METHODS OF ADMINISTERING MONOMETHYL FUMARATE AND PRODRUGS THEREOF HAVING REDUCED SIDE EFFECTS

Cross Reference to Related Applications

Technical Field

[002] Disclosed herein are methods of reducing patient flushing while administering monomethyl fumarate and/or a prodrug thereof during the treatment of diseases such as multiple sclerosis and psoriasis.

Background

[003] Fumaric acid esters (FAEs) are approved in Germany for the treatment of psoriasis, are being evaluated in the United States for the treatment of psoriasis and multiple sclerosis, and have been proposed for use in treating a wide range of immunological, autoimmune, and inflammatory diseases and conditions.

and US 6,436,992; Went and Lieberburg, US 2008/0089896; Schimrigk et al., *Eur J Neurology* 2006, 13, 604-610; and Schilling et al., *Clin Experimental Immunology* 2006, 145, 101-107); ischemia and reperfusion injury (Joshi et al., US 2007/0027076); AGE-induced genome damage (Heidland, WO 2005/027899); inflammatory bowel diseases such as Crohn's disease and ulcerative colitis; arthritis; and others (Nilsson et al., WO 2006/037342 and Nilsson and Muller, WO 2007/042034).

[005] Fumaderm®, an enteric coated tablet containing a mixture of salts of monoethyl fumarate and dimethyl fumarate was approved in Germany in 1994 for the treatment of psoriasis. Dimethyl fumarate (DMF) is rapidly metabolized *in vivo* to monomethyl fumarate (MMF), and hence DMF is considered to be a prodrug of MMF.

\[

\text{dimethyl fumarate} & \quad & \text{monomethyl fumarate}
\end{align*}
\]

[006] Fumaderm® is dosed three times per day with 1-2 grams/day administered for the treatment of psoriasis. Fumaderm® exhibits a high degree of interpatient variability with respect to drug absorption and food strongly reduces bioavailability. Absorption is thought to occur in the small intestine with peak levels achieved 5-6 hours after oral administration. Significant side effects occur in 70-90% of patients (Brewer and Rogers, *Clin Expt'l Dermatology* 2007, 32, 246-49; and Hoefnagel et al., *Br J Dermatology* 2003, 149, 363-369). Side effects of current FAE therapy include gastrointestinal upset including nausea, vomiting, and diarrhea; and transient flushing of the skin. In particular, significant flushing incidences have been reported in patients with psoriasis after administration of BG00012 (DMF) (Artuc et al., *Br J Dermatology* Preprint, 2006, 154, 21). Artuc et al. found flushing incidences in 18 of 24 patients dosed. They also observed increases in PGD₂, PGF₂, and serotonin plasma levels. The skin flushing side effect of FAEs is thought to be the result of interactions with the hydroxy-carboxylic acid receptor, HCA₂, on keratinocytes, as well as on Langerhans cells in the skin (Blad et al., *Biological and Pharmacological Roles of HCA Receptors, Advances in Pharmacology*, 2011, 62, 219-250).

and Strebel, WO 2003/087174 (carbocyclic and oxacarbocyclic compounds); Joshi et al., WO 2006/122652 (thiosuccinates); Joshi et al., US 2008/0233185 (dialkyl and diaryl esters); Nielsen and Bundgaard, J Pharm Sci 1988, 77(4), 285-298 (glycolamide ester prodrugs); and Nilsson et al., US 2008/0004344 (salts)) have been developed in an effort to overcome the deficiencies of current FAE therapy. Controlled release pharmaceutical compositions comprising fumaric acid esters are disclosed by Nilsson and Miuller, WO 2007/042034; by Nilsson and Rupp, US 2012/0034274 and US 2012/0034303. These last two publications describe FAE formulations exhibiting reduced flushing in patients.

**Summary**

[008] Disclosed herein are methods of systemically administering a therapeutically effective amount of a compound selected from (i) monomethyl fumarate (MMF), (ii) a prodrug of monomethyl fumarate, and (iii) a combination thereof, to treat a disease in each patient of a population of patients in need of such treatment. The methods comprise administering the compound(s) to each patient to achieve across the population of patients a maximum average concentration, as defined herein, of monomethyl fumarate in the blood plasma of the patients of less than 500 ng/ml. In certain aspects, the maximum average concentration of monomethyl fumarate in the blood plasma of the patients is maintained at less than 400 ng/ml.

[009] The methods further comprise administering the compound(s) to each patient to achieve, across the population of patients, an average Cmax, as defined herein, of monomethyl fumarate in the blood plasma of the patients of less than 1100 ng/ml. In certain aspects, the average Cmax of monomethyl fumarate in the blood plasma of the patients is maintained at less than 600 ng/ml. In other aspects, the average Cmax of monomethyl fumarate in the blood plasma of the patients is maintained at less than 400 ng/ml.

[0010] The methods are effective in reducing the incidence/frequency of flushing across the population of patients.

[0011] Also disclosed herein are methods of systemically administering a therapeutically effective amount of a compound selected from (i) monomethyl fumarate (MMF), (ii) a prodrug of monomethyl fumarate, and (iii) a combination thereof, to treat a disease in each patient in a population of patients in need of such treatment. The methods comprise administering the compound(s) to each patient to achieve across the population of patients: an average maximum rate of rise in monomethyl fumarate concentration in the blood plasma of the patients of less than 0.25 wt% ng-eq of MMF dosed/ml/hr. In certain aspects, the average maximum rate of rise in monomethyl fumarate concentration is less than
0.20 wt% ng-eq of MMF dosed/ml/hr. In other aspects, the average maximum rate of rise in monomethyl fumarate concentration is less than 0.15 wt% ng-eq of MMF dosed/ml/hr. In other aspects, the average maximum rate of rise in monomethyl fumarate concentration is less than 500 ng/mL/hr. In other aspects, the average maximum rate of rise in monomethyl fumarate concentration is less than 400 ng/mL/hr. In other aspects, the average maximum rate of rise in monomethyl fumarate concentration is less than 250 ng/mL/hr. In other aspects, the average maximum rate of rise in monomethyl fumarate concentration is less than 200 ng/mL/hr. In other aspects, the average maximum rate of rise in monomethyl fumarate concentration is less than 180 ng/mL/hr. In other aspects, the average maximum rate of rise in monomethyl fumarate concentration is less than 140 ng/mL/hr.

[0012] In some embodiments, the methods comprise administering the compound(s) to each patient in a population of patients to achieve across the population an average maximum rate of rise in monomethyl fumarate concentration in the blood plasma of the patients of less than 0.25 wt% ng-eq of MMF dosed/ml/hr, and an average monomethyl fumarate concentration in the blood plasma of the patients, measured at a time of said maximum rate of rise, of less than 250 ng/ml. In another embodiment, the average maximum rate of rise in monomethyl fumarate concentration in the blood plasma of the patients is less than 0.15 wt% ng-eq of MMF dosed/ml/hr, and an average monomethyl fumarate concentration in the blood plasma of the patients, measured at a time of said maximum rate of rise, is less than 200 ng/ml. In yet another embodiment, the average maximum rate of rise in monomethyl fumarate concentration in the blood plasma of the patients is less than 0.10 wt% ng-eq of MMF dosed/ml/hr, and an average monomethyl fumarate concentration in the blood plasma of the patients, measured at a time of said maximum rate of rise, is less than 140 ng/ml.

[0013] Also disclosed herein are methods of systemically administering a therapeutically effective amount of a compound selected from (i) monomethyl fumarate (MMF), (ii) a prodrug of monomethyl fumarate, and (iii) a combination thereof, to treat a disease in a patient in need of such treatment, comprising one of: (a) orally administering to the patient, at a dosing frequency of not more than twice per day, an enteric-coated oral or a non-enteric-coated sustained release dosage form containing a therapeutically effective dose of the compound(s), wherein the dosage form, when subjected to an in vitro dissolution test employing as a dissolution medium 750 mL of 0.1 N hydrochloric acid, at pH 1.2, for a period of 2 hours, followed by addition of 250 mL of 200 mM tribasic sodium phosphate buffer resulting in an adjustment of the pH of the dissolution medium to 6.8, the dissolution
medium being maintained at 37 °C and stirred at 100 rpm, releases: (i) less than 10 wt% of the dose over an initial 2 hours of the in vitro dissolution test; (ii) at least 90 wt% of the dose over not less than an initial 8 hours of the in vitro dissolution test; (iii) no more than 30 wt% of the dose in any one hour during the in vitro dissolution test; and (iv) no more than 40 wt% of the dose in any consecutive two hours during the in vitro dissolution test; or (b) orally administering to the patient, at a frequency of not more than twice per day, a non-enteric-coated oral sustained release dosage form containing a therapeutically effective dose of the compound(s), wherein the dosage form, when subjected to an in vitro dissolution test employing as a dissolution medium 750 mL of 0.1 N hydrochloric acid, at pH 1.2, for a period of 2 hours, followed by addition of 250 mL of 200 mM tribasic sodium phosphate buffer resulting in an adjustment of the pH of the dissolution medium to 6.8, releases (i) at least 90 wt% of the dose over not less than an initial 8 hours of the in vitro dissolution test; (ii) no more than 30 wt% of the dose in any one hour during the in vitro dissolution test; and (iii) no more than 40 wt% of the dose in any consecutive two hours during the in vitro dissolution test.

[0014] The therapeutic treatments disclosed herein can be used to treat any number of diseases for which FAEs are known or thought to be therapeutically effective. In certain embodiments, the therapeutic treatments disclosed herein can be used to treat adrenal leukodystrophy, AGE-induced genome damage, Alexander's Disease, Alzheimer's disease, amyotrophic lateral sclerosis, angina pectoris, arthritis, asthma, balo concentric sclerosis, Canavan disease, cardiac insufficiency including left ventricular insufficiency, central nervous system vasculitis, Charcot-Marie-Tooth Disease, childhood ataxia with central nervous system hypomyelination, chronic idiopathic peripheral neuropathy, chronic obstructive pulmonary disease, Crohn's disease, diabetic retinopathy, graft versus host disease, hepatitis C viral infection, herpes simplex viral infection, human immunodeficiency viral infection, Huntington's disease, irritable bowel disorder, ischemia, Krabbe Disease, lichen planus, macular degeneration, mitochondrial encephalomyopathy, monomelic amyotrophy, multiple sclerosis, myocardial infarction, neurodegeneration with brain iron accumulation, neuromyelitis optica, neurosarcoidosis, NF-κB mediated diseases, optic neuritis, paraneoplastic syndromes, Parkinson's disease, Pelizaeus-Merzbacher disease, primary lateral sclerosis, progressive supranuclear palsy, psoriasis, reperfusion injury, retinopathy pigmentosa, Schilders Disease, subacute necrotizing myelopathy, susac syndrome, transplantation rejection, transverse myelitis, a tumor, ulcerative colitis, Zellweger's syndrome, granulomas including annulaire, pemphigus, bullus pemphigoid,
behçet's, contact dermatitis, acute dermatitis, chronic dermatitis, alopecia areata (totalis and universalis), sarcoidosis, cutaneous sarcoidosis, pyoderma gangrenosum, cutaneous lupus, Crohn's disease or cutaneous Crohn's disease. In some embodiments, the therapeutic treatments disclosed herein can be used for the treatment of multiple sclerosis and psoriasis.

[0015] In a first aspect, the compound being administered comprises monomethyl fumarate.

[0016] In a second aspect, the compound being administered comprises a prodrug of monomethyl fumarate.

[0017] In a third aspect, the prodrug of monomethyl fumarate comprises a compound of Formula (I):

\[
\text{(I)}
\]

or a pharmaceutically acceptable salt thereof, wherein \( R_1 \) is chosen from a \( \text{C}_1 \) to \( \text{C}_6 \) alkyl.

