Compounds useful as inhibitors of inflammasome activity

A compound of formula (I) or pharmaceutically acceptable salt thereof is provided, wherein $R^1$ is a 5 or 6 membered alkyl or aryl monocycle, having at least one group substituent comprising a (2-8C) alkyl, or a 9 or 10 membered bicyclic partially unsaturated carbocyclic ring system which may be optionally substituted as herein defined, or a 12, 13, 14, 15 or 16 membered tricyclic partially unsaturated carbocyclic ring system as herein defined; $R^2$ is $H$; $R^3$ is $H$ or alkyl(C1-4)-$R^4$ where $R^2$ is a substituent as herein defined; and $R^4$ is $H$, alkyl, monocylic alkyl or monocylic aryl group. The compounds defined herein inhibit the maturation of cytokines of the IL-1 family by inhibiting inflammasome and may be useful in the treatment of disorders in which inflammasome activity is implicated, such as inter alia autoinflammatory and autoimmune diseases and cancer.
CHEMICAL COMPOUNDS

The present disclosure concerns particular novel compounds and directly related pro-drugs, or pharmaceutically-acceptable salt(s) thereof, which possess inflamasome inhibitory activity and are accordingly useful in methods of treatment of the human or animal body. The present disclosure also relates to processes for the preparation of these compounds, to pharmaceutical compositions comprising them, and to their use in the treatment of disorders in which inflamasome activity is implicated, such as autoinflammatory and autoimmune diseases.

BACKGROUND

Autoimmune diseases are associated with the overproduction of pro-inflammatory factors. One of them is interleukin-1 (IL-1), produced by activated macrophages, monocytes, fibroblasts, and other components of the innate immune system like dendritic cells, involved in a variety of cellular activities, including cell proliferation, differentiation and apoptosis (Seth L. al. Rev. Immunol. 2009. 27:621–68).

Cytokines from the IL-1 family are highly active and, as important mediators of inflammation, primarily associated with acute and chronic inflammation (Sims J. et al. Nature Reviews Immunology 10, 89-102 (February 2010)). The overproduction of IL-1 is considered to be a mediator of some autoimmune and autoinflammatory diseases. Autoinflammatory diseases are characterised by recurrent and unprovoked inflammation in the absence of autoantibodies, infection, or antigen-specific T lymphocytes.

Pro-inflammatory cytokines of the IL-1 superfamily include IL-1α, IL-1β, IL-18, and IL-36α, β, λ and are produced in response to pathogens and other cellular stressors as part of a host innate immune response. Unlike many other secreted cytokines which are processed and released via the standard cellular secretory apparatus consisting of the endoplasmic reticulum and Golgi apparatus, IL-1 family members lack leader sequences required for endoplasmic reticulum entry and thus are retained intracellularly following translation. In addition, IL-1β, IL-18, and IL-36α, β, λ are synthesized as procytokines that require
proteolytic activation to become optimal ligands for binding to their cognate receptors on target cells.

In the case of IL-1α, IL-1β and IL-18, it is now appreciated that a multimeric protein complex known as an inflammasome is responsible for activating the proforms of IL-1β and IL-18 and for release of these cytokines extracellularly. An inflammasome complex typically consists of a sensor molecule, such as an NLR (Nucleotide-Oligomerisation Domain (NOD)-like receptor), an adaptor molecule ASC (Apoptosis-associated speck-like protein containing a CARD (Capsase Recruitment Domain)) and pro-caspase-1. In response to a variety of “danger signals”, including pathogen-associated molecule patterns (PAMPs) and danger associated molecular patterns (DAMPs), subunits of an inflammasome oligomerize to form a supermolecular structure within the cell. PAMPs include molecules such as peptidoglycan, viral DNA or RNA and bacterial DNA or RNA. DAMPs, on the other hand, consist of a wide range of endogenous sterile triggers including monosodium urate crystals, silica, alum, asbestos, fatty acids, ceramides, cholesterol crystals and aggregates of beta-amyloid peptide. Assembly of an inflammasome platform facilitates autocatalysis of pro-caspase-1 yielding a highly active cysteine protease responsible for activation and release of pro-IL-1β and pro-IL-18. Thus, release of these highly inflammatory cytokines is achieved only in response to inflammasome sensors detecting and responding to specific molecular danger signals.

In humans, 22 NLR proteins are divided into four NLR subfamilies according to their N-terminal domains. NLRA contains a CARD-AT domain, NLRB (NAIP) contains a BIR domain, NLRC (including NOD1 and NOD2) contains a CARD domain, and NLRP contains a pyrin domain. Multiple NLR family members are associated with inflammasome formation including NLRP1, NLRP3, NLRP6, NLRP7, NLRP12 and NLRC4 (IPAF).

Two other structurally distinct inflammasome structures containing a PYHIN domain (pyrin and HIN domain containing protein) namely Absent in Melanoma 2 (AIM2) and IFNα-inducible protein 16 (IFI16) (Latz et al., Nat Rev Immunol 2013 13(6) 397-311) serve as intracellular DNA sensors.
Requiring assembly of an inflammasome platform to achieve activation and release of IL-1 and IL-18 from monocytes and macrophages ensures their production is carefully orchestrated via a 2-step process. First, the cell must encounter a priming ligand (such as the TLR4 receptor ligand LPS, or an inflammatory cytokine such as TNFα) which leads NFkB dependent transcription of NLRP3, pro-IL-1β and pro-IL-18. The newly translated procytokines remain intracellular and inactive unless producing cells encounter a second signal leading to activation of an inflammasome scaffold and maturation of procaspase-1.

In addition to proteolytic activation of pro-IL-1β and pro-IL-18, active caspase-1 also triggers a form of inflammatory cell death known as pyroptosis through cleavage of gasdermin-D. Pyroptosis allows the mature forms of IL-1β and IL-18 to be externalized along with release of alarmin molecules (compounds that promote inflammation and activate innate and adaptive immunity) such as high mobility group box 1 protein (HMGB1), IL-33, and IL-1α.

Although inflammasome activation appears to have evolved as an important component of host immunity to pathogens, the NLRP3 inflammasome is unique in its ability activate in response to endogenous sterile danger signals. Many such sterile signals have been elucidated, and their formation is associated with specific disease states. For example, uric acid crystals found in gout patients are effective triggers of NLRP3 activation. Similarly, cholesterol crystals found in atherosclerotic patients can also promote NLRP3 activation. Recognition of the role of sterile danger signals as NLRP3 activators led to IL-1 and IL-18 being implicated in a diverse range of pathophysiological indications including metabolic, physiologic, inflammatory, hematologic and immunologic disorders.

A link to human disease is best exemplified by discovery that mutations in the NLRP3 gene which lead to gain-of-function confer a range of autoinflammatory conditions collectively known as cryopyrin-associated periodic syndromes (CAPS) including familial cold autoinflammatory syndrome (FCAS), Muckle-Wells syndrome (MWS) and Neonatal onset multisystem inflammatory disease (NOMID) (Hoffman et al., Nat Genet. 29(3) (2001) 301-305). Likewise, sterile mediator-induced activation of NLRP3 has been implicated in a wide range of disorders including joint degeneration (gout, rheumatoid arthritis, osteoarthritis), cardiometabolic (type 2 diabetes, atherosclerosis, hypertension), Central Nervous System
(Alzheimer’s Disease, Parkinson’s disease, multiple sclerosis), Gastrointestinal (Crohn’s disease) lung (chronic obstructive pulmonary disease) and fibrosis (non-alcoholic fatty liver disease, non-alcoholic hepatosteatosis, idiopathic pulmonary fibrosis).

Current treatment options for diseases where IL-1 is implicated as a contributor to pathogenesis include the IL-1 receptor antagonist anakinra, an Fc-containing soluble fusion construct of the type 1 IL-1 receptor, the IL-1 receptor accessory protein rilonacept and the anti-IL-1β monoclonal antibody canakinumab. For example canakinumab is licenced for CAPS, Tumor Necrosis Factor Receptor Associated Periodic Syndrome (TRAPS), Hyperimmunoglobulin D Syndrome (HIDS)/Mevalonate Kinase Deficiency (MKD), Familial Mediterranean Fever (FMF) and gout.

Some small molecules have been reported to inhibit function of the NLRP3 inflammasome. Glyburide, for example, is a specific inhibitor of NLRP3 activation, albeit at micromolar concentrations which are unlikely attainable in vivo. Non-specific agents such as parthenolide, Bay 11-7082, and 3,4-methylenedioxy-β-nitrostyrene are reported to impair NLRP3 activation but are expected to possess limited therapeutic utility due to their sharing of a common structural feature consisting of an olefin activated by substitution with an electron withdrawing group; this can lead to undesirable formation of covalent adducts with protein-bearing thiol groups. A number of natural products, for example β-hydroxybutyrate, sulforaphane, quercetin, and salvianolic acid, also are reported to suppress NLRP3 activation. Likewise, numerous effectors/modulators of other molecular targets have been reported to impair NLRP3 activation including agonists of the G-protein coupled receptor TGR5, an inhibitor of sodium-glucose cotransport epigallocatechin, the dopamine receptor antagonist A-68930, the serotonin reuptake inhibitor fluoxetine, fenamate non-steroidal anti-inflammatory drugs, and the β-adrenergic receptor blocker nebivolol. Utility of these molecules as therapeutics for the chronic treatment of NLRP3-dependent inflammatory disorders remains to be established. A series of sulphonylurea-containing molecules was previously identified as potent and selective inhibitors of post-translational processing of pro-IL-1β (Perregaux et al., J Pharmacol. Exp. Ther. 299, 187-197, 2001). The exemplar molecule CP-456,773 from this work was recently characterised as a specific inhibitor of NLRP3 activation (Coll et al., Nat Med 21.3 (2015): 248-255.).
The disclosure arises from a need to provide further compounds for the specific modulation of NLRP3-dependent cellular processes. In particular, compounds with improved physicochemical, pharmacological and pharmaceutical properties to existing compounds are desirable.

**SUMMARY**

According to a first aspect, the present disclosure relates to a compound of Formula (I), or a prodrug, or pharmaceutically acceptable salt thereof:

![Chemical Structure](image)

in which:

- $R_1$ is a 5 or 6 membered alkyl or aryl monocycle, having at least one group substituent comprising a (2-8C) alkyl or a 9 or 10 membered bicyclic partially unsaturated carbocyclic ring system, wherein said bicyclic ring system is optionally substituted by 1, 2, 3 or 4 substituents independently selected from (1-6C)alkyl, (2-6C)alkylene, (2-6C)alkynylene, (3-8C)cycloalkyl, (1-3C)alkoxy, halo, oxo, hydroxy, cyano, amino, (1-3C)alkylamino, di-[(1-3C)alkyl]-amino, CF$_3$, OCF$_3$, S(O)$_2$CH$_3$, S(O)CH$_3$, S(O)$_2$NH$_2$, S(O)$_2$NHCH$_3$, S(O)$_2$N(CH$_3$)$_2$, NHS(O)$_2$CH$_3$ and N(CH$_3$)$_2$S(O)$_2$CH$_3$ or a 12, 13, 14, 15 or 16 membered tricyclic partially unsaturated carbocyclic ring system, wherein said tricyclic ring system is optionally substituted by 1, 2, 3 or 4 substituents independently selected from (1-6C)alkyl, (2-6C)alkylene, (2-6C)alkynylene, (3-8C)cycloalkyl, (1-3C)alkoxy, halo, oxo, hydroxy, cyano, amino, (1-3C)alkylamino, di-[(1-3C)alkyl]-amino, CF$_3$, OCF$_3$, S(O)$_2$CH$_3$, S(O)CH$_3$, S(O)$_2$NH$_2$, S(O)$_2$NHCH$_3$, S(O)$_2$N(CH$_3$)$_2$, NHS(O)$_2$CH$_3$ and N(CH$_3$)$_2$S(O)$_2$CH$_3$;

- $R_2$ is H.
R₃ is H or Alkyl(C1-4)-R₇,

wherein R₇ is selected from H, NH₂, C(O)NH₂, C(O)OCH₃, S (1-3C) or a 5 or 6 membered monocyclic aryl or non-aryl ring system optionally comprising 1, 2 or 3 heteroatoms independently selected from oxygen, nitrogen and sulfur, or 3, 4, 5 or 6 membered monocyclic heterocyclic ring system optionally comprising 1 or 2 heteroatoms independently selected from oxygen, nitrogen and sulfur and a 3, 4, 5 or 6 membered saturated or partially unsaturated carbocyclic ring system, and wherein said monocyclic aryl ring, non-aryl heterocyclic ring, monocyclic heterocyclic aryl ring or said carbocyclic ring system is optionally substituted with 1 or more substituents independently selected from (1-6C) alkyl, alkylhydroxy, nitro, OH, COCH₃, halo, amino, cyano, and R₈,

wherein R₈ is, an optionally N-linked, 5 or 6 membered monocyclic heteroaryl ring comprising 1 or 2 heteroatoms independently selected from oxygen, nitrogen and sulfur, or a 3, 4, 5 or 6 membered monocyclic heterocyclic ring system comprising 1 heteroatom independently selected from oxygen, nitrogen and sulfur, said ring being optionally substituted with an alkyl, oxo, halo or amino group; and

R₄ is H, alkyl, monocyclic aryl or monocyclic aryl group.

