about 16%; about 1% to about 20%; about 10% to about 20% and about 15% to about 20% on a weight basis.

7. The method of any of claims 1 to 6, wherein the binder comprises a polyurethane, lacquer, fluoropolymer, epoxy or thermoplastic powder coating.

8. The method of any of claims 1 to 6, wherein the binder comprises a polyurethane, lacquer, fluoropolymer, or thermoplastic powder coating.

9. The method of any of claims 1 to 6, wherein the binder comprises a polyurethane, lacquer, or fluoropolymer.

10. The method of any of claims 1 to 9, wherein the method comprises brushing, painting, dipping, spin coating, spraying, or electrostatic spraying at least a portion of one layer comprising a binder and said first particles.

11. The method of any of claims 1 to 10, wherein the binder comprises a powder coating.

12. The method of any of claims 1 to 11, wherein the binders are hydrophilic or hydrophobic in the absence of said first particles and said second particles.

13. The method of any of claims 1 to 12, wherein said first particles comprise a material selected from the group consisting of: wood, cellulose, glass, metal oxides, metalloid oxides, plastics, carbides, nitrides, borides, spinels, diamond and fibers.

14. The method of any of claims 1 to 12, wherein said first particle comprise a material selected from the group consisting of: a thermoplastic and a glass.

15. The method of any of claims 1 to 12, wherein said first particles are selected from the group consisting of: wood particles, cellulose particles, glass particles, metal oxide particles, metalloid oxide particles, plastic particles, carbide particles, nitride particles, boride particles, spinel particles, diamond particles, fly ash particles, fibers and hollow glass spheres.
16. The method of any of claims 1 to 15, wherein the first particles have an average size in a range selected from: greater than about 5 µm to about 50 µm; about 10 µm to about 100 µm; about 10 µm to about 200 µm; about 20 µm to about 200 µm; about 30 µm to about 100 µm; about 30 µm to about 200 µm; about 50 µm to about 100 µm; about 50 µm to about 200 µm; about 75 µm to about 150 µm; about 75 µm to about 200 µm; about 100 µm to about 225 µm; about 125 µm to about 225 µm; and about 100 µm to about 250 µm.

17. The method of any of claims 1 to 15, wherein the first particles have an average size in a range selected from: about 30 µm to about 225 µm (microns); about 30 µm to about 50 µm; about 30 µm to about 100 µm; about 30 µm to about 200 µm; about 50 µm to about 100 µm; about 50 µm to about 200 µm; about 75 µm to about 150 µm; about 75 µm to about 200 µm; about 100 µm to about 225 µm; about 100 µm to about 225 µm and about 100 µm to about 250 µm.

18. The method of any of claims 1 to 15, wherein the first particles have an average size greater than 30 microns and less than 250 microns.

19. The method of any of claims 1 to 18, wherein the coatings do not contain only particles with a size of 25 microns or less, or only particles with an average size of 25 microns or less.

20. The method of any of claims 1 to 18, wherein the coatings do not contain only particles with a size of 30 microns or less, or only particles with an average size of 30 microns or less.

21. The method of any of claims 1 to 17, wherein the coatings do not contain only particles with a size of 50 microns or less, or only particles with an average size of 50 microns or less.

22. The method of any of claims 1 to 8 or 10 to 21, wherein, said binder comprises a thermoplastic powder coating.

23. The method of claim 21, wherein said first particles are extended.

24. The method of any of claims 22 to 23, wherein said powder coat is mixed an amount of first particles in a range selected from: from 5% to 60%; from 10% to 30%; from 20% to 30%; from 22% to 27%; from 20% to 40%; from 20% to 50%; from 30% to 40%; and from 30% to 50% on a weight basis prior to applying the powder coat and filler to said surface.

25. The method of any of claims 22 to 23, wherein the powder coating is applied to said substrate at a rate of 12 to 24 grams per 16 inch² based on the dry weight of the powder coating.

26. The method of claims 25 wherein said rate is about 12 grams per 16 inch².

27. The method of any of claims 22 to 26, wherein the powder coating is applied to the substrate at about 18° to about 24°C (65° to 75°F).

28. The method of any of claims 22 to 27, wherein prior to applying said powder coating, said substrate is heated to a temperature in a range selected from: about 45° to about 150°C.
50° to about 150°C (122°-302°F); 50° to about 175°C (122°-347°F); and 55° to about 180°C (131°-355°F), and said powder coat is applied to said substrate at the temperature in the range selected.

29. The method of any of claims 22 to 28, wherein said substrate is brought to temperature in a range selected from: about 50° to about 150°C (122°-302°F); 55° to about 175°C (131°-347°F); and 65° to about 180°C (149°-355°F) after the applying the powder coating to form a thermoplastic coating on said substrate.

30. The method of any of claim 22 to 29, wherein said thermoplastic coating on said substrate is brought to a temperature in a range selected from: about 50° to about 150°C (122°-302°F); about 80° to about 121°C (175°-250°F); about 93° to about 99°C (200°-210°F); or about 70° to about 110°C (160°-230°F), prior to applying a top coat of second particles.

31. The method of any of claims 22 to 30, further comprising applying one or more applications of (a) a coating composition comprising second particles having a size of about 1 nanometer to 25 microns that comprise one or more independently selected alkyl, haloalkyl or perfluoroalkyl groups covalently bound, either directly or indirectly, to said second particles, or (b) a composition comprising a silanizing agent of formula (I).

32. The method of claim 31, further comprising curing said coating following said one or more applications, for a time and temperature selected from the ranges in the group consisting of: about 380° to about 420° F for 2 to 9 minutes; about 390° to about 410° F for 3 to 8 minutes and about 400° F for 4 to 7 minutes.

33. The method of any of claims 1 to 32, wherein said first particles do not comprises one or more independently selected covalently bound hydrophobic or oleophobic moieties.

34. The method of any of claims 1 to 32, wherein said first particles comprise one or more independently selected covalently bound hydrophobic or oleophobic moieties.

35. The method of claim 34, wherein said one or more independently selected covalently bound hydrophobic or oleophobic moieties comprise one or more independently selected alkyl, fluoroalkyl or perfluoroalkyl moieties.

36. The method of any of claims 1 to 35, wherein said first particles comprises one or more covalently bound hydrophobic or oleophobic moieties introduced by reacting the first particles with a silanizing agent of formula (I)

\[ \text{R}_n \text{Si-X}_n \]  

where n is an integer from 1 to 3;
each R is independently selected from 
(i) alkyl or cycloalkyl group optionally substituted one or more fluorine atoms,
(ii) C_{10} to 20 alkyl optionally substituted with one or more independently selected substituents selected from fluorine atoms and C_{6,14} aryl groups, which aryl groups are optionally substituted with one or more independently selected halo, C_{10} to 20 alkyl, C_{10} to 20 haloalkyl, C_{10} to 20 alkoxy, or C_{10} to 20 haloalkoxy substituents,

(iii) C_{6} to 20 alkyl ether optionally substituted with one or more substituents independently selected from fluorine and C_{6,14} aryl groups, which aryl groups are optionally substituted with one or more independently selected halo, C_{10} to 20 alkyl, C_{10} to 20 haloalkyl, C_{10} to 20 alkoxy, or C_{10} to 20 haloalkoxy substituents,

(iv) C_{6,14} aryl, optionally substituted with one or more substituents independently selected from halo or alkoxy, and haloalkoxy substituents;

(v) C_{6} to 20 alkenyl or C_{6} to 20 alkynyl, optionally substituted with one or more substituents independently selected from halo, alkoxy, or haloalkoxy; and

(vi) -Z-(CF_{2})_{q}(CF_{3})_{r}, wherein Z is a C_{1,12} divalent alkane radical or a C_{2,12} divalent alkene or alkyne radical, q is an integer from 1 to 12, and r is an integer from 1-4;

each X is independently selected from -H, -Cl, -I, -Br, -OH, -OR, -NHR, or -N(R)_{2};

each R^{2} is independently selected C_{1,04} alkyl or haloalkyl group; and

each R^{3} is independently an independently selected H, C_{1,04} alkyl or haloalkyl group.

37. The method of any of claims 1 to 36, wherein second particles have an average size in a range selected from about 1 nm to about 100 nm; about 10 nm to about 200 nm; about 20 nm to about 400 nm; about 10 nm to about 500 nm; about 40 nm to about 800 nm; about 100 nm to about 1 micron; about 200 nm to about 1.5 micron; about 500 nm to about 2 microns; about 500 nm to about 2.5 microns; about 1.0 micron to about 10 microns; about 2.0 micron to about 20 microns; about 2.5 micron to about 25 microns; about 500 nm to about 25 microns; about 400 nm to about 20 microns; and about 100 nm to about 15 microns.

38. The method of any of claims 1-37, wherein said second particles comprise: a metal oxide, an oxide of a metalloid, a silicate, or a glass.

39. The method of any of claims 1 to 38, wherein said second particles are comprised of silica and having an average size in a range selected from about 1 nm to about 50 nm; about 1 nm to about 100 nm; about 1 nm to about 400 nm; about 1 nm to about 500 nm; about 2 nm to about 120 nm; about 5 nm to about 150 nm; about 5 nm to about 400 nm; about 10 nm to about 300 nm; and about 20 nm to 400 nm.

40. The method of claim 39, wherein said second particles have an average size in the range of 1 nm to 100 nm or 2 nm to 200 nm.
41. The method of any of claims 1 to 40, wherein said second particles comprise one or more chemical moieties that provide hydrophobic or oleophobic properties.

42. The method of any of claims 1 to 41, wherein said second particles comprise one or more alkyl, fluoroalkyl, and perfluoroalkyl moieties that are covalently bound to the second particles directly or indirectly through one or more atoms bound to the second particles.

43. The method of any of claims 1 to 41, wherein said second particles are treated with a silanizing agent of formula (I):

$$R_4-n\text{Si-X}_n \quad (I)$$

where n is an integer from 1 to 3;

each R is independently selected from

(i) alkyl or cycloalkyl group optionally substituted one or more fluorine atoms,

(ii) \(C_{10t020}\) alkyl optionally substituted with one or more independently selected substituents selected from fluorine atoms and \(C_{6-14}\) aryl groups, which aryl groups are optionally substituted with one or more independently selected halo, \(C_{1to f0}\) alkyl, \(C_{1to f0}\) haloalkyl, \(C_{1to f0}\) alkoxy, or \(C_{1to f0}\) haloalkoxy substituents,

(iii) \(C_{6to22}\) alkyl ether optionally substituted with one or more substituents independently selected from fluorine and \(C_{6-14}\) aryl groups, which aryl groups are optionally substituted with one or more independently selected halo, \(C_{1to f0}\) alkyl, \(C_{1to f0}\) haloalkyl, \(C_{1to f0}\) alkoxy, or \(C_{1to f0}\) haloalkoxy substituents,

(iv) \(C_{6-14}\) aryl, optionally substituted with one or more substituents independently selected from halo or alkoxy, and haloalkoxy substituents;

(v) \(C_{6to20}\) alkenyl or \(C_{60t20}\) alkynyl, optionally substituted with one or more substituents independently selected from halo, alkoxy, or haloalkoxy; and

(vi) \(-Z\cdot(CF_2)_q(CF_3)_r\), wherein Z is a \(C_{1-12}\) divalent alkane radical or a \(C_{2-12}\) divalent alkene or alkyne radical, q is an integer from 1 to 12, and r is an integer from 1-4;

each X is independently selected from \(-H\), \(-Cl\), \(-I\), \(-Br\), \(-OH\), \(-OR^2\), \(-NHR^3\), or \(-N(R^3)_2\); each \(R^2\) is independently selected \(C_{1to4}\) alkyl or haloalkyl group; and each \(R^3\) is independently an independently selected \(H\), \(C_{1to4}\) alkyl or haloalkyl group.

44. The method of claim 43, wherein R is selected from: (a) an alkyl or fluoroalkyl group having from 6 to 20 carbon atoms; (b) an alkyl or fluoroalkyl group having from 8 to 20 carbon atoms; (c) an alkyl or fluoroalkyl group having from 10 to 20 carbon atoms; (d) an alkyl or fluoroalkyl group having from 6 to 20 carbon atoms when n is 3; (e) an alkyl or fluoroalkyl
group having from 8 to 20 carbon atoms when n is 3; and (f) an alkyl or fluoroalkyl group
having from 10 to 20 carbon atoms when n is 3.

45. The method of claim 43 or 44, wherein R is \( \text{-Z-}((\text{CF}_2)_q(\text{CF}_3))_r \), where Z is a \( \text{C}_{1-12} \) divalent alkane radical or a \( \text{C}_{2-12} \) divalent alkene or alkyne radical, and q is an integer from 1 to 12,
and r is an integer from 1-4.

46. The method of any of claims 40 to 45, wherein n is 3.

47. The method of any of claims 40 to 45, wherein n is 2.

48. The method of any of claims 40 to 45, wherein n is 1.

49. The method of any of claims 43 to 48, wherein all halogen atoms present in any one or more
R groups are fluorine atoms.

50. The method of any of claims 43 to 49, wherein each X is independently selected from H, Cl,
-OR\(^2\), -NHR\(^3\), and -N(R3)2.

51. The method of any of claims 43 to 49, wherein each X is independently selected from Cl, -
OR\(^2\), -NHR\(^3\), and -N(R3)2.

52. The method of any of claims 43 to 49, wherein each X is independently selected from Cl, -
NHR\(^3\), and -N(R3)2.

53. The method of any of claims 43 to 52, wherein said coating is prepared with two or more,
three or more, or four or more compounds of formula (I) employed alone or in combination
to modify at least one of a first particle, or a second particle.

54. The method of any of claims 1 to 42, wherein said second particles are treated with a
silanizing agent selected from tridecafluoro-1,1,2,2-tetrahydrooctylsilane (SIT8173.0);
(tridecafluoro-1,1,2,2-tetrahydrooctyl) trichlorosilane (SIT8174.0); (tridecafluoro-
1,1,2,2-tetrahydrooctyl) triethoxysilane (SIT8175.0); (tridecafluoro-1,1,2,2-
tetrahydrooctyl)trimethoxysilane (SIT8176.0); (heptadecafluoro-1,1,2,2-
tetrahydrodecyl)dimethyl(dimethylamino) silane (S1H5840.5); (heptadecafluoro-1,1,2,2-
tetrahydrodecyl)tris(dimethylamino) silane (S1H5841.7); n-octadecyltrimethoxysilane
(SIO6645.0); n-octyltrimethoxysilane (SIO6715.0); and

55. The method of any of claims 1 to 42, wherein said second particles are treated with a
silanizing agent selected from: dimethylidichlorosilane, hexamethyldisilazane,
octyltrimethoxysilane, polydimethyldisiloxane, and tridecafluoro-
1,1,2,2-tetrahydrooctyl trichlorosilane.
56. The method of any of claims 43 to 52, wherein said second particles are silica particles treated with a silicon containing reagent that can increase the number of sites that can react with silanizing agents prior to being treated with said silanizing agent.