[0018] In a fourth aspect, the prodrug of monomethyl fumarate comprises a compound of Formula (II):

\[
\text{(II)}
\]

or a pharmaceutically acceptable salt thereof, wherein:

\[ R^2 \text{ and } R^3 \text{ are independently chosen from hydrogen, } \text{C}_1-6 \text{ alkyl, and substituted } \text{C}_1-6 \text{ alkyl; } \]

\[ R^4 \text{ and } R^5 \text{ are independently chosen from hydrogen, } \text{C}_1-6 \text{ alkyl, substituted } \text{C}_1-6 \text{ alkyl, } \text{C}_1-6 \text{ alkoxy, substituted } \text{C}_1-6 \text{ alkoxy, } \text{C}_1-6 \text{ alkoxy carbonyl, substituted } \text{C}_1-6 \text{ alkoxy carbonyl, } \text{C}_1-6 \text{ heteroalkyl, substituted } \text{C}_1-6 \text{ heteroalkyl, } \text{C}_4-12 \text{ cycloalkylalkyl, substituted } \text{C}_4-12 \text{ cycloalkylalkyl, } \text{C}_7-12 \text{ arylalkyl, and substituted } \text{C}_7-12 \text{ arylalkyl; or } R^4 \text{ and } R^5 \text{ together with the nitrogen to which they are bonded form a ring chosen from a } \text{C}_5-10 \text{ heteroaryl, substituted } \text{C}_5-10 \text{ heteroaryl, } \text{C}_5-10 \text{ heterocycloalkyl, and substituted } \text{C}_5-10 \text{ heterocycloalkyl; and } \]
wherein each substituent group is independently chosen from halogen, -OH, -CN, -
CF₃, =O, -NO₂, benzyl, -C(0)NR¹¹₂, - R¹¹, -OR¹¹, -C(0)R¹¹, -COOR¹¹, and -NR¹¹₂ wherein
each R¹¹ is independently chosen from hydrogen and C₁₋₄ alkyl.

[0019] In a fifth aspect, the prodrug of monomethyl fumarate comprises a compound
of Formula (III):

![Formula III]

or a pharmaceutically acceptable salt thereof, wherein:

R⁶ is chosen from C₁₋₆ alkyl, substituted C₁₋₆ alkyl, substituted C₁₋₆
heteroalkyl, C₃₋₈ cycloalkyl, substituted C₃₋₈ cycloalkyl, C₆₋₈ aryl, substituted C₆₋₈ aryl, and
-OR¹⁰ wherein R¹⁰ is chosen from C₁₋₆ alkyl, substituted C₁₋₆ alkyl, C₃₋₁₀ cycloalkyl,
substituted C₃₋₁₀ cycloalkyl, C₆₋₁₀ aryl, and substituted C₆₋₁₀ aryl;

R⁷ and R⁸ are independently chosen from hydrogen, C₁₋₆ alkyl, and substituted C₁₋₆
alkyl; and

wherein each substituent group is independently chosen from halogen, -OH, -CN, -
CF₃, =O, -NO₂, benzyl, -C(0)NR¹¹₂, - R¹¹, -OR¹¹, -C(0)R¹¹, -COOR¹¹, -
N(R¹¹)C(0)C(R¹¹)₂NR¹¹₂, and -NR¹¹₂ wherein each R¹¹ is independently chosen from
hydrogen and C₁₋₄ alkyl.

[0020] In a sixth aspect, the prodrug of monomethyl fumarate comprises a compound
of Formula (IV):

![Formula IV]

or a pharmaceutically acceptable salt thereof, wherein n is an integer from 2 to 6.
Figures

[0021] Figure 1 shows the in vitro release profile of an enteric-coated sustained released tablet according to Example 1.

[0022] Figure 2 shows the mean plasma concentration of MMF following the oral dosing of an enteric-coated sustained released tablet according to Example 1.

[0023] Figure 3 shows the percent of prodrug released from the Example 5 dosage forms over time.

[0024] Figure 4 shows the mean plasma concentration of MMF following oral dosing of a formulation prepared according to Example 6 to fasted and fed healthy adult patients.

[0025] Figure 5 shows the percent of prodrug released from the Example 8 dosage forms over time.

[0026] Figure 6 shows the percent of prodrug released from the Example 9 dosage forms over time.

[0027] Figure 7 shows the percent of prodrug released from the Example 10 dosage forms over time.

[0028] Figure 8 shows the percent of prodrug released from the two Example 12 dosage forms over time.

[0029] Figure 9 shows the percent of prodrug released from the two Example 13 dosage forms over time.

[0030] Figure 10 shows the percent of prodrug released from the Example 14 dosage form over time.

[0031] Figure 11 shows the percent of prodrug released from the Example 15 dosage form over time.

[0032] Figure 12 shows the mean plasma concentration of MMF following oral dosing of a formulation prepared according to Example 10 to fasted and fed healthy adult patients.

[0033] Figure 13 shows the % flushing incidences as a function of mean MMF Cmax (maximum average concentration) (ng/mL) over patient populations for DMF and Compound 1 (a prodrug of MMF).

[0034] Figure 14 shows the % flushing incidences as a function of mean of individual MMF Cmax (average Cmax) (ng/mL) for DMF and Compound 1 (a prodrug of MMF).

[0035] Figure 15 shows the % flushing incidences as a function of maximum MMF slope (%MMF ng-eq dose/mL/hr) for DMF and Compound 1 (a prodrug of MMF).
Figure 16 shows the % flushing incidences as a function of maximum MMF slope (ng/mL/hr) for DMF and Compound 1 (a prodrug of MMF).

The curves in the above figures, where applicable, were fitted using a Hill $E_{max}$ model.

Definitions

A dash ("-") that is not between two letters or symbols is used to indicate a point of attachment for a moiety or substituent. For example, -CONH$_2$ is bonded through the carbon atom.

"Alkyl" refers to a saturated or unsaturated, branched, or straight-chain, monovalent hydrocarbon radical derived by the removal of one hydrogen atom from a single carbon atom of a parent alkane, alkene, or alkyne. Examples of alkyl groups include, but are not limited to, methyl; ethyls such as ethanyl, ethenyl, and ethynyl; propyls such as propan-1-yl, propan-2-yl, prop-1-en-1-yl, prop-1-yn-1-yl, prop-2-en-1-yl, prop-2-yn-1-yl (allyl), prop-1-yn-1-yl, prop-2-yn-1-yl, etc.; butyls such as butan-1-yl, butan-2-yl, 2-methyl-propan-1-yl, 2-methyl-propan-2-yl, but-1-en-1-yl, but-1-en-2-yl, 2-methyl-prop-1-en-1-yl, but-2-en-1-yl, but-2-en-2-yl, buta-1,3-dien-1-yl, buta-1,3-dien-2-yl, buta-1,3-dien-2-yl, butyl; 1-yn-1-yl, butyl-3-yn-1-yl, butyl-5-yn-1-yl, etc. and the like.

The term "alkyl" is specifically intended to include groups having any degree or level of saturation, i.e., groups having exclusively single carbon-carbon bonds, groups having one or more double carbon-carbon bonds, groups having one or more triple carbon-carbon bonds, and groups having combinations of single, double, and triple carbon-carbon bonds. Where a specific level of saturation is intended, the terms alkanyl, alkenyl, and alkynyl are used. In certain embodiments, an alkyl group can have from 1 to 20 carbon atoms (C$_{1-20}$), in certain embodiments, from 1 to 10 carbon atoms (C$_{1-10}$), in certain embodiments from 1 to 8 carbon atoms (C$_{1-8}$), in certain embodiments, from 1 to 6 carbon atoms (C$_{1-6}$), in certain embodiments from 1 to 4 carbon atoms (C$_{1-4}$), and in certain embodiments, from 1 to 3 carbon atoms (C$_{1-3}$).

"Aryl" refers to a monovalent aromatic hydrocarbon radical derived by the removal of one hydrogen atom from a single carbon atom of a parent aromatic ring system. Aryl encompasses benzene; bicyclic ring systems wherein at least one ring is carbocyclic and aromatic, for example, naphthalene, indane, and tetralin; and tricyclic ring systems wherein at least one ring is carbocyclic and aromatic, for example, fluorene. Aryl encompasses multiple ring systems having at least one carbocyclic aromatic ring fused to at least one carbocyclic aromatic ring, cycloalkyl ring, or heterocycloalkyl ring. For example, aryl includes a phenyl
ring fused to a 5- to 7-membered heterocycloalkyl ring containing one or more heteroatoms chosen from N, O, and S. For such fused, bicyclic ring systems wherein only one of the rings is a carbocyclic aromatic ring, the radical carbon atom may be at the carbocyclic aromatic ring or at the heterocycloalkyl ring. Examples of aryl groups include, but are not limited to, groups derived from aceantrhylene, acenaphthylene, acephenanthrylene, anthracene, azulene, benzene, chrysene, coronene, fluoranthene, fluorene, hexacene, hexaphene, hexalene, as-indacene, s-indacene, indane, indene, naphthalene, octacene, octaphene, octalene, ovalene, penta-2,4-diene, pentacene, pentalene, pentaphene, perylene, phenalene, phenanthrene, picene, pleiadene, pyrene, pyranthrene, rubicene, triphenylene, trinaphthalene, and the like.

In certain embodiments, an aryl group can have from 6 to 20 carbon atoms (C₆-2₀), from 6 to 12 carbon atoms (C₆-1₂), from 6 to 10 carbon atoms (C₆-1₀), and in certain embodiments from 6 to 8 carbon atoms (C₆-8).

[0042] "Arylalkyl" refers to an acyclic alkyl radical in which one of the hydrogen atoms bonded to a carbon atom, typically a terminal or sp³ carbon atom, is replaced with an aryl group. Examples of arylalkyl groups include, but are not limited to, benzyl, 2-phenylethanol-1-yl, 2-phenylethanol-1-yl, naphthylmethyl, 2-naphthylethan-1-yl, 2-naphthylethene-1-yl, naphthobenzyl, 2-naphthophenylethan-1-yl and the like. Where specific alkyl moieties are intended, the nomenclature arylalkanly, arylalkenyl, or arylalkynyl is used. In certain embodiments, an arylalkyl group is C₇-₀ arylalkyl, e.g., the alkanyl, alkenyl or alkynyl moiety of the arylalkyl group is C₂-₀ and the aryl moiety is C₆-2₀. In certain embodiments, an arylalkyl group is C₆-₁₀ arylalkyl, e.g., the alkanyl, alkenyl or alkynyl moiety of the arylalkyl group is C₇-₁₀ and the aryl moiety is C₆-₁₀. In certain embodiments, an arylalkyl group is C₇-₁₂ arylalkyl.

[0043] "Compounds" of Formulae (I)-(IV) disclosed herein include any specific compounds within these formulae. Compounds may be identified either by their chemical structure and/or chemical name. Compounds are named using Chemistry 4-D Draw Pro, version 7.01c (Chemlnnovation Software, Inc., San Diego, CA). When the chemical structure and chemical name conflict, the chemical structure is determinative of the identity of the compound. The compounds described herein may comprise one or more chiral centers and/or double bonds and therefore may exist as stereoisomers such as double-bond isomers (i.e., geometric isomers), enantiomers, or diastereomers. Accordingly, any chemical structures within the scope of the specification depicted, in whole or in part, with a relative configuration are deemed to encompass all possible enantiomers and stereoisomers of the illustrated compounds including the stereoisomerically pure form (e.g., geometrical pure,
enantiomerically pure, or diastereomerically pure) and enantiomeric and stereoisomeric mixtures. Enantiomeric and stereoisomeric mixtures may be resolved into their component enantiomers or stereoisomers using separation techniques or chiral synthesis techniques well known to the skilled artisan. Compounds selected from monomethyl fumarate, or a prodrug of monomethyl fumarate such as dimethyl fumarate or a compound of Formulae (I)-(IV), include, but are not limited to, optical isomers thereof, racemates thereof, and other mixtures thereof. In such embodiments, a single enantiomer or diastereomer, i.e., optically active form can be obtained by asymmetric synthesis or by resolution of the racemates. Resolution of the racemates may be accomplished, for example, by conventional methods such as crystallization in the presence of a resolving agent, or chromatography using, for example, chiral stationary phases. Notwithstanding the foregoing, in compounds selected from monomethyl fumarate, or a prodrug of monomethyl fumarate such as dimethyl fumarate or a compound of Formulae (I)-(IV), the configuration of the illustrated double bond is only in the E configuration (i.e. trans configuration).