In some embodiments, R₁ is 12, 13, 14, 15 or 16 membered tricyclic partially unsaturated carbocyclic ring system selected from the group consisting of

wherein # denotes the bond to the nitrogen atom of Formula (); wherein n and n₃ is an integer independently selected from 0, 1, 2 and 3; and wherein R₉ is selected from the group consisting of hydrogen, (1-6C)alkyl, (2-6C)alkylene, (2-
6C)alkynylene, (3-8C)cycloalkyl, halo, oxo, hydroxy, cyano, amino, (1-3C)alkylamino, di-[(1-3C)alkyl]-amino, CF$_3$, OCF$_3$, S(O)$_2$CH$_3$, S(O)CH$_3$, S(O)$_2$NH$_2$, S(O)$_2$NHCH$_3$, S(O)$_2$N(CH$_3$)$_2$, NHS(O)$_2$CH$_3$ and N(CH$_3$)S(O)$_2$CH$_3$;

or a 12, 13, 14, 15 or 16 membered tricyclic partially unsaturated carbocyclic ring system selected from the group consisting of

![Diagram](image1)

wherein # denotes the bond to the nitrogen atom of Formula (I); wherein n and n$_a$ is an integer independently selected from 0, 1, 2 and 3; and wherein R$_9$ is selected from the group consisting of hydrogen, (1-6C)alkyl, halo, CF$_3$ and OCF$_3$; or

![Diagram](image2)

wherein # denotes the bond to the nitrogen atom of Formula (I); and wherein R$_9$ is selected from the group consisting of hydrogen, (1-6C)alkyl, (2-6C)alkenylene, (2-6C)alkynylene, (3-8C)cycloalkyl, halo, oxo, hydroxy, cyano, amino, (1-3C)alkylamino, di-[(1-3C)alkyl]-amino, CF$_3$, OCF$_3$, S(O)$_2$CH$_3$, S(O)CH$_3$, S(O)$_2$NH$_2$, S(O)$_2$NHCH$_3$, S(O)$_2$N(CH$_3$)$_2$, NHS(O)$_2$CH$_3$ and N(CH$_3$)S(O)$_2$CH$_3$; or

![Diagram](image3)
wherein # denotes the bond to the nitrogen atom of Formula (I); and wherein \( R_9 \) is selected from hydrogen, (1-6)alkyl, halo, \( CF_3 \) and \( OCF_3 \); or

an unsubstituted hexahydroindacene ring:

```
      #
     /  \\
    /    \\
   /      \\
  /        \\
 /          \\
```

wherein # denotes the bond to the nitrogen atom of Formula (I).

According to a further aspect, the present disclosure relates to a compound of Formula (II), or a prodrug, or pharmaceutically acceptable salt thereof:

```
  R2
N-  |   |
   \  /  \\
    \  R3
     /  \\
    /    \\
   /      \\
  /        \\
```

in which:

- \( R_2 \) is \( H \)

- \( R_3 \) is \( H \) or \( \text{Alkyl(C1-4)}-R_7 \)

wherein \( R_7 \) is selected from \( H \), \( \text{NH}_2 \), \( \text{C(O)NH}_2 \), \( \text{C(O)OCH}_3 \), \( S \) 1-3C \( ) \) or a 5 or 6 membered monocyclic aryl or non-aryl ring system optionally comprising 1, 2 or 3 heteroatoms
independently selected from oxygen, nitrogen and sulfur, or 3, 4, 5 or 6 membered monocyclic heterocyclyl ring system optionally comprising 1 or 2 heteroatoms independently selected from oxygen, nitrogen and sulfur and a 3, 4, 5 or 6 membered saturated or partially unsaturated carbocyclic ring system, and wherein said monocyclic aryl ring, non-aryl heterocyclyl ring, monocyclic heterocyclyl aryl ring or said carbocyclic ring system is optionally substituted with 1 or more substituents independently selected from (1-6C) alkyl, alkylhydroxy, nitro, OH, COCH₃, halo, amino, cyano, and R₈,

wherein R₈ is, an optionally N-linked, 5 or 6 membered monocyclic heteroaryl ring comprising 1 or 2 heteroatoms independently selected from oxygen, nitrogen and sulfur, or a 3, 4, 5 or 6 membered monocyclic heterocyclyl ring system comprising 1 heteroatom independently selected from oxygen, nitrogen and sulfur, said ring being optionally substituted with an alkyl, oxo, halo or amino group; and

R₄ is H, alkyl, monocyclic alkyl or monocyclic aryl group.

The applicants have found that the compounds of the present disclosure serve as potent inhibitors of NLRP3 inflammasome activation, and as such are expected to be useful in the treatment of diseases in which inflammasome activity is implicated.

In some embodiments R₃ is Methyl or Ethyl-R₇.

Preferably, R₇ is a monocyclic aryl optionally with at least one hydroxyl substitution.

Preferably, R₇ is a monocyclic aryl with a cyano substitution.

Preferably, R₇ is a 5 or 6 membered monocyclic aryl ring comprising 1, 2 or 3 heteroatoms independently selected from oxygen, nitrogen and sulfur.

In some embodiments R₄ is methyl or ethyl.

According to a further aspect of the present disclosure, there is provided a pharmaceutical
composition comprising a compound as defined herein, or a pharmaceutically acceptable salt thereof, in admixture with a pharmaceutically acceptable diluent or carrier.

According to a further aspect of the present disclosure, there is provided a method of inhibiting inflammasome (such as the NLRP3 inflammasome) activity in vitro or in vivo, said method comprising contacting a cell with an effective amount of a compound of Formula (I) or (II) a pharmaceutically acceptable salt thereof as defined herein.

According to a further aspect of the present disclosure, there is provided a method of treating a disease or disorder in which inflammasome activity is implicated in a patient in need of such treatment, said method comprising administering to said patient a therapeutically effective amount of a compound of Formula (I) or (II) a pharmaceutically acceptable salt thereof as defined herein, or a pharmaceutical composition as defined herein.

According to a further aspect of the present disclosure, there is provided a method of treating an autoinflammatory disorder, an autoimmune disorder, a neurodegenerative disease or cancer in a patient in need of such treatment, said method comprising administering to said patient a therapeutically effective amount of a compound of Formula (I) or (II) a pharmaceutically acceptable salt thereof as defined herein, or a pharmaceutical composition as defined herein.

According to a further aspect of the present disclosure, there is provided a method of treating an autoinflammatory disorder and/or an autoimmune disorder selected from cryopyrin-associated autoinflammatory syndromes (CAPS) including familial cold autoinflammatory syndrome (FCAS), Muckle-Wells syndrome (MWS), chronic infantile neurological cutaneous and articular (CINCA) syndrome, neonatal-onset multisystem inflammatory disease (NOMID), familial Mediterranean fever and nonalcoholic fatty liver disease (NAFLD), Non-alcoholic steatohepatitis (NASH), gout, rheumatoid arthritis, osteoarthritis, Crohn’s disease, COPD, fibrosis, obesity, type 2 diabetes, multiple sclerosis and neuro-inflammation occurring in protein misfolding diseases, such as Prion diseases in a patient in need of such treatment, said method comprising administering to said patient a
therapeutically effective amount of a compound of Formula (I) or (II) or a pharmaceutically acceptable salt thereof as defined herein, or a pharmaceutical composition as defined herein.

According to a further aspect of the present disclosure, there is provided a method of treating a neurodegenerative disease such as Parkinson’s disease or Alzheimer’s disease in a patient in need of such treatment, said method comprising administering to said patient a therapeutically effective amount of a compound of Formula (I), (II) or a pharmaceutically acceptable salt thereof as defined herein, or a pharmaceutical composition as defined herein.

According to a further aspect of the present disclosure, there is provided a compound of Formula (I), (II) or a pharmaceutically acceptable salt thereof, or a pharmaceutical composition as defined herein for use in therapy.

According to a further aspect of the present disclosure, there is provided a compound of Formula (I), (II) or a pharmaceutically acceptable salt thereof as defined herein, or a pharmaceutical composition as defined herein, for use in the treatment of a disorder in which inflammasome activity is implicated.

In one embodiment the composition is for use in the treatment of a cancer. In particularly preferred embodiments the cancer is selected from a metastasizing cancer, gastrointestinal cancer, skin cancer, non-small-cell lung carcinoma and colorectal adenocarcinoma.

According to a further aspect of the present disclosure, there is provided a compound of Formula (I), (II) or a pharmaceutically acceptable salt, hydrate or solvate thereof, or a pharmaceutical composition as defined herein for use in the treatment of an autoinflammatory disorder, an autoimmune disorder, a neurodegenerative disease or cancer. In a particular embodiment, the autoinflammatory or autoimmune disorder is a cryopyrin-associated autoinflammatory syndrome (CAPS) such as for example familial cold autoinflammatory syndrome (FCAS), Muckle-Wells syndrome (MWS), chronic infantile neurological cutaneous and articular (CINCA) syndrome, neonatal-onset multisystem
inflammatory disease (NOMID), familial Mediterranean fever and nonalcoholic fatty liver disease (NAFLD), gout, rheumatoid arthritis, Crohn’s disease, COPD, fibrosis, obesity, type 2 diabetes, multiple sclerosis or neuro-inflammation occurring in protein miss-folding diseases, such as Prion diseases. In a further embodiment, the neurodegenerative disease is Parkinson’s disease or Alzheimer’s disease, NASH and osteoarthritis.

According to a further aspect of the present disclosure, there is provided the use of a compound of Formula (I), (II) or a pharmaceutically acceptable salt thereof, as defined herein in the manufacture of a medicament for the treatment of an autoinflammatory disorder, an autoimmune disorder, a neurodegenerative disease or cancer. Suitably, the autoinflammatory or autoimmune disorder is cryopyrin-associated autoinflammatory syndrome (CAPS) such as for example familial cold autoinflammatory syndrome (FCAS), Muckle-Wells syndrome (MWS), chronic infantile neurological cutaneous and articular (CINCA) syndrome, neonatal-onset multisystem inflammatory disease (NOMID), familial Mediterranean fever and nonalcoholic fatty liver disease (NAFLD), gout, rheumatoid arthritis, Crohn’s disease, COPD, fibrosis, obesity, type 2 diabetes, multiple sclerosis or neuro-inflammation occurring in protein misfolding diseases, such as Prion diseases. Suitably, the neurodegenerative disease is Parkinson’s disease or Alzheimer’s disease, NASH and osteoarthritis.

According to a further aspect of the present disclosure, there is provided a process for preparing a compound of Formula (I), (II) or a pharmaceutically acceptable salt thereof, as defined herein.

According to a further aspect of the present disclosure, there is provided a compound of Formula (I), (II) or a pharmaceutically acceptable salt thereof, obtainable by, or obtained by, or directly obtained by a process of preparing a compound as defined herein.

According to a further aspect of the present disclosure, there are provided novel intermediates as defined herein which are suitable for use in any one of the synthetic methods set out herein.
Unless otherwise defined, all technical and scientific terms used herein have the same meaning as commonly understood by one of ordinary skill in the art to which this disclosure belongs. Although methods and materials similar or equivalent to those described herein can be used in the practice or testing of the present disclosure, suitable methods and materials are described below. All publications, patent applications, patents, and other references mentioned herein are incorporated by reference in their entirety. In the case of conflict, the present specification, including definitions, will control. In addition, the materials, methods, and examples are illustrative only and are not intended to be limiting.

Other features and advantages of the disclosure will be apparent from the following detailed description and claims.

DETAILED DESCRIPTION

A link to human disease is best exemplified by discovery that mutations in the NLRP3 gene which lead to gain-of-function confer a range of autoinflammatory conditions collectively known as cryopyrin-associated periodic syndromes (CAPS) including familial cold autoinflammatory syndrome (FCAS), Muckle-Wells syndrome (MWS) and Neonatal onset multisystem inflammatory disease (NOMID) (Hoffman et al., Nat Genet. 29(3) (2001) 301-305). Likewise, sterile mediator-induced activation of NLRP3 has been implicated in a wide range of disorders including joint degeneration (gout, rheumatoid arthritis, osteoarthritis), cardiometabolic (type 2 diabetes, atherosclerosis, hypertension), Central Nervous System (Alzheimer’s Disease, Parkinson’s disease, multiple sclerosis), Gastrointestinal (Crohn’s disease) lung (chronic obstructive pulmonary disease) and fibrosis (non-alcoholic fatty liver disease, non-alcoholic hepatosteatosis, idiopathic pulmonary fibrosis).

DEFINITIONS

Unless otherwise stated, the following terms used in the specification and claims have the following meanings set out below.

It is to be appreciated that references to “treating” or “treatment” include the alleviation of
established symptoms of a condition. “Treating” or “treatment” of a state, disorder or condition therefore includes: (1) preventing or delaying the appearance of clinical symptoms of the state, disorder or condition developing in a human that may be afflicted with or predisposed to the state, disorder or condition but does not yet experience or display clinical or subclinical symptoms of the state, disorder or condition, (2) inhibiting the state, disorder or condition, i.e., arresting, reducing or delaying the development of the disease or a relapse thereof (in case of maintenance treatment) or at least one clinical or subclinical symptom thereof, or (3) relieving or attenuating the disease, i.e., causing regression of the state, disorder or condition or at least one of its clinical or subclinical symptoms.

A “therapeutically effective amount” means the amount of a compound that, when administered to a mammal for treating a disease, is sufficient to effect such treatment for the disease. The "therapeutically effective amount" will vary depending on the compound, the disease and its severity and the age, weight, etc., of the mammal to be treated.