57. The method of claim 56 wherein said silicon containing reagent that can increase the number of sites that can react with silanizing agents is selected from the group consisting of: SiCl₄, Si(OMe)₄, Si(OMe)₃CH₃, SiCl₃CH₂SiCl₂, SiCl₃CH₂CH₂SiCl₃, Si(OMe)₃CH₂Si(OMe)₃, Si(OEt)₃CH₂Si(OEt)₃, Si(OEt)₃CH₂Si(OEt)₂Si(OEt)₃, and Si(OEt)₃CH₂CH₂Si(OEt)₃.

58. The method of any of claims 1 to 57, further comprising drying or curing said coatings at a temperature in a range selected from: about 65°F to about 90°F; about 90 to about 120°F; about 100°F to about 400°F; about 100°F to about 150°F; about 100°F to about 200°F; about 100°F to about 300°F; about 200°F to about 300°F; and about 200°F to about 400°F.

59. The method of claim 58, wherein said drying or curing is conducted for a time in the range of about 1 minute to about 5 minutes; about 1 minute to about 20 minutes; about 10 minutes to about 60 minutes; about 30 minutes to 100 minutes; about 30 minutes to about 130 minutes; about 1 hour to about 5 hours; about 1 hour to 10 hours; or about 4 hours to 24 hours.

60. The method of any of claims 1 to 59, further comprising applying a silanizing agent to said coating after its application to the substrate.

61. The method of claim 60, wherein said silanizing agent comprises a compound of formula (I).

62. The method of claim 61, wherein said silanizing agent is selected from tridecafluoro-1,1,2,2-tetrahydrooctyl)silane (SIT8173.0); (tridecafluoro-1,1,2,2-tetrahydrooctyl)trichlorosilane (SIT81 74.0); (tridecafluoro-1,1,2,2-tetrahydrooctyl)triethoxysilane (SIT81 75.0); (tridecafluoro-1,1,2,2-tetrahydrooctyl)trimethoxysilane (SIT81 76.0); (heptadecafluoro-1,1,2,2-tetrahydrodecyl)dimethyl(dimethylamino)silane (SIH5840.5); (heptadecafluoro-1,1,2,2-tetrahydrodecyl)tris(dimethylamino)silane (SIH5841.7); n-octadecyltrimethoxysilane (SIO6645.0); n-octyltriethoxysilane (SIO6715.0); and nonafluorohexyldimethyl(dimethylamino)silane (SIN6597.4).

63. The method of any of claims 1 to 59, further comprising applying an agent selected from dimethyldichlorosilane, hexamethyldisilazane, octyltrimethoxysilane, polydimethylsiloxane, and tridecafluoro-1,1,2,2-tetrahydrooctyl trichlorosilane to said coating after its application to the substrate.

64. The method of any of claims 1 to 63, wherein said coating has a surface in contact with said substrate and an exposed surface that is not in contact with the substrate, said coating
having a greater amount of second particles on, at, or adjacent to the exposed surface than
the surface in contact with the substrate.

65. The method of claim 64, wherein said surface in contact with said substrate has no second
particles.

66. The method of claim 64, wherein the amount of second particles on said surface in contact
with said substrate is less than 5%, 10%, 20%, 30%, 40%, 50%, 60%, 70%, 80%, or 90% of
the amount of second particles on said exposed surface, wherein said amount of second
particles is determined by the number of said second particles.

67. The method of any of claims 64 to 66, wherein said amount of second particles is
determined by electron microscopy.

68. The method of any of claims 1 to 67, wherein the coating has a textured surface having
projections due to the presence of said first particles, said projections having a maximum
height above the level of the binder in a range selected from: from about 10 to about 180
microns; from about 15 to about 150 micron; from about 20 to about 100 microns; from 30 to
120 microns; from about 40 to 140 microns; from about 50 to about 150 microns, and from
about 20 to about 80 microns.

69. The method of any of claims 1 to 67, wherein the coating has an arithmetical mean
roughness in a range selected from: greater than about 0.2 microns to about 20 microns; from
about 0.3 microns to about 18 microns; from about 0.2 microns to about 8 microns; from
about 8 microns to about 20 microns; or from about 0.5 microns to about 15 microns.

70. The method of any of claims 1 to 67, wherein the durable coating has a ten point mean
roughness selected from: greater than about 1 micron to about 90 microns; from about 2
microns to about 80 microns; from about 3 microns to about 70 microns; from about 1
micron to about 40 microns; from about 40 microns to about 80 microns; from about 10
microns to about 65 microns; and from about 20 microns to about 60 microns.

71. The method of any of claims 1 to 70, wherein said coating retains its hydrophobicity when
subject to at least 200, 300, 400 or 500 abrasions cycles, as measured with a Taber Abrasion
tester model 503 using CS-10 wheels and 250 g loads, wherein a surface is no long
considered to retain its hydrophobicity when more than half of water droplets placed on the
abraded surface are retained where the surface is inclined at an angle of 6°.

72. The method of any of claims 4 to 70, wherein said coating retains its hydrophobicity when
subject to at least 100, 200, 300, 400, 500, 600, or 700 abrasions cycles, as measured with a
Taber Abrasion tester model 503 using CS-10 wheels and 250 g loads, wherein a surface is
no long considered to retain its hydrophobicity when more than half of water droplets placed on the abraded surface are retained when the surface is inclined at an angle of 6°.

73. The method of any of claims 1 to 70, wherein said coating retains its hydrophobicity when subject to at least 100, 200, 300, 400, 500, 600, 700, 800, 900 or 1,000 abrasions cycles of manual abrasion using an 800g load, wherein a surface is no long considered to retain its hydrophobicity when more than half of water droplets placed on the abraded surface are retained where the surface is inclined at an angle of 6°.

74. The method of any of claims 4 to 70, wherein said coating retains its hydrophobicity when subject to at least 100, 200, 300, 400, 500, 600, 700, 800, 900, 1,000, 1,200, 1,400, 1,600, 1,800, 2,000, 2,500, 3,000, or 3,500 cycles of manual abrasion using an 800g load, wherein a surface is no long considered to retain its hydrophobicity when more than half of water droplets placed on the abraded surface are retained where the surface is inclined at an angle of 6°.

75. The method of any of claims 1 to 74, wherein said coating has a contact angle with water that is greater than about 90°, 100°, 110°, 120°, 130°, 140°, 150°, 160°, 165°, 170° or 175° measured at 18°C to 23°C.

76. The method of any of claims 1 to 75 wherein said substrate is selected from metal, ceramic, glass, masonry, stone, wood, wood composites, wood laminates, cardboard, and paper plastic rubber.

77. A coating prepared by the method of any of claims 1 to 76.

78. The coating of claim 77, wherein said substrate is selected from: wire, cable, insulators for electric equipment wires or cables, glass, glass shelving, glass plates, metal adhesive tape, plastic adhesive tape, paper adhesive tape, fiber glass adhesive tape, a metal sheet, a bed pan, a commode, a toilet plunger, an umbrella, bridge element, a ladder, stairs, automobile body, a satellite receiver dish, and a part of a boat, including, but not limited to, a hull, mast, antenna, deck, or ladder, or a portion of any of those substrates.

79. A composition for applying a coating to a substrate comprising:
   i) a binder; ii) first particles having a size of about 30 microns to about 225 microns; and
   iii) second particles having a size of about 1 nanometer to 25 microns and optionally comprising one or more independently selected alkyl, haloalkyl, or perfluoroalkyl groups covalently bound, either directly or indirectly, to said second particles; wherein said composition optionally contains 5% to 10% of a block copolymer on a weight basis; and wherein said composition optionally comprises one or more solvents.
80. The method of claim 79, wherein the composition comprises first particles in a range selected from: about 1% to about 50%; about 2% to about 40%; about 4% to about 30%; about 5% to about 25%; about 5% to about 35%; about 10% to about 25%; about 10% to about 30%; about 10% to about 40%; about 10% to about 45%; about 15% to about 25%; about 15% to about 35%; about 15% to about 45%; about 20% to about 30%; about 20% to about 35%; about 20% to about 40%; about 20% to about 45%; about 20% to about 55%; about 25% to about 40%; about 25% to about 45%; about 25% to about 55%; about 30% to about 40%; about 30% to about 45%; about 30% to about 55%; about 30% to about 60%; about 35% to about 45% or about 35% to about 50%; about 35% to about 60%, and about 40% to about 60% on a weight basis.

81. The method of claim 79 or claim 80, wherein the coating composition comprises second particles in a range selected from: about 1% to about 5%; about 2% to about 6%; about 4% to about 10%; about 6% to about 12%; about 8% to about 16%; about 1% to about 16%; about 1% to about 20%; about 10% to about 20% or about 15% to about 20% on a weight basis.

82. A composition for applying a coating to a substrate comprising components (a) and (b): wherein component (a) comprises i) a binder and ii) first particles having a size of about 30 microns to about 225 microns, wherein said component (a) optionally comprises one or more solvents; and wherein component (b) comprises second particles having a size of about 1 nanometer to 25 microns that optionally comprise one or more independently selected alkyl, haloalkyl or perfluoroalkyl groups covalently bound, either directly or indirectly, to said second particles, wherein said component (b) optionally comprises one or more solvents.

83. The method of claim 82, wherein said component (a) comprises first particles in a range selected from: about 1% to about 50%; about 2% to about 40%; about 4% to about 30%; about 5% to about 25%; about 5% to about 35%; about 10% to about 25%; about 10% to about 30%; about 10% to about 40%; about 10% to about 45%; about 15% to about 25%; about 15% to about 35%; about 15% to about 45%; about 20% to about 30%; about 20% to about 35%; about 20% to about 40%; about 20% to about 45%; about 20% to about 55%; about 25% to about 40%; about 25% to about 45%; about 25% to about 55%; about 30% to about 40%; about 30% to about 45%; about 25% to about 55%; about 30% to about 60%; about 35% to about 45%; about 35% to about 50%; about 35% to about 60%, and about 40% to about 60% on a weight basis.
84. The method of claim 82 or 83, wherein component (b) comprises second particles in a range selected from: about 1% to about 5%; about 2% to about 6%; about 4% to about 10%; about 6% to about 12%; about 8% to about 16%; about 1% to about 16%; about 1% to about 20%; about 10% to about 20% and about 15% to about 20% on a weight basis.

85. The composition of any of claims 79 to 84, wherein the binder comprises a polyurethane, lacquer, fluoropolymer, epoxy or thermoplastic powder coating.

86. The composition of any of claims 79 to 84, wherein the binder comprises a polyurethane, lacquer, or fluoropolymer.

87. The composition of any of claims 79 to 84, wherein the binder comprises a thermoplastic powder coating.

88. The composition of any of claims 79 to 87, wherein the binders are hydrophilic or hydrophobic in the absence of said first particles and said second particles.

89. The composition of any of claims 79 to 88, wherein said first particles comprise a material selected from the group consisting of: wood, cellulose, glass, metal oxides, metalloid oxides, plastics, carbides, nitrides, borides, spinels, diamond and fibers.

90. The composition of any of claims 79 to 88, wherein said first particle comprise a material selected from the group consisting of: a thermoplastic and a glass.

91. The composition of any of claims 79 to 88, wherein said first particles are selected from the group consisting of: wood particles, cellulose particles, glass particles, metal oxide particles, metalloid oxide particles, plastic particles, carbide particles, nitride particles, boride particles, spinel particles, diamond particles, fly ash particles, fibers and hollow glass spheres.

92. The composition of any of claims 79 to 91, wherein the first particles have an average size in a range selected from: greater than about 5 µm to about 50 µm; about 10 µm to about 100 µm; about 10 µm to about 200 µm; about 20 µm to about 200 µm; about 30 µm to about 100 µm; about 30 µm to about 200 µm; about 50 µm to about 100 µm; about 50 µm to about 200 µm; about 75 µm to about 150 µm; about 75 µm to about 200 µm; about 100 µm to about 225 µm; about 125 µm to about 225 µm; or about 100 µm to about 250 µm.

93. The composition of any of claims 79 to 91, wherein the first particles have an average size in a range selected from: about 30 µm to about 225 µm (microns); about 30 µm to about 50 µm; about 30 µm to about 100 µm; about 30 µm to about 200 µm; about 50 µm to about 100 µm; about 50 µm to about 200 µm; about 75 µm to about 150 µm; about 75 µm to about 200 µm; about 100 µm to about 225 µm; about 100 µm to about 225 µm or about 100 µm to about 250 µm.
94. The composition of any of claims 79 to 91, wherein the first particles have an average size greater than 30 microns and less than 250 microns.

95. The composition of any of claims 79 to 91, wherein the compositions does not contain only particles with a size of 25 microns or less, or only particles with an average size of 25 microns or less.

96. The composition of any of claims 79 to 93, wherein the composition does not contain only particles with a size of 30 microns or less, or only particles with an average size of 30 microns or less.

97. The composition of any of claims 79 to 93, wherein the composition does not contain only particles with a size of 50 microns or less, or only particles with an average size of 50 microns or less.

98. The composition of any of claims 79 to 85 or 87 to 97, wherein, said binder is a thermoplastic powder coating.

99. The composition of claim 98, wherein said first particles are extended spheres.

100. The composition of any of claims 98 to 99, wherein said powder coat is mixed an amount of first particles in a range selected from: from 5% to 60%; from 10% to 30%; from 20% to 30%; from 22% to 27%; from 20% to 40%; from 20% to 50%; from 30% to 40%; from 30% to 50% on a weight basis.

101. The composition of any of claims 79 to 100, wherein said first particles do not comprises one or more independently selected covalently bound hydrophobic or oleophobic moieties.

102. The composition of any of claims 79 to 100, wherein said first particles comprises one or more independently selected covalently bound hydrophobic or oleophobic moieties

103. The composition of claim 102, wherein said one or more independently selected covalently bound hydrophobic or oleophobic moieties comprise one or more independently selected alkyl, fluoroalkyl or perfluoroalkyl moieties.