[0044] Compounds selected from monomethyl fumarate, or a prodrug of monomethyl fumarate such as dimethyl fumarate or a compound of Formulae (I)-(IV), may also exist in several tautomeric forms including the enol form, the keto form, and mixtures thereof. Accordingly, the chemical structures depicted herein encompass all possible tautomeric forms of the illustrated compounds. Compounds selected from monomethyl fumarate, or a prodrug of monomethyl fumarate such as dimethyl fumarate or a compound of Formulae (I)-(IV), also include isotopically labeled compounds where one or more atoms have an atomic mass different from the atomic mass conventionally found in nature. Examples of isotopes that may be incorporated into the compounds disclosed herein include, but are not limited to, $^2$H, $^3$H, $^{13}$C, $^{14}$C, $^{15}$N, $^{18}$O, $^{17}$O, etc. Compounds may exist in unsolvated forms as well as solvated forms, including hydrated forms and as N-oxides. In general, compounds as referred to herein may be free acid, hydrated, solvated, or N-oxides. Certain compounds may exist in multiple crystalline, co-crystalline, or amorphous forms. Compounds selected from monomethyl fumarate, or a prodrug of monomethyl fumarate such as dimethyl fumarate or a compound of Formulae (I)-(IV), include pharmaceutically acceptable salts thereof, or pharmaceutically acceptable solvates of the free acid form of any of the foregoing, as well as crystalline forms of any of the foregoing.

[0045] Compounds selected from monomethyl fumarate, or a prodrug of monomethyl fumarate such as dimethyl fumarate or a compound of any of Formulae (I)-(IV), also include solvates. A solvate refers to a molecular complex of a compound with one or more solvent
molecules in a stoichiometric or non-stoichiometric amount. Such solvent molecules are those commonly used in the pharmaceutical art, which are known to be innocuous to a patient, e.g., water, ethanol, and the like. A molecular complex of a compound or moiety of a compound and a solvent can be stabilized by non-covalent intra-molecular forces such as, for example, electrostatic forces, van der Waals forces, or hydrogen bonds. The term "hydrate" refers to a solvate in which the one or more solvent molecules is water.

[0046] Further, when partial structures of the compounds are illustrated, an asterisk (*) indicates the point of attachment of the partial structure to the rest of the molecule.

[0047] "Cycloalkyl" refers to a saturated or partially unsaturated cyclic alkyl radical. Where a specific level of saturation is intended, the nomenclature cycloalkanyl or cycloalkenyl is used. Examples of cycloalkyl groups include, but are not limited to, groups derived from cyclopropane, cyclobutane, cyclopentane, cyclohexane, and the like. In certain embodiments, a cycloalkyl group is C\(_{3-15}\) cycloalkyl, C\(_{3-12}\) cycloalkyl, and in certain embodiments, C\(_{3-8}\) cycloalkyl.

[0048] "Cycloalkylalkyl" refers to an acyclic alkyl radical in which one of the hydrogen atoms bonded to a carbon atom, typically a terminal or \(sp^3\) carbon atom, is replaced with a cycloalkyl group. Where specific alkyl moieties are intended, the nomenclature cycloalkylalkanyl, cycloalkylalkenyl, or cycloalkylalkynyl is used. In certain embodiments, a cycloalkylalkyl group is C\(_{4-30}\) cycloalkylalkyl, e.g., the alkanyl, alkenyl, or alkynyl moiety of the cycloalkylalkyl group is C\(_{1-10}\) and the cycloalkyl moiety is C\(_{3-20}\) and in certain embodiments, a cycloalkylalkyl group is C\(_{3-20}\) cycloalkylalkyl, e.g., the alkanyl, alkenyl, or alkynyl moiety of the cycloalkylalkyl group is C\(_{1-8}\) and the cycloalkyl moiety is C\(_{3-12}\). In certain embodiments, a cycloalkylalkyl group is C\(_{4-12}\) cycloalkylalkyl.

[0049] "Dimethyl fumarate" refers to the dimethyl ester of fumaric acid. The compound has the formula H\(_2\)COOCCH=CHCOOCH \(_3\), and has a molecular weight of 144.13 daltons. This compound is also known by the names Dimethyl (E)-butenedioate (IUPAC), trans-1,2-Ethyleneedicarboxylic acid dimethyl ester and (E)-2-Butenedioic acid dimethyl ester. The compound is also referred to herein by the acronym DMF.

[0050] "Disease" refers to a disease, disorder, condition, or symptom of any of the foregoing.

[0051] "Drug" as defined under 21 U.S.C. § 321(g)(1) means "(A) articles recognized in the official United States Pharmacopoeia, official Homeopathic Pharmacopoeia of the United States, or official National Formulary, or any supplement to any of them; and (B)
articles intended for use in the diagnosis, cure, mitigation, treatment, or prevention of disease in man or other animals; and (C) articles (other than food) intended to affect the structure or any function of the body of man or other animals.

[0052] "Flushing" refers to a transient erythema or redness of the skin, together with a sensation of warmth or burning, typically over the face and/or neck and less frequently on the upper trunk and abdomen. A flush is usually temporary and is caused by medications or other substances that cause widening of the capillaries, such as niacin. A more detailed description of flushing can be found in Champion R.H., et al. Rook/Wilkinson/Ebling Textbook of Dermatology, 6th ed., vol. 3, Oxford, UK: Blackwell Scientific, 1998; "Flushing and Flushing Syndromes, Rosacea and Perioral Dermatitis", pp. 2099-2104.

[0053] "Halogen" refers to a fluoro, chloro, bromo, or iodo group. In certain embodiments, halogen refers to a chloro group.

[0054] "Heteroalkyl" by itself or as part of another substituent refers to an alkyl group in which one or more of the carbon atoms (and certain associated hydrogen atoms) are independently replaced with the same or different heteroatomic groups. Examples of heteroatomic groups include, but are not limited to, -O-, -S-, -0-0-, -S-S-, -0-S-, -NR\(^3\), =N-N=, -N=N-, -N=N-NR\(^1\), -PR\(^3\), -P(0)\(^2\), -P(0)\(^2\), -S-, -SO-, -SO\(^2\), -Sn(R\(^3\))\(^2\), and the like, where each R\(^3\) is independently chosen from hydrogen, \(\text{Ci}_6\) alkyl, substituted \(\text{Ci}_6\) alkyl, \(\text{C}_{6,12}\) aryl, substituted \(\text{C}_{6,12}\) aryl, \(\text{C}_{7,18}\) arylalkyl, \(\text{C}_{3,7}\) cycloalkyl, substituted \(\text{C}_{3,7}\) cycloalkyl, \(\text{C}_{3,7}\) heterocycloalkyl, substituted \(\text{C}_{3,7}\) heterocycloalkyl, \(\text{Ci}_6\) heteroalkyl, substituted \(\text{Ci}_6\) heteroalkyl, \(\text{C}_{6,12}\) heteroaryl, substituted \(\text{C}_{6,12}\) heteroaryl, \(\text{C}_{7,18}\) heteroarylalkyl, or substituted \(\text{C}_{7,18}\) heteroarylalkyl. Reference to, for example, a \(\text{Ci}_6\) heteroalkyl means a \(\text{Ci}_6\) alkyl group in which at least one of the carbon atoms (and certain associated hydrogen atoms) is replaced with a heteroatom. For example \(\text{Ci}_6\) heteroalkyl includes groups having five carbon atoms and one heteroatom, groups having four carbon atoms and two heteroatoms, etc. In certain embodiments, each R\(^3\) is independently chosen from hydrogen and \(\text{C}_{1,3}\) alkyl. In certain embodiments, a heteroatomic group is chosen from -O-, -S-, -NH-, -N(CH\(_3\))\(^2\), and -SO\(^2\) and in certain embodiments, the heteroatomic group is -0-.

[0055] "Heteroaryl" refers to a monovalent heteroaromatic radical derived by the removal of one hydrogen atom from a single atom of a parent heteroaromatic ring system. Heteroaryl encompasses multiple ring systems having at least one heteroaromatic ring fused to at least one other ring, which can be aromatic or non-aromatic. For example, heteroaryl encompasses bicyclic rings in which one ring is heteroaromatic and the second ring is a
heterocycloalkyl ring. For such fused, bicyclic heteroaryl ring systems wherein only one of the rings contains one or more heteroatoms, the radical carbon may be at the aromatic ring or at the heterocycloalkyl ring. In certain embodiments, when the total number of N, S, and O atoms in the heteroaryl group exceeds one, the heteroatoms are not adjacent to one another.

In certain embodiments, the total number of heteroatoms in the heteroaryl group is not more than two.

[0056] Examples of heteroaryl groups include, but are not limited to, groups derived from acridine, arsindole, carbazole, β-carboline, chromane, chromene, cinnoline, furan, imidazole, indazole, indole, indolizine, isolbenzofuran, isochromene, isoindole, isoindoline, isoquinoline, isothiazole, isoxazole, naphthyridine, oxadiazole, oxazole, perimidine, phenanthridine, phenanthroline, phenazine, phthalazine, pteridine, purine, pyran, pyrazine, pyrazole, pyridazine, pyridine, pyrimidine, pyrrole, pyrrrolizine, quinazoline, quinoline, quinolizine, quinoxaline, tetrazole, thiadiazole, thiazole, thiophene, triazole, xanthene, thiazolidine, oxazolidine, and the like. In certain embodiments, a heteroaryl group is from 4- to 20-membered heteroaryl (C_{4,20}), and in certain embodiments from 4- to 12-membered heteroaryl (C_{4,12}). In certain embodiments, heteroaryl groups are those derived from thiophene, pyrrole, benzothiophene, benzofuran, indole, pyridine, quinoline, imidazole, oxazole, or pyrazine. For example, in certain embodiments, a 5 heteroaryl can be furyl, thienyl, pyrrolyl, imidazolyl, pyrazolyl, isothiazolyl, isoxazolyl.

[0057] "Heterocycloalkyl" refers to a saturated or unsaturated cyclic alkyl radical in which one or more carbon atoms (and certain associated hydrogen atoms) are independently replaced with the same or different heteroatom; or to a parent aromatic ring system in which one or more carbon atoms (and certain associated hydrogen atoms) are independently replaced with the same or different heteroatom such that the ring system no longer contains at least one aromatic ring. Examples of heteroatoms to replace the carbon atom(s) include, but are not limited to, N, P, O, S, Si, etc. Examples of heterocycloalkyl groups include, but are not limited to, groups derived from epoxides, azirines, thiranes, imidazolidine, morpholine, piperazine, piperidine, pyrazolidine, pyrrolidine, quinuclidine, and the like. In certain embodiments, a heterocycloalkyl group is C_{5,10} heterocycloalkyl, C_{5,8} heterocycloalkyl, and in certain embodiments, C_{5,6} heterocycloalkyl.

[0058] "Leaving group" has the meaning conventionally associated with it in synthetic organic chemistry, i.e., an atom or a group capable of being displaced by a nucleophile and includes halogen such as chloro, bromo, fluoro, and iodo, acyloxy
(alkoxycarbonyl) such as acetoxy and benzoyloxy, aryloxycarbonyl, mesyloxy, tosylxy, trifluoromethanesulfonyloxy, aryloxy such as 2,4-dinitrophenoxy, methoxy, N,O-dimethylhydroxylamino, p-nitrophenolate, imidazolyl, and the like.

[0059] "Monomethyl fumarate" refers to the monomethyl ester of fumaric acid. The compound has the formula HOOCCH=CHCOOCH₃, and has a molecular weight of 130.10 daltons. The compound is also commonly referred to as 2(E)-Butenedioic acid 1-methyl ester, (2E)-4-Methoxy-4-oxobut-2-enoic acid; Fumaric acid hydrogen 1-methyl ester; (2E)-2-Butenedioic acid 1-methyl ester; (E)-2-Butenedioic acid monomethyl ester; Monomethyl trans-ethylene-1,2-dicarboxylate; and methyl hydrogen fumarate. The compound is also referred to herein and elsewhere by the acronyms MMF and/or MHF.