In this specification the term “alkyl” includes both straight and branched chain alkyl groups such as propyl, isopropyl and t-butyl. However, references to individual alkyl groups such as “propyl” are specific for the straight chain version only and references to individual branched chain alkyl groups such as “isopropyl” are specific for the branched chain version only. For example, “(1-6C)alkyl” includes (1-4C)alkyl, (1-3C)alkyl, propyl, isopropyl and t-butyl.

An “alkylene,” “alkenylene,” or “alkynylene” group is an alkyl, alkenyl, or alkynyl group that is positioned between and serves to connect two other chemical groups. Thus, “(1-6C)alkylene” means a linear saturated divalent hydrocarbon radical of one to six carbon atoms or a branched saturated divalent hydrocarbon of three to six carbon atoms, for example, methylene, ethylene, propylene, 2-methylpropylene, pentylene, and the like.

“(2-6C)alkenylene” means a linear divalent hydrocarbon radical of two to six carbon atoms or a branched divalent hydrocarbon radical of three to six carbon atoms, containing at least one double bond, for example, as in ethenylene, 2,4-pentadienylene, and the like.
“(2-6C)alkynylene” means a linear divalent hydrocarbon radical of two to six carbon atoms or a branched divalent hydrocarbon radical of three to six carbon atoms, containing at least one triple bond, for example, as in ethynylene, propynylene, and butynylene and the like.

“(3-8C)cycloalkyl” means a hydrocarbon ring containing from 3 to 8 carbon atoms, for example, cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl or bicyclo[2.2.1]heptyl.

The term “halo” refers to fluoro, chloro, bromo and iodo.

Suitable values for the term “(1-6C)alkoxy” include methoxy, ethoxy, propoxy, isopropoxy and butoxy.

Suitable values for the term “(1-3C)alkylamino” include methylamino, ethylamino, propylamino, isopropylamino and butylamino.

Suitable values for the term “di-[(1-3C)alkyl]-amino” include dimethylamino, diethylamino, N-ethyl-N-methylamino and diisopropylamino.

The term “aryl” means a cyclic or polycyclic aromatic ring having from 5 to 12 carbon atoms. The term aryl includes both monovalent species and divalent species. Examples of aryl groups include, but are not limited to, phenyl, biphenyl, naphthyl and the like. Conveniently, an aryl is phenyl.

The term “5 membered monocyclic heteroaryl ring system” when used to define the ring system wherein the ring system, optionally comprises 1, 2 or 3 heteroatoms independently
selected from oxygen, nitrogen and sulfur. Suitable examples include Furanyl, thiophenyl, pyrrolyl, isoxazolyl, thiazolyl, isothiazolyl, pyrazolyl, imidazolyl, oxadiazolyl, thia diazolyl, triazolyl and tetrazolyl.

The term “8, 9 or 10 membered bicyclic heteroaryl ring system” when used to define the ring system formed, optionally comprises 1, 2 or 3 heteroatoms independently selected from oxygen, nitrogen and sulfur. Suitable examples include indolyl, isoindolyl, indazolyl, benzimidazolyl, benzo xathiazolyl, benzoxadiazolyl, benzothiadiazolyl, quinolinyl, isoquinolinyl, purinyl, 1,8-naphthyridyl, pteridyl, 1H-pyrrolo[3,2-b]pyridinyl, 1H-pyrrolo[2,3-c]pyridinyl, pyrido[3,2-d]pyrimidinyl and pyridoimidazolyl. The term “8, 9 or 10 membered bicyclic heteroaryl ring system” also covers partially aromatic bicyclic ring systems wherein the first ring is aromatic and the other second ring is non-aromatic, saturated or partially saturated. Suitable examples of partially aromatic bicyclic ring systems include for example, 4,5,6,7-tetrahydroindolyl, 4,5,6,7-tetrahydroisoindolyl and 2H,4H,5H,6H-cyclopenta[c]pyrrolyl.

The term “5 or 6 membered monocyclic heteroaryl ring system” refers to a 5 or 6 membered aromatic ring system comprising 1, 2 or 3 heteroatoms independently selected from oxygen, nitrogen and sulfur. Suitable examples include furanyl, thiophenyl, pyrrolyl, isoxazolyl, thiazolyl, isothiazolyl, pyrazolyl, imidazolyl, oxadiazolyl, thia diazolyl, triazolyl, tetrazolyl, pyridyl, pyrimidinyl, pyrazinyl and pyridazinyl.

The term “3, 4, 5, or 6 membered monocyclic heterocyclic ring system” refers to a 3, 4, 5, or 6 membered non-aromatic saturated or partially saturated heterocyclic ring system, wherein the ring system optionally comprises 1 or 2 heteroatoms independently selected from oxygen, nitrogen and sulfur, wherein a ring sulfur atom is optionally oxidized to form the S-oxide(s). Suitable examples include oxiranyl, aziridinyl, azetidinyl, oxetanyl, pyrrolinyl, pyrrolidinyl, imidazolinyl, imidazolidinyl, pyrazolinyl, pyrazolidinyl, morpholinyl, thiomorpholinyl, piperidinyl, homopiperidinyl, piperazinyl, homopiperazinyl, tetrahydrofuranyl, tetrahydropyran and tetrahydro-1,4-thiazinyl.
The term “12, 13, 14, 15 or 16 membered tricyclic partially unsaturated heterocyclic ring system” when used to define the ring system refers to a 12, 13, 14, 15 or 16 partially unsaturated heterocyclic ring system, which comprises 1 or 2 heteroatoms independently selected from oxygen, nitrogen and sulfur, wherein a ring sulfur atom is optionally oxidized to form the S-oxide(s). Suitable examples include rings such as 2-azatricyclo[7.3.0.0⁷]dodeca-1,3(7),8-trienyl, 1,2,3,4,5,6,7,8-octahydroacridinyl, 7-azatricyclo[7.3.0.0⁶]dodeca-1,6,8-trienyl, 1,2,3,4,7,8,9,10-octahydrophenanthridinyl, 1H,2H,3H,6H,7H,8H,9H-cyclopenta[c]isoquinolinyl, 1H,2H,3H,6H,7H,8H,9H-cyclopenta[c]quinolonyln, 1H,2H,3H,5H,6H,7H,8H-cyclopenta[b]quinolonyln, 1H,2H,3H,5H,6H,7H-cyclopenta[b]pyrrolizinyl, 1H,2H,3H,5H,6H,7H,8H-cyclohexa[b]pyrrolizinyl, 1H,2H,3H,5H,6H,7H-cyclopenta[b]pyrrolizinyl and 1H,2H,3H,5H,6H,7H,8H-cyclopenta[b]indolizinyl. It will be understood by the person skilled in the art that when the carbon atom is sp²-hybridized, the said carbon atom will have no hydrogen attached.

The term “12, 13, 14, 15 or 16 membered tricyclic partially unsaturated carbocyclic ring system” comprising only carbon atoms. Suitable examples include rings such as 1,2,3,5,6,7-hexahydro-s-indacenyl, 1H,2H,3H,6H,7H,8H,9H-cyclopenta[a]naphthalenyl, 1,2,3,6,7,8-hexahydroas-indacenyl, 1,2,3,4,5,6,7,8-octahydroanthracenyl, 1,2,3,4,5,6,7,8-octahydrophenanthrenyl and 1H,2H,3H,5H,6H,7H,8H-cyclopenta[b]naphthalenyl.

The term “3, 4, 5 or 6 membered saturated or partially unsaturated carbocyclic ring system” refers to a monocyclic ring system comprising only carbon atoms. Suitable examples include cyclopropanyl, cyclopentanyl, cyclohexanyl and cyclohexenyl.

The phrase “compound of the disclosure” means those compounds which are disclosed herein, both generically and specifically.
COMPOUNDS OF THE DISCLOSURE

For the avoidance of doubt it is to be understood that where in this specification a group is qualified by 'hereinbefore defined' or 'defined hereinbefore' the said group encompasses the first occurring and broadest definition as well as each and all of the particular definitions for that group.

Particular compounds of the disclosure include, for example, compounds of the Formula (I) or (II), or pharmaceutically acceptable salt thereof, wherein, unless otherwise stated, each of $R_1$, $R_2$, $R_3$, $R_4$ and any associated substituent groups has any of the meanings defined hereinbefore.

The various functional groups and substituents making up the compounds of the Formula (I) or (II) are typically chosen such that the molecular weight of the compound does not exceed 1000 daltons. More usually, the molecular weight of the compound will be less than 900, for example less than 800, or less than 750, or less than 700, or less than 650 daltons. More conveniently, the molecular weight is less than 600 and, for example, is 550 daltons or less.

A suitable pharmaceutically acceptable salt of a compound of the disclosure is, for example, an acid-addition salt of a compound of the disclosure which is sufficiently basic, for example, an acid-addition salt with, for example, an inorganic or organic acid, for example hydrochloric, hydrobromic, sulfuric, phosphoric, trifluoroacetic, formic, citric methane sulfonate or maleic acid. In addition, a suitable pharmaceutically acceptable salt of a compound of the disclosure which is sufficiently acidic is an alkali metal salt, for example a sodium or potassium salt, an alkaline earth metal salt, for example a calcium or magnesium salt, an ammonium salt or a salt with an organic base which affords a pharmaceutically acceptable cation, for example a salt with methylamine, dimethylamine, trimethylamine, piperidine, morpholine or tris-(2-hydroxyethyl)amine.

It will be understood that the compounds of Formula (I), (II) and any pharmaceutically acceptable salts thereof, comprise stereoisomers, mixtures of stereoisomers, polymorphs of all isomeric forms of said compounds.
Compounds that have the same molecular formula but differ in the nature or sequence of bonding of their atoms or the arrangement of their atoms in space are termed “isomers”. Isomers that differ in the arrangement of their atoms in space are termed “stereoisomers”. Stereoisomers that are not mirror images of one another are termed “diastereomers” and those that are non-superimposable mirror images of each other are termed “enantiomers”. When a compound has an asymmetric centre, for example, it is bonded to four different groups, a pair of enantiomers is possible. An enantiomer can be characterised by the absolute configuration of its asymmetric centre and is described by the R- and S-sequencing rules of Cahn and Prelog, or by the manner in which the molecule rotates the plane of polarised light and designated as dextrorotatory or levo rotatory (i.e., as (+) or (-)-isomers respectively). A chiral compound can exist as either individual enantiomer or as a mixture thereof. A mixture containing equal proportions of the enantiomers is called a “racemic mixture”.

The compounds of this disclosure may possess one or more asymmetric centres; such compounds can therefore be produced as individual (R)- or (S)-stereoisomers or as mixtures thereof. Unless indicated otherwise, the description or naming of a particular compound in the specification and claims is intended to include both individual enantiomers and mixtures, racemic or otherwise, thereof. The methods for the determination of stereochemistry and the separation of stereoisomers are well-known in the art (see discussion in Chapter 4 of “Advanced Organic Chemistry”, 4th edition J. March, John Wiley and Sons, New York, 2001), for example by synthesis from optically active starting materials or by resolution of a racemic form. Some of the compounds of the disclosure may have geometric isomeric centres (E- and Z- isomers). It is to be understood that the present disclosure encompasses all optical, diastereoisomers and geometric isomers and mixtures thereof that possess inflammable inhibition activity.

The present disclosure also encompasses compounds of the disclosure as defined herein which comprise one or more isotopic substitutions.

It is also to be understood that certain compounds of the Formula (I) or (II) may exist in
solvated as well as unsolvated forms such as, for example, hydrated forms. A suitable pharmaceutically-acceptable solvate is, for example, a hydrate such as hemi-hydrate, a mono-hydrate, a di-hydrate or a tri-hydrate. It is to be understood that the disclosure encompasses all such solvated forms that possess inflammasome inhibitory activity.

It is also to be understood that certain compounds of the Formula (I) or (II) may exhibit polymorphism, and that the disclosure encompasses all such forms, or mixtures thereof, which possess inflammasome inhibitory activity. It is generally known that crystalline materials may be analysed using conventional techniques such as X-Ray Powder Diffraction analysis, Differential Scanning Calorimetry, Thermal Gravimetric Analysis, Diffuse Reflectance Infrared Fourier Transform (DRIFT) spectroscopy, Near Infrared (NIR) spectroscopy, solution and/or solid state nuclear magnetic resonance spectroscopy. The water content of such crystalline materials may be determined by Karl Fischer analysis.

Compounds of the Formula (I) or (II) may exist in a number of different tautomeric forms and references to compounds of the formula I include all such forms. For the avoidance of doubt, where a compound can exist in one of several tautomeric forms, and only one is specifically described or shown, all others are nevertheless embraced by Formula (I). Examples of tautomeric forms include keto-, enol-, and enolate-forms, as in, for example, the following tautomeric pairs: keto/enol (illustrated below), imine/enamine, amide/imino alcohol, amidine/amidine, nitroso/oxime, thio ketone/enethiol, and nitro/aci-nitro.

\[
\begin{align*}
\text{keto} & \quad \leftrightarrow \quad \text{enol} \quad \leftrightarrow \quad \text{enolate} \\
\end{align*}
\]

Compounds of the Formula (I) or (II) containing an amine function may also form N-oxides. A reference herein to a compound of the Formula I that contains an amine function also includes the N-oxide. Where a compound contains several amine functions, one or more than one nitrogen atom may be oxidised to form an N-oxide. Particular examples of N-oxides are the N-oxides of a tertiary amine or a nitrogen atom of a nitrogen-containing heterocycle. N-oxides can be formed by treatment of the corresponding amine with an oxidizing agent such as hydrogen peroxide or a peracid (e.g. a peroxy carboxylic acid), see for
example Advanced Organic Chemistry, by Jerry March, 4th Edition, Wiley Interscience, pages. More particularly, N-oxides can be made by the procedure of L. W. Deady (Syn. Comm. 1977, 7, 509-514) in which the amine compound is reacted with m-chloroperoxybenzoic acid (mCPBA), for example, in an inert solvent such as dichloromethane.