104. The composition of any of claims 79 to 103, wherein said first particles comprises one or more covalently bound hydrophobic or oleophobic moieties of the form:

\[ R_{3-n}X_nSi- \]

where \( n \) is an integer from 0 to 2;

each \( R \) is independently selected from

(i) alkyl or cycloalkyl group optionally substituted one or more fluorine atoms,

(ii) \( C_{102} \) alkyl optionally substituted with one or more independently selected substituents selected from fluorine atoms and \( C_{6-14} \) aryl groups, which aryl groups are optionally
substituted with one or more independently selected halo, C_{10} alkyl, C_{10} haloalkyl, C_{10} alkoxy, or C_{10} haloalkoxy substituents,

(iii) C_{6-10} alkyl ether optionally substituted with one or more substituents independently selected from fluorine and C_{6-14} aryl groups, which aryl groups are optionally substituted with one or more independently selected halo, C_{10} alkyl, C_{10} haloalkyl, C_{10} alkoxy, or C_{10} haloalkoxy substituents,

(iv) C_{6-14} aryl, optionally substituted with one or more substituents independently selected from halo or alkoxy, and haloalkoxy substituents;

(v) C_{6-10} alkynyl or C_{6-10} alkenyl, optionally substituted with one or more substituents independently selected from halo, alkoxy, or haloalkoxy; and

(vi) -Z-(CF_{2})_{q}-(CF_{3})_{r}, wherein Z is a C_{1-12} divalent alkane radical or a C_{2-12} divalent alkene or alkyne radical, q is an integer from 1 to 12, and r is an integer from 1-4;

each X is independently selected from -H, -Cl, -I, -Br, -OH, -OR, -NHR, or -N(R)_{2};
each R^{2} is independently selected C_{1-10} alkyl or haloalkyl group; and
each R^{3} is independently an independently selected H, C_{1-10} alkyl or haloalkyl group.

105. The composition of any of claims 79 to 104, wherein second particles have an average size in a range selected from about 1 nm to about 100 nm; about 10 nm to about 200 nm; about 20 nm to about 400 nm; about 10 nm to about 500 nm; about 40 nm to about 800 nm; about 100 nm to about 1 micron; about 200 nm to about 1.5 microns; about 500 nm to about 2 microns; about 500 nm to about 2.5 microns; about 1.0 micron to about 10 microns; about 2.0 micron to about 20 microns; about 2.5 micron to about 25 microns; about 500 nm to about 25 microns; about 400 nm to about 20 microns; or about 100 nm to about 15 microns.

106. The composition of any of claims 79-105, wherein said second particles comprise: a metal oxide, an oxide of a metalloid, a silicate, or a glass.

107. The composition of any of claims 79 to 106, wherein said second particles are comprised of silica and having an average size in a range selected from about 1 nm to about 50 nm; about 1 nm to about 100 nm; about 1 nm to about 400 nm; about 1 nm to about 500 nm; about 2 nm to about 120 nm; about 5 nm to about 150 nm; about 5 nm to about 400 nm; about 10 nm to about 300 nm; or about 20 nm to 400 nm.

108. The composition of claim 107, wherein said second particles have an average size in the range of 1 nm to 100 nm or 2 nm to 200 nm.

109. The composition of any of claims 79 to 108, wherein said second particles comprise one or more chemical moieties that provide hydrophobic or oleophobic properties
110. The composition of any of claims 79 to 109, wherein said second particles comprise one or more alkyl, fluoroalkyl, and perfluoroalkyl moieties that are covalently bound to the second particles directly or indirectly through one or more atoms bound to the second particles.

111. The composition of any of claims 79 to 109, wherein said second particles comprises one or more covalently bound hydrophobic or oleophobic moieties of the form:

$$R_{3-n} X_n Si$$

where \( n \) is an integer from 0 to 2;

each \( R \) is independently selected from:

(i) alkyl or cycloalkyl group optionally substituted one or more fluorine atoms,

(ii) \( C_{1020} \) alkyl optionally substituted with one or more independently selected substituents selected from fluorine atoms and \( C_{6-14} \) aryl groups, which aryl groups are optionally substituted with one or more independently selected halo, \( C_{10} \) alkyl, \( C_1 \) to \( 10 \) haloalkyl, \( C_{10} \) \( 10 \) alkoxy, or \( C_{10} \) \( 10 \) haloalkoxy substituents,

(iii) \( C_{6-1020} \) alkyl ether optionally substituted with one or more substituents independently selected from fluorine and \( C_{6-14} \) aryl groups, which aryl groups are optionally substituted with one or more independently selected halo, \( C_{10} \) alkyl, \( C_1 \) to \( 10 \) haloalkyl, \( C_{10} \) \( 10 \) alkoxy, or \( C_{10} \) \( 10 \) haloalkoxy substituents,

(iv) \( C_{6-14} \) aryl, optionally substituted with one or more substituents independently selected from halo or alkoxy, and haloalkoxy substituents;

(v) \( C_{4-1020} \) alkenyl or \( C_{4-1020} \) alkynyl, optionally substituted with one or more substituents independently selected from halo, alkoxy, or haloalkoxy;

(vi) \(-Z-((CF_2)_q(CF_3)_r)\), wherein \( Z \) is a \( C_{1-12} \) divalent alkane radical or a \( C_{2-12} \) divalent alkene or alkylene radical, \( q \) is an integer from 1 to 12, and \( r \) is an integer from 1-4; each \( X \) is independently selected from -H, -Cl, -I, -Br, -OH, -OR\(^2\), -NHR\(^3\), or -N(R\(^3\))\(^2\);
each \( R^2 \) is independently selected \( C_{104} \) alkyl or haloalkyl group; and each \( R^3 \) is independently an independently selected H, \( C_{104} \) alkyl or haloalkyl group.

112. The composition of claim 111, wherein \( R \) is selected from: (a) an alkyl or fluoroalkyl group having from 6 to 20 carbon atoms; (b) an alkyl or fluoroalkyl group having from 8 to 20 carbon atoms; (c) an alkyl or fluoroalkyl group having from 10 to 20 carbon atoms; (d) an alkyl or fluoroalkyl group having from 6 to 20 carbon atoms when \( n \) is 3; (e) an alkyl or fluoroalkyl group having from 6 to 20 carbon atoms when \( n \) is 3; (f) an alkyl or fluoroalkyl group having from 10 to 20 carbon atoms when \( n \) is 3.

113. The composition of any of claims 111 to 112, wherein \( R \) is \(-Z-((CF_2)_q(CF_3)_r)\)
114. The composition of any of claims 111 to 113, wherein n is 3.
115. The composition of any of claims 111 to 113, wherein n is 2.
116. The composition of any of claims 111 to 113, wherein n is 1.
117. The composition of any of claims 111 to 116, wherein all halogen atoms present in any one or more R groups are fluorine atoms.
118. The composition of any of claims 111 to 117, wherein each X is independently selected from H, Cl, -OR, -NHR, or -N(R3)2.
119. The composition of any of claims 111 to 117, wherein each X is independently selected from Cl, -OR, -NHR, or -N(R3)2.
120. The composition of any of claims 11 to 117, wherein each X is independently selected from Cl, -NHR, or -N(R3)2.
121. The composition of any of claims 111 to 120, wherein said coating is prepared with two or more, three or more, or four or more compounds of formula (I) employed alone or in combination to modify at least one of a first particle, or a second particle.
122. The composition of any of claims 79 to 110, wherein said second particles are treated with a silanizing agent is selected from tridecafluoro-1,1,2,2-tetrahydrooctyl)silane (SIT8173.0); (tridecafluoro-1,1,2,2-tetrahydrooctyl)trichlorosilane (SIT8174.0); (tridecafluoro-1,1,2,2-tetrahydrooctyl)trimethoxysilane (SIT8175.0); (tridecafluoro-1,1,2,2-tetrahydrooctyl)trimethoxysilane (SIT8176.0); (heptadecafluoro-1,1,2,2-tetrahydrodecyl)dimethyl(dimethylamino)silane (SIH5840.5); (heptadecafluoro-1,1,2,2-tetrahydrodecyl)tris(dimethylamino)silane (SIH5841.7); n-octadecyltrimethoxysilane (SIO6645.0); n-octyltrithoxysilane (SIO6715.0); and nonafluoroheptyldimethyl(dimethylamino)silane (SIN6597.4).
123. The composition of any of claims 79 to 110, wherein said second particles are treated with a silanizing agent selected from: dimethylidichlorosilane, hexamethyldisilazane, octyltrimethoxysilane, polydimethylsiloxane, or tridecafluoro-1,1,2,2-tetrahydrooctyl trichlorosilane.
124. The method of any of claims 79 to 123, wherein said second particles are silica particles treated with a silicon containing reagent that can increase the number of site that can react with silanizing agents prior to being treated with said silanizing agent.
125. The method of claim 124, wherein said silicon containing reagent that can increase the number of site that can react with silanizing agents is selected from the group consisting of: SiCl₄, Si(OMe)₄, Si(OEt)₄, SiCl₃CH₃, SiCl₃CH₂SiCl₃, SiCl₃CH₂CH₂SiCl₃.
Si(OMe)$_3$CH$_2$Si(OMe)$_3$, Si(OMe)$_3$CH$_2$CH$_2$Si(OMe)$_3$, Si(OMe)$_3$CH$_2$CH$_2$Si(OEt)$_3$, and Si(OEt)$_3$CH$_2$CH$_2$Si(OEt)$_3$.

126. The composition of any of claims 79 to 81, or 85 to 125, further comprising a composition not in admixture with said binder, first particles or second particles; wherein said composition not in admixture comprises a silanizing agent and optionally comprises one or more solvents.

127. The composition of any of claims 82 to 125, further comprising as an additional component (c) a composition not in admixture with said binder, first particles or second particles comprising a silanizing agent, wherein said component optionally comprises one or more solvents.

128. The composition of claim 126 or 127, wherein said composition not in admixture comprises a silanizing agent of formula (I).

129. The composition of claim 126 or 127, wherein said composition not in admixture comprises a silanizing agent is selected from tridecafluoro-1,2,2-tetrahydrooctyl)silane (SIT8173.0); (tridecafluoro-1,2,2-tetrahydrooctyl) trichlorosilane (SIT8174.0); (tridecafluoro-1,2,2-tetrahydrooctyl)triethoxysilane (SIT8175.0); (tridecafluoro-1,2,2-tetrahydrooctyl)trimethoxysilane (SIT8176.0); (heptadecafluoro-1,1,2,2-tetrahydrodecyl)dimethyl(dimethylamino)silane (S1H5840.5); (heptadecafluoro-1,1,2,2-tetrahydrodecyl)tris(dimethylamino)silane (S1H5841.7); n-octadecyltrimethoxysilane (SIO6645.0); n-octyltriethoxysilane (SIO6715.0); and nonafluorohexyldimethyl(dimethylamino)silane (SIN6597.4).

130. The composition of claim 126 or 127, wherein said composition not in admixture comprises a silanizing agent is selected from dimethyldichlorosilane, hexamethyldisilazane, octyltrimethoxysilane, polydimethylsiloxane, or tridecafluoro-1,1,2,2-tetrahydrooctyl trichlorosilane.

131. The composition of any of claims 79 to 130, wherein said one or more solvents are compatible with said binder, first particle or second particle which they contact in said composition.

132. The composition of any of claims 79 to 131, wherein said one or more solvents are selected from the group consisting of alkanes, alkenes, aromatics, alcohols, ethers, ketones, esters, halogenated alkanes, halogenated alkenes, halogenated aromatics halogenated alcohols, halogenated ethers, halogenated ketones, halogenated esters, and combinations thereof.
133. The composition of claim 131 or 132, wherein said one or more solvents are comprised of independently selected solvents having between 1 and 12 carbon atoms alone or in combination with other atoms.

134. A kit comprising a composition of any of claims 79 to 133 and instructions for the application of a coating using said composition.

135. The kit according to claim 134, wherein said kit includes instructions instruction on how to prepare one or more coatings with said composition and how to observe one or more of hydrophobic, oleophobic, or anti-icing phenomena.

136. A composition applied to a substrate, wherein the composition has a surface in contact with said substrate and an exposed surface that is not is not in contact with the substrate, the composition comprising:
   i) a binder;
   ii) first particles having a size of about 30 microns to about 225 microns; and
   iii) second particles having a size of about 1 nanometer to 25 microns comprising one or more independently selected hydrophobic or oleophobic moieties; wherein said composition optionally contains 5% to 10% of a block copolymer on a weight basis.

137. The composition of claim 136, wherein the composition comprises first particles in a range selected from: about 1% to about 50%; about 2% to about 40%; about 4% to about 30%; about 5% to about 25%; about 5% to about 35%; about 10% to about 25%; about 10% to about 30%; about 10% to about 40%; about 10% to about 45%; about 15% to about 25%; about 15% to about 35%; about 15% to about 45%; about 20% to about 30%; about 20% to about 35%; about 20% to about 40%; about 20% to about 45%; about 20% to about 55%; about 25% to about 40%; about 25% to about 45%; about 25% to about 55%; about 30% to about 40%; about 30% to about 45%; about 30% to about 55%; about 30% to about 60%; about 35% to about 45% or about 35% to about 50%; about 35% to about 60%, or about 40% to about 60% on a weight basis.

138. The composition of claim 136 or claim 137, wherein the composition comprises second particles in a range selected from: about 1% to about 5%; about 2% to about 6%; about 4% to about 10%; about 6% to about 12%; about 8% to about 16%; about 1% to about 16%; about 1% to about 20%; about 10% to about 20% or about 15% to about 20% on a weight basis.

139. The composition of any of claims 136 to 138, wherein said composition has a greater amount of second particles on, at, or adjacent to the exposed surface than the surface in contact with the substrate.

140. The composition of claim 139, wherein said surface in contact with said substrate has, no second particles.
141. The composition of claim 139, wherein the amount of second particles on said surface in contact with said substrate is less than 1%, 2%, 5%, 10%, 20%, 30%, 40%, 50%, 60%, 70%, 80%, or 90% of the amount of second particles on said exposed surface, wherein said amount of second particles is determined by the number of said second particles.

142. The composition of any of claims 139 to 141, wherein said amount of second particles is determined by electron microscopy.

143. The composition of any of claims 136 to 142 wherein the binder comprises a polyurethane, lacquer, fluoropolymer, epoxy or thermoplastic powder coating.

144. The composition of any of claims 136 to 142, wherein the binder comprises a polyurethane, lacquer, fluoropolymer, or thermoplastic powder coating.

145. The composition of any of claims 136 to 142, wherein the binder comprises a polyurethane, lacquer, or fluoropolymer.

146. The composition of any of claims 136 to 142, wherein the binder comprises a thermoplastic powder coating.

147. The composition of any of claims 136 to 146, wherein the binders are hydrophilic or hydrophobic in the absence of said first particles and said second particles.

148. The composition of any of claims 136 to 147, wherein said first particles comprise a material selected from the group consisting of: wood, cellulose, glass, metal oxides, metalloid oxides, plastics, carbides, nitrides, borides, spinels, diamond and fibers.