[0060] "Parent aromatic ring system" refers to an unsaturated cyclic or polycyclic ring system having a conjugated \( \pi \) (pi) electron system. Included within the definition of "parent aromatic ring system" are fused ring systems in which one or more of the rings are aromatic and one or more of the rings are saturated or unsaturated, such as, for example, fluorene, indane, indene, phenalene, etc. Examples of parent aromatic ring systems include, but are not limited to, aceanthrylene,acenaphthylene, acephenanthrylene, anthracene, azulene, benzene, chrysene, coronene, fluoranthene, fluorene, hexacene, hexaphene, hexalene, as-indacene, s-indacene, indane, indene, naphthalene, octacene, octaphene, octalene, ovalene, penta-2,4-diene, pentacene, pentalene, pentaphene, perylene, phenalene, phenanthrene, picene, pleiadene, pyrene, pyranthrene, rubicene, triphenylene, triphthalene, and the like.

[0061] "Parent heteroaromatic ring system" refers to an aromatic ring system in which one or more carbon atoms (and any associated hydrogen atoms) are independently replaced with the same or different heteroatom in such a way as to maintain the continuous \( \pi \)-electron system characteristic of aromatic systems and a number of out-of-plane \( \pi \)-electrons corresponding to the Hückel rule \( (\text{An}+2) \). Examples of heteroatoms to replace the carbon atoms include, but are not limited to, N, P, O, S, and Si, etc. Specifically included within the definition of "parent heteroaromatic ring systems" are fused ring systems in which one or more of the rings are aromatic and one or more of the rings are saturated or unsaturated, such as, for example, arsindole, benzodioxan, benzofuran, chromane, chromene, indole, indolone, xanthen, etc. Examples of parent heteroaromatic ring systems include, but are not limited to, arsindole, carbazole, \( \beta \)-carboline, chromane, chromene, cinnoline, furan, imidazole, indazole, indole, indoline, indolizine, isobenzofuran, isochromene, isoindole, isoindoline,
isoquinoline, isothiazole, isoxazole, naphthyridine, oxadiazole, oxazole, perimidine, phenanthridine, phenanthroline, phenazine, phthalazine, pteridine, purine, pyran, pyrazine, pyrazole, pyridazine, pyridine, pyrimidine, pyrrole, pyrrolizine, quinazoline, quinoline, quinolizine, quinoxaline, tetrazole, thiadiazole, thiazole, thiophene, triazole, xanthen, thiazolidine, oxazolidine, and the like.

[0062] "Patient" refers to a mammal, for example, a human.

[0063] "Pharmaceutically acceptable" refers to approved or approvable by a regulatory agency of the Federal or a state government or listed in the U.S. Pharmacopoeia or other generally recognized pharmacopoeia for use in animals, and more particularly in humans.

[0064] "Pharmaceutically acceptable salt" refers to a salt of a compound, which possesses the desired pharmacological activity of the parent compound. Such salts include acid addition salts, formed with inorganic acids such as hydrochloric acid, hydrobromic acid, sulfuric acid, nitric acid, phosphoric acid, and the like; or formed with organic acids such as acetic acid, propionic acid, hexanoic acid, cyclopentanepropionic acid, glycolic acid, pyruvic acid, lactic acid, malonic acid, succinic acid, malic acid, maleic acid, fumaric acid, tartaric acid, citric acid, benzoic acid, 3-(4-hydroxybenzoyl) benzoic acid, cinnamic acid, mandelic acid, methanesulfonic acid, ethanesulfonic acid, 1,2-ethane-disulfonic acid, 2-hydroxyethanesulfonic acid, benzenesulfonic acid, 4-chlorobenzenesulfonic acid, 2-naphthalenesulfonic acid, 4-toluencesulfonic acid, camphorsulfonic acid, 4-methylbicyclo[2.2.2]-oct-2-ene-1-carboxylic acid, glucoheptonic acid, 3-phenylpropionic acid, trimethylacetic acid, tertiary butylacetic acid, lauryl sulfuric acid, gluconic acid, glutamic acid, hydroxynaphthoic acid, salicylic acid, stearic acid, muconic acid, and the like; and salts formed when an acidic proton present in the parent compound is replaced by a metal ion, e.g., an alkali metal ion, an alkaline earth ion, or an aluminum ion; or coordinates with an organic base such as ethanolamine, diethanolamine, triethanolamine, N-methylglucamine, and the like. In certain embodiments, a pharmaceutically acceptable salt is the hydrochloride salt. In certain embodiments, a pharmaceutically acceptable salt is the sodium salt.

[0065] "Pharmaceutically acceptable vehicle" refers to a pharmaceutically acceptable diluent, a pharmaceutically acceptable adjuvant, a pharmaceutically acceptable excipient, a pharmaceutically acceptable carrier, or a combination of any of the foregoing with which a compound provided by the present disclosure may be administered to a patient and which does not destroy the pharmacological activity thereof and which is non-toxic when
administered in doses sufficient to provide a therapeutically effective amount of the compound.

[0066] "Pharmaceutical composition" refers to a compound selected from monomethyl fumarate, or a prodrug of monomethyl fumarate such as dimethyl fumarate or a compound of Formulae (I)-(IV), and at least one pharmaceutically acceptable vehicle, with which the compound is administered to a patient.

[0067] "Substituted" refers to a group in which one or more hydrogen atoms are independently replaced with the same or different substituent group(s). In certain embodiments, each substituent group is independently chosen from halogen, -OH, -CN, -CF₃, =0, -N0₂, benzyl, -C(0)NH₂, -R¹¹, -OR¹¹, -C(0)R¹¹, -COOR¹¹, and -NR¹¹₂ wherein each R¹¹ is independently chosen from hydrogen and C₁₋₄ alkyl. In certain embodiments, each substituent group is independently chosen from halogen, -OH, -CN, -CF₃, =0, -N0₂, benzyl, -R¹¹, -OR¹¹, and -NR¹¹₂ wherein each R¹¹ is independently chosen from hydrogen and C₁₋₄ alkyl. In certain embodiments, each substituent group is independently chosen from halogen, -OH, -CN, -CF₃, =0, -N0₂, benzyl, -C(0)NR¹¹₂, -R¹¹, -OR¹¹, -C(0)R¹¹, -COOR¹¹, and -NR¹¹₂ wherein each R¹¹ is independently chosen from hydrogen and C₁₋₄ alkyl. In certain embodiments, each substituent group is independently chosen from -OH, C₁₋₄ alkyl, and -NH₂.

[0068] "Systemic administration" and "systemically administering" shall each mean a route of administration of a compound (as defined herein) into the circulatory system of a patient in a therapeutically effective amount (as defined herein). In some non-limiting embodiments, administration can take place via enteral administration (absorption of the medication through the gastrointestinal tract) or parenteral administration (generally injection, infusion, or implantation). These terms are in contrast with topical and other types of local administration where a therapeutically effective amount is not in the circulatory system. In some embodiments, systemic administration is oral administration. In some embodiments, systemic administration is parenteral administration by injection.

[0069] "Treating" or "treatment" of any disease refers to reversing, alleviating, arresting, or ameliorating a disease or at least one of the clinical symptoms of a disease, reducing the risk of acquiring at least one of the clinical symptoms of a disease, inhibiting the progress of a disease or at least one of the clinical symptoms of the disease or reducing the risk of developing at least one of the clinical symptoms of a disease. "Treating" or "treatment" also refers to inhibiting the disease, either physically, (e.g., stabilization of a discernible symptom), physiologically, (e.g., stabilization of a physical parameter), or both,
and to inhibiting at least one physical parameter that may or may not be discernible to the patient. In certain embodiments, "treating" or "treatment" refers to protecting against or delaying the onset of at least one or more symptoms of a disease in a patient.

[0070] "Therapeutically effective amount" refers to the amount of a compound that, when administered to a subject for treating a disease, or at least one of the clinical symptoms of a disease, is sufficient to affect such treatment of the disease or symptom thereof. The "therapeutically effective amount" may vary depending, for example, on the compound, the disease and/or symptoms of the disease, severity of the disease and/or symptoms of the disease or disorder, the age, weight, and/or health of the patient to be treated, and the judgment of the prescribing physician. An appropriate amount in any given instance may be ascertained by those skilled in the art or capable of determination by routine experimentation.

[0071] "Therapeutically effective dose" refers to a dose that provides effective treatment of a disease or disorder in a patient. A therapeutically effective dose may vary from compound to compound, and from patient to patient, and may depend upon factors such as the condition of the patient and the route of delivery. A therapeutically effective dose may be determined in accordance with routine pharmacological procedures known to those skilled in the art.

[0072] "Average Cmax" refers to the average of two or more individual Cmax values determined across a group of multiple subjects. For example, if multiple subjects are dosed as described herein they can each have a different individual Cmax value. The calculated mean of these different Cmax values is the "Average Cmax" for the group.

[0073] "Maximum Average Concentration" refers to the observed Cmax of an average plot of MMF concentration versus time for a group of subjects, constructed as a single curve using the calculated average MMF concentration across all subjects at each time point. For example, if a group comprising multiple subjects is dosed as described herein each subject can each have different MMF concentrations at any given time point. The observed Cmax value obtained from the single curve constructed by plotting the average concentration values at each time point is the "Maximum Average Concentration". The "Maximum Average Concentration" value may not be the same as the "Average Cmax" value for the same group of individuals.

[0074] "Average maximum rate of rise" refers to the average of all of the individual maximum rates of rise determined across all subjects.
Detailed Description

[0075] Reference is now made in detail to certain embodiments of the methods for reducing flushing in patients during administration of a compound selected from: (i) monomethyl fumarate, (ii) a prodrug of monomethyl fumarate, and/or (iii) a combination thereof. The disclosed embodiments are not intended to be limiting of the claims. To the contrary, the claims are intended to cover all alternatives, modifications, and equivalents.

Methods

In Vitro Measurement of MMF or MMF Prodrug Release from a Dosage Form

[0076] A 2-stage dissolution test in which the dosage form to be tested is first placed in a low pH solution for 2 hours, followed by placement in a near neutral pH solution for the remainder of the test period. This dissolution test is used to better approximate the pH conditions experienced by a dosage form after swallowing by a patient, i.e., low pH of the stomach followed by near neutral pH of the intestines. The dosage forms are first placed into a dissolution vessel (USP, Type I, basket) containing 750 mL of 0.1 N hydrochloric acid (pH 1.2). After 2 hours, 250 mL of 200 mM tribasic sodium phosphate is added to the vessel resulting in a pH adjustment from 1.2 to 6.8. The dissolution medium is kept at 37 °C and is agitated at 100 rpm. Samples are taken at each sampling time point and analyzed by reverse phase HPLC using a C18 column for the compound being tested. The HPLC parameters are set as follows: a 7 minute gradient method according to Table 4 (Example 2) where Mobile Phase A is water/0.1%H₃PO₄ and Mobile Phase B is water/acetonitrile/H₃PO₄ (10/90/0.1 by volume) with UV detection at 210 nm.