The compounds of Formula (I) or (II) may be administered in the form of a pro-drug which is broken down in the human or animal body to release a compound of the disclosure. A pro-drug may be used to alter the physical properties and/or the pharmacokinetic properties of a compound of the disclosure. A pro-drug can be formed when the compound of the disclosure contains a suitable group or substituent to which a property-modifying group can be attached. Examples of pro-drugs include in vivo cleavable ester derivatives that may be formed at a carboxy group or a hydroxy group in a compound of the Formula (I) or (II) and in vivo cleavable amide derivatives that may be formed at a carboxy group or an amino group in a compound of the Formula (I) or (II).

Accordingly, the present disclosure includes those compounds of the Formula (I) or (II) as defined hereinbefore when made available by organic synthesis and when made available within the human or animal body by way of cleavage of a pro-drug thereof. Accordingly, the present disclosure includes those compounds of the Formula (I) or (II) that are produced by organic synthetic means and also such compounds that are produced in the human or animal body by way of metabolism of a precursor compound, that is a compound of the Formula (I) or (II) may be a synthetically-produced compound or a metabolically-produced compound.

A suitable pharmaceutically acceptable pro-drug of a compound of the Formula (I) or (II) is one that is based on reasonable medical judgment as being suitable for administration to the human or animal body without undesirable pharmacological activities and without undue toxicity. Various forms of pro-drug have been described, for example in the following documents:-

b) Design of Pro-drugs, edited by H. Bundgaard, (Elsevier, 1985);

d) H. Bundgaard, Advanced Drug Delivery Reviews, 8, 1-38 (1992);

g) T. Higuchi and V. Stella, “Pro-Drugs as Novel Delivery Systems”, A.C.S. Symposium Series, Volume 14; and

A suitable pharmaceutically acceptable pro-drug of a compound of the Formula (I) or (II) that possesses a carboxy group is, for example, an in vivo cleavable ester thereof. An in vivo cleavable ester of a compound of the Formula (I) or (II) containing a carboxy group is, for example, a pharmaceutically acceptable ester which is cleaved in the human or animal body to produce the parent acid. Suitable pharmaceutically acceptable esters for carboxy include C1-alkyl esters such as methyl, ethyl and tert-butyl, C1-alkoxymethyl esters such as methoxymethyl esters, C1-alkanoyloxymethyl esters such as pivaloyloxymethyl esters, 3-phthalidyl esters, C3-alkycarbonyloxy- C1-alkyl esters such as cyclopentylcarbonyloxyethyl and 1-cyclohexylcarbonyloxyethyl esters, 2-oxo-1,3-dioxolenylmethyl esters such as 5-methyl-2-oxo-1,3-dioxolen-4-ylmethyl esters and C1-alkoxycarbonyloxy- C1-alkyl esters such as methoxycarbonyloxyethyl and 1-methoxycarbonyloxyethyl esters.

A suitable pharmaceutically acceptable pro-drug of a compound of the Formula (I) or (II) that possesses a hydroxy group is, for example, an in vivo cleavable ester or ether thereof. An in vivo cleavable ester or ether of a compound of the Formula (I) or (II) containing a hydroxy group is, for example, a pharmaceutically acceptable ester or ether which is cleaved in the human or animal body to produce the parent hydroxy compound. Suitable
pharmaceutically acceptable ester forming groups for a hydroxy group include inorganic esters such as phosphate esters (including phosphoramidic cyclic esters). Further suitable pharmaceutically acceptable ester forming groups for a hydroxy group include (1-10C)alkanoyl groups such as acetyl, benzoyl, phenylacetyl and substituted benzoyl and phenylacetyl groups, (1-10C)alkoxycarbonyl groups such as ethoxycarbonyl, N,N-(C1-6)carbamoyl, 2-dialkylaminoacetyl and 2-carboxyacetyl groups. Examples of ring substituents on the phenylacetyl and benzoyl groups include aminomethyl, N-alkylaminomethyl, N,N-dialkylaminomethyl, morpholinomethyl, piperazin-1-ylmethyl and 4-(C1-4alkyl)piperazin-1-ylmethyl. Suitable pharmaceutically acceptable ether forming groups for a hydroxy group include α-acyloxyalkyl groups such as acetoxymethyl and pivaloyloxyethyl groups.

A suitable pharmaceutically acceptable pro-drug of a compound of the Formula (I) or (II) that possesses a carboxy group is, for example, an in vivo cleavable amide thereof, for example an amide formed with an amine such as ammonia, a C1-4alkylamine such as methylamine, a (C1-4alkyl)2amine such as dimethylamine, N-ethyl-N-methylamine or diethylamine, a C1-4alkoxy- C2-4alkylamine such as 2-methoxyethylamine, a phenyl-C1-4alkylamine such as benzylamine and amino acids such as glycine or an ester thereof.

A suitable pharmaceutically acceptable pro-drug of a compound of the Formula (I) or (II) that possesses an amino group is, for example, an in vivo cleavable amide derivative thereof. Suitable pharmaceutically acceptable amides from an amino group include, for example an amide formed with C1-10alkanoyl groups such as an acetyl, benzoyl, phenylacetyl and substituted benzoyl and phenylacetyl groups. Examples of ring substituents on the phenylacetyl and benzoyl groups include aminomethyl, N-alkylaminomethyl, N,N-dialkylaminomethyl, morpholinomethyl, piperazin-1-ylmethyl and 4-(C1-4alkyl)piperazin-1-ylmethyl.

The in vivo effects of a compound of the Formula (I) or (II) may be exerted in part by one or more metabolites that are formed within the human or animal body after administration of
a compound of the Formula (I) or (II). As stated hereinafter, the in vivo effects of a compound of the Formula (I) or (II) may also be exerted by way of metabolism of a precursor compound (a pro-drug).

Though the present disclosure may relate to any compound or particular group of compounds defined herein by way of optional, preferred or suitable features or otherwise in terms of particular embodiments, the present disclosure may also relate to any compound or particular group of compounds that specifically excludes said optional, preferred or suitable features or particular embodiments. A feature of the disclosure concerns particular structural groups at R1, which is relevant to the scope of the claims, as defined herein. In some cases, specific groups define structures that are not relevant to the present invention and thus may be disclaimed. Such structures may be disclaimed where R1 corresponds to a phenyl directly substituted with at least 2 groups including: 1 halogen group and 1 methyl group; 2 or more halogen groups; or 2 methyl groups.

Suitably, the present disclosure excludes any individual compounds not possessing the biological activity defined herein.

GENERAL METHODS OF PREPARATION

The compounds of the present disclosure can be prepared by any suitable technique known in the art. Particular processes for the preparation of these compounds are described further in the accompanying examples.

In the description of the synthetic methods described herein and in any referenced synthetic methods that are used to prepare the starting materials, it is to be understood that all proposed reaction conditions, including choice of solvent, reaction atmosphere, reaction temperature, duration of the experiment and workup procedures, can be selected by a person skilled in the art.
It is understood by one skilled in the art of organic synthesis that the functionality present on various portions of the molecule must be compatible with the reagents and reaction conditions utilised.

It will be appreciated that during the synthesis of the compounds of the disclosure in the processes defined herein, or during the synthesis of certain starting materials, it may be desirable to protect certain substituent groups to prevent their undesired reaction. The skilled chemist will appreciate when such protection is required, and how such protecting groups may be put in place, and later removed. For examples of protecting groups see one of the many general texts on the subject, for example, ‘Protective Groups in Organic Synthesis’ by Theodora Green (publisher: John Wiley & Sons). Protecting groups may be removed by any convenient method described in the literature or known to the skilled chemist as appropriate for the removal of the protecting group in question, such methods being chosen so as to effect removal of the protecting group with the minimum disturbance of groups elsewhere in the molecule. Thus, if reactants include, for example, groups such as amino, carboxy or hydroxy it may be desirable to protect the group in some of the reactions mentioned herein.

By way of example, a suitable protecting group for an amino or alkylamino group is, for example, an acyl group, for example an alkanoyl group such as acetyl, an alkoxy carbonyl group, for example a methoxycarbonyl, ethoxycarbonyl or t-butoxycarbonyl group, an arylmethoxycarbonyl group, for example benzoyloxycarbonyl, or an aryl group, for example benzoyl. The deprotection conditions for the above protecting groups necessarily vary with the choice of protecting group. Thus, for example, an acyl group such as an alkanoyl or alkoxy carbonyl group or an aryl group may be removed by, for example, hydrolysis with a suitable base such as an alkali metal hydroxide, for example lithium or sodium hydroxide. Alternatively an acyl group such as a tert-butoxycarbonyl group may be removed, for example, by treatment with a suitable acid as hydrochloric, sulfuric or phosphoric acid or trifluoroacetic acid and an arylmethoxycarbonyl group such as a benzoyloxycarbonyl group may be removed, for example, by hydrogenation over a catalyst such as palladium on carbon, or by treatment with a Lewis acid for example boron tris(trifluoroacetate). A
suitable alternative protecting group for a primary amino group is, for example, a phthaloyl group which may be removed by treatment with an alkylamine, for example dimethylaminopropylamine, or with hydrazine.

A suitable protecting group for a hydroxy group is, for example, an acyl group, for example an alkanoyl group such as acetyl, an aroyl group, for example benzoyl, or an arylmethyl group, for example benzyl. The deprotection conditions for the above protecting groups will necessarily vary with the choice of protecting group. Thus, for example, an acyl group such as an alkanoyl or an aroyl group may be removed, for example, by hydrolysis with a suitable base such as an alkali metal hydroxide, for example lithium, sodium hydroxide or ammonia. Alternatively an arylmethyl group such as a benzyl group may be removed, for example, by hydrogenation over a catalyst such as palladium on carbon.

A suitable protecting group for a carboxy group is, for example, an esterifying group, for example a methyl or an ethyl group which may be removed, for example, by hydrolysis with a base such as sodium hydroxide, or for example a t-butyl group which may be removed, for example, by treatment with an acid, for example an organic acid such as trifluoroacetic acid, or for example a benzyl group which may be removed, for example, by hydrogenation over a catalyst such as palladium on carbon.

Once a compound of Formula (I) or (II) has been synthesised by any one of the processes defined herein, the processes may then further comprise the additional steps of:

(i) removing any protecting groups present;

(ii) converting the compound Formula (I) or (II) into another compound of Formula (I) or (II);

(iii) forming a pharmaceutically acceptable salt, hydrate or solvate thereof; and/or

(iv) forming a prodrug thereof.

The resultant compounds of Formula (I) or (II) can be isolated and purified using techniques well known in the art.

Conveniently, the reaction of the compounds is carried out in the presence of a suitable solvent, which is preferably inert under the respective reaction conditions. Examples of
suitable solvents comprise but are not limited to hydrocarbons, such as hexane, petroleum ether, benzene, toluene or xylene; chlorinated hydrocarbons, such as trichlorethylene, 1,2-dichloroethane, tetrachloromethane, chloroform or dichloromethane; alcohols, such as methanol, ethanol, isopropanol, n-propanol, n-butanol or tert-butanol; ethers, such as diethyl ether, diisopropyl ether, tetrahydrofuran (THF), 2-methyltetrahydrofuran, cyclopentylmethyl ether (CPME), methyl tert-butyl ether (MTBE) or dioxane; glycol ethers, such as ethylene glycol monomethyl or monoethyl ether or ethylene glycol dimethyl ether (diglyme); ketones, such as acetone, methylisobutylketone (MIBK) or butanone; amides, such as acetamide, dimethylacetamide, dimethylformamide (DMF) or N,N-methylpyrrolidinone (NMP); nitriles, such as acetonitrile; sulfoxides, such as dimethyl sulfoxide (DMSO); nitro compounds, such as nitromethane or nitrobenzene; esters, such as ethyl acetate or methyl acetate, or mixtures of the said solvents or mixtures with water.

The reaction temperature is suitably between about -100°C and 300°C, depending on the reaction step and the conditions used.

Reaction times are generally in the range between a fraction of a minute and several days, depending on the reactivity of the respective compounds and the respective reaction conditions. Suitable reaction times are readily determinable by methods known in the art, for example reaction monitoring. Based on the reaction temperatures given above, suitable reaction times generally lie in the range between 10 minutes and 48 hours.

Moreover, by utilising the procedures described herein, in conjunction with ordinary skills in the art, additional compounds of the present disclosure can be readily prepared. Those skilled in the art will readily understand that known variations of the conditions and processes of the following preparative procedures can be used to prepare these compounds.

As will be understood by the person skilled in the art of organic synthesis, compounds of the present disclosure are readily accessible by various synthetic routes, some of which are exemplified in the accompanying examples. The skilled person will easily recognise which kind of reagents and reactions conditions are to be used and how they are to be applied and adapted in any particular instance – wherever necessary or useful – in order to obtain the compounds of the present disclosure. Furthermore, some of the compounds of the present disclosure can readily be synthesised by reacting other compounds of the present disclosure.
under suitable conditions, for instance, by converting one particular functional group being present in a compound of the present disclosure, or a suitable precursor molecule thereof, into another one by applying standard synthetic methods, like reduction, oxidation, addition or substitution reactions; those methods are well known to the skilled person. Likewise, the skilled person will apply – whenever necessary or useful – synthetic protecting (or protective) groups; suitable protecting groups as well as methods for introducing and removing them are well-known to the person skilled in the art of chemical synthesis and are described, in more detail, in, e.g., P.G.M. Wuts, T.W. Greene, “Greene’s Protective Groups in Organic Synthesis”, 4th edition (2006) (John Wiley & Sons).