149. The composition of any of claims 1136 to 147, wherein said first particle comprise a material selected from the group consisting of: a thermoplastic or a glass.

150. The composition of any of claims 136 to 147, wherein said first particles are selected from the group consisting of: wood particles, cellulose particles, glass particles, metal oxide particles, metalloid oxide particles, plastic particles, carbide particles, nitride particles, boride particles, spinel particles, diamond particles, fly ash particles, fibers and hollow glass spheres.

151. The composition of any of claims 136 to 150, wherein the first particles have an average size in a range selected from: greater than about 5 µm to about 50 µm; about 10 µm to about 100 µm; about 10 µm to about 200 µm; about 20 µm to about 200 µm; about 30 µm to about 100 µm; about 30 µm to about 200 µm; about 50 µm to about 100 µm; about 75 µm to about 150 µm; about 75 µm to about 200 µm; about 100 µm to about 225 µm; about 125 µm to about 225 µm; and about 100 µm to about 250 µm.
152. The composition of any of claims 136 to 150, wherein the first particles have an average size in a range selected from: about 30 µm to about 225 µm (microns); about 30 µm to about 50 µm; about 30 µm to about 100 µm; about 30 µm to about 200 µm; about 50 µm to about 100 µm; about 50 µm to about 200 µm; about 75 µm to about 150 µm; about 75 µm to about 200 µm; about 100 µm to about 225 µm; about 100 µm to about 225 µm or about 100 µm to about 250 µm.

153. The composition of any of claims 136 to 150, wherein the first particles have an average size greater than 30 microns and less than 250 microns.

154. The composition of any of claims 136 to 150, wherein the composition does not contain only particles with a size of 25 microns or less, or only particles with an average size of 25 microns or less.

155. The composition of any of claims 136 to 152, wherein the composition does not contain only particles with a size of 30 microns or less, or only particles with an average size of 30 microns or less.

156. The composition of any of claims 136 to 152, wherein the composition does not contain only particles with a size of 50 microns or less, or only particles with an average size of 50 microns or less.

157. The composition of any of claims 136 to 144 or 146 to 156, wherein, said binder is a thermoplastic powder coating.

158. The composition of claim 157, wherein said first particles are extended spheres.

159. The composition of any of claims 157 to 158, wherein said powder coat is mixed an amount of first particles in a range selected from: from 5% to 60%; from 10% to 30%; from 20% to 30%; from 22% to 27%; from 20% to 40%; from 20% to 50%; from 30% to 40%; from 30% to 50% on a weight basis.

160. The composition of any of claims 136 to 159, wherein said first particles do not comprise one or more independently selected hydrophobic and/or oleophobic moieties covalently bound to said first particle.

161. The composition of any of claims 136 to 159, wherein said first particles comprises one or more independently selected hydrophobic and/or oleophobic moieties covalently bound to said first particle.

162. The composition of claim 161, wherein said one or more hydrophobic and/or oleophobic moieties comprise one or more independently selected alkyl, fluoroalkyl or perfluoroalkyl moieties.
The composition of any of claims 136 to 159 and 161 to 162, wherein said first particles comprise one or more covalently bound hydrophobic or oleophobic moieties of the form:

\[ R_{3-n}X_nSi- \]

where \( n \) is an integer from 0 to 2;

each \( R \) is independently selected from

(i) alkyl or cycloalkyl group optionally substituted one or more fluorine atoms,
(ii) \( C_{10-20} \) alkyl optionally substituted with one or more independently selected substituents selected from fluorine atoms and \( C_{6-14} \) aryl groups, which aryl groups are optionally substituted with one or more independently selected halo, \( C_{10-20} \) alkyl, \( C_1 \) to \( C_{10} \) haloalkyl, \( C_{10} \) alkoxy, or \( C_{10} \) haloalkoxy substituents,
(iii) \( C_{6-14} \) Qalkyl ether optionally substituted with one or more substituents independently selected from fluorine and \( C_{6-14} \) aryl groups, which aryl groups are optionally substituted with one or more independently selected halo, \( C_{10-20} \) alkyl, \( C_1 \) to \( C_{10} \) haloalkyl, \( C_{10} \) alkoxy, or \( C_{10} \) haloalkoxy substituents,
(iv) \( C_{6-14} \) aryl, optionally substituted with one or more substituents independently selected from halo or alkoxy, and haloalkoxy substituents;
(v) \( C_{4-12} \) alkenyl or \( C_{4-20} \) alkynyl, optionally substituted with one or more substituents independently selected from halo, alkoxy, or haloalkoxy;
(vi) -Z-((CF\(_2\))\(_q\)(CF\(_3\)))\(_r\), wherein \( Z \) is a \( C_{1-12} \) divalent alkane radical or a \( C_{2-12} \) divalent alkene or alkyne radical, \( q \) is an integer from 1 to 12, and \( r \) is an integer from 1-4);

each \( X \) is independently selected from -H, -Cl, -I, -Br, -OH, -OR\(^2\), -NHR\(^3\), or -N(R\(^3\))\(_2\);

each \( R^2 \) is independently selected \( C_{10-4} \) alkyl or haloalkyl group; and each \( R^3 \) is independently an independently selected H, \( C_{10-4} \) alkyl or haloalkyl group.

The composition of any of claims 136 to 163, wherein second particles have an average size in a range selected from about 1 nm to about 100 nm; about 10 nm to about 200 nm; about 20 nm to about 400 nm; about 10 nm to about 500 nm; about 40 nm to about 800 nm; about 100 nm to about 1 micron; about 200 nm to about 1.5 micron; about 500 nm to about 2 micron; about 500 nm to about 2.5 microns; about 1.0 micron to about 10 microns; about 2.0 micron to about 20 microns; about 2.5 micron to about 25 microns; about 500 nm to about 25 microns; about 400 nm to about 20 microns; and about 100nm to about 15 microns.

The composition of any of claims 136 to 164, wherein said second particles comprise: a metal oxide, an oxide of a metalloid, a silicate, or a glass.

The composition of any of claims 136 to 165, wherein said second particles are comprised of silica and having an average size in a range selected from about 1nm to about 100nm.
50 nm; about 1 nm to about 100 nm; about 1 nm to about 400 nm; about 1 nm to about 500
nm; about 2 nm to about 120 nm; about 5 nm to about 150 nm; about 5 nm to about 400 nm;
about 10 nm to about 300 nm; and about 20 nm to 400 nm.

167. The composition of claim 166, wherein said second particles have an average size in the
range of 1 nm to 100 nm or 2 nm to 200 nm.

168. The composition of any of claims 136 to 167, wherein said one or more hydrophobic
and/or oleophobic moieties comprise one or more independently selected alkyl, fluoroalkyl
or perfluoroalkyl moieties.

169. The composition of any of claims 136 to 167, wherein said one or more independently
selected hydrophobic and/or oleophobic moieties of said second particles, are of the form:

\[ R_{3-n} X_n Si- \]

where n is an integer from 0 to 2;

each R is independently selected from

(i) alkyl or cycloalkyl group optionally substituted one or more fluorine atoms,

(ii) C_{10} alkyl optionally substituted with one or more independently selected
    substituents selected from fluorne atoms and C_{6-14} aryl groups, which aryl groups are
    optionally substituted with one or more independently selected halo, C_{10} alkyl, C_{1}
    haloalkyl, C_{10} alkoxy, or C_{10} haloalkoxy substituents,

(iii) C_{6-20} alkyl ether optionally substituted with one or more substituents
    independently selected from fluorne and C_{6-14} aryl groups, which aryl groups are
    optionally substituted with one or more independently selected halo, C_{10} alkyl, C_{1}
    haloalkyl, C_{10} alkoxy, or C_{10} haloalkoxy substituents,

(iv) C_{6-14} aryl, optionally substituted with one or more substituents independently
    selected from halo or alkoxy, and haloalkoxy substituents;

(v) C_{4-20} alkenyl or C_{4-20} alkynyl, optionally substituted with one or more
    substituents independently selected from halo, alkoxy, or haloalkoxy;

(vi) \(-Z-(CF_2)_q(CF_3)_r\), wherein Z is a C_{1-12} divalent alkane radical or a C_{2-12} divalent
    alkene or alkyne radical, q is an integer from 2 to 12, and r is an integer from 1-4);
    each X is independently selected from -H, -Cl, -I, -Br, -OH, -OR, -NHR, or -N(R^3)^02;
    each R^2 is independently selected C_{1-10} alkyl or haloalkyl group; and
    each R^3 is independently an independently selected H, C_{1-10} alkyl or haloalkyl group.

170. The composition of claim 169, wherein R is selected from: (a) an alkyl or fluoroalkyl
group having from 6 to 20 carbon atoms; (b) an alkyl or fluoroalkyl group having from 6 to
20 carbon atoms; (c) an alkyl or fluoroalkyl group having from 10 to 20 carbon atoms; (d) an
alkyl or fluoroalkyl group having from 6 to 20 carbon atoms when n is 3; (e) an alkyl or fluoroalkyl group having from 8 to 20 carbon atoms when n is 3; (f) an alkyl or fluoroalkyl group having from 10 to 20 carbon atoms when n is 3.

171. The composition of any of claims 169 to 170, wherein R is \(-Z-((\text{CF}_2)_q\text{CF}_3)_{r}\).

172. The composition of any of claims 169 to 171, wherein all halogen atoms present in any one or more R groups are fluorine atoms.

173. The composition of any of claims 136 to 172, wherein said second particles are prepared by treating a particle having a size of about 1 nanometer to 25 microns with a silanizing agent selected from: tridecafluoro-1,1,2,2-tetrahydrooctyl)silane (SIT8173.0); (tridecafluoro-1,1,2,2-tetrahydrooctyl) trichlorosilane (SIT8174.0); (tridecafluoro-1, 1,2,2-tetrahydrooctyl)triethoxysilane (SIT8175.0); (tridecafluoro-1,1,2,2-tetrahydrooctyl)trimethoxysilane (SIT8176.0); (heptadecafluoro-1,1,2,2-tetrahydrodecyl)dimethyl(dimethylamino)silane (SIH5840.5); (heptadecafluoro-1,1,2,2-tetrahydrodecyl)tris(dimethylamino) silane (SIH5841.7); n-octadecyltrimethoxysilane (SIO6645.0); n-octyltriethoxysilane (SIO6715.0); and nonafluorohexyldimethyl(dimethylamino)silane (SIN6597.4).

174. The composition of any of claims 136 to 172, wherein said second particles are prepared by treating a particle having a size of about 1 nanometer to 25 microns with a silanizing agent selected from: dimethyldichlorosilane, hexamethyldisilazane, octyltrimethoxysilane, polydimethylsiloxane, or tridecafluoro-1,1,2,2-tetrahydrooctyl trichlorosilane.

175. The composition of any of claims 136 to 174, wherein said second particles are silica particles prepared by treating said silica particles with an agent that will increase the number of sites on the silica particles that can react with a silanizing agent prior to being treated with said silanizing agent.

176. The composition of claim 175, wherein said agent that will increase the number of sites on the silica particles that can react with silanizing agents is selected from the group consisting of: SiCl\(_4\), SiCl\(_4\)\_Si(OMe)\(_4\), Si(OEt)\(_4\), SiCl\(_3\)CH\(_3\), SiCl\(_3\)CH\(_2\)SiCl\(_3\), SiCl\(_3\)CH\(_2\)CH\(_2\)SiCl\(_3\), SiCl\(_3\)CH\(_2\)CH\(_2\)SiCl\(_3\), Si(OMe)\(_3\)CH\(_2\)Si(OMe)\(_3\), Si(OMe)\(_3\)CH\(_2\)CH\(_2\)Si(OMe)\(_3\), Si(OEt)\(_3\)CH\(_2\)Si(OEt)\(_3\), or Si(OEt)\(_3\)CH\(_2\)CH\(_2\)Si(OEt)\(_3\).

177. The composition of any of claims 136 to 176, treated with a silanizing agent of formula (I).

178. The composition of any of claims 136 to 176, treated with a silanizing agent selected from tridecafluoro-1,1,2,2-tetrahydrooctyl)silane (SIT8173.0); (tridecafluoro-1, 1,2,2-tetrahydrooctyl) trichlorosilane (SIT8174.0); (tridecafluoro-1, 1,2,2-tetrahydrooctyl) triethoxysilane (SIT8175.0); (tridecafluoro-1, 1,2,2-tetrahydrooctyl)trimethoxysilane (SIT8176.0); (heptadecafluoro-1,1,2,2-tetrahydrodecyl)dimethyl(dimethylamino)silane (SIH5840.5); (heptadecafluoro-1,1,2,2-tetrahydrodecyl)tris(dimethylamino) silane (SIH5841.7); n-octadecyltrimethoxysilane (SIO6645.0); n-octyltriethoxysilane (SIO6715.0); and nonafluorohexyldimethyl(dimethylamino)silane (SIN6597.4).
tetrahydrooctyl)triethoxysilane (SIT8 175.0); (tridecafluoro-1,2,2-tetrahydrooctyl)trimethoxysilane (SIT8 176.0); (heptadecafluoro-1,2,2-tetrahydrodecyl)trimethoxy(dimethylamino)silane (SIH5840.5); (heptadecafluoro-1,2,2-tetrahydrodecyl)tris(dimethylamino)silane (SIH5841.7); n-octadecyltrimethoxysilane (SIO6645.0); n-octyltriethoxysilane (SIO6715.0); and nonafluorohexyldimethyl(dimethylamino)silane (SI6707.4).

179. The composition of any of claims 136 to 176, treated with a silanizing agent selected from silanizing agent selected from dimethyl dichlorosilane, hexamethyldisilazane, octyltrimethoxysilane, polydimethylsiloxane, or tridecafluoro-1,2,2-tetrahydrooctyl trichlorosilane.

180. A composition of any of claims 136 to 179, wherein said substrate is selected from: substrate is selected from metal, ceramic, glass, masonry, stone, wood, wood composites, wood laminates, cardboard, or paper plastic rubber.

181. A composition of any of claims 136 to 179, wherein said substrate is selected from: wire, cable, insulators for electric equipment wires or cables, glass, glass shelving, glass plates, metal adhesive tape, plastic adhesive tape, paper adhesive tape, fiber glass adhesive tape, a metal sheet, a boat hull, a bed pan, a commode, a toilet plunger, an umbrella, or a portion of any of those substrates.

182. The composition of any of claims 136 to 181, wherein the exposed surface is a textured surface having projections due to the presence of said first particles, said projections having a maximum height above the level of the binder in a range selected from: from 10 to about 180 microns; from about 15 to about 150 micron; from about 20 to about 100 microns; from 30 to 120 microns; from about 40 to 140 microns; from about 50 to about 150 microns, or from about 20 to about 80 microns.