[0077] Individual patients exhibit varying susceptibilities to flushing caused by exposure to MMF. Thus, at identical MMF exposures, certain patients exhibit no flushing while other patients exhibit flushing. For this reason, in the present context, a reduction of flushing is intended to denote a decrease in the incidence/frequency among a given treated patient population of flushing observed after administration of the compound(s) according to the disclosures herein. The incidence/frequency of flushing observed after administration of the same compound(s) but at pharmacokinetic parameters (i.e., Cmax and slopes of the MMF blood plasma concentration versus time curves) exceeding those set forth herein is used as the basis for comparison. The incidence/frequency of flushing in a patient population can be measured, e.g., as described by O’toole et al. Cancer 2000, 88(4), 770-776. Typically, the incidence/frequency of flushing is measured and expressed as the percentage of patients within a test group who experience flushing.
[0078] In the context of treating multiple sclerosis by systemically administering MMF and/or an MMF prodrug, the only reported incidences of flushing reported to date have been in connection with the clinical testing of Biogen Idec's BG-12 product, which is a delayed release (i.e., enteric coated microtablets) oral dosage form of the MMF prodrug dimethyl fumarate; see, e.g., Sheikh et al., Safety Tolerability and Pharmacokinetics of BG-12 Administered with and without Aspirin, Key Findings from a Randomized, Double-blind, Placebo-controlled Trial in Healthy Volunteers, Poster P04.136 presented at the 64th Annual Meeting of the American Academy of Neurology, April 21-28, 2012, New Orleans, LA; Dawson et al., Bioequivalence of BG-12 (Dimethyl Fumarate) Administered as a Single 240 mg Capsule and Two 120 mg Capsules: Findings from a Randomized, Two-period Crossover Study, Poster P913 presented at the 28th Congress of the European Committee for Treatment and Research in Multiple Sclerosis, October 10-13, 2012, Lyon, France; and Woodworth et al., Pharmacokinetics of Oral BG-12 Alone Compared with BG-12 and Interferon β-1a or Glatiramer Acetate Administered Together, Studied in Health Volunteers, Poster P04.207 presented at the 62nd Annual Meeting of the American Academy of Neurology, April 10-17, 2010, Toronto, Ontario, Canada. In these publications, Sheikh reported flushing incidences of 83% and 100% for patients taking BG-12 only, BID and TID, respectively; Dawson reported flushing incidences of 84% and 86% for two different BG-12 dosage forms; and Woodward reported flushing incidences of 50% and 76% in treatment groups receiving BG-12 alone. Thus, the reported incidences of flushing in patients taking BG-12 averages to 80% across multiple patient populations.

[0079] In one aspect, in the context of systemic treatment of multiple sclerosis by systemic administration of MMF and/or an MMF prodrug, a reduction in flushing according to the methods disclosed herein is construed as a flushing incidence of less than 50% of a treated patient population. In another aspect, the incidence of flushing is less than 40% of a treated patient population. In another aspect the incidence of flushing is less than 30% of a treated patient population. The reduction of flushing incidence/frequency, as described above, can be monitored in a clinical trial setting.

[0080] In the context of treating psoriasis by systemically administering MMF and/or an MMF prodrug, the only reported incidences of flushing published to date have been in connection with the clinical testing of Fumapharm's Fumaderm product, which is a delayed release (i.e., enteric coated tablet) oral dosage form of the MMF prodrug dimethyl fumarate together with several different salts of monoethyl fumarate. Monoethyl fumarate and salts thereof are not MMF prodrugs. Mrowietz et al. (Treatment of Psoriasis with Fumaric Acid
Esters: Results of a prospective Multicenter Study, British Journal of Dermatology, 1998, 138(3), 456-460) report flushing incidence of 31%. Other reported flushing incidence in psoriasis patients taking Fumaderm of about 30% and one-third of patients are common.

[0081] In one aspect, in the context of systemic treatment of psoriasis by systemic administration of MMF and/or an MMF prodrug, a reduction in flushing according to the methods disclosed herein is construed as a flushing incidence of less than 20% of a treated patient population. In another aspect, the incidence of flushing is less than 15% of a treated patient population. In another aspect the incidence of flushing is less than 10% of a treated patient population. The reduction of flushing incidence/frequency, as described above, can be monitored in a clinical trial setting.

[0082] In accordance with a first aspect of the presently disclosed treatment methods, the MMF and/or MMF prodrug is systemically administered in therapeutic amounts using a dosage form and a dosing frequency that achieves across a population of patients receiving said treatment a maximum average concentration, as defined herein, of monomethyl fumarate in the blood plasma of the patients less than 500 ng/ml. In one embodiment, the maximum average concentration of monomethyl fumarate in the blood plasma of the patients is less than 400 ng/ml. In another embodiment, the maximum average concentration of monomethyl fumarate in the blood plasma of the patients is less than 350 ng/ml. In yet another embodiment, the maximum average concentration of monomethyl fumarate in the blood plasma of the patients is less than 300 ng/ml. In yet another embodiment, the maximum average concentration of monomethyl fumarate in the blood plasma of the patients is less than 250 ng/ml. In yet another embodiment, the maximum average concentration of monomethyl fumarate in the blood plasma of the patients is less than 200 ng/ml. In yet another embodiment, the maximum average concentration of monomethyl fumarate in the blood plasma of the patients is less than 150 ng/ml. In yet another embodiment, the maximum average concentration of monomethyl fumarate in the blood plasma of the patients is less than 100 ng/ml.

[0083] In another aspect, the average Cmax, as defined herein, of monomethyl fumarate in the blood plasma of the patients is less than 1100 ng/ml. In certain aspects, the average Cmax of monomethyl fumarate in the blood plasma of the patients is maintained at less than 600 ng/ml. In yet another aspect, the average Cmax of monomethyl fumarate in the blood plasma of the patients is maintained at less than 500 ng/ml. In yet another aspect, the average Cmax of monomethyl fumarate in the blood plasma of the patients is maintained at less than 400 ng/ml. In yet another aspect, the average Cmax of monomethyl fumarate in the
blood plasma of the patients is maintained at less than 300 ng/ml. In yet another aspect, the average Cmax of monomethyl fumarate in the blood plasma of the patients is maintained at less than 200 ng/ml. In yet another aspect, the average Cmax of monomethyl fumarate in the blood plasma of the patients is maintained at less than 100 ng/ml.

The following table and Figures 13-14 show flushing incidence as a function of MMF Cmax (maximum average concentration and average Cmax) over patient populations for DMF and an MMF prodrug of Formula (II). The curves in the figures were fitted using a Hill E\textsubscript{max} model.

*Formulation 2 is the dosage form described in Example 10; Formulation 3 is the dosage form described in Example 3; Formulation 4 is the dosage form described in Example 5; ** maximum average Concentration; ***average Cmax; *Poster (see above); **Compound (1) referred to in the above table is an MMF prodrug of Formula (II); (N,N-

Diethylcarbamoyl)methyl methyl (2£)but-2-ene-1,4-dioate having the following chemical structure:

![Chemical Structure](image)

[0085] The fifth column of the above table lists the values of MMF Cmax of the mean plot (maximum average concentration) in decreasing order. As shown in Table 1, as the mean MMF Cmax (maximum average concentration) drops from 649 to 439 ng/ml, the flushing incidence drops below the rates reported previously in the literature for the BG-12 DMF product. The sixth column of the above table lists the corresponding mean of individual MMF Cmax (Average Cmax) values. As shown in Table 1, as the mean MMF Cmax...
(Average Cmax) drops below 1100 ng/ml, the flushing incidence drops below the rates reported previously in the literature for the BG-12 DMF product.

In accordance with a second aspect of the presently disclosed treatment methods, the MMF and/or MMF prodrug is systemically administered in therapeutic amounts using a dosage form and a dosing frequency that achieves across a population of patients receiving said treatment an average maximum rate of rise in MMF concentration in the blood plasma of the patients of less than 0.25 wt% ng-eq of MMF dosed/ml/hr. In one embodiment, the average maximum rate of rise in MMF concentration in the blood plasma of the patients is less than 0.20 wt% ng-eq of MMF dosed/ml/hr. In another embodiment, the average maximum rate of rise in MMF concentration in the blood plasma of the patients is less than 0.15 wt% ng-eq of MMF dosed/ml/hr. In yet another embodiment, the average maximum rate of rise in MMF concentration in the blood plasma of the patients is less than 0.10 wt% ng-eq of MMF dosed/ml/hr.

In one embodiment, the methods comprise controlling administration of the compound(s) to the patient to achieve across a population of patients receiving said controlled administration of compound(s), an average maximum rate of rise in monomethyl fumarate concentration in the blood plasma of the patients of less than 0.25 wt% ng-eq of MMF dosed/ml/hr, and an average monomethyl fumarate concentration in the blood plasma of the patients, measured at a time of said maximum rate of rise, of less than 200 ng/ml. In another embodiment, the average maximum rate of rise in monomethyl fumarate concentration in the blood plasma of the patients is less than 0.15 wt% ng-eq of MMF dosed/ml/hr, and an average monomethyl fumarate concentration in the blood plasma of the patients, measured at a time of said maximum rate of rise, is less than 180 ng/ml. In yet another embodiment, the average maximum rate of rise in monomethyl fumarate concentration in the blood plasma of the patients is less than 0.10 wt% ng-eq of MMF dosed/ml/hr, and an average monomethyl fumarate concentration in the blood plasma of the patients, measured at a time of said maximum rate of rise, is less than 140 ng/ml.

The maximum slope values (% dose and ng) for different dosage treatments are given in Table 2. The Figures 15-16 show plots of maximum MMF slope vs flushing incidence. The curves in the figures were fitted using a Hill $E_m$s model.

*Formulation 2 is the dosage form described in Example 10; Formulation 3 is the dosage form described in Example 3; Formulation 4 is the dosage form described in Example 5.

[0089] In order to achieve the pharmacokinetic values of (i) a maximum average concentration of monomethyl fumarate in the blood plasma of the patients of less than 500 ng/ml, and/or (ii) an average maximum rate of rise in MMF concentration in the blood plasma of the patients of less than 0.25 wt% ng-eq of MMF dosed/ml/hr, it is necessary to control the introduction of MMF and/or MMF prodrug into the patients' bloodstream. For systemic oral delivery, this generally means an oral sustained release dosage form. While sustained and delayed-sustained release dosage forms of MMF prodrugs of Formula 1, and most typically sustained release dosage forms of DMF, have been disclosed in the literature for reducing flushing, we have discovered that such dosage forms in fact offer little improvement in reducing patient flushing, either because they achieve too high of a maximum average concentration of monomethyl fumarate in the blood plasma of the patients, and/or too high of an average maximum rate of rise in MMF concentration in the blood plasma of the patients. Specifically, Nilsson et al. in US Patent Publication Nos. 2012/0034274 and 2012/0034303 disclose oral sustained release and oral delayed sustained release dosage forms of DMF, the latter dosage forms being enteric coated. Although the Nilsson dosage forms purport to reduce the incidence of flushing in patients, they present their flushing incidence as a percentage of the patients who flush upon administration of Fumaderm which contains DMF as a primary active ingredient (see Tables II in both Nilsson publications) and at least some of the reported reductions in the incidence of flushing (23%
and 35% reductions compared to Fumaderm) may well be within the range of experimental
error or variability within small patient populations. Of the many dosage forms disclosed in
these two publications, the slowest DMF-releasing dosage forms are in Example 2 of US
2012/0034274 and Examples 16 and 23 of US 2012/0034303. The Example 2 dosage form is
shown to release: (i) about 90% of the DMF dose over a period of 3 hours, (ii) about 43% of
the DMF dose in the third hour of in vitro release, and (iii) about 65% of the DMF loading
over the second and third hours of in vitro release. The Example 16 dosage form, which is
enteric coated and therefore exhibits little to no release during the first 2 hours of the in vitro
test at low pH conditions, is shown to release (i) about 90% of the DMF dose over a period of
3.5 hours marked from the start of the near-neutral pH portion of the test, and (ii) about 50-
55% of its DMF loading over the second and third hours of in vitro release. The Example 23
dosage form is shown to release (i) about 90% of the DMF dose over a period of 4 hours, and
(ii) about 65% of its DMF loading over the third and fourth hours of in vitro release. Thus,
all of the Nilsson dosage forms release the majority (90%) of their DMF dose in periods of 4
hours or less, measured from the start of DMF release.

[0090] In contrast to the Nilsson et al. dosage forms, the dosage forms disclosed
herein release MMF and/or MMF prodrug at a slower rate and over longer time periods than
the Nilsson dosage forms. The oral dosage forms disclosed herein can be characterized as
either enteric-coated, and therefore not designed to release much of the compound in the low
pH environment of a patient's stomach, or non-enteric coated, in which release of compound
in the stomach is not necessarily prohibited.