PHARMACEUTICAL COMPOSITIONS

According to a further aspect of the disclosure there is provided a pharmaceutical composition which comprises a compound of the disclosure as defined hereinbefore, or a pharmaceutically acceptable salt, hydrate or solvate thereof, in association with a pharmaceutically acceptable diluent or carrier.

The compositions of the disclosure may be in a form suitable for oral use (for example as tablets, lozenges, hard or soft capsules, aqueous or oily suspensions, emulsions, dispersible powders or granules, syrups or elixirs), for topical use (for example as creams, ointments, gels, or aqueous or oily solutions or suspensions), for administration by inhalation (for example as a finely divided powder or a liquid aerosol), for administration by insufflation (for example as a finely divided powder) or for parenteral administration (for example as a sterile aqueous or oily solution for intravenous, subcutaneous, intramuscular, intraperitoneal or intramuscular dosing or as a suppository for rectal dosing).

The compositions of the disclosure may be obtained by conventional procedures using conventional pharmaceutical excipients, well known in the art. Thus, compositions intended for oral use may contain, for example, one or more colouring, sweetening, flavouring and/or preservative agents.

An effective amount of a compound of the present disclosure for use in therapy is an amount sufficient to treat or prevent an inflammasome related condition referred to herein, slow its progression and/or reduce the symptoms associated with the condition.
The amount of active ingredient that is combined with one or more excipients to produce a single dosage form will necessarily vary depending upon the individual treated and the particular route of administration. For example, a formulation intended for oral administration to humans will generally contain, for example, from 0.5 mg to 0.5 g of active agent (more suitably from 0.5 to 100 mg, for example from 1 to 30 mg) compounded with an appropriate and convenient amount of excipients which may vary from about 5 to about 98 percent by weight of the total composition.

The size of the dose for therapeutic or prophylactic purposes of a compound of the Formula I will naturally vary according to the nature and severity of the conditions, the age and sex of the animal or patient and the route of administration, according to well-known principles of medicine.

In using a compound of the disclosure for therapeutic or prophylactic purposes it will generally be administered so that a daily dose in the range, for example, 0.1 mg/kg to 75 mg/kg body weight is received, given if required in divided doses. In general lower doses will be administered when a parenteral route is employed. Thus, for example, for intravenous or intraperitoneal administration, a dose in the range, for example, 0.1 mg/kg to 30 mg/kg body weight will generally be used. Similarly, for administration by inhalation, a dose in the range, for example, 0.05 mg/kg to 25 mg/kg body weight will be used. Oral administration may also be suitable, particularly in tablet form. Typically, unit dosage forms will contain about 0.5 mg to 0.5 g of a compound of this disclosure.

**THERAPEUTIC USES AND APPLICATIONS**

The present disclosure provides compounds that function as inhibitors of inflamasome activity. The present disclosure therefore provides a method of inhibiting inflamasome activity *in vitro* or *in vivo*, said method comprising contacting a cell with an effective amount of a compound, or a pharmaceutically acceptable salt thereof, as defined herein.

Effectiveness of compounds of the disclosure can be determined by industry-accepted assays/ disease models according to standard practices of elucidating the same as described in the art and are found in the current general knowledge.
The present disclosure also provides a method of treating a disease or disorder in which inflammasome activity is implicated in a patient in need of such treatment, said method comprising administering to said patient a therapeutically effective amount of a compound, or a pharmaceutically acceptable salt thereof, or a pharmaceutical composition as defined herein.

On a general level, the compounds of the present disclosure, which inhibit the maturation of cytokines of the IL-1 family, are effective in all therapeutic indications that are mediated or associated with elevated levels of active forms of cytokines belonging to IL-1 family of cytokines (Sims J. et al. Nature Reviews Immunology 10, 89-102 (February 2010).

Suitably, the compounds according to the present disclosure can be used for the treatment of a disease selected from the group consisting of an autoimmune disease, an autoimmune disease, a neurodegenerative disease and cancer. Said autoinflammatory and autoimmune disease is suitably selected from the group consisting of a cryopyrin-associated autoinflammatory syndrome (CAPS) such as for example familial cold autoinflammatory syndrome (FCAS), Muckle-Wells syndrome (MWS), chronic infantile neurological cutaneous and articular (CINCA) syndrome, neonatal-onset multisystem inflammatory disease (NOMID), familial Mediterranean fever and nonalcoholic fatty liver disease (NAFLD), gout,
rheumatoid arthritis, Crohn's disease, COPD, fibrosis, obesity, type 2 diabetes, multiple sclerosis and neuro-inflammation occurring in protein misfolding diseases, such as Prion diseases. Said neurodegenerative disease is suitably selected from Parkinson's disease and Alzheimer's disease.

Accordingly, the compounds of the present disclosure can be used for the treatment of a disease selected from the group consisting of cryopyrin-associated autoinflammatory syndrome (CAPS) such as for example familial cold autoinflammatory syndrome (FCAS), Muckle-Wells syndrome (MWS), chronic infantile neurological cutaneous and articular (CINCA) syndrome, neonatal-onset multisystem inflammatory disease (NOMID), familial Mediterranean fever and nonalcoholic fatty liver disease (NAFLD), gout, rheumatoid arthritis, Crohn's disease, COPD, fibrosis, obesity, type 2 diabetes, multiple sclerosis, neuro-inflammation occurring in protein misfolding diseases, such as Prion diseases, Parkinson's disease, Alzheimer's disease, NASH, osteoarthritis and cancer.

Treatment in Cancer; links with inflamasome

Chronic inflammation responses have long been observed to be associated with various types of cancer. During malignant transformation or cancer therapy inflamasomes may become activated in response to danger signals and this activation may be both beneficial and detrimental in cancer.

IL-1β expression is elevated in a variety of cancers (including breast, prostate, colon, lung, head and neck cancers and melanomas) and patients with IL-1β producing tumours generally have a worse prognosis (Lewis, Anne M., et al. "Interleukin-1 and cancer progression: the emerging role of interleukin-1 receptor antagonist as a novel therapeutic agent in cancer treatment." Journal of translational medicine 4.1 (2006): 48).

Cancers derived from epithelial cells (carcinoma) or epithelium in glands (adenocarcinoma) are heterogeneous; consisting of many different cell types. This may include fibroblasts, immune cells, adipocytes, endothelial cells and pericytes amongst others, all of which may be cytokine/ chemokine secreting (Grivennikov, Sergei I., Florian R. Greten, and Michael
Karin. "Immunity, inflammation, and cancer." Cell 140.6 (2010): 883-899). This can lead to cancer-associated inflammation through the immune cell infiltration. The presence of leukocytes in tumours is known but it has only recently become evident that an inflammatory microenvironment is an essential component of all tumours. Most tumours (>90%) are the result of somatic mutations or environmental factors rather than germline mutations and many environmental causes of cancer are associated with chronic inflammation (20% of cancers are related to chronic infection, 30% to smoking/ inhaled pollutants and 35% to dietary factors (20% of all cancers are linked to obesity) (Aggarwal, Bharat B., R. V. Vijayalekshmi, and Bokyung Sung. "Targeting inflammatory pathways for prevention and therapy of cancer: short-term friend, long-term foe." Clinical Cancer Research 15.2 (2009): 425-430).

GI cancer

In 19% of gastric cancer cases, caspase-1 expression is decreased which correlates with stage, lymph node metastasis and survival (Jee et al., 2005). Mycoplasma hyorhinis is associated with the development of gastric cancer its activation of the NLRP3 inflammasome may be associated with its promotion of gastric cancer metastasis (Xu et al., 2013).

Skin cancers
Ultraviolet radiation is the greatest environmental risk for skin cancer which is promoted by causing DNA damage, immunosuppression and inflammation. The most malignant skin cancer, melanoma, is characterised by the upregulation of inflammatory cytokines, all of which can be regulated by IL-1β (Lázár-Molnár, Eszter, et al. "Autocrine and paracrine regulation by cytokines and growth factors in melanoma." Cytokine 12.6 (2000): 547-554). Systemic inflammation induces an enhancement of melanoma cell metastasis and growth by IL-1-dependent mechanisms in vivo. Using thymoquinone inhibition of metastasis in a B16F10 mouse melanoma model was shown to be dependent on inhibition of the NLRP3 inflammasome (Ahmad, Israr, et al. "Thymoquinone suppresses metastasis of melanoma cells by inhibition of NLRP3 inflammasome." Toxicology and applied pharmacology 270.1 (2013): 70-76).

Glioblastoma

Metastasis

More widely, NLRP3 is considered by the applicants to be involved in the promotion of metastasis and consequently modulation of NLRP3 should plausibly block this. IL-1 is involved in tumour genesis, tumour invasiveness, metastasis, tumour host interactions (Apte, Ron N., et al. "The involvement of IL-1 in tumorigenesis, tumor invasiveness, metastasis and tumor-host interactions." Cancer and Metastasis Reviews 25.3 (2006): 387-408) and angiogenesis (Voronov, Elena, et al. "IL-1 is required for tumor invasiveness and angiogenesis." Proceedings of the National Academy of Sciences 100.5 (2003): 2645-2650).
The IL-1 gene is frequently expressed in metastases from patients with several types of human cancers. For example, IL-1mRNA was highly expressed in more than half of all tested metastatic human tumour specimens including specifically non-small-cell lung carcinoma, colorectal adenocarcinoma, and melanoma tumour samples (Elaraj, Dina M., et al. "The role of interleukin 1 in growth and metastasis of human cancer xenografts." Clinical Cancer Research 12.4 (2006): 1088-1096) and IL-1RA inhibits xenograft growth in IL-1 producing tumours but without anti-proliferative effects in vitro.

Further, IL-1 signalling is a biomarker for predicting breast cancer patients at increased risk for developing bone metastasis. In mouse models IL-1β and its receptor are upregulated in breast cancer cells that metastasise to bone compared with cells that do not. In a mouse model the IL-1 receptor antagonist anakinra reduced proliferation and angiogenesis in addition to exerting significant effects on the tumour environment reducing bone turnover markers, IL-1β and TNF alpha (Holen, Ingunn, et al. "IL-1 drives breast cancer growth and bone metastasis in vivo." Oncotarget (2016).

CD36

The fatty acid scavenger receptor CD36 serves a dual role in priming gene transcription of pro-IL-1β and inducing assembly of the NLRP3 inflammasome complex. CD36 and the TLR4-TLR6 heterodimer recognize oxLDL, which initiates a signaling pathway leading to transcriptional upregulation of NLRP3 and pro-IL-1β (signal 1). CD36 also mediates the internalization of oxLDL into the lysosomal compartment, where crystals are formed that induce lysosomal rupture and activation of the NLRP3 inflammasome (signal 2) (Kagan, J.

A subpopulation of human oral carcinoma cells express high levels of the fatty acid scavenger receptor CD36 and are unique in their ability to initiate metastasis. Palmitic acid or a high fat diet boosted the metastatic potential of the CD36+ cells. Neutralising anti-CD36 antibodies blocked metastasis in orthotopic mouse models of human oral cancer. The presence of CD36+ metastasis-initiating cells correlates with a poor prognosis for numerous types of carcinomas. It is suggested that dietary lipids may promote metastasis (Pasqual, G, Avgustinova, A., Mejetta, S, Martin, M, Castellanos, A, Attolini, CS-O, Berenguer, A., Prats, N, Toll, A, Hueto, JA, Bescos, C, Di Croce, L, and Benitah, SA. 2017 “Targeting metastasis-initiating cells through the fatty acid receptor CD36” Nature 541:41-45).

In hepatocellular carcinoma exogenous palmitic acid activated an epithelial-mesenchymal transition (EMT)-like program and induced migration that was decreased by the CD36 inhibitor, sulfo-N-succinimidyl oleate (Nath, Aritro, et al. "Elevated free fatty acid uptake via CD36 promotes epithelial-mesenchymal transition in hepatocellular carcinoma." Scientific reports 5 (2015). Body mass index was not associated with the degree of EMT highlighting that it is actually CD36 and free fatty acids that are important.

Cancer stems cells (CSCs) use CD36 to promote their maintenance. Oxidised phospholipids, ligands of CD36, were present in glioblastoma and the proliferation of CSCs but not non-CSCs increased with exposure to oxidised LDL. CD36 also correlated with patient prognosis.

Chemotherapy resistance

In addition to direct cytotoxic effects, chemotherapeutic agents harness the host immune system which contributes to anti-tumour activity. However, gemcitabine and 5-FU were shown to activate NLRP3 in myeloid-derived suppressor cells leading to production of IL-1β which curtails anti-tumour efficacy. Mechanistically these agents destabilised the lysosome to release cathepsin B to activate NLRP3. IL-1β drove the production of IL-17 from CD4+ T cells which in turn blunted the efficacy of the chemotherapy. Higher anti-tumoral effects for both gemcitabine and 5-FU were observed when tumours were established in NLRP3−/− or Caps1−/− mice, or WT mice treated with IL-1RA. Myeloid-derived suppressor cell NLRP3
activation therefore limits the anti-tumour efficacy of gemcitabine and 5-FU (Bruchard, Mélanie, et al. "Chemotherapy-triggered cathepsin B release in myeloid-derived suppressor cells activates the Nlrp3 inflammasome and promotes tumor growth." Nature medicine 19.1 (2013): 57-64.). Compounds of the present disclosure may therefore be useful in chemotherapy to treat a range of cancers.