183. The composition of any of claims 136 to 181, wherein the exposed surface has an arithmetical mean roughness in a range selected from: about 0.2 microns to about 20 microns; from about 0.3 microns to about 18 microns; from about 0.2 microns to about 8 microns; from about 8 microns to about 20 microns; and from about 0.5 microns to about 15 microns.

184. The composition of any of claims 136 to 181, wherein the exposed surface has a ten point mean roughness selected from: about 1 micron to about 90 microns; from about 2 microns to about 80 microns; from about 3 microns to about 70 microns; from about 1 micron to about 40 microns; from about 40 microns to about 80 microns; from about 10 microns to about 65 microns; and from about 20 microns to about 60 microns.
185. The composition of any of claims 136 to 184, wherein the composition retains its hydrophobicity when subject to at least 100, 200, 300, 400, 500, 600, or 700 abrasions cycles, as measured with a Taber Abrasion tester model 503 using CS-10 wheels and 250 g loads, wherein a surface is no long considered to retain its hydrophobicity when more than half of water droplets placed on the abraded surface are retained where the surface is inclined at an angle of 6°.

186. The composition of any of claims 136 to 184, wherein the composition retains its hydrophobicity when subject to at least 100, 200, 300, 400, 500, 600, 700, 800, 900, 1,000, 1,200, 1,400, 1,600, 1,800, 2,000, 2,500, 3,000, or 3,500 cycles of manual abrasion using an 800g load, wherein a surface is no long considered to retain its hydrophobicity when more than half of water droplets placed on the abraded surface are retained where the surface is inclined at an angle of 6°.

187. The composition of any of claims 136 to 186, wherein said coating, has contact angle with water that is greater than about 90°, 100°, 110°, 120°, 130°, 140°, 150°, 160°, 165°, 170° or 175° measured at 18°C to 23°C.

188. The composition of any of claims 136 to 186, wherein said composition applied to a surface retains a greater surface air fraction when immersed in water than an untreated aluminum control surface.

189. The composition of any of claims 136 to 188, wherein the composition will reduce the drag experienced by an object coated with said composition when placed in flowing water.

190. The composition of claim 189, wherein said flowing water has a velocity of about 1 to 10 meters per second.

191. The composition of any of claims 136 to 190, wherein the composition remains attached to said substrate when exposed to water flowing at 19 meters per second.

192. The composition of any of claims 136 to 190, wherein the composition remains attached to said substrate when exposed to water flowing at 19 meters per second at 2 bars of pressure.

193. The composition of any of claims 136 to 192, wherein the composition is stable in boiling water.

194. The composition of any of claims 136 to 193, wherein the composition displays hydrophobic properties with solutions of aqueous acids and/or bases.

195. The composition of any of claims 136 to 184, wherein the composition displays hydrophobic properties with aqueous salt solutions including sea water.

196. The composition of any of claims 136 to 195, wherein the composition reduces ice formation and the ability of ice to adhere to surfaces.
197. The composition of claim 196 wherein the substrate is a wire, cable, bridge element, a ladder, stairs, automobile body, a satellite receiver dish, or a part of a boat, including, but not limited to, a hull, mast, antenna, deck, or ladder.

198. The composition of any of claims 136 to 197, wherein the composition resists the adherence of mud.

199. A thermal deposition method for applying a coating to a substrate comprising the steps:
   a) applying to said substrate by a thermal spray process a base coating spray composition optionally comprising one or more independently selected first particles having a size of about 1 micron to about 100 microns, to provide a base coating; and
   b) applying to said base coating one or more of: i) a composition comprising one or more independently selected second particles having a size of about 1 nanometer to 25 microns that optionally comprise one or more groups that provide hydrophobic, or oleophobic properties; ii) a composition comprising one or more independently selected silanizing agents or iii) a composition comprising a silicon containing reagent that can increase the number of site that can react with silanizing agents, followed by a composition containing a silanizing agent.

200. The method of claim 199, wherein said one or more chemical moieties that provide hydrophobic, or oleophobic properties are selected independently selected alkyl, haloalkyl, fluoroalkyl or perfluoroalkyl groups.

201. The method of an of claims 199 to 200, wherein said thermal spray process is selected from Rokide Process, High Velocity Oxyfuel (HOVF), plasma spray and Twin-Arc Spray.

202. The method of any of claims 199 to 201, wherein said base coating spray composition comprises one or more: metals; metal alloys; metal oxides; metalloids; metalloid oxides; carbides, nitrides; or one or more metals in combination of one or more metal oxides, metalloid oxides or carbides, and said base coating spray composition optionally comprises one or more independently selected first particles.

203. The method of any of claims 199 to 202, wherein the base coating spray composition comprises one or more of: zirconia, silica Al₂O₃, Ni-Cr (e.g., 80%-20%), stainless steel (e.g., a 316 stainless), tungsten carbide/cobalt, chromium carbide/nickel or nickel/aluminum.

204. The method of any of claims 199 to 202, wherein the base coating comprises: one or more metals, metal alloys, metal oxides, metalloids, metalloid oxides, carbides; one or more metals in combination with one or more metal oxides, metalloid oxides or carbides; or one or more alloys formed by thermal spray deposition; and wherein said base coating optionally comprising one or more independently selected first particles.
205. The method of any of claims 199 to 204, wherein said one or more independently selected first or second particles comprises or said one or more: metals, metal oxides, metalloids, oxides of a metalloid, silicates, or glasses.

206. The method of any of claims, 199-205, wherein said first or second are comprised of a material selected independently from silica or alumina.

207. The method of any of claims, 199 to 206, wherein the first particles have an average sizes in a range selected from 1 micron to about 75 microns, or about 5 to about 50 microns, or about 25 microns to 70 microns, or about 10 to about 40 microns.

208. The method of any of claims, 199 to 207, wherein the second particles having an average size in a range selected from about 1 nm to about 100 nm; about 10 nm to about 200 nm; about 20 nm to about 400 nm; about 10 nm to 500 nm; about 40 nm to about 800 nm; about 100 nm to about 1 micron; about 200 nm to about 1.5 micron; about 500 nm to about 2 micron; about 500 nm to about 2.5 microns; about 1.0 micron to about 10 microns; about 2.0 micron to about 20 microns; about 2.5 micron to about 25 microns; about 500 nm to about 25 microns; about 400 nm to about 20 microns; and about 100nm to about 15 microns.

209. The method of any of claims 199 to 208, wherein said composition comprising a silicon containing reagent that can increase the number of site that can react with silanizing agents comprises one or more of SiCl₄, SiCl₃, Si(OMe)₄, Si(OEt)₄, SiCl₃CH₃, SiCl₃CH₂SiCl₃, SiCl₃CH₂CH₂SiCl₃, Si(OMe)₃CH₃Si(OMe)₃, Si(OEt)₃CH₂Si(OEt)₃, or Si(OEt)₃CH₂CH₂Si(OEt)₃.

210. The method of any of claims 199 to 209, wherein the silanizing agent comprises one or more compounds of formula (I).

211. The method of claim 210, wherein R is selected from: (a) an alkyl or fluoroalkyl group having from 6 to 20 carbon atoms; (b) an alkyl or fluoroalkyl group having from 8 to 20 carbon atoms; (c) an alkyl or fluoroalkyl group having from 10 to 20 carbon atoms; (d) an alkyl or fluoroalkyl group having from 6 to 20 carbon atoms when n is 3; (e) an alkyl or fluoroalkyl group having from 8 to 20 carbon atoms when n is 3; (f) an alkyl or fluoroalkyl group having from 10 to 20 carbon atoms when n is 3.

212. The method of any of claims 210 to 211, wherein R is -Z-((CF₂)₅(CF₃))₁, where Z is a d.i.₂ divalent alkane radical or a C₂-H₂₂ divalent alkene or alkyne radical, and q is an integer from 1 to 12, and r is an integer from 1-4.

213. The method of any of claims 210 to 212, wherein n is 3.

214. The method of any of claims 210 to 212 wherein n is 2.

215. The method of any of claims 210 to 212, wherein n is 1.
216. The method of any of claims 210 to 215, wherein all halogen atoms present in any one or more R groups are fluorine atoms.

217. The method of any of claims 210 to 216, wherein each X is independently selected from H, Cl, -OR\(^2\), -NHR\(^3\), or -N(R3)2.

218. The method of any of claims 210 to 217, wherein each X is independently selected from Cl, -OR\(^2\), -NHR\(^3\), or -N(R3)2.

219. The method of any of claims 210 to 218, wherein each X is independently selected from, Cl, -NHR\(^3\), or -N(R3)2.

220. The method of any of claims 199 to 209, wherein the silanizing agent comprises one or more of tridecafluoro-1,1,2,2-tetrahydrooctyl)silane (SIT8173.0); (tridecafluoro-1,1,2,2-tetrahydrooctyl) trichlorosilane (SIT8174.0); (tridecafluoro-1,1,2,2-tetrahydrooctyl)trithoxysilane (SIT8175.0); (tridecafluoro-1,1,2,2-tetrahydrooctyl)trimethoxysilane (SIT8176.0); (heptadecafluoro-1,1,2,2-tetrahydrodecyl)dimethyl(dimethylamino)silane (S1H5840.5); (heptadecafluoro-1,1,2,2-tetrahydrodecyl)tris(dimethylamino)silane (S1H5841.7); n-octadecyltrimethoxysilane (SIO6645.0); n-octyltrithoxysilane (SIO6715.0); and nonafluoroheptyldimethyl(dimethylamino) silane (SIN6597.4).

221. The method of any of claims 199 to 209, wherein the first or second particles are treated with a composition that provides them hydrophobic or oleophobic properties.

222. The method of any of claims 199 to 221, wherein the first or second particles comprises one or more covalently bound hydrophobic or oleophobic moieties of the form:

\[ R_{3-n} X_n Si^- \]

where \( n \) is an integer from 0 to 2;

each R is independently selected from

(i) alkyl or cycloalkyl group optionally substituted one or more fluorine atoms,

(ii) \( C_{1\text{ to } 20} \) alkyl optionally substituted with one or more independently selected substituents selected from fluorine atoms and \( C_{6\text{ to } 14} \) aryl groups, which aryl groups are optionally substituted with one or more independently selected halo, \( C_{1\text{ to } 20} \) alkyl, \( C_1 \) to \( C_{10} \) haloalkyl, \( C_{10\text{ to } 20} \) haloalkoxy, or \( C_{1\text{ to } 20} \) haloalkoxy substituents,

(iii) \( C_{6\text{ to } 20} \) alkyl ether optionally substituted with one or more substituents independently selected from fluorine and \( C_{6\text{ to } 14} \) aryl groups, which aryl groups are optionally substituted with one or more independently selected halo, \( C_{1\text{ to } 20} \) alkyl, \( C_1 \) to \( C_{10} \) haloalkyl, \( C_{10\text{ to } 20} \) haloalkoxy, or \( C_{1\text{ to } 20} \) haloalkoxy substituents,
(iv) C_{6-14} aryl, optionally substituted with one or more substituents independently selected from halo or alkoxy, and haloalkoxy substituents;

(v) C_{4 to 2} Oalkenyl or C_{4to2} Oalkynyl, optionally substituted with one or more substituents independently selected from halo, alkoxy, or haloalkoxy;

(vi) \(-Z-\{(CF_2)_q\}(CF_3)\)_r, wherein Z is a C_{1-12} divalent alkane radical or a C_{2-42} divalent alkene or alkyne radical, q is an integer from 1 to 12, and r is an integer from 1-4); each X is independently selected from -H, -Cl, -I, -Br, -OH, -OR^2, -NHR^3, or -N(R^3)_2; each R^2 is independently selected C_{1to4} alkyl or haloalkyl group; and each R^3 is independently an independently selected H, C_{1to4} alkyl or haloalkyl group.

223. The method of any of claims 199 to 221, wherein the first or second particles are treated with a composition comprising one or more of tridecafluoro-1,1,2,2-tetrahydrooctyl)silane (SIT8173.0); (tridecafluoro-1,1,2,2-tetrahydrooctyl) trichlorosilane (SIT8174.0); (tridecafluoro-1,1,2,2-tetrahydrooctyl)triethoxysilane (SIT8175.0); (tridecafluoro-1,1,2,2-tetrahydrooctyl)trimethoxysilane (SIT8176.0); (heptadecafluoro-1,1,2,2-tetrahydrodecyl)dimethyl(dimethylamino)silane (S1H5840.5); (heptadecafluoro-1,1,2,2-tetrahydrodecyl)tris(dimethylamino)silane (S1H5841.7); n-octadecyltrimethoxysilane (SIO6645.0); n-octyltrimethoxysilane (SIO6715.0); and nonafluorohexyldimethyl(dimethylamino)silane (SIN6597.4).

224. The method of any of claims 199 to 221, wherein the first or second particles are treated with hexamethyldisilazane, octyltrimethoxysilane, polydimethylsiloxane, or tridecafluoro-1,1,2,2-tetrahydrooctyl trichlorosilane.

225. The method of any of claims 199 to 221, wherein the first or second particles are treated with on or more of hexamethyldisilazane, octyltrimethoxysilane, polydimethylsiloxane, or tridecafluoro-1,1,2,2-tetrahydrooctyl trichlorosilane.

226. The method of any of claims 199 to 221, wherein the silane is tridecafluoro-1,1,2,2-tetrahydrooctyl trichlorosilane.

227. The method of any one of claims 199 to 226, wherein the substrate is selected from: metals, metalloids, ceramics, and glasses.

228. The method of any one of claims 199 to 226, wherein the substrate is selected from: wire, cable, insulators for electric equipment wires or cables, glass, glass shelving, glass plates, metal adhesive tape, fiber glass adhesive tape, a metal sheet, a bed pan, a commode, bridge element, a ladder, stairs, an automobile body, a satellite receiver dish, or a part of a boat, including, but not limited to, a hull, mast, antenna, deck, or ladder or a portion of any of those substrates.
229. A coating prepared by the method of any of claims 199 to 226.

230. The coating of claim 229, wherein said substrate is selected from: wire, cable, insulators for electric equipment wires or cables, glass, glass shelving, glass plates, metal adhesive, fiber glass adhesive tape, a metal sheet, a bed pan, a commode, bridge element, a ladder, stairs, automobile body, a satellite receiver dish, or a part of a boat, including, but not limited to, a hull, mast, antenna, deck, or ladder or a portion of any of those substrates.

231. The coating of any of claims 229 to 230, wherein the coating has a contact angle with water measured at room temperature in a range selected from: about 120° to about 170°, about 120° to about 140°, about 130° to about 150°, about 140° to about 160°, about 150° to about 170° or about 120° to about 150°.