[0091] Thus, for oral enteric-coated dosage forms disclosed herein, the dosage forms
contain a therapeutically effective dose of the MMF and/or MMF prodrug and are designed to
be administered to each patient in a population of patients at a dosing frequency of not more
than twice per day. The dosage forms, when subjected to the in vitro dissolution test
employing pH 1.2 for the first 2 hours, and pH 6.8 thereafter, releases the dose of MMF
and/or MMF prodrug as follows: (i) less than 10 wt% of the dose over the first 2 hours of the
in vitro dissolution test; (ii) at least 90 wt% of the dose over not less than the first 8 hours of
the in vitro dissolution test; (iii) no more than 30 wt% of the dose in any one hour during the
in vitro dissolution test; and (iv) no more than 40 wt% of the dose in any consecutive two
hours during the in vitro dissolution test.

[0092] For oral non-enteric-coated dosage forms disclosed herein, the dosage forms
contain a therapeutically effective dose of the MMF and/or MMF prodrug and are designed to
be administered to each patient in a population of patients at a dosing frequency of not more
than twice per day. The dosage forms, when subjected to the *in vitro* dissolution test employing pH 1.2 for the first 2 hours, and pH 6.8 thereafter, releases the dose of MMF and/or MMF prodrug as follows: (i) at least 90 wt% of the dose over not less than the first 8 hours of the *in vitro* dissolution test; (ii) no more than 30 wt% of the dose in any one hour during the *in vitro* dissolution test; and (iii) no more than 40 wt% of the dose in any consecutive two hours during the *in vitro* dissolution test.

[0093] Suitable sustained release oral dosage forms that achieve the above described *in vitro* release profiles are disclosed in Examples 1 and 3 (enteric-coated sustained release tablets), 5 (enteric-coated pellets in a Vcaps plus capsule) and 8-15 (non-enteric-coated, compression coated tablets) herein.

**Compounds**

[0094] Certain embodiments of the methods disclosed herein utilize a compound of Formula (I):

![Formula (I)](image)

(I)

or a pharmaceutically acceptable salt thereof, wherein R<sub>1</sub> is chosen from a C<sub>1</sub> to C<sub>6</sub> alkyl.

[0095] In certain embodiments, R<sub>1</sub> is C<sub>2</sub> to C<sub>6</sub> alkyl.

[0096] In certain embodiments, R<sub>1</sub> is methyl.

[0097] In certain embodiments, R<sub>1</sub> is ethyl, n-propyl, isopropyl, n-butyl, isobutyl, tert-butyl, n-pentyl, pentyl-2-yl, 2-methylbutyl, isopentyl, 3-methylbutan-2-yl, neopentyl, tert-pentyl, n-hexyl, hexan-2-yl, 2-methylpentyl, 3-methylpentyl, 4-methylpentyl, 3-methylpentan-2-yl, 4-methylpentan-2-yl, 2,3-dimethylbutyl, or 3,3-dimethylbutyl.

[0098] Examples of compounds of Formula (I) include dimethylfumarate, diethylfumarate, dipropylfumarate, dibutylfumarate, dipentylfumarate, methyl-ethylfumarate, methyl-propylfumarate, methyl-butyrfumarate, methyl-pentylfumarate, monoethylfumarate, monopropylfumarate, monobutylfumarate and monopentylfumarate, and/or pharmaceutically acceptable salts of any of the foregoing. In certain embodiments, the compounds of Formula (I) include dimethyl fumarate, methyl ethyl fumarate, methyl n-propyl fumarate and methyl i-propyl fumarate, including pharmaceutically acceptable salts thereof. Pharmaceutically acceptable salts thereof comprise metal salts, such as a salt selected from alkali metal salts.
and alkaline earth metal salts including sodium, potassium, calcium, magnesium, strontium or zinc salts, amino acid salts etc.

[0099] Certain embodiments of the methods disclosed herein utilize a compound of Formula (II):

\[
\begin{align*}
\text{(II)} \\
\end{align*}
\]

or a pharmaceutically acceptable salt thereof, wherein:

- \(R^2\) and \(R^3\) are independently chosen from hydrogen, \(\text{C}_6\) alkyl, and substituted \(\text{C}_6\) alkyl;
- \(R^4\) and \(R^5\) are independently chosen from hydrogen, \(\text{C}_6\) alkyl, substituted \(\text{C}_6\) alkyl, \(\text{C}_6\) alkoxy, substituted \(\text{C}_6\) alkoxy, \(\text{C}_6\) alkoxy carbonyl, substituted \(\text{C}_6\) alkoxy carbonyl, \(\text{C}_6\) heteroalkyl, substituted \(\text{C}_6\) heteroalkyl, \(\text{C}_4-12\) cycloalkylalkyl, substituted \(\text{C}_4-12\) cycloalkylalkyl, \(\text{C}_7-12\) arylalkyl, and substituted \(\text{C}_7-12\) arylalkyl; or \(R^4\) and \(R^5\) together with the nitrogen to which they are bonded form a ring chosen from a \(\text{C}_5-10\) heteroaryl, substituted \(\text{C}_5-10\) heteroaryl, \(\text{C}_5-10\) heterocycloalkyl, and substituted \(\text{C}_5-10\) heterocycloalkyl; and

wherein each substituent group is independently chosen from halogen, \(-\text{OH}\), \(-\text{CN}\), \(-\text{CF}_3\), \(=\text{O}\), \(-\text{NO}_2\), benzyl, \(-\text{C}(\text{0})\text{NR}^{11}_2\), \(-\text{R}^{11}\), \(-\text{OR}^{11}\), \(-\text{C}(\text{0})\text{R}^{11}\), \(-\text{COOR}^{11}\), and \(-\text{NR}^{11}_2\) wherein each \(R^{11}\) is independently chosen from hydrogen and \(\text{C}_{1-4}\) alkyl.

[00100] In certain embodiments of a compound of Formula (II), each substituent group is independently chosen from halogen, \(-\text{OH}\), \(-\text{CN}\), \(-\text{CF}_3\), \(-\text{R}^{11}\), \(-\text{OR}^{11}\), and \(-\text{NR}^{11}_2\) wherein each \(R^{11}\) is independently chosen from hydrogen and \(\text{C}_{1-4}\) alkyl. In certain embodiments, each substituent group is independently chosen from \(-\text{OH}\), and \(-\text{COOH}\).

[00101] In certain embodiments of a compound of Formula (II), each substituent group is independently chosen from =\(\text{O}\), \(\text{C}_{1-4}\) alkyl, and \(-\text{COOR}^{11}\) wherein \(R^{11}\) is chosen from hydrogen and \(\text{C}_{1-4}\) alkyl.

[00102] In certain embodiments of a compound of Formula (II), each of \(R^2\) and \(R^3\) is hydrogen.

[00103] In certain embodiments of a compound of Formula (II), one of \(R^2\) and \(R^3\) is hydrogen and the other of \(R^2\) and \(R^3\) is \(\text{C}_{1-4}\) alkyl.
In certain embodiments of a compound of Formula (II), one of R² and R³ is hydrogen and the other of R² and R³ is chosen from methyl, ethyl, n-propyl, isopropyl, n-butyl, isobutyl, sec-butyl, and tert-butyl.

In certain embodiments of a compound of Formula (II), one of R² and R³ is hydrogen and the other of R² and R³ is methyl.

In certain embodiments of a compound of Formula (II), R⁴ and R⁵ are independently chosen from hydrogen and C₁₋₆ alkyl.

In certain embodiments of a compound of Formula (II), R⁴ and R⁵ are independently chosen from hydrogen and C₁₋₄ alkyl.

In certain embodiments of a compound of Formula (II), R⁴ and R⁵ are independently chosen from hydrogen, methyl, and ethyl.

In certain embodiments of a compound of Formula (II), each of R⁴ and R⁵ is hydrogen; in certain embodiments, each of R⁴ and R⁵ is methyl; and in certain embodiments, each of R⁴ and R⁵ is ethyl.

In certain embodiments of a compound of Formula (II), R⁴ is hydrogen; and R⁵ is chosen from C₁₋₄ alkyl, substituted C₁₋₄ alkyl wherein the substituent group is chosen from =0, -OR, -COOR, and -NR₂, wherein each R¹ is independently chosen from hydrogen and C₁₋₄ alkyl.

In certain embodiments of a compound of Formula (II), R⁴ is hydrogen; and R⁵ is chosen from C₁₋₄ alkyl, benzyl, 2-methoxyethyl, carboxymethyl, carboxypropyl, 1,3,4-thiadiazolyl, methoxy, 2-methoxycarbonyl, 2-oxo(1,3-oxazolidinyl), 2-(methylethoxy)ethyl, 2-ethoxyethyl, (leri-butyl)oxycarbonyl)methyl, (ethoxycarbonyl)methyl, carboxymethyl, (methylthyl)oxycarbonylmethyl, and ethoxycarbonylmethyl.

In certain embodiments of a compound of Formula (II), R⁴ and R⁵ together with the nitrogen to which they are bonded form a ring chosen from a C₅₋₆ heterocycloalkyl, substituted C₅₋₆ heterocycloalkyl, C₅₋₆ heteroaryl, and substituted C₅₋₆ heteroaryl ring. In certain embodiments of a compound of Formula (II), R⁴ and R⁵ together with the nitrogen to which they are bonded form a ring chosen from a C₅ heterocycloalkyl, substituted C₅ heterocycloalkyl, C₅ heteroaryl, and substituted C₅ heteroaryl ring. In certain embodiments of a compound of Formula (II), R⁴ and R⁵ together with the nitrogen to which they are bonded form a ring chosen from a C₆ heterocycloalkyl, substituted C₆ heterocycloalkyl, C₆ heteroaryl, and substituted C₆ heteroaryl ring. In certain embodiments of a compound of Formula (II), R⁴ and R⁵ together with the nitrogen to which they are bonded form a ring chosen from piperazine, 1,3-oxazolidinyl, pyrolidine, and morpholine ring.
In certain embodiments of a compound of Formula (II), one of R² and R³ is hydrogen and the other of R² and R³ is C₅₋₆ alkyl; R⁴ is hydrogen; and R⁵ is chosen from hydrogen, C₅₋₆ alkyl, and benzyl.

In certain embodiments of a compound of Formula (II), one of R² and R³ is hydrogen and the other of R² and R³ is C₅₋₆ alkyl; R⁴ is methyl; and R⁵ is chosen from hydrogen, C₅₋₆ alkyl, and benzyl.

In certain embodiments of a compound of Formula (II), one of R² and R³ is hydrogen and the other of R² and R³ is chosen from hydrogen and C₅₋₆ alkyl; and each of R⁴ and R⁵ is C₅₋₆ alkyl.

In certain embodiments of a compound of Formula (II), one of R² and R³ is hydrogen and the other of R² and R³ is chosen from hydrogen and C₅₋₆ alkyl; and each of R⁴ and R⁵ is C₅₋₆ alkyl. In certain embodiments of a compound of Formula (II), each of R² and R³ is hydrogen; and each of R⁴ and R⁵ is C₅₋₆ alkyl.

In certain embodiments of a compound of Formula (II), one of R² and R³ is hydrogen and the other of R² and R³ is chosen from hydrogen and C₁₋₄ alkyl; R⁴ is hydrogen; and R⁵ is chosen from C₁₋₄ alkyl and substituted C₁₋₄ alkyl, wherein the substituent group is chosen from =O, -OR, -COOR, and -NR, wherein each R is independently chosen from hydrogen and C₁₋₄ alkyl. In certain embodiments of a compound of Formula (II), one of R² and R³ is hydrogen; and each of R⁴ and R⁵ is methyl; and R⁵ is chosen from C₁₋₄ alkyl and substituted C₁₋₄ alkyl, wherein the substituent group is chosen from =O, -OR, -COOR, and -NR, wherein each R is independently chosen from hydrogen and C₁₋₄ alkyl. In certain embodiments of a compound of Formula (II), each of R² and R³ is hydrogen; R⁴ is hydrogen; and R⁵ is chosen from C₁₋₄ alkyl and substituted C₁₋₄ alkyl, wherein the substituent group is chosen from =O, -OR, -COOR, and -NR, wherein each R is independently chosen from hydrogen and C₁₋₄ alkyl.

In certain embodiments of a compound of Formula (II), R⁴ and R⁵ together with the nitrogen to which they are bonded form a C₅₋₁₀ heterocycloalkyl ring.