Compounds of the present disclosure, or pharmaceutically acceptable salts thereof, may be administered alone as a sole therapy or can be administered in addition with one or more other substances and/or treatments. Such conjoint treatment may be achieved by way of the simultaneous, sequential or separate administration of the individual components of the treatment.

For example, therapeutic effectiveness may be enhanced by administration of an adjuvant (i.e., by itself the adjuvant may only have minimal therapeutic benefit, but in combination with another therapeutic agent, the overall therapeutic benefit to the individual is enhanced). Alternatively, by way of example only, the benefit experienced by an individual may be increased by administering the compound of Formula (I) or (II) with another therapeutic agent (which also includes a therapeutic regimen) that also has therapeutic benefit.

In the instances where the compound of the present disclosure is administered in combination with other therapeutic agents, the compound of the disclosure may need not be administered via the same route as other therapeutic agents, and may, because of different physical and chemical characteristics, be administered by a different route. For example, the compound of the disclosure may be administered orally to generate and maintain good blood levels thereof, while the other therapeutic agent may be administered intravenously. The initial administration may be made according to established protocols known in the art, and then, based upon the observed effects, the dosage, modes of administration and times of administration can be modified by the skilled clinician.

The particular choice of other therapeutic agent will depend upon the diagnosis of the attending physicians and their judgment of the condition of the individual and the appropriate treatment protocol. According to this aspect of the disclosure there is provided a combination for use in the treatment of a disease in which inflammasome activity is
implicated comprising a compound of the disclosure as defined hereinbefore, or a pharmaceutically acceptable salt thereof, and another suitable agent.

According to a further aspect of the disclosure there is provided a pharmaceutical composition which comprises a compound of the disclosure, or a pharmaceutically acceptable salt thereof, in combination with a suitable, in association with a pharmaceutically acceptable diluent or carrier.

In addition to its use in therapeutic medicine, compounds of Formula (I) or (II) and pharmaceutically acceptable salts thereof are also useful as pharmacological tools in the development and standardization of in vitro and in vivo test systems for the evaluation of the effects of inhibitors of inflammasome in laboratory animals such as dogs, rabbits, monkeys, rats and mice, as part of the search for new therapeutic agents.

In any of the above-mentioned pharmaceutical composition, process, method, use, medicament, and manufacturing features of the instant disclosure, any of the alternate embodiments of macromolecules of the present disclosure described herein also apply.

**ROUTES OF ADMINISTRATION**

The compounds of the disclosure or pharmaceutical compositions comprising these compounds may be administered to a subject by any convenient route of administration, whether systemically/ peripherally or topically (i.e., at the site of desired action).

Routes of administration include, but are not limited to, oral (e.g. by ingestion); buccal; sublingual; transdermal (including, e.g., by a patch, plaster, etc.); transmucosal (including, e.g., by a patch, plaster, etc.); intranasal (e.g., by nasal spray); ocular (e.g., by eye drops); pulmonary (e.g., by inhalation or insufflation therapy using, e.g., via an aerosol, e.g., through the mouth or nose); rectal (e.g., by suppository or enema); vaginal (e.g., by pessary); parenteral, for example, by injection, including subcutaneous, intradermal, intramuscular, intravenous, intra-arterial, intracardiac, intrathecal, intraspinal, intracapsular, subcapsular, intraorbital, intraperitoneal, intratracheal, subcuticular, intraarticular, subarachnoid, and intrasternal; by implant of a depot or reservoir, for example, subcutaneously or intramuscularly.
The disclosure having been described, the following examples are offered by way of illustration and not limitation.

5 SPECIFIC EXAMPLES

The disclosure will now be described with reference to the following illustrative examples. Some abbreviations that may appear in this section are defined as follows:

- ACN - acetonitrile
- Boc - tert-butoxy carbonyl
- TFA - trifluoroacetic acid
- MeOH - methanol
- HCl - hydrochloride acid
- DCM - dichloromethane
- TLC - thin layer chromatography
- DMSO - dimethyl sulphoxide
- HPLC - high performance liquid chromatography
- EtOAc - ethyl acetate
- FCC - flash column chromatography
- THF - tetrahydrofuran
- NaOH - sodium hydroxide
- UPLC - ultra performance liquid chromatography
- Ar - argon
- SM - starting material
- LC-MS - liquid chromatography combined with mass spectrometer
- Et₃N - triethylamine
- RM - reaction mixture
- eq. - equivalents
- rt - room temperature / ambient temperature
- h - hours
- Pd₂dba₃ - Tris(dibenzylideneacetone)dipalladium(0)
- Me₄BuXPhos - methanesulfonato(2-di-tert-butylphosphino-3,4,5,6
tetramethyl-2',4',6'-triisopropyl-1,1'-biphenyl)(2'-amino-1,1'-
biphenyl-2-yl) palladium(II)
- HPLC - high performance liquid chromatography

The compounds of the present disclosure can be prepared according to the procedures of
the following Schemes and Examples, using appropriate materials and are further
exemplified by the following specific examples. Analytical data of compounds made
according to the following examples are shown. Unless otherwise specified, all starting
materials are obtained from commercial suppliers and used without further purifications.
Unless otherwise specified, all temperatures are expressed in °C and all reactions are
conducted at rt. Compounds are typically purified by silica chromatography, preparative
thin-layer chromatography or preparative HPLC.

1H NMR is recorded on 400 MHz spectrometers. Chemical shifts (δ) are reported in ppm
relative to the residual solvent signal (δ= 2.5 ppm for 1H NMR in DMSO-d6). 1H NMR data
are reported as follows: chemical shift (multiplicity, coupling constants and number of
hydrogens). Multiplicity is abbreviated as follows: s (singlet), d (doublet), t (triplet) and m
(multiplet).

**General Procedures:**

**General procedure A**

![Chemical structure: Intermediate A](image)

To a stirred solution of amino ester (or amino ester hydrochloride with 1 eq. of Et₃N) in ACN was added dropwise a solution of intermediate A in ACN. The RM was stirred overnight then filtered. The resulting precipitate was washed with ACN and dried under reduced pressure to give the desired product.

**General procedure B:**

![Chemical structure: Conversion of amino acid to ester](image)

To a 0°C cooled solution of methanol was added dropwise thionyl chloride (20 eq.) and the RM stirred at 0°C for 30 min. The amino acid was added and the RM stirred at ambient
temperature overnight. The RM was evaporated under reduced pressure to give the desired product.

**General procedure C:**

\[
\begin{align*}
\text{H}_3\text{C} & \quad \text{CH}_3 \\
\text{H}_3\text{C} & \quad \text{O} \quad \text{N} \quad \text{H} \quad \text{O} \quad \text{CH}_3 \\
\text{O} & \quad \text{CH}_3
\end{align*}
\]

To a solution of the Boc protected starting material in MeOH was added dropwise 4 M HCl in dioxane (20 eq.). The reaction mixture was stirred until the starting material was no longer visible on TLC and then evaporated to give the desired product.

**Intermediates:**

The following intermediates were prepared as follows:

**Intermediate A**

4-isocyanato-1,2,3,5,6,7-hexahydro-s-indacene (Intermediate A)

\[
\begin{align*}
\text{Step 1} & \quad \text{Step 2} & \quad \text{Step 3} \\
\text{Step 4}
\end{align*}
\]

**Step 1**

3-chloro-1-(2,3-dihydro-1H-inden-5-yl)propan-1-one

A suspension of aluminium chloride (12.4 g, 0.093 mol) in DCM (50 ml) under an argon atmosphere was cooled to -10° C with vigorous stirring. To this was added dropwise a
solution of 3-chloropropionyl chloride (11 g, 0.093 mol) and indan (10 g, 0.085 mol) in DCM (15 ml) over 0.5 h, the temperature was kept between -15°C and -5°C. The reaction was allowed to warm to rt and stirred overnight. The reaction mixture was added dropwise to cold (0°C) 2 M HCl over 30 min with the temperature kept between 0°C and 10°C. The layers were separated and the aqueous phase washed with DCM (3 x 30 ml). The combined organic layers were washed sequentially with water, saturated sodium bicarbonate and brine. The organic phases were dried over Na₂SO₄, filtered and evaporated under reduced pressure to around 30 ml. Hexane (50 ml) was added and the evaporation continued, the procedure was repeated twice. After further addition of hexane (50 ml) the slurry was filtered and dried to provide 3-chloro-1-(2,3-dihydro-1H-inden-5-yl)propan-1-one as a tan solid.

Y = 81%
MS ES⁺: not ionised

\[ ^1H \text{ NMR (400 MHz, DMSO-d6) } \delta\ 7.84\ (d, \ 1H),\ 7.78\ -\ 7.76\ (m, \ 1H),\ 7.37\ (d, \ J = 8\ Hz, \ 1H),\ 3.92\ (t, \ J = 6\ Hz, \ 2H),\ 3.51\ (t, \ J = 6\ Hz, \ 2H),\ 2.92\ (t, \ J = 8\ Hz, \ 4H),\ 2.09\ -\ 2.01\ (m, \ 2H).\ ]

**Step 2**
Mixture of 8-nitro-1,2,3,5,6,7-hexahydro-s-indacen-1-one, 4-nitro-1,2,3,5,6,7-hexahydro-s-indacen-1-one and 5-nitro-1,2,3,6,7,8-hexahydro-s-indacen-3-one

3-chloro-1-(2,3-dihydro-1H-inden-5-yl)propan-1-one (82 g, 0.39 mol) was added portion wise to concentrated sulfuric acid (71 ml, 1.34 mol). The resulting mixture was heated to 60°C for 2 days. The RM was cooled to 0°C and a mixture of nitric acid (26 ml, 0.59 mol) and sulfuric acid (26 ml, 0.49 mol) was added dropwise. The RM was stirred at a temperature between 0°C and 5°C for 1 h. The RM was slowly added to a mixture of water and DCM with ice bath cooling. The layers were separated and the aqueous layer was extracted with DCM. The combined organic layers were washed sequentially with brine and saturated sodium bicarbonate. The organic layers were dried over Na₂SO₄ and filtered. The crude mixture was purified by FCC (hexane/ethyl acetate). The products were further purified by crystallisation from MeOH to give the desired products.
8-nitro-1,2,3,5,6,7-hexahydro-s-indacen-1-one:

Y = 36 %

MS ES⁺: 218

¹H NMR (400 MHz, DMSO-d6) δ 7.67 (s, 1H), 3.15 – 3.08 (m, 2H), 3.04 (t, J = 8 Hz, 2H), 2.90 (t, J = 8 Hz, 2H), 2.77 – 2.71 (m, 2H), 2.17 – 2.10 (m, 2H).

4-nitro-1,2,3,5,6,7-hexahydro-s-indacen-1-one:

Y = 5 %

MS ES⁺: 218

5-nitro-1,2,3,6,7,8-hexahydroas-indacen-3-one:

Y = 4 %

MS ES⁺: 218

¹H NMR (400 MHz, DMSO-d6) δ 8.09 (s, 1H), 3.39 (t, J = 8 Hz, 2H), 3.14 – 3.09 (m, 2H), 3.01 (t, J = 8 Hz, 2H), 2.81 – 2.73 (m, 2H), 2.23 – 2.15 (m, 2H).

Step 3

1,2,3,5,6,7-hexahydro-s-indacen-4-amine

A mixture of 8-nitro-1,2,3,5,6,7-hexahydro-s-indacen-1-one and 4-nitro-1,2,3,5,6,7-hexahydro-s-indacen-1-one (7.00 g, 0.032 mol) was suspended in MeOH (70 ml). This was treated with 20 % palladium hydroxide on carbon (50 % water wet. 1.72 g, 0.012 mol) then methanesulfonic acid (3.41 g, 0.035 mol). The mixture was hydrogenated at 35 psi for 5 h. The catalyst was removed by filtration and washed with MeOH. The filtrate was diluted with water (350 ml) and then the pH adjusted to 11 with 2 N NaOH. The resulting slurry was filtered and the crude solids were recrystallised from MeOH/water (9:1) to afford of 1,2,3,5,6,7-hexahydro-s-indacen-4-amine as colourless, crystal needles.

Y = 73 %

MS ES⁺: 174.1
$^1$H NMR (400 MHz, DMSO-d6) $\delta$ 6.35 (s, 1H), 4.52 (s, 2H), 2.72 (t, $J$ = 7 Hz, 4H), 2.59 (t, $J$ = 7 Hz, 4H), 2.00 - 1.93 (m, 4H).

**Step 4**

5 4-isocyano-1,2,3,5,6,7-hexahydro-s-indacene (Intermediate A)

To a stirred solution of 1,2,3,5,6,7-hexahydro-s-indacen-4-amine (1.1 g, 6.35 mmol) and Et$_3$N (0.973 ml, 6.98 mmol) in THF (20 ml) was added triphosgene (0.64 g, 2.16 mmol) in one portion. The mixture was heated to reflux for 4 h then cooled to rt. The THF was evaporated and the residue taken up in pentane and filtered through a plug of silica gel. Evaporation of the solvent *in vacuo* afforded 4-isocyano-1,2,3,5,6,7-hexahydro-s-indacene as a white solid.