232. A composition for applying a coating to a substrate comprising components (a) and (b): wherein component (a) comprises a base coating spray composition optionally comprising one or more independently selected first particles having a size of about 1 micron to about 100 microns, to provide a base coating; and wherein component (b) comprises: i) a composition comprising one or more independently selected second particles having a size of about 1 nanometer to 25 microns that optionally comprise one or more groups that provide hydrophobic, or oleophobic properties; ii) a composition comprising one or more independently selected silanizing agents or iii) a composition comprising a silicon containing reagent that can increase the number of site that can react with silanizing agents and a composition containing a silanizing agent.

233. The composition of claim 232, wherein said one or more chemical moieties that provide hydrophobic, or oleophobic properties are selected independently selected alkyl, haloalkyl, fluoroalkyl or perfluoroalkyl groups.

234. The composition of any of claims 232-233, wherein said base coating spray composition comprises one or more: metals; metal alloys; metal oxides; metalloids; metalloid oxides; carbides, nitrides; or one or more metals in combination of one or more metal oxides, metalloid oxides or carbides, and said base coating spray composition optionally comprises one or more independently selected first particles.

235. The composition of any of claims 232 to 234, wherein the base coating spray composition comprises one or more of: zirconia, Al₂O₃, Ni-Cr (e.g., 80%-20%), stainless steel (e.g., a 316 stainless), tungsten carbide/cobalt, chromium carbide/nickel or nickel/aluminum.
236. The composition of any of claims 232 to 235, wherein the base coating comprises: one or more metals, metal alloys, metal oxides, metalloids, metalloid oxides, carbides; one or more metals in combination with one or more metal oxides, metalloid oxides or carbides; or one or more alloys formed by thermal spray deposition; and wherein said base coating optionally comprising one or more independently selected first particles.

237. The composition of any of claims 232 to 236, wherein said one or more independently selected first or second particles comprises or said one or more: metals, metal oxides, metalloids, oxides of a metalloid, silicates, or glasses.

238. The composition of any of claims 232-237, wherein said first or second are comprised of a material selected independently from silica or alumina.

239. The composition of any claims, 232-238, wherein the first particles have an average sizes in a range selected from 1 micron to about 75 microns, or about 5 to about 50 microns, or about 25 microns to 70 microns, or about 10 to about 40 microns.

240. The composition of any claims 232 to 239, wherein the second particles having an average size in a range selected from about 1 nm to about 100 nm; about 10 nm to about 200 nm; about 20 nm to about 400 nm; about 10 nm to 500 nm; about 40 nm to about 800 nm; about 100 nm to about 1 micron; about 200 nm to about 1.5 microns; about 500 nm to about 2 microns; about 500 nm to about 2.5 microns; about 1.0 micron to about 10 microns; about 2.0 micron to about 20 microns; about 2.5 micron to about 25 microns; about 500 nm to about 25 microns; about 400 nm to about 20 microns; or about 100 nm to about 15 microns.

241. The composition of any of claims 232 to 240, wherein said composition comprising a silicon containing reagent that can increase the number of site that can react with silanizing agents comprises one or more of SiCl₄, SiCl₄, Si(OMe)₄, Si(OMe)₄, SiCl₃CH₃, SiCl₃CH₂SiCl₃, SiCl₃CH₂CH₂SiCl₃, Si(OMe)₃CH₂Si(OMe)₃, Si(OMe)₃CH₂CH₂Si(OMe)₃, Si(OEt)₃CH₂Si(OEt)₃, or Si(OEt)₃CH₂CH₂Si(OEt)₃.

242. The composition of any of claims 232 to 241, wherein the silanizing agent comprises one or more compounds of formula (I).

243. The composition of claim 242, wherein R is selected from: (a) an alkyl or fluoroalkyl group having from 6 to 20 carbon atoms; (b) an alkyl or fluoroalkyl group having from 8 to 20 carbon atoms; (c) an alkyl or fluoroalkyl group having from 10 to 20 carbon atoms; (d) an alkyl or fluoroalkyl group having from 6 to 20 carbon atoms when n is 3; (e) an alkyl or fluoroalkyl group having from 8 to 20 carbon atoms when n is 3; (f) an alkyl or fluoroalkyl group having from 10 to 20 carbon atoms when n is 3.
The composition of any of claims 242 to 243, wherein R is Z is a C₁₋₁₂ divalent alkane radical or a C₂₋₁₂ divalent alkene or alkyne radical, and q is an integer from 1 to 12, and r is an integer from 1-4.

The composition of any of claims 242 to 244, wherein n is 3.

The composition of any of claims 242 to 244, wherein n is 2.

The composition of any of claims 242 to 244, wherein n is 1.

The composition of any of claims 242 to 247, wherein all halogen atoms present in any one or more R groups are fluorine atoms.

The composition of any of claims 242 to 248, wherein each X is independently selected from H, Cl, -OR², -NHR³, or -N(R³)².

The composition of any of claims 242 to 249, wherein each X is independently selected from Cl, -OR², -NHR³, or -N(R³)².

The composition of any of claims 242 to 250, wherein each X is independently selected from Cl, -NHR³, or -N(R³)².

The composition of any of claims 242 to 241, wherein the silanizing agent comprises one or more of tridecafluoro-l,1,2,2-tetrahydrooctyl)silane (SIT8 173.0); (tridecafluoro-l,1,2,2-tetrahydrooctyl)trichlorosilane (SIT8 174.0); (tridecafluoro-l,1,2,2-tetrahydrooctyl)triethoxysilane (SIT8 175.0); (tridecafluoro-l,1,2,2-tetrahydrooctyl)trimethoxysilane (SIT8 176.0); (heptadecafluoro-1,1,2,2-tetrahydrodecyl)dimethyl(dimethylamino)silane (SIH5840.5); (heptadecafluoro-1,1,2,2-tetrahydrodecyl)tris(dimethylamino)silane (SIH5841.7); n-octadecyltrimethoxysilane (SIO6645.0); n-octyltriethoxysilane (SIO6715.0); and nonafluorohexyldimethyl(dimethylamino)silane (SIN6597.4).

The composition of any of claims 232 to 241, wherein at least one of the first or second particles are treated with a composition that provides them hydrophobic or oleophobic properties.

The composition of any of claims 232 to 253, wherein at least one of the first or second particles comprises one or more covalently bound hydrophobic or oleophobic moieties of the form:

\[ \text{R}_{3-n} \text{X}_n \text{Si}^- \]

where n is an integer from 0 to 2;

each R is independently selected from

(i) alkyl or cycloalkyl group optionally substituted one or more fluorine atoms,
(ü) C₁₀₂₀ alkyl optionally substituted with one or more independently selected substituents selected from fluorine atoms and C₆₋₁₄ aryl groups, which aryl groups are optionally substituted with one or more independently selected halo, C₁₋₁₀ alkyl, C₁₋₁₀ haloalkyl, C₁₋₁₀ haloalkoxy, or C₁₋₁₀ haloalkoxy substituents,

(iii) C₆₋₁₀₀ alkyl ether optionally substituted with one or more substituents independently selected from fluorine and C₆₋₁₄ aryl groups, which aryl groups are optionally substituted with one or more independently selected halo, C₁₋₁₀ alkyl, C₁₋₁₀ haloalkyl, C₁₋₁₀ haloalkoxy, or C₁₋₁₀ haloalkoxy substituents,

(iv) C₆₋₁₄ aryl, optionally substituted with one or more substituents independently selected from halo or alkoxyl, and haloalkoxy substituents;

(v) C₄₋₂₀₀ alkynyl or C₄₋₂₀₀ alkynyl, optionally substituted with one or more substituents independently selected from halo, alkoxyl, or haloalkoxy;

(vi) \(-Z-((\text{CF}_2)_q(\text{CF}_3)_r\), wherein \(Z\) is a C₁₋₁₂ divalent alkane radical or a C₂₋₁₂ divalent alkene or alkyne radical, \(q\) is an integer from 1 to 12, and \(r\) is an integer from 1-4);

each X is independently selected from -H, -Cl, -I, -Br, -OH, -OR, -OH, -NHR, or -N(R)₂;
each R is independently selected C₁₋₁₀₄ alkyl or haloalkyl group; and
each R is independently an independently selected H, C₁₋₁₀₄ alkyl or haloalkyl group.

255. The composition of any of claims 232 to 253, wherein the first or second particles are treated with a composition comprising one or more of tridecafluoro-1,1,2,2-tetrahydrooctylsilane (SIT8 173.0); (tridecafluoro-1,1,2,2-tetrahydrooctyl) trichlorosilane (SIT8 74.0); (tridecafluoro-1,1,2,2-tetrahydrooctyl)trithoxysilane (SIT8 175.0); (tridecafluoro-1,1,2,2-tetrahydrooctyl)trimethoxy silane (SIT8 74.0); (tridecafluoro-1,1,2,2-tetrahydrodecyl)dimethyl(dimethylamino) silane (S1H5840.5); (heptadecafluoro-1,1,2,2-tetrahydrodecyl)tris(dimethylamino)silane (S1H5841.7); n-octadecytrimethoxysilane (SIO6645.0); n-octyltrimethoxysilane (SIO6715.0); and nonafluoroheptyldimethyl(dimethylamino)silane (SIN6597.4).

256. The composition of any of claims 232 to 253, wherein the first or second particles are treated with hexamethyldisilazane, octyltrimethoxysilane, polydimethylsiloxane, or tridecafluoro-1,1,2,2-tetrahydrooctyl trichlorosilane.

257. The composition of any of claims 232 to 253, wherein the first or second particles are comprised of silica and treated with one or more of hexamethyldisilazane, octyltrimethoxysilane, polydimethylsiloxane, or tridecafluoro-1,1,2,2-tetrahydrooctyl trichlorosilane.
258. The composition of any of claims 232 to 257, wherein the silanizing agent is tridecafluoro-1,1,2,2-tetrahydrooctyl trichlorosilane.

259. The composition of any one of claims 232 to 258, further comprising a substrate, wherein the substrate is selected from metals, metalloids, ceramics, and glasses.

260. A composition comprising:
   i) a base coating, wherein said base coating optionally comprises one or more independently selected first particles having a size of about 1 micron to about 100 microns that optionally comprise one or more groups that provide hydrophobic, or oleophobic properties; and ii) (a) one or more independently selected groups that provide hydrophobic, or oleophobic properties covalently bound to the surface of the base coating, (b) one or more second particles having a size of about 1 nm to about 25 microns on the surface of said base coating that optionally comprise one or more groups that provide hydrophobic, or oleophobic properties, or (c) one or more independently selected groups that provide hydrophobic, or oleophobic properties covalently bound to the surface of the base coating and one or more second particles having a size of about 1 nm to about 25 microns on the surface of said base coating that optionally comprise one or more groups that provide hydrophobic, or oleophobic properties.

261. The composition of claim 260 wherein said groups that provide hydrophobic, or oleophobic properties are independently selected alkyl, haloalkyl, fluoroalkyl or perfluoroalkyl groups.

262. The composition of any of claims 260 to 261, wherein said one or more second particles on the surface of said base coating are not covalently bound to said base coating.

263. The composition of any of claims 260 to 261, wherein at least a portion of said one or more second particles on the surface of said base coating are covalently bound to said base coating.

264. The composition of any of any of claims 260 to 23, wherein said base coating comprises: one or more metals, metal alloys, metal oxides, metalloids, metalloid oxides, carbides; one or more metals in combination with one or more metal oxides, metalloid oxides or carbides; or one or more alloys formed by thermal spray deposition; and wherein said base coating optionally comprising one or more independently selected first particles having a size of 1 micron to 100 microns.

265. The composition of any of claims 260 to 264, wherein the base coating comprises one or more of: zirconia, $\text{Al}_2\text{O}_3$, Ni-Cr (e.g., 80%-20%), stainless steel (e.g., a 316 stainless), tungsten carbide/cobalt, chromium carbide/nickel or nickel/aluminum.
266. The composition of any of claims 260 to 264 wherein the base coating comprises: one or more metals, metal alloys, metal oxides, metalloids, metalloid oxides, carbides or nitrides; one or more metals in combination with one or more metal oxides, metalloid oxides or carbides; or one or more alloys formed by thermal spray deposition; and wherein said base coating optionally comprising one or more independently selected first particles.

267. The composition of any of claims 260 to 265, wherein said one or more independently selected first or second particles comprises or said one or more: metals, metal oxides, metalloids, oxides of a metalloid, silicates, or glasses.

268. The composition of any of claims 260-267, wherein said first or second are comprised of a material selected independently from silica or alumina.

269. The composition of any of claims, 260-268, wherein the first particles have an average sizes in a range selected from 1 micron to about 75 microns, or about 5 to about 50 microns, or about 25 microns to 70 microns, or about 10 to about 40 microns.

270. The composition of any of claims 260 to 269, wherein the second particles having an average size in a range selected from about 1 nm to about 100 nm; about 10 nm to about 200 nm; about 20 nm to about 400 nm; about 10 nm to 500 nm; about 40 nm to about 800 nm; about 100 nm to about 1 micron; about 200 nm to about 1.5 micron; about 500 nm to about 2 micron; about 500 nm to about 2.5 microns; about 1.0 micron to about 10 microns; about 2.0 micron to about 20 microns; about 2.5 micron to about 25 microns; about 500 nm to about 25 microns; about 400 nm to about 20 microns; and about 100 nm to about 15 microns.

271. The composition of any of claims 260 to 270, wherein at least one of the first or second particles are treated with a silanizing agent, where the silanizing agent comprises one or more compounds of formula (I).

272. The composition of claim 271, wherein R is selected from: (a) an alkyl or fluoroalkyl group having from 6 to 20 carbon atoms; (b) an alkyl or fluoroalkyl group having from 8 to 20 carbon atoms; (c) an alkyl or fluoroalkyl group having from 10 to 20 carbon atoms; (d) an alkyl or fluoroalkyl group having from 6 to 20 carbon atoms when n is 3; (e) an alkyl or fluoroalkyl group having from 8 to 20 carbon atoms when n is 3; (f) an alkyl or fluoroalkyl group having from 10 to 20 carbon atoms when n is 3.

273. The composition of any of claims 271 to 272, wherein R is Z is a C_{1-12} divalent alkane radical or a C_{2-12} divalent alkene or alkyne radical, and q is an integer from 1 to 12, and r is an integer from 1-4.