In certain embodiments of a compound of Formula (II), one of R² and R³ is hydrogen and the other of R² and R³ is chosen from hydrogen and C₅₋₆ alkyl; and R⁴ and R⁵ together with the nitrogen to which they are bonded form a ring chosen from a C₅₋₆ heterocycloalkyl, substituted C₅₋₆ heterocycloalkyl, C₅₋₆ heteroaryl, and substituted C₅₋₆ heteroaryl ring. In certain embodiments of a compound of Formula (II), one of R² and R³ is hydrogen and the other of R² and R³ is methyl; and R⁴ and R⁵ together with the nitrogen to which they are bonded form a ring chosen from a C₅₋₆ heterocycloalkyl, substituted C₅₋₆ heterocycloalkyl, and substituted C₅₋₆ heteroaryl ring.
heterocycloalkyl, C5-6 heteroaryl, and substituted C5-6 heteroaryl ring. In certain embodiments of a compound of Formula (II), each of R² and R³ is hydrogen; and R⁴ and R⁵ together with the nitrogen to which they are bonded form a ring chosen from a C5-6 heterocycloalkyl, substituted C5-6 heterocycloalkyl, C5-6 heteroaryl, and substituted C5-6 heteroaryl ring.

[00120] In certain embodiments of a compound of Formula (II), one of R² and R³ is hydrogen and the other of R² and R³ is chosen from hydrogen and C₆₋₁₀ alkyl; and R⁴ and R⁵ together with the nitrogen to which they are bonded form a ring chosen from morpholine, piperazine, and N-substituted piperazine.

[00121] In certain embodiments of a compound of Formula (II), one of R² and R³ is hydrogen and the other of R² and R³ is chosen from hydrogen and C₆₋₁₀ alkyl; and R⁴ and R⁵ together with the nitrogen to which they are bonded form a ring chosen from morpholine, piperazine, and N-substituted piperazine.

[00122] In certain embodiments of a compound of Formula (II), R² is hydrogen, and in certain embodiments, R³ is hydrogen.

[00123] In certain embodiments of a compound of Formula (II), R⁴ and R⁵ are independently chosen from hydrogen, C₁₋₆ alkyl, substituted C₁₋₆ alkyl, C₆₋₁₀ aryl, substituted C₆₋₁₀ aryl, C₄₋₁₂ cycloalkylalkyl, substituted C₄₋₁₂ cycloalkylalkyl, C₇₋₁₂ arylalkyl, substituted C₇₋₁₂ arylalkyl, C₆₋₁₀ heteroaryl, substituted C₆₋₁₀ heteroaryl, C₅₋₁₀ heterocycloalkyl, and substituted C₅₋₁₀ heterocycloalkyl.

[00124] In certain embodiments, the Formula (II) compound is chosen from:

(NN -diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate;
methyl /N-benzylcarbamoyl)methyl (2E)but-2-ene-1,4-dioate;
methyl 2-morpholin-4-yl-2-oxoethyl (2E)but-2-ene-1,4-dioate;
(N-butyldicarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate;
/N-(2-methoxyethyl)carbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate;
2-[(2E)-3-(methoxycarbonyl)prop-2-enoyloxy]acetylamino acetic acid;
4-[(2E)-3-(methoxycarbonyl)prop-2-enoyloxy]acetylamino butanoic acid;
methyl (N-(1,3,4-thiadiazol-2-yl)carbamoyl)methyl (2E)but-2-ene-1,4-dioate;
(NN -dimethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate;
(N-methoxy-N-methylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate;
bis-(2-methoxyethylamino)carbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate;
N-(methoxycarbonyl)carbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate;
4-{2-[2(2E)-3-(methoxycarbonyl)prop-2-enoyloxy]acetamidino}butanoic acid, sodium salt;
methyl 2-oxo-2-piperazinylethyl (2E)but-2-ene-1,4-dioate;
methyl 2-oxo-2-(2-oxo(1,3-oxazolidin-3-yl)ethyl) (2E)but-2-ene-1,4-dioate;
N-[2-(dimethylamino)ethyl]carbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate;
methyl 2-(4-methylpiperazinyl)-2-oxoethyl (2E)but-2-ene-1,4-dioate;
methyl N-[propylamino]carbonyl]carbamoyl)methyl (2E)but-2-ene-1,4-dioate;
2-(4-acetylpiperezinyl)-2-oxoethyl methyl (2E)but-2-ene-1,4-dioate;
N,N-bis[2-(methylethoxy)ethyl]carbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate;
methyl 2-(4-benzylpiperazinyl)-2-oxoethyl (2E)but-2-ene-1,4-dioate;
2-{2(2S)-2-[(tert-butyl)oxycarbonyl]pyrrolidinyl}-2-oxoethyl methyl (2E)but-2-ene-
1,4-dioate;
1-{2-[2(2E)-3-(methoxycarbonyl)prop-2-enoyloxy]acetyl} (2S)pyrrolidine-2-
carboxylic acid;
(2S)-[tert-butoxy carbonyl] methyl N-methylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-
dioate;
methyl 1-methyl-2-morpholin-4-yl-2-oxoethyl (2E)but-2-ene-1,4-dioate;
(IS)-[N,N-bis(2-methoxyethyl)carbamoyl]ethyl methyl (2E)but-2-ene-1,4-dioate;
(IS)-[N,N-dimethylcarbamoyl]ethyl methyl (2E)but-2-ene-1,4-dioate;
2-{2-[2(2E)-3-(methoxycarbonyl)prop-2-enoyloxy]N-methylacetylamino}acetic acid;
(2S)-[(tert-butyl)oxycarbonyl]methyl]carbamoyl)methyl methyl (2E)but-2-ene-1,4-
dioate;
methyl (N-methyl-N-f [methylthylethoxy carbonyl]methyl]carbamoyl)methyl (2E)but-
2-ene-1,4-dioate;
(2S)-[N-(ethoxycarbonyl) methyl]N-[N-benzylcarbamoyl]methyl methyl (2E)but-2-ene-1,4-
dioate;
1-{N-[(ethoxycarbonyl) methyl]N-benzylcarbamoyl}ethyl methyl (2E)but-2-ene-1,4-
dioate;
1-[(N-[(ethoxycarbonyl)methyl]-N-methylcarbamoyl)ethyl methyl (2E)but-2-ene-1,4-dioate;
(IS)-l-methyl-2-morpholin-4-yl-2-oxoethyl methyl (2E)but-2-ene-1,4-dioate;
(IS)-l-[(N-[(methoxycarbonyl)ethyl]carbamoyl)ethyl methyl (2E)but-2-ene-1,4-dioate;
(IR)-l-[(N-(2-methoxyethyl)carbamoyl)ethyl methyl (2E)but-2-ene-1,4-dioate; and
pharmaceutically acceptable salts of any of the foregoing.

[00125] In certain embodiments of a compound of Formula (II), the compound is chosen from:
(NN-diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate;
methyl [N-benzylcarbamoyl]methyl (2E)but-2-ene-1,4-dioate;
methyl 2-morpholin-4-yl-2-oxoethyl (2E)but-2-ene-1,4-dioate;
(N-butylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate;
[N-(2-methoxyethyl)carbamoyl]methyl methyl (2E)but-2-ene-1,4-dioate;
2-{2-[(2E)-3-(methoxycarbonyl)prop-2-enoyloxy]acetylamino}acetic acid;
{2-[(2E)-3-(methoxycarbonyl)prop-2-enoyloxy]acetylamino}butanoic acid;
Methyl (N-(1,3,4-thiadiazol-2yl)carbamoyl)methyl (2E)but-2-ene-1,4-dioate;
(NN-dimethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate;
(N-methoxy-N-methylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate;
bis-(2-methoxyethylamino)carbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate;
(N-(methoxycarbonyl)carbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate;
methyl 2-oxo-2-piperazinylethyl (2E)but-2-ene-1,4-dioate;
methyl 2-oxo-2-(2-oxo(1,3-oxazolidin-3yl)ethyl (2E)but-2-ene-1,4-dioate;
[N-[(dimethylamino)ethyl]carbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate;
(N-[(methoxycarbonyl)ethyl]carbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate;
2-{2-[(2E)-3-(methoxycarbonyl)prop-2-enoyloxy]acetylamino}propanoic acid; and
pharmaceutically acceptable salts of any of the foregoing.

[00126] In certain embodiments of a compound of Formula (II), the compound is selected from (NN-dimethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate:

or a pharmaceutically acceptable salt thereof;
or a pharmaceutically acceptable salt thereof.

[00127] Certain embodiments of the methods disclosed herein utilize a compound of Formula (III):

![Formula (III)](image)

or a pharmaceutically acceptable salt thereof, wherein:

- $R^6$ is chosen from $C_{i_6}$ alkyl, substituted $C_{i_6}$ alkyl, substituted $C_{i_6}$ heteroalkyl, substituted $C_{i_6}$ heteroalkyl, substituted $C_{3:8}$ cycloalkyl, $C_{3:8}$ aryl, substituted $C_{3:8}$ aryl, and $-OR^{10}$ wherein $R^{10}$ is chosen from $C_{i_6}$ alkyl, substituted $C_{i_6}$ alkyl, $C_{3:10}$ cycloalkyl, substituted $C_{3:10}$ cycloalkyl, $C_{6:io}$ aryl, and substituted $C_{6:io}$ aryl; and

- $R^7$ and $R^8$ are independently chosen from hydrogen, $C_{i_6}$ alkyl, and substituted $C_{i_6}$ alkyl;

- wherein each substituent group is independently chosen from halogen, -OH, -CN, -CF$_3$, =0, -NO$_2$, benzyl, -C(0)NR$_{11}$, -R$_{11}$, -OR$_{11}$, -C(0)R$_{11}$, -COOR$_{11}$, N(R$_{11}$)C(0)C(R$_{11}$)$_2$NR$_{11}$, and -NR$_{11}$ wherein each R$_{11}$ is independently chosen from hydrogen and $C_{1:4}$ alkyl.

[00128] In certain embodiments of a compound of Formula (III), each substituent group is independently chosen from halogen, -OH, -CN, -CF$_3$, =0, -NO$_2$, benzyl, -C(0)NR$_{11}$, -R$_{11}$, -OR$_{11}$, -C(0)R$_{11}$, -COOR$_{11}$, N(R$_{11}$)C(0)C(R$_{11}$)$_2$NR$_{11}$, and -NR$_{11}$ wherein each R$_{11}$ is independently chosen from hydrogen and $C_{1:4}$ alkyl.

[00129] In certain embodiments of a compound of Formula (III), each substituent group is independently chosen from =0, $C_{1:4}$ alkyl, and -COOR$_{11}$ wherein R$_{11}$ is chosen from hydrogen and $C_{1:4}$ alkyl.

[00130] In certain embodiments of a compound of Formula (III), one of $R^7$ and $R^8$ is hydrogen and the other of $R^7$ and $R^8$ is $C_{i_6}$ alkyl. In certain embodiments of a compound of Formula (II), one of $R^7$ and $R^8$ is hydrogen and the other of $R^7$ and $R^8$ is $C_{1:4}$ alkyl.
[00131] In certain embodiments of a compound of Formula (III), one of R and R is hydrogen and the other of R and R is chosen from methyl, ethyl, n-propyl, and isopropyl.

In certain embodiments of a compound of Formula (III), each of R and R is hydrogen.

[00132] In certain embodiments of a compound of Formula (III), R is Ci alkyl; one of R and R is hydrogen and the other of R and R is Ci alkyl.

[00133] In certain embodiments of a compound of Formula (III), R is -OR.

[00134] In certain embodiments of a compound of Formula (III), R is chosen from C alkyl, cyclohexyl, and phenyl.

[00135] In certain embodiments of a compound of Formula (III), R is chosen from methyl, ethyl, n-propyl, and isopropyl; one of R and R is hydrogen and the other of R and R is chosen from methyl, ethyl, n-propyl, and isopropyl.

[00136] In certain embodiments of a compound of Formula (III), R is substituted C alkyl, wherein each of the one or more substituent groups are chosen from -COOH, -NHCOCH, -NH2, and -NH2.