$Y = 71\%$

15 MS ES$^+$: not ionised

**Intermediate B**

20 Ethyl 1H,2H,3H,6H,7H,8H,9H-cyclopenta[a]naphthalen-5-amine (Intermediate B)

[Chemical structure diagram]

**Step 1**
3-chloro-1-(5,6,7,8-tetrahydronaphthalen-2-yl)propan-1-one

A suspension of aluminium chloride (5.58 g, 0.042 mol) in DCM (30 ml) under an argon atmosphere was cooled to -10° C with vigorous stirring. To this was added dropwise a solution of 3-chloropropionyl chloride (3.6 ml, 0.038 mol) and tetralin (5 g, 0.038 mol) in DCM (10 ml) over 0.5 h, the temperature was kept between -15° C and -5° C. The reaction was allowed to warm to rt and stirred overnight. The reaction mixture was added dropwise to cold (0° C) 2 M HCl over 30 min with the temperature kept between 0° C and 10° C. The layers were separated and the aqueous phase washed with DCM (3 x 20 ml). The combined organic layers were washed sequentially with water, saturated sodium bicarbonate and brine. The organic phases were dried over Na₂SO₄, filtered and evaporated under reduced pressure to provide 3-chloro-1-(2,3-dihydro-1H-inden-5-yl)propan-1-one as a yellow solid.

Y = 91%

MS ES⁺: not ionised

H NMR (400 MHz, DMSO-d6) δ 7.84 (d, 1H), 7.69 – 7.66 (m, 2H), 7.20 (d, J = 8 Hz, 1H), 3.91 (t, J = 6 Hz, 2H), 3.49 (t, J = 6 Hz, 2H), 2.78 (d, J = 4 Hz, 4H), 1.77 – 1.72 (m, 4H).

Step 2

Mixture of 9-nitro-1H,2H,3H,5H,6H,7H,8H-cyclopenta[b]naphthalen-1-one, 4-nitro-1H,2H,3H,5H,6H,7H,8H-cyclopenta[b]naphthalen-1-one and 5-nitro-1H,2H,3H,6H,7H,8H,9H-cyclopenta[a]naphthalen-3-one

3-chloro-1-(5,6,7,8-tetrahydronaphthalen-2-yl)propan-1-one (7.52 g, 34 mmol) was added portion wise to concentrated sulfuric acid (36 ml). The resulting mixture was heated to 60° C for 2 days. The RM was cooled to 0° C and a mixture of nitric acid (2.4 ml, 52 mmol) and sulfuric acid (2.4 ml) was added dropwise. The RM was stirred at a temperature between 0° C and 5° C for 1 h. The RM was slowly added to a mixture of water and DCM with ice bath cooling. The layers were separated and the aqueous layer was extracted with DCM. The combined organic layers were washed sequentially with brine and saturated sodium bicarbonate. The organic layers were dried over Na₂SO₄ and filtered. The crude mixture was purified by FCC (hexane/ethyl acetate) to provide a mixture of 9-nitro-
1H,2H,3H,5H,6H,7H,8H-cyclopenta[b]naphthalen-1-one, 4-nitro-1H,2H,3H,5H,6H,7H,8H-cyclopenta[b]naphthalen-1-one and 5-nitro-1H,2H,3H,6H,7H,8H,9H-cyclopenta[a]naphthalen-3-one as a yellow semisolid.

5 Y = 13 %
MS ES⁺: 232

Step 3
1H,2H,3H,6H,7H,8H,9H-cyclopenta[a]naphthalen-5-amine (Intermediate B)

A mixture of 9-nitro-1H,2H,3H,5H,6H,7H,8H-cyclopenta[b]naphthalen-1-one, 4-nitro-1H,2H,3H,5H,6H,7H,8H-cyclopenta[b]naphthalen-1-one and 5-nitro-1H,2H,3H,6H,7H,8H,9H-cyclopenta[a]naphthalen-3-one (0.992 g, 2.3 mmol) was suspended in MeOH (40 ml). This was treated with 20 % palladium hydroxide on carbon (50 % water wet, 0.389 g, 0.21 mmol) then methanesulfonic acid (0.32 ml, 4.8 mmol). The mixture was hydrogenated at 35 psi overnight. The catalyst was removed by filtration and washed with MeOH. The filtrate was diluted with water (50 ml) and then the pH adjusted to 11 with 2 M NaOH. The resulting slurry was filtered and the crude solids were purified by FCC (hexane/ethyl acetate) to provide 1H,2H,3H,6H,7H,8H,9H-cyclopenta[a]naphthalen-5-amine as a brown oil.

15 Y = 19 %
MS ES⁺: 188.4

1H NMR (400 MHz, DMSO-d6) δ 6.35 (s, 1H), 4.42 (s, 2H), 2.69 (t, J = 8 Hz, 2H), 2.58 (t, J = 7 Hz, 2H), 2.48 (t, J = 6 Hz, 2H), 2.32 (t, J = 6 Hz, 2H), 1.95 – 1.88 (m, 2H), 1.76 – 1.60 (m, 4H).

Certain of the intermediates defined herein may be novel and these may be provided as a further feature of the disclosure.

Additional starting materials
The starting materials for the preparation of compounds of the present disclosure can be prepared by methods as described in the examples or by methods known per se, as described in the literature of synthetic organic chemistry and known to the skilled person, or can be obtained commercially. The starting materials for the processes may, if desired, also be formed in situ by not isolating them from the reaction mixture, but instead immediately converting them further into the compounds of the disclosure or intermediate compounds. On the other hand, in general it is possible to carry out the reaction stepwise.

The following additional starting materials were used in the production of the compounds of the disclosure and their method of production is included below:

**Methyl 2-amino-3-(2-hydroxyphenyl)propanoate hydrochloride**

\[
\begin{align*}
\text{H}_2\text{N} & \quad \text{O} \\
\text{O} & \quad \text{Cl} \\
\text{HO} & \quad \text{O} \quad \text{CH}_3 \\
\text{H}_2\text{N} & \quad \text{O} \\
\end{align*}
\]

SM: 2-amino-3-(2-hydroxyphenyl)propanoic acid

**General procedure B**

The product was taken on to the next step without further purification.

**MS ES**: 196

**1-(3-(bromomethyl)phenyl)ethan-1-one**

\[
\begin{align*}
\text{H}_3\text{C} & \quad \text{CH}_3 \\
\text{Br} & \quad \text{CH}_3 \\
\end{align*}
\]
A solution of meta-tolylethanone (5 g, 37 mmol), N-bromosuccinimide (1 eq, 6.6 g, 37 mmol) and benzoic peroxoanhydride (0.2 eq, 1.8 g, 7.5 mmol) in acetonitrile was stirred at 85°C under argon overnight. The solvent was removed under reduced pressure. The residue was purified by FCC (EtOAc in Hexane 0-5%) to give the desired product as a yellow oil.

Y = 58%

MS ES⁺: not ionised

¹H NMR (400 MHz, Chloroform-d) δ 8.00 (t, J = 2 Hz, 1H), 7.94 – 7.88 (m, 1H), 7.65 – 7.59 (m, 1H), 7.48 (t, J = 8 Hz, 1H), 4.56 (s, 2H), 2.64 (s, 3H).

A suspension of 1-[(3-bromomethyl)phenyl]ethan-1-one (2.5 g, 11.7 mmol), diethyl acetalidomalonate (1 eq, 2.55 g, 11.7 mmol), K₂CO₃ (1.2 eq, 1.95 g, 14.1 mmol), potassium iodide (0.25 eq, 487 mg, 2.9 mmol) and Cs₂CO₃ (1.2 eq, 4.59 g, 14.1 mmol) in acetonitrile (100 ml) was heated to reflux and stirred overnight. The reaction mixture was cooled to room temperature, filtered through a pad of Celite and concentrated in vacuo. Purification by FCC (EtOAc in Hexane 0-50%) gave the desired product as a white solid.

Y = 31%
MS ES⁺: 335.3

¹H NMR (400 MHz, DMSO-d6) δ 8.45 – 8.40 (m, 2H), 7.67 (d, J = 8 Hz, 1H), 7.37 – 7.29 (m, 2H), 5.10 – 5.02 (m, 1H), 4.17 – 4.08 (m, 1H), 3.03 – 2.96 (m, 1H), 2.93 – 2.86 (m, 1H), 1.85 – 1.70 (m, 2H), 1.65 – 1.55 (m, 3H), 1.53 – 1.40 (m, 3H), 1.33 (s, 9H).

Cyclopentyl (2R)-2-amino-3-(pyridine-3-yl)propanoate di-TFA salt

Cyclopentyl (2R)-2-[(tert-butoxy)carbonyl]amino)-3-(pyridine-3-yl)propanoate (100 mg, 0.26 mmol, 1 eq.) was dissolved in DCM (1 ml) and TFA (2 ml) was added. The reaction
mixture was stirred overnight at rt and concentrated under reduced pressure to give the title compound as a brown oil.

\[ Y = 78\% \]

(2R)-2-Amino-3-(pyridin-3-yl)propanoic acid hydrochloride

\[
\begin{align*}
\text{H}_2\text{NN} & \text{C} & \text{O} & \text{HCl} \\
\text{N} & \text{C} & \text{O} & \text{C} & \text{H}_3
\end{align*}
\]

In a pressure vessel, (2R)-2-amino-3-(pyridin-3-yl)propanoic acid (2 g, 12.0 mmol, 1 eq.) was suspended in dry EtOH (30 ml). The mixture was cooled to 0° C over an ice bath and conc. sulfuric acid (0.5 ml) was added under argon. The vessel was sealed and the mixture was stirred at 85° C for 18 h. After allowing to cool to rt, the reaction mixture was evaporated to one quarter of its volume and poured into sat. NaHCO₃. The mixture was extracted four times with CHCl₃ and the combined organic layers dried over sodium sulfate and filtered. To the filtrate was added 4 M HCl in dioxane (12 ml). The resulting solution was evaporated to give a colourless oil which was dissolved in EtOH (10 ml). The solution was added to rapidly stirring Et₂O (100 ml) and stirring was continued for 1 h, until the resulting oil solidified into a white solid. The solid was filtered off, washed with Et₂O and dried \textit{in vacuo} to give the title compound as a white powder.

\[ Y = 61\% \]

cyclopentyl(2R)-2-\([(1,2,3,5,6,7\text{-hexahydro-s-indacen-4-yl})\text{carbamoyl}]\text{amino}\)-3-(pyridin-3-yl)propanoate

![Chemical Structure](image)

SM: Cyclopentyl (2R)-2-amino-3-(pyridine-3-yl)propanoate ditrifluoromethanesulfonic acid salt

General procedure A

The crude product was purified by preparative HPLC (HCOOH buffer) to give the title compound as a white solid.

Y = 9%

**MS ES\(^+\): 434.5**

\(^1\)H NMR (400 MHz, DMSO-d6) \(\delta\) 8.45 (d, \(J = 5\) Hz, 1H), 8.43 - 8.38 (m, 1H), 7.85 (s, 1H), 7.63 (d, \(J = 8\) Hz, 1H), 7.40 - 7.29 (m, 1H), 6.88 (s, 1H), 6.42 (d, \(J = 8\) Hz, 1H), 5.12 - 5.03 (m, 1H), 4.47 - 4.37 (m, 1H), 3.11 - 2.94 (m, 2H), 2.79 (t, \(J = 7\) Hz, 4H), 2.63 (d, \(J = 7\) Hz, 4H), 1.95 2.02 - 1.88 (m, 4H), 1.87 - 1.72 (m, 2H), 1.67 - 1.46 (m, 6H).

**2QQ**
methyl(2R)-3-cyano-2-\([(1,2,3,5,6,7\text{-hexahydro-s-indacen-4-yl})\text{carbamoyl}]\text{amino}\)

propanoate
Methyl (2R)-3-carbamoyl-2-{[(1,2,3,5,6,7-hexahydro-s-indacen-4-yl)carbamoyl]amino}propanoate (Example 2BB) (103 mg, 0.3 mmol, 1 eq.) was suspended in anhydrous DCM (3 ml). Para-tosyl chloride (239 mg, 1.2 mmol, 4.2 eq.) was added, followed by pyridine (240 μl, 3 mmol, 10 eq.) and the RM stirred at rt under argon for 72 h. The RM was evaporated and the resulting solid washed sequentially with DCM, H₂O and Et₂O. The crude was purified by preparative HPLC (formic acid buffer) to give the title compound.

Activity

5 Determination of the inhibitory activity in vitro

The biological activity of the compounds of the present disclosure was determined utilising the assay described hereinafter.

10 PBMC IC50 determination assay

The compounds of the present disclosure were tested for their inhibitory activity against IL1-β release upon NLRP3 activation in peripheral blood mononuclear cells (PBMC).

15 PBMC were isolated from buffy coats by density gradient centrifugation on Histopaque-1077 (Sigma, cat no. 10771). Isolated cells were seeded into the wells of a 96-well plate and incubated for 3 h with lipopolysaccharide (LPS). Following medium exchange, the compounds of the present disclosure were added (a single compound per well) and the cells were incubated for 30 min. Next, the cells were stimulated either with ATP (5 mM) or nigericin (10 μM) for 1 h and the cell culture media from the wells were collected for further analysis.