274. The composition of any of claims 271 to 273, wherein n is 3.

275. The composition of any of claims 271 to 273, wherein n is 2.
276. The composition of any of claims 271 to 273, wherein n is 1.
277. The composition of any of claims 271 to 276, wherein all halogen atoms present in any one or more R groups are fluorine atoms.
278. The composition of any of claims 271 to 277, wherein each X is independently selected from H, Cl, -OR, -NHR3, or -N(R3)2.
279. The composition of any of claims 271 to 277, wherein each X is independently selected from Cl, -OR, -NHR3, or -N(R3)2.
280. The composition of any of claims 271 to 277, wherein each X is independently selected from Cl, -NHR3, or -N(R3)2.
281. The composition of any of claims 260 to 270, wherein at least one of the first or second particles are treated with a silanizing agent, where the silanizing agent comprises one or more of tridecafluoro-1,1,2,2-tetrahydrooctyl)silane (SIT8 173.0); (tridecafluoro-1, 1,2,2-tetrahydrooctyl) trichlorosilane (SIT8174.0); (tridecafluoro-1,2,2-tetrahydrooctyl) triethoxysilane (SIT8175.0); (tridecafluoro-l, 1,2,2-tetrahydrooctyl) trimethoxysilane (SIT8 176.0); (heptadecafluoro-1,1,2,2-tetrahydrodecyl)dimethyl(dimethylamino) silane (S1H5840.5); (heptadecafluoro-1,1,2,2-tetrahydrodecyl)trimethyl(dimethylamino)silane (S1H5841.7); n-octadecyltrimethoxysilane (SIO6645.0); n-octyltriethoxysilane (SIO6715.0); and nonafluorohexyldimethyl(dimethylamino) silane (SIN6597.4).
282. The composition of any of claims 260 to 270, wherein at least one of the first or second particles are treated with a composition that provides them hydrophobic or oleophobic properties.
283. The composition of any of claims 260 to 282, wherein at least one of the first or second particles comprises one or more covalently bound hydrophobic or oleophobic moieties of the form:

\[ \text{R}_{3-n} \text{X}_n \text{Si}^- \]

where n is an integer from 0 to 2;

each R is independently selected from

(i) alkyl or cycloalkyl group optionally substituted one or more fluorine atoms,

(ii) C_{1020} alkyl optionally substituted with one or more independently selected substituents selected from fluorine atoms and C_{6-14} aryl groups, which aryl groups are optionally substituted with one or more independently selected halo, C_{10-18} alkyl, C_{1-10} haloalkyl, C_{10-18} alkoxy, or C_{10-18} haloalkoxy substituents,
(iii) C_{6-20} alkyl ether optionally substituted with one or more substituents independently selected from fluorine and C_{6-14} aryl groups, which aryl groups are optionally substituted with one or more independently selected halo, C_{1-4} alkyl, C_{1-10} haloalkyl, C_{1-10} haloalkoxy, or C_{1-10} haloalkoxy substituents, 

(iv) C_{6-14} aryl, optionally substituted with one or more substituents independently selected from halo or alkoxy, and haloalkoxy substituents; 

(v) C_{4-10} alkenyl or C_{4-10} alkynyl, optionally substituted with one or more substituents independently selected from halo, alkoxy, or haloalkoxy; 

(vi) -Z-((CF_{2})_{q}(CF_{3}))_{r} wherein Z is a C_{1-12} divalent alkane radical or a C_{2-42} divalent alken or alkyne radical, q is an integer from 1 to 12, and r is an integer from 1-4); each X is independently selected from -H, -Cl, -I, -Br, -OH, -OR^{2}, -NHR^{3}, or -N(R^{3})_{2}; each R^{2} is independently selected C_{1-10} alkyl or haloalkyl group; and each R^{3} is independently an independently selected H, C_{1-10} alkyl or haloalkyl group.

284. The composition of any of claims 260 to 282, wherein at least one of the first or second particles are treated with a composition comprising one or more of tridecafluoro-1,1,2,2-tetrahydroctylsilane (SIT8173.0); (tridecafluoro-1,1,2,2-tetrahydroctyl) trichlorosilane (SIT8174.0); (tridecafluoro-1,1,2,2-tetrahydroctyl) trimethoxy silane (SIT8175.0); (tridecafluoro-1,1,2,2-tetrahydroctyl) trimethoxy silane (SIT176.0); (heptadecafluoro-1,1,2,2-tetrahydrodecyl) dimethyl(dimethylamino)silane (S1H5840.5); (heptadecafluoro-1,1,2,2-tetrahydrodecyl) tris(dimethylamino)silane (S1H5841.7); n-octadecyltrimethoxysilane (SIO6645.0); n-octyltrimethoxysilane (SIO6715.0); and nonafluorohexyl(dimethylamino)silane (SIN6597.4).

285. The composition of any of claims 260 to 282, wherein at least one of the first or second particles is treated with hexamethyldisilazane, octyltrimethoxysilane, polydimethylsiloxane, or tridecafluoro-1,1,2,2-tetrahydroctyl trichlorosilane.

286. The composition of any of claims 260 to 282, wherein at least one of the first or second particles are comprised of silica and treated with on or more of hexamethyldisilazane, octyltrimethoxysilane, polydimethylsiloxane, or tridecafluoro-1,1,2,2-tetrahydroctyl trichlorosilane.

287. The composition of any of claims 260 to 282, wherein at least one of first or second particles are treated with tridecafluoro-1,1,2,2-tetrahydroctyl trichlorosilane.

288. The composition of any of claims 260 to 287, further comprising a substrate.

289. The composition of claim 288, wherein the substrate is selected from metals, metalloids, ceramics, and glasses.
290. The composition of claim 288, wherein said substrate is comprises: ferrous metal, non-ferrous metal, ceramic, glass or a metal alloy.

291. The composition of claim 288, wherein said substrate is selected from: wire, cable, insulators for electric equipment wires or cables, glass, glass shelving, glass plates, metal adhesive tape, plastic adhesive tape, paper adhesive tape, fiber glass adhesive tape, a metal sheet, a boat hull, a bed pan, a commode, a toilet plunger, an umbrella, or a portion of any of those substrates.

292. The composition of any of claims 260 to 291, wherein said composition is a coating that has contact angle with water that is greater than about 90°, 100°, 110°, 120°, 130°, 140°, 150°, 160°, 165°, 170° or 175° measured at 18°C to 23°C.

293. The composition of any of claims 260 to 292, wherein said composition applied to a surface retains a greater surface air fraction when immersed in water than an untreated aluminum control surface.

294. The composition of any of claims 260 to 293, wherein the composition is stable in boiling water.

295. The composition of any of claims 260 to 294, wherein the composition displays hydrophobic properties with solutions of aqueous acids and/or bases.

296. The composition of any of claims 260 to 295, wherein the composition displays hydrophobic properties with aqueous salt solutions including sea water.

297. The composition of any of claims 260 to 296, wherein the composition reduces ice formation and the ability of ice to adhere to surfaces.

298. The composition of claim 297, wherein the substrate is a wire, cable, bridge element, a ladder, stairs, automobile body, a satellite receiver dish, or a part of a boat, including, but not limited to, a hull, mast, antenna, deck, or ladder.

299. The composition of any of claims 260 to 287, wherein the composition resists the adherence of mud.

300. A method for forming a spill-resistant border on a surface comprising applying a coating or composition of any of claims 77 to 133, 136 to 179, 182 to 195, 229 to 287, or 292 to 297, to a surface that increases the hydrophobicity or oleophobicity of a portion of the surface that will server as a border, wherein said border forms a perimeter around at least one area that has a lower hydrophobicity and/or lower oleophobicity than the border.

301. The method of claim 300, wherein said applying comprises applying a tape or ribbon comprising said coating or composition to said surface.
302. The method of claim 300 further comprising applying a mask to said surface either before said applying a coating or composition.

303. The method of any of any of claims 300 to 302, wherein said surface is selected from a glass, metal, metalloid, ceramic, wood, plastic, resin, rubber, stone, and concrete surface.

304. The method of any of claims 300-303, wherein said spill resistant border resists the spreading of a liquid selected from the group consisting of water, an aqueous solutions, an aqueous suspension, and an aqueous emulsion.

305. The method of claim 304, wherein said spill-resistant border provides a retention of $\geq 4.0$ mm of said liquid.

306. The method claim 304, wherein said spill-resistant border provides a retention of $\geq 4.5$ mm of said liquid.

307. The method of any of claims 300-304, wherein said spill resistant border resists the spreading of a liquid comprising an alcohol.

308. The method of claim 307, wherein said liquid comprises water and up to 95% by weight of an alcohol.

309. The method of claim 307 or claim 308, wherein said spill-resistant border provides a retention of $\geq 2.0$ mm of said liquid.

310. The method of claims 307 or claim 308, wherein said spill-resistant border provides a retention of $\geq 2.5$ mm of said liquid.

311. The method of claims 307 or claim 308, wherein said spill-resistant border provides a retention of $\geq 3.0$ mm of said liquid.

312. The method of claims 307 or claim 308, wherein said spill-resistant border provides a retention of $\geq 3.5$ mm of said liquid.

313. The method of any of claims 300-304, wherein said spill resistant border resists the spreading of a liquid comprising oil or lipid.

314. The method of claim 313, wherein said spill-resistant border provides a retention of $\geq 0.9$ mm of said liquid.

315. The method of claim 313, wherein said spill-resistant border provides a retention of $\geq 1.0$ mm of said liquid.

316. The method of claim 313, wherein said spill-resistant border provides a retention of $\geq 1.25$ mm of said liquid.

317. 25. The method of claim 313, wherein said spill-resistant border provides a retention of $\geq 1.5$ mm of said liquid.
318. The method of claim 313, wherein said spill-resistant border provides a retention of ≥ 2.0 mm of said liquid.

319. A surface prepared by the method of any of claims 300-313.

320. The surface of claim 319, wherein said surface is selected from the group consisting of stone, glass and ceramic.

321. The surface of claim 329 or claim 320, wherein said surface is selected from the group consisting of a counter top, table top, cutting board, and a shelf for use in a refrigerated apparatus.

322. A surface comprising a hydrophobic or oleophobic spill-resistant border comprising a coating or composition of any of claims 77 to 133, 136 to 179, 182 to 195, 229 to 287, or 292 to 297, wherein said border forms a perimeter around at least one area that has a lower hydrophobicity and/or lower oleophobicity than said border; or wherein said surface has a contact angle with water at about 68°F to 70°F that is less than about 120°, and wherein said spill resistant border has a contact angle with water at room temperature that is greater than the contact angle of water with the surface on which it is formed by greater than about 7°.

323. The method of claim 322, wherein said coating or composition comprises a tape or ribbon in contact with said surface.

324. The method of claim 323, wherein said a tape or ribbon in contact with said surface is attached to the surface by an adhesive.

325. The surface of any of any of claims 322 to 324, wherein said surface is selected from the group consisting of glass, metal, metalloid, ceramic, wood, plastic, resin, rubber, stone, and concrete.

326. The surface of any of any of claims 322 to 325, wherein said spill resistant border resists the spreading of a liquid selected from the group consisting of water, an aqueous solutions, an aqueous suspension, and an aqueous emulsion.

327. The surface of claim 326, wherein said spill-resistant border provides a retention of ≥ 4.0 mm of said liquid.

328. The surface of claim 326, wherein said spill-resistant border provides a retention of ≥ 4.5 mm of said liquid.

329. The surface of any of any of claims 322 to 325, wherein said spill resistant border resists the spreading of a liquid comprising an alcohol.

330. The surface of claim 328, wherein said liquid comprises water and up to 95% by weight of an alcohol.
331. The surface of claims 328 to 330, wherein said spill-resistant border provides a retention of \( \geq 2.0 \) mm of said liquid.

332. The surface of claims 328 to 330, wherein said spill-resistant border provides a retention of \( \geq 2.5 \) mm of said liquid.

333. The surface of claims 328 to 330, wherein said spill-resistant border provides a retention of \( \geq 3.0 \) mm of said liquid.

334. The surface of claims 328 to 330, wherein said spill-resistant border provides a retention of \( \geq 3.5 \) mm of said liquid.

335. The surface of any of any of claims 322 - 325, wherein said spill resistant border resists the spreading of a liquid comprising oil or lipid.

336. The surface of claim 335, wherein said spill-resistant border provides a retention of \( \geq 0.9 \) mm of said liquid.

337. The surface of claim 335, wherein said spill-resistant border provides a retention of \( \geq 1.0 \) mm of said liquid.

338. The surface of claim 335, wherein said spill-resistant border provides a retention of \( \geq 1.25 \) mm of said liquid.

339. The surface of claim 335, wherein said spill-resistant border provides a retention of \( \geq 1.5 \) mm of said liquid.

340. The surface of claim 335, wherein said spill-resistant border provides a retention of \( \geq 2.0 \) mm of said liquid.

341. The surface of any of claims 322 to 340, wherein said spill-resistant border provides a contact angle of about 45° to about 125° with water on a glass surface that has a fine, medium or coarse visible border.

342. The surface of any of claims 322 to 340, wherein said spill-resistant border provides a contact angle of about 60° to about 116° with water on a glass surface that has a border that is not visible.

343. The surface of any of claims 322 to 340, wherein said spill-resistant border provides a contact angle of about 36° to about 91° with light mineral oil on a glass surface that has a fine, medium or coarse visible border.

344. The surface of any of claims 322 to 340, wherein said spill-resistant border provides a contact angle of about 27° to about 109° with light mineral oil on a glass surface that has a border that is not visible.

345. The surface of any of claims 322 to 340, wherein said surface has a contact angle with water less than about 90°, and wherein said spill resistant border has a contact angle with
water at room temperature that is greater than the contact angle of water with the surface on which it is formed by greater than about 10°.

346. The surface of any of claims 322 to 340, wherein said surface has a contact angle with water less than about 80°, and wherein said spill resistant border has a contact angle with water at room temperature that is greater than the contact angle of water with the surface on which it is formed by greater than about 30°.

347. The surface of any of claims 322 to 340, wherein said surface has a contact angle with water less than about 70°, and wherein said spill resistant border has a contact angle with water at room temperature that is greater than the contact angle of water with the surface on which it is formed by greater than about 30°.

348. The surface of any of claims 322 to 340, wherein said surface has a contact angle with water less than about 60°, and wherein said spill resistant border has a contact angle with water at room temperature that is greater than the contact angle of water with the surface on which it is formed by greater than about 30°.

349. The surface of any of claims 322 to 340, wherein said surface has a contact angle with water less than about 50°, and wherein said spill resistant border has a contact angle with water at room temperature that is greater than the contact angle of water with the surface on which it is formed by greater than about 30°.

350. The surface of any of claims 322 to 340, wherein said surface has a contact angle with water less than about 30°, and wherein said spill resistant border has a contact angle with water at room temperature that is greater than the contact angle of water with the surface on which it is formed by greater than about 30°.

351. The surface of any of claims 322 to 340, wherein said surface has a contact angle with water less than about 20°, and wherein said spill resistant border has a contact angle with water at room temperature that is greater than the contact angle of water with the surface on which it is formed by greater than about 20°.