The release of IL1-β into the media was determined by a quantitative detection of IL-1β in the media using an IL-1β enzyme-linked immunosorbent assay (ELISA) Ready-SET-Go!, eBioscience cat. No. 88-7261-88. Briefly, in a first step, high affinity binding plates (Corning, Costar 9018 or NUNC Maxisorp Cat No. 44-2404) were coated overnight at 4°C with specific capture antibody included in the kit (anti-human IL-1β ref. 14-7018-68). Subsequently, plates were blocked with blocking buffer for 1 h at room temperature (rt) and after washing
with a buffer (PBS with 0.05 % Tween-20) incubated with protein standard and culture media. After 2 h of incubation at rt, plates were washed and incubated with biotinylated detection antibody included in the kit (anti-human IL-1β Biotin ref. 33-7110-68) for 1 h at rt. Plates were washed and incubated with HRP-streptavidin for 30 min at rt and washed again.

The signal was developed after addition of 3,39,5,59-tetramethylbenzidine-peroxidase (TMB) until color appeared and the reaction was stopped by 2 M H₂SO₄. A microplate spectrophotometer (BioTek) was used to detect signals with 450 nM. The detection range of IL-1β ELISA was 2-150 ng/ml.

The determination of the IC₅₀ values was preformed using the Graph Pad Prism software and the measured IC₅₀ values of compounds of the present disclosure are shown in Table 1 below.

These results show that the compounds of the present disclosure are capable of inhibiting IL-1β release upon inflammasome activation.
EQUIVALENTS

The details of one or more embodiments of the disclosure are set forth in the accompanying description above. Although any methods and materials similar or equivalent to those described herein can be used in the practice or testing of the present disclosure, the preferred methods and materials are now described. Other features, objects, and advantages of the disclosure will be apparent from the description and from the claims. In the specification and the appended claims, the singular forms include plural referents unless the context clearly dictates otherwise. Unless defined otherwise, all technical and scientific terms used herein have the same meaning as commonly understood by one of ordinary skill in the art to which this disclosure belongs. All patents and publications cited in this specification are incorporated by reference.

The foregoing description has been presented only for the purposes of illustration and is not intended to limit the disclosure to the precise form disclosed, but by the claims appended hereto.
**CLAIMS:**

1. A compound of Formula (I) or pharmaceutically acceptable salt thereof:

   ![Chemical Structure](image)

   in which:

   - $R_1$ is a 5 or 6 membered alkyl or aryl monocycle, having at least one group substituent comprising a (2-8C) alkyl or a 9 or 10 membered bicyclic partially unsaturated carbocyclic ring system, wherein said bicyclic ring system is optionally substituted by 1, 2, 3 or 4 substituents independently selected from (1-6C)alkyl, (2-6C)alkenylene, (2-6C)alkynylene, (3-8C)cycloalkyl, (1-3C)alkoxy, halo, oxo, hydroxy, cyano, amino, (1-3C)alkylamino, di-[(1-3C)alkyl]-amino, CF$_3$, OCF$_3$, S(O)$_2$CH$_3$, S(O)CH$_3$, S(O)$_2$NH$_2$, S(O)$_2$NHCH$_3$, S(O)$_2$N(CH$_3$)$_2$, NHS(O)$_2$CH$_3$ and N(CH$_3$)S(O)$_2$CH$_3$ or a 12, 13, 14, 15 or 16 membered tricyclic partially unsaturated carbocyclic ring system, wherein said tricyclic ring system is an unsubstituted hexahydroindacene ring

   ![Tricyclic Ring](image)

   wherein # denotes the bond to the nitrogen atom of Formula (I), or said tricyclic ring system is an optionally substituted by 1, 2, 3 or 4 substituents independently selected from (1-6C)alkyl, (2-6C)alkenylene, (2-6C)alkynylene, (3-8C)cycloalkyl, (1-3C)alkoxy, halo, oxo, hydroxy, cyano, amino, (1-3C)alkylamino, di-[(1-3C)alkyl]-amino, CF$_3$, OCF$_3$, S(O)$_2$CH$_3$, S(O)CH$_3$, S(O)$_2$NH$_2$, S(O)$_2$NHCH$_3$, S(O)$_2$N(CH$_3$)$_2$, NHS(O)$_2$CH$_3$ and N(CH$_3$)S(O)$_2$CH$_3$;
$R_2$ is H

$R_3$ is H or Alkyl(C1-4)-$R_7$.

wherein $R_7$ is selected from H, NH$_2$, C(O)NH$_2$, C(O)OCH$_3$, S (1-3C) or a 5 or 6 membered monocyclic aryl or non-aryl ring system optionally comprising 1, 2 or 3 heteroatoms independently selected from oxygen, nitrogen and sulfur, or 3, 4, 5 or 6 membered monocyclic heterocyclyl ring system optionally comprising 1 or 2 heteroatoms independently selected from oxygen, nitrogen and sulfur and a 3, 4, 5 or 6 membered saturated or partially unsaturated carbocyclic ring system, and wherein said monocyclic aryl ring, non-aryl heterocyclic ring, monocyclic heterocyclic aryl ring or said carbocyclic ring system is optionally substituted with 1 or more substituents independently selected from (1-6C) alkyl, alkylhydroxy, nitro, OH, COCH$_3$, halo, amino, cyano, and $R_8$.

wherein $R_8$ is, an optionally N-linked, 5 or 6 membered monocyclic heteroaryl ring comprising 1 or 2 heteroatoms independently selected from oxygen, nitrogen and sulfur, or a 3, 4, 5 or 6 membered monocyclic heterocyclyl ring system comprising 1 heteroatom independently selected from oxygen, nitrogen and sulfur, said ring being optionally substituted with an alkyl, oxo, halo or amino group; and

$R_4$ is H, alkyl, monocyclic alkyl or monocyclic aryl group.

2. The compound of claim 1, wherein $R_3$ is Methyl- $R_7$ or Ethyl-$R_7$.

3. The compound of claim 1 or Claim 2, wherein $R_7$ is a monocyclic aryl, optionally substituted with at least one hydroxyl group.

4. The compound of Claim 1 or Claim 2, wherein $R_7$ is a monocyclic aryl with a cyano substitution.

5. The compound of Claim 1 or Claim 2, wherein $R_7$ is a 5 or 6 membered monocyclic aryl ring comprising 1, 2 or 3 heteroatoms independently selected from oxygen, nitrogen, nitrogen.
and sulfur.

6. The compound of any preceding claim, wherein \( R_4 \) is alkyl (C1-C4) or cyclo alkyl (C3-C6).

7. The compound of any preceding claim, wherein \( R_1 \) is:

a 12, 13, 14, 15 or 16 membered tricyclic partially unsaturated carbocyclic ring system selected from the group consisting of

\[
\begin{array}{c}
\text{and} \\
\text{\# denotes the bond to the nitrogen atom of Formula (I); wherein } n \text{ and } n_a \text{ is an integer independently selected from 0, 1, 2 and 3; and wherein } R_9 \text{ is selected from the group consisting of hydrogen, (1-6C)alkyl, (2-6C)alkenylene, (2-6C)alkynylene, (3-8C)cycloalkyl, halo, oxo, hydroxy, cyano, amino, (1-3C)alkylamino, di-[(1-3C)alkyl]-amino, CF_3, OCF_3, S(O)CH_3, S(O)_2CH_3, S(O)NH_2, S(O)_2NHCH_3, S(O)_2N(CH_3)_2, NHS(O)CH_3 and N(CH_3)S(O)CH_3; or}
\end{array}
\]

a 12, 13, 14, 15 or 16 membered tricyclic partially unsaturated carbocyclic ring system selected from the group consisting of

\[
\begin{array}{c}
\text{and} \\
\text{\# denotes the bond to the nitrogen atom of Formula (I); wherein } n \text{ and } n_a \text{ is an integer independently selected from 0, 1, 2 and 3; and wherein } R_9 \text{ is selected from the group consisting of hydrogen, (1-6C)alkyl, (2-6C)alkenylene, (2-6C)alkynylene, (3-8C)cycloalkyl, halo, oxo, hydroxy, cyano, amino, (1-3C)alkylamino, di-[(1-3C)alkyl]-amino, CF_3, OCF_3, S(O)CH_3, S(O)_2CH_3, S(O)NH_2, S(O)_2NHCH_3, S(O)_2N(CH_3)_2, NHS(O)CH_3 and N(CH_3)S(O)CH_3; or}
\end{array}
\]

\[\text{\# denotes the bond to the nitrogen atom of Formula (I); wherein } n \text{ and } n_a \text{ is an integer independently selected from 0, 1, 2 and 3; and wherein } R_9 \text{ is selected from the group consisting of hydrogen, (1-6C)alkyl, (2-6C)alkenylene, (2-6C)alkynylene, (3-8C)cycloalkyl, halo, oxo, hydroxy, cyano, amino, (1-3C)alkylamino, di-[(1-3C)alkyl]-amino, CF_3, OCF_3, S(O)CH_3, S(O)_2CH_3, S(O)NH_2, S(O)_2NHCH_3, S(O)_2N(CH_3)_2, NHS(O)CH_3 and N(CH_3)S(O)CH_3; or}
\]

\[\text{\# denotes the bond to the nitrogen atom of Formula (I); wherein } n \text{ and } n_a \text{ is an integer independently selected from 0, 1, 2 and 3; and wherein } R_9 \text{ is selected from the group consisting of hydrogen, (1-6C)alkyl, (2-6C)alkenylene, (2-6C)alkynylene, (3-8C)cycloalkyl, halo, oxo, hydroxy, cyano, amino, (1-3C)alkylamino, di-[(1-3C)alkyl]-amino, CF_3, OCF_3, S(O)CH_3, S(O)_2CH_3, S(O)NH_2, S(O)_2NHCH_3, S(O)_2N(CH_3)_2, NHS(O)CH_3 and N(CH_3)S(O)CH_3; or}
\]
wherein # denotes the bond to the nitrogen atom of Formula (I); wherein \( n \) and \( n_a \) is an integer independently selected from 0, 1, 2 and 3; and wherein \( R_9 \) is selected from the group consisting of hydrogen, (1-6C)alkyl, halo, CF\(_3\) and OCF\(_3\); or

\[
\text{[Diagram of structures]}
\]

wherein # denotes the bond to the nitrogen atom of Formula (I); and wherein \( R_9 \) is selected from the group consisting of hydrogen, (1-6C)alkyl, (2-6C)alkenylene, (2-6C)alkynylene, (3-8C)cycloalkyl, halo, oxo, hydroxy, cyano, amino, (1-3C)alkylamino, di-[(1-3C)alkyl]amino, CF\(_3\), OCF\(_3\), S(O)\(_2\)CH\(_3\), S(O)CH\(_3\), S(O)\(_2\)NH\(_2\), S(O)\(_2\)NHCH\(_3\), S(O)\(_2\)N(CH\(_3\))\(_2\), NHS(O)\(_2\)CH\(_3\) and N(CH\(_3\))S(O)\(_2\)CH\(_3\); or

\[
\text{[Diagram of structures]}
\]

wherein # denotes the bond to the nitrogen atom of Formula (I); and wherein \( R_9 \) is selected from hydrogen, (1-6C)alkyl, halo, CF\(_3\) and OCF\(_3\); or

an unsubstituted hexahydroindacene ring:

\[
\text{[Diagram of structures]}
\]

wherein # denotes the bond to the nitrogen atom of Formula (I).
8. A compound of any of the preceding claims wherein the compound is selected from the group consisting of:

9. A pharmaceutical composition comprising a compound as defined in any of the preceding claims or a pharmaceutically acceptable salt thereof, in a mixture with a
pharmaceutically acceptable diluent or carrier.

10. A method of inhibiting the NLRP3 inflammasome activity *in vitro* or *in vivo*, said method comprising contacting a cell with an effective amount of a compound according to any preceding claim or a pharmaceutically acceptable salt thereof.

11. A method of treating a disease or disorder in which inflammasome activity is implicated in a patient in need of such treatment, said method comprising administering to said patient a therapeutically effective amount of a compound according to any preceding claim or a pharmaceutically acceptable salt or composition thereof.

12. A method of treating an auto-inflammatory disorder, an autoimmune disorder, a neurodegenerative disease or cancer in a patient in need of such treatment, said method comprising administering to said patient a therapeutically effective amount of a compound according to any preceding claim.

13. A compound according to any preceding claim, a prodrug, or a pharmaceutically acceptable salt or composition thereof, or a pharmaceutical composition for use in therapy.

14. A compound according to any preceding claim or a pharmaceutical composition thereof for use in the treatment of a disorder in which inflammasome activity is implicated.

15. The compound according to claim 14 for use in the treatment of a disorder, wherein the disorder is a cancer is selected from gastrointestinal cancer, skin cancer, non-small-cell lung carcinoma and colorectal adenocarcinoma.

16. The compound according to claim 14 for use in treatment of a disorder, wherein the disorder is selected from the treatment of an auto-inflammatory disorder, an autoimmune disorder, a neurodegenerative disease or cancer.

17. The compound according to claim 16, wherein the disorder is selected from cryopyrin-associated auto-inflammatory syndrome (CAPS) including familial cold auto-
inflammatory syndrome (FCAS), Muckle-Wells syndrome (MWS), chronic infantile neurological cutaneous and articular (CINCA) syndrome, neonatal-onset multisystem inflammatory disease (NOMID), familial Mediterranean fever, nonalcoholic fatty liver disease (NAFLD), gout, rheumatoid arthritis, Crohn’s disease, COPD, fibrosis, obesity, type 2 diabetes, multiple sclerosis, neuro-inflammation occurring in protein misfolding diseases, Parkinson’s disease, osteoarthritis, Non-alcoholic steatohepatitis (NASH) and Alzheimer’s disease.