353. A method of treating a fabric comprising:

a) contacting the fabric with a silicon containing reagent that can increase the number of site that can react with silanizing agents prior to being treated with said silanizing agent

b) contacting the fabric with a silanizing agent.

354. The method of claim 352 or claim 353, wherein said silicon containing reagent that can increase the number of site that can react with silanizing agents is selected from the group consisting of: SiCl₄, Si(OEt)₄, SiCl₃CH₃, SiH₃CH₂SiCl₃, SiCl₃CH₂CH₂SiCl₃.
Si(OMe)$_3$CH$_2$Si(OMe)$_3$, Si(OMe)$_3$CH$_2$Si(OMe)$_3$, Si(OMe)$_3$CH$_2$Si(OEt)$_3$, and
Si(OEt)$_3$CH$_2$Si(OEt)$_3$.

355. The method of any of claims 352-354, wherein said silanizing agent is an agent of
formula (I):

$$\mathbf{R_4nSi-X_n} \quad (I)$$

where \( n \) is an integer from 1 to 3;

each \( R \) is independently selected from

(i) alkyl or cycloalkyl group optionally substituted one or more fluorine atoms,
(ii) \( \mathbf{C_{1to2} alkyl} \) optionally substituted with one or more independently selected
substituents selected from fluorine atoms and \( \mathbf{C_{6to14 aryl groups}} \), which aryl groups
are optionally substituted with one or more independently selected halo, \( \mathbf{C_{1to}} \)
alkyl, \( \mathbf{C_{1to}} \) haloalkyl, \( \mathbf{C_{1to}} \) alkoxy, or \( \mathbf{C_{1to}} \) haloalkoxy substituents,
(iii) \( \mathbf{C_{6to20 alkyl ether}} \) optionally substituted with one or more substituents
independently selected from fluorine and \( \mathbf{C_{6to14 aryl groups}} \), which aryl groups are
optionally substituted with one or more independently selected halo, \( \mathbf{C_{1to}} \)
alkyl, \( \mathbf{C_{1to}} \) haloalkyl, \( \mathbf{C_{1to}} \) alkoxy, or \( \mathbf{C_{1to}} \) haloalkoxy substituents,
(iv) \( \mathbf{C_{6to14 aryl}} \), optionally substituted with one or more substituents independently
selected from halo or alkoxy, and haloalkoxy substituents;
(v) \( \mathbf{C_{6to20 alkenyl}} \) or \( \mathbf{C_{6to20 alkynyl}} \), optionally substituted with one or more
substituents independently selected from halo, alkoxy, or haloalkoxy; and
(vi) \( \mathbf{Z-((CF_2)_q(CF_2)_r)} \), wherein \( Z \) is a \( \mathbf{C_{1to12 divalent alkane radical}} \) or a \( \mathbf{C_{2to42}}
divalent alkene or alkyne radical, \( q \) is an integer from 1 to 12, and \( r \) is an integer
from 1-4;

each \( X \) is independently selected from -H, -Cl, -I, -Br, -OH, -OR$^2$, -NHR$^3$, or -N(R$^3$)$_2$;

each \( R^2 \) is independently selected \( \mathbf{C_{1to4 alkyl or haloalkyl group}} \); and

each \( R^3 \) is independently an independently selected H, \( \mathbf{C_{1to4 alkyl or haloalkyl group}} \).

356. The method of claim 355, wherein \( R \) is selected from: (a) an alkyl or fluoroalkyl group
having from 6 to 20 carbon atoms; (b) an alkyl or fluoroalkyl group having from 8 to 20.
carbon atoms; (c) an alkyl or fluoroalkyl group having from 10 to 20 carbon atoms; (d) an
alkyl or fluoroalkyl group having from 6 to 20 carbon atoms when \( n \) is 3; (e) an alkyl or
fluoroalkyl group having from 8 to 20 carbon atoms when \( n \) is 3; (f) an alkyl or fluoroalkyl
group having from 10 to 20 carbon atoms when \( n \) is 3.
357. The method of any of claims 355 to 356, wherein R is -Z-((CF$_2$)$_q$(CF$_3$)$_r$), where Z is a C$_{12}$ divalent alkane radical or a C$_{24}$ divalent alkene or alkyne radical, and q is an integer from 1 to 12, and r is an integer from 1 to 4.

358. The method of any of claims 355 to 357, wherein n is 3.

359. The method of any of claims 355 to 357, wherein n is 2.

360. The method of any of claims 355 to 357, wherein n is 1.

361. The method of any of claims 355 to 360, wherein all halogen atoms present in any one or more R groups are fluorine atoms.

362. The method of any of claims 355 to 361, wherein each X is independently selected from H, Cl, -OR$_2$, -NHR$_3$, or -N(R3)2.

363. The method of any of claims 355 to 361, wherein each X is independently selected from Cl, -OR$_2$, -NHR$_3$, or -N(R3)2.

364. The method of any of claims 355 to 361, wherein each X is independently selected from Cl, -NHR$_3$, or -N(R3)2.

365. The method of any of claims 355 to 364, wherein said fabric is treated with two or more, three or more, or four or more compounds of formula (I) employed alone or in combination.

366. The method of any of claims 352 to 354, wherein said second particles are treated with a silanizing agent is selected from tridecafluoro-1,1,2,2-tetrahydrooctyl)trimethoxysilane (SIT8 173.0); (tridecafluoro-1,1,2,2-tetrahydrooctyl)trichlorosilane (SIT8 174.0); (tridecafluoro-1,1,2,2-tetrahydrooctyl)triethoxysilane (SIT8 175.0); (tridecafluoro-1,1,2,2-tetrahydrooctyl)trimethoxysilane (SIT8 176.0); (heptadecafluoro-1,1,2,2-tetrahydrodecyl)dimethyl(dimethylamino)silane (S1H5840.5); (heptadecafluoro-1,1,2,2-tetrahydrodecyl)tris(dimethylamino)silane (S1H5841.7); n-octadecyltrimethoxysilane (SIO6645.0); n-octyltrimethoxysilane (SIO6715.0); and nonafluorohexyl(dimethylamino)silane (SIN6597.4).

367. The method of any of claims 352 to 354, wherein said second particles are treated with a silanizing agent selected from: dimethyldichlorosilane, hexamethyldisilazane, octyltrimethoxysilane, polydimethylsiloxane, or tridecafluoro-1,1,2,2-tetrahydrooctyl trichlorosilane.

368. The method of any of claims 352 to 367, wherein at least one contacting step is conducted at 20 to 100 pounds of pressure above atmospheric pressure.

369. The method of any one of claims 352-368, wherein one or more contacting step is conducted with agitation.
370. The method of any of claims 352-369, wherein said fabric is selected from: nylon, polyester, acetate, velvet, vinyl, cotton, army fabric, and wool.

372. A fabric bearing one or more groups comprises one or more covalently bound hydrophobic or oleophobic moieties of the form:

$$R_{3-n} X_n Si-$$

where n is an integer from 0 to 2;

each R is independently selected from

(i) alkyl or cycloalkyl group optionally substituted one or more fluorine atoms,

(ii) C_{10-20} alkyl optionally substituted with one or more independently selected substituents selected from fluorine atoms and C_{6-14} aryl groups, which aryl groups are optionally substituted with one or more independently selected halo, C_{1-10} alkyl, C_1 to 4 haloalkyl, C_{1-10} alkoxoy, or C_{1-10} haloalkoxy substituents,

(iii) C_{6-20} alkyl ether optionally substituted with one or more substituents independently selected from fluorine and C_{6-14} aryl groups, which aryl groups are optionally substituted with one or more independently selected halo, C_{1-10} alkyl, C_1 to 4 haloalkyl, C_{1-10} alkoxoy, or C_{1-10} haloalkoxy substituents,

(iv) C_{6-14} aryl, optionally substituted with one or more substituents independently selected from halo or alkoxy, and haloalkoxy substituents;

(v) C_{4-20} alkenyl or C_{4-20} alkynyl, optionally substituted with one or more substituents independently selected from halo, alkoxy, or haloalkoxy;

(vi) -Z-((CF_2)_q(CF_3))_r, wherein Z is a C_{1-12} divalent alkane radical or a C_{2-12} divalent alken or alkyn radical, q is an integer from 1 to 12, and r is an integer from 1-4);

each X is independently selected from -H, -Cl, -I, -Br, -OH, -OR^2, -NHR^3, or -N(R^3)_2;

each R^2 is independently selected C_{10-4} alkyl or haloalkyl group; and

each R^3 is independently an independently selected H, C_{10-4} alkyl or haloalkyl group.

373. The method of claim 372, wherein said fabric is selected from: nylon, polyester, acetate, velvet, vinyl, cotton, army fabric, and wool.

374. The fabric of any of claims 371 to 373, wherein said fabric retains its hydrophobicity when subject to at least 20 abrasions cycles as measured with a Taber Abrasion tester model 503 using CS-IO wheels and 250 g loads, wherein a surface is no long considered to retain its hydrophobicity when more than half of water droplets placed on the abraded surface are retained when the surface is inclined at an angle of 6°.
375. The fabric of claim 374, wherein said fabric retains its hydrophobicity when subject to at least 40 abrasions cycles as measured with said Taber Abrasion tester.

376. The fabric of claim 374, wherein said fabric retains its hydrophobicity when subject to at least 60 abrasions cycles as measured with said Taber Abrasion tester.
Figure 3: Taber cycles as affected by concentration of M5 and the amount of M5 used per 4- × 4-in. aluminum plate.

The uniformly covered the surface giving rise to a sandpaper-like texture with water droplets on the surface described in **Example 13**
Super-cooled water on super-cooled aluminum plates shows: (a) ice formation on uncoated sample and (b) no ice or easily dislodging ice on coated sample described in Example 15
A treated aluminum tape border is created on an aluminum plate shows no seepage of liquid beyond the border. See Example 18b

Liquid seeps onto and over an untreated aluminum tape border created on an aluminum plate.
SEM images of surface morphology of superhydrophobic-coated samples:
(a) 25-1000 and (b) 25-1000U. See Example 19b
An emergency switch was opened and dip-coated to coat the entire inside of the switch. During installation in-service, the points of electrical connection were painted with a brush. See Example 14

Heat exchanger prototype: (a) uncoated and (b) coated by brushing because of the unavailable space. The heat exchanger is for recovering heat from clothes dryers with the expectation that lint will not stick to the superhydrophobic surface. See Example 14
A complex shape such as a section of steam turbine blades coated by air gun spray process. This turbine blade section is being tested for reduction in water film formation on blades from steam condensation. See Example 14

An anti-slip plate of steel coated by air gun spray process. This plate is to produce a non-wetting/no-stick surface and is being tested with work-force traffic. See Example 14
Photo of the Cable segments described in Example 16.

A Superhydrophobic coated electrical transmission cable (A) and after bending 35° at room temperature (B)

B Superhydrophobic coated electrical transmission cable bent at room temperature to 48° after refrigerating to about -29°C for 2 hours; Bottom cable, which is also shown in the photo above, was not cooled
Example 19

Photos show the captured images of the contact angles and the hysteresis, respectively.

Captured images of water droplets on SH-coated samples: (a) 25-1000, (b) 25-1000 μm.

Figure 29: Captured images of advancing and receding water droplets on SH-coated samples (25-1000U): (a) advancing droplet and (b) receding droplet.
Photo of the plates resulting from bend testing in Example 21.

A science fun and training kit is shown as described in Example 23 (without the instructions).

B – Inside coated plunger head
A coated bed pan as described in Example 22

Coated bedside commode pot pan as described in Example 22
INTERNATIONAL SEARCH REPORT

INTERNATIONAL application No
PCT/US 09/05512

A CLASSIFICATION OF SUBJECT MATTER
IPC(8) - B32B 9/04, 27/40; G 11B 5/65 (2009.01)
USPC - 428/411.1, 423.1, 835.7
According to International Patent Classification (IPC) or to both national classification and IPC

B FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)
USPC - 428/411.1, 423.1, 835.7

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched
USPC - 428/411.1, 423.1, 835.7 (text search only-see search terms below)

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

C DOCUMENTS CONSIDERED TO BE RELEVANT

Category Citation of document, with indication, where appropriate, of the relevant passages Relevant to claim No

X US 2008/0160257 A1 (Takada et al) 03 Jul 2008 (03 07 2008) Abstract, para [0001], [0016]-[0017], [0020], [0036]-[0037], [0043], [0048], [0099]-[01 04], [01 11], [01 18]-[01 21] 1-6, 79-84, 136-138, 232-234, 260-263

D Further documents are listed in the continuation of Box C

E Special categories of cited documents
"A" document defining the general state of the art which is not considered to be of particular relevance
"E" earlier application or patent but published on or after the international filing date
"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
"O" document referring to an oral disclosure, use, exhibition or other means
"T" document published prior to the international filing date but later than the priority date claimed
"T" document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention or to consider its applicability
"X" document of particular relevance, the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

Date of the actual completion of the international search

Form PCT/ISA/210 (second sheet) (July 2009)
**INTERNATIONAL SEARCH REPORT**

**Box No. II  Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)**

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons

<table>
<thead>
<tr>
<th>No.</th>
<th>Claims Nos</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td>1</td>
</tr>
<tr>
<td></td>
<td></td>
<td>because they relate to subject matter not required to be searched by this Authority, namely</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>No.</th>
<th>Claims Nos</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td></td>
<td>D</td>
</tr>
<tr>
<td></td>
<td></td>
<td>because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be earned out, specifically</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>No.</th>
<th>Claims Nos</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>7, 28, 85, 135, 139, 168, 202-231, 235-259, 264-351, 355-371, and 374-376</td>
<td>IXI</td>
</tr>
<tr>
<td></td>
<td></td>
<td>because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6(4)</td>
</tr>
</tbody>
</table>

**Box No. III  Observations where unity of invention is lacking (Continuation of item 3 of first sheet)**

This International Searching Authority found multiple inventions in this international application, as follows

<table>
<thead>
<tr>
<th>No.</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims</td>
</tr>
<tr>
<td>2</td>
<td>As all searchable claims could be searched without effort justifying additional fees, this Authority did not invite payment of additional fees</td>
</tr>
<tr>
<td>3</td>
<td>As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos</td>
</tr>
<tr>
<td>4</td>
<td>No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims, it is covered by claims Nos</td>
</tr>
</tbody>
</table>

**Remark on Protest**

- The additional search fees were accompanied by the applicant's protest and, where applicable, the payment of a protest fee
- The additional search fees were accompanied by the applicant’s protest but the applicable protest fee was not paid within the time limit specified in the invitation
- No protest accompanied the payment of additional search fees