[00137] In certain embodiments of a compound of Formula (III), R is chosen from ethoxy, methylethoxy, cyclohexyl, cyclohexyloxy, and -CH(NH2)-COOH, -CH2CH(NH2)COOH, -CH(NH2)-CH2COOH, and -CH2CH(NH2)-COOH.

[00138] In certain embodiments of a compound of Formula (III), one of R and R is hydrogen and the other of R and R is chosen from hydrogen, methyl, ethyl, n-propyl, and isopropyl; and R is chosen from C alkyl and substituted C alkyl, wherein each of the one or more substituent groups are chosen from -COOH, -NHCOCH, -NH2, and -NH2, -OR.

[00139] In certain embodiments of a compound of Formula (III), the compound is chosen from:

1. [(1-ethoxycarbonyloxy)] ethyl methyl (2E)but-2-ene-1,4-dioate;
2. methyl [1-(methylethoxycarbonyloxy)]ethyl (2E)but-2-ene-1,4-dioate;
3. [1-(cyclohexyloxy)carbonyloxy)]ethyl methyl (2E)but-2-ene-1,4-dioate; and pharmaceutically acceptable salts of any of the foregoing.

[00140] In certain embodiments of a compound of Formula (III), the compound is chosen from:

1. methyl (2-methylpropanoyloxy)ethyl (2E)but-2-ene-1,4-dioate;
2. methyl [1-(phenylcarbonyloxy)]ethyl (2E)but-2-ene-1,4-dioate;
3. [1-(cyclohexylcarbonyloxy)]butyl methyl (2E)but-2-ene-1,4-dioate;
1- [(2E)-3-(methoxycarbonyl)prop-2-enoyloxy]ethyl methyl (2E)but-2-ene-1,4-dioate; methyl 2-methyl-1-phenylcarbonyloxypropyl (2E)but-2-ene-1,4-dioate; and pharmaceutically acceptable salts of any of the foregoing.

[00141] In certain embodiments of a compound of Formula (III), the compound is chosen from:

- [l-(ethoxycarbonyloxy)] ethyl methyl (2E)but-2-ene-1,4-dioate;
- methyl [l-(methylethoxycarbonyloxy)]ethyl (2E)but-2-ene-1,4-dioate;
- methyl [l-(2-methylpropanoyloxy)]ethyl (2E)but-2-ene-1,4-dioate;
- methyl[l- phenylcarbonyloxy]ethyl (2E)but-2-ene-1,4-dioate;
- [1-cyclohexylcarbonyloxy]butyl methyl (2E)but-2-ene-1,4-dioate;
- [(2E)-3-(methoxycarbonyl)prop-2-enoyloxy]ethyl methyl (2E)but-2-ene-1,4-dioate;
- [l-(cyclohexyloxycarbonyloxy)]ethyl methyl (2E)but-2-ene-1,4-dioate;
- methyl 2-methyl-1-phenylcarbonyloxypropyl (2E)but-2-ene-1,4-dioate;
- 3-({[(2E)-3-(methoxycarbonyl)prop-2-enoyloxy]methyl}oxycarbonyl)(3S)-3-aminopropanoic acid;
- 3-({[(2E)-3-(methoxycarbonyl)prop-2-enoyloxy]methyl}oxycarbonyl)(2S)-2-aminopropanoic acid;
- 3-({[(2E)-3-(methoxycarbonyl)prop-2-enoyloxy]methyl}oxycarbonyl)(3S)-3-(2-aminoacetylamino)propanoic acid;
- 3-({[(2E)-3-(methoxycarbonyl)prop-2-enoyloxy]methyl}oxycarbonyl)(2S)-(2-aminoacetylamino)propanoic acid;

and pharmaceutically acceptable salts of any of the foregoing.

[00142] In certain embodiments of a compound of Formula (III), the compound is chosen from:

- 3-({[(2E)-3-(methoxycarbonyl)prop-2-enoyloxy]methyl}oxycarbonyl)(3S)-3-aminopropanoic acid, 2,2,2-trifluoroacetic acid salt;
- 3-({[(2E)-3-(methoxycarbonyl)prop-2-enoyloxy]methyl}oxycarbonyl)(2S)-2-aminopropanoic acid, 2,2,2-trifluoroacetic acid salt;
- 3-({[(2E)-3-(methoxycarbonyl)prop-2-enoyloxy]methyl}oxycarbonyl)(3S)-3-(2-aminoacetylamino)propanoic acid, 2,2,2-trifluoroacetic acid salt;
- 3-({[(2E)-3-(methoxycarbonyl)prop-2-enoyloxy]methyl}oxycarbonyl)(2S)-(2-aminoacetylamino)propanoic acid, 2,2,2-trifluoroacetic acid salt;
3-{{1-{{[(2E)-3-(methoxycarbonyl)prop-2-enoyloxy]}ethoxycarbonyl}}}(2S)-2-
aminopropanoic acid, hydrochloride salt; and
pharmaceutically acceptable salts of any of the foregoing.

[00143] Certain embodiments of the methods disclosed herein utilize a compound of
5 Formula (IV):

![Formula IV](image)

or a pharmaceutically acceptable salt thereof, wherein \( n \) is an integer from 2 to 6.

[00144] In certain embodiments of a compound of Formula (IV), \( n = 2 \), \( n = 3 \), \( n = 4 \), \( n = 5 \)
10 and in certain embodiments, \( n = 6 \).

[00145] In certain embodiments of a compound of Formula (IV), the compound is a
pharmaceutically acceptable salt.

[00146] In certain embodiments of a compound of Formula (IV), the compound is the
hydrochloride salt.

Synthesis of Compounds

[00147] MMF can be synthesized according to the methods described in Dymicky,
Preparation of Monomethyl Fumarate, Organic Preparations and Procedures International:
Chem., 1958, 23 (10), 1559-1560.

[00148] DMF can be synthesized according to the methods described in Chinese Patent
Publication CN 101318901A, the disclosures of which are incorporated herein by reference.

[00149] Compounds of Formula (I) can be synthesized according to the methods
described in Speiser et al., US Patent 5,424,332, at column 3, line 33 through column 4, line
2, the disclosures of which are incorporated herein by reference.

[00150] Compounds of Formula (II) can be synthesized according to the methods
described in Gangakhedkar et al., US Patent 8,148,414, at column 23, line 44 through column
26, line 55 and column 28, line 10 through column 29, line 34, the disclosures of which are
incorporated herein by reference.
[00151] Compounds of Formula (III) can be synthesized according to the methods described in Gangakhedkar et al., US Patent 8,148,414, at column 29, line 43 through column 31, line 13, the disclosures of which are incorporated herein by reference.

[00152] Compounds of Formula (IV) can be synthesized according to the methods described in Cundy et al., US Patent Application Serial No. 13/761,864, filed February 7, 2013, at page 34, line 21 through page 41, line 3, the disclosures of which are incorporated herein by reference.

**Pharmaceutical Compositions**

[00153] Pharmaceutical compositions provided by the present disclosure may comprise a therapeutically effective amount of MMF and/or a prodrug of MMF together with a suitable amount of one or more pharmaceutically acceptable vehicles so as to provide a composition for proper administration to a patient. Suitable pharmaceutical vehicles are described in the art.

[00154] In certain embodiments, MMF and/or a compound of Formulae (I)-(IV) may be incorporated into pharmaceutical compositions to be administered orally. Oral administration of such pharmaceutical compositions may result in uptake of MMF and/or a compound of Formulae (I)-(IV) throughout the intestine and entry into the systemic circulation. Such oral compositions may be prepared in a manner known in the pharmaceutical art and comprise MMF and/or a compound of Formulae (I)-(IV) and at least one pharmaceutically acceptable vehicle. Oral pharmaceutical compositions may include a therapeutically effective amount of MMF and/or a compound of Formulae (I)-(IV) and a suitable amount of a pharmaceutically acceptable vehicle, so as to provide an appropriate form for administration to a patient.

[00155] MMF and/or a compound of Formulae (I)-(IV) may be incorporated into pharmaceutical compositions to be administered by any other appropriate route of systemic administration including intramuscular, intravenous and oral.

[00156] Pharmaceutical compositions comprising MMF and/or a compound of Formulae (I)-(IV) and may be manufactured by means of conventional mixing, dissolving, granulating, dragee-making, levigating, emulsifying, encapsulating, entrapping, or lyophilizing processes. Pharmaceutical compositions may be formulated in a conventional manner using one or more physiologically acceptable carriers, diluents, excipients, or auxiliaries, which facilitate processing of MMF and/or a compound of Formulae (I)-(IV) or crystalline forms thereof and one or more pharmaceutically acceptable vehicles into formulations that can be used pharmaceutically. Proper formulation is dependent upon the
route of administration chosen. Pharmaceutical compositions provided by the present disclosure take the form of sustained-release formulations suitable for administration to a patient.

[00157] Pharmaceutical compositions provided by the present disclosure may be formulated in a unit dosage form. A unit dosage form refers to a physically discrete unit suitable as a unitary dose for patients undergoing treatment, with each unit containing a predetermined quantity of MMF and/or a compound of Formulae (I)-(IV) calculated to produce an intended therapeutic effect. A unit dosage form may be for a single daily dose, for administration 2 times per day, or one of multiple daily doses, e.g., 3 or more times per day. When multiple daily doses are used, a unit dosage form may be the same or different for each dose. One or more dosage forms may comprise a dose, which may be administered to a patient at a single point in time or during a time interval.

[00158] In certain embodiments, an oral dosage form provided by the present disclosure may be a controlled release dosage form. Controlled delivery technologies can improve the absorption of a drug in a particular region or regions of the gastrointestinal tract. Controlled drug delivery systems may be designed to deliver a drug in such a way that the drug level is maintained within a therapeutically effective window and effective and safe blood levels are maintained for a period as long as the system continues to deliver the drug with a particular release profile in the gastrointestinal tract. Controlled drug delivery may produce substantially constant blood levels of a drug over a period of time as compared to fluctuations observed with immediate release dosage forms. For some drugs, maintaining a constant blood and tissue concentration throughout the course of therapy is the most desirable mode of treatment. Immediate release of drugs may cause blood levels to peak above the level required to elicit a desired response, which may waste the drug and may cause or exacerbate toxic side effects. Controlled drug delivery can result in optimum therapy, and not only can reduce the frequency of dosing, but may also reduce the severity of side effects. Examples of controlled release dosage forms include dissolution controlled systems, diffusion controlled systems, ion exchange resins, osmotically controlled systems, erodible matrix systems, pH independent formulations, gastric retention systems, and the like.

[00159] An appropriate oral dosage form for a particular pharmaceutical composition provided by the present disclosure may depend, at least in part, on the gastrointestinal absorption properties of MMF and/or a compound of Formulae (I)-(IV) the stability of MMF and/or a compound of Formulae (I)-(IV) in the gastrointestinal tract, the pharmacokinetics of MMF and/or a compound of Formulae (I)-(IV) and the intended therapeutic profile. An
appropriate controlled release oral dosage form may be selected for a particular compound. For example, gastric retention oral dosage forms may be appropriate for compounds absorbed primarily from the upper gastrointestinal tract, and sustained release oral dosage forms may be appropriate for compounds absorbed primarily from the lower gastrointestinal tract.

Certain compounds are absorbed primarily from the small intestine. In general, compounds traverse the length of the small intestine in about 3 to 5 hours. For compounds that are not easily absorbed by the small intestine or that do not dissolve readily, the window for active agent absorption in the small intestine may be too short to provide a desired therapeutic effect.

[00160] In certain embodiments, pharmaceutical compositions provided by the present disclosure may be practiced with dosage forms adapted to provide sustained release of MMF and/or a compound of Formulae (I)-(IV) upon oral administration. Sustained release oral dosage forms may be used to release drugs over a prolonged time period and are useful when it is desired that a drug or drug form be delivered to the lower gastrointestinal tract, including the colon. Sustained release oral dosage forms include any oral dosage form that maintains therapeutic concentrations of a drug in a biological fluid such as the plasma, blood, cerebrospinal fluid, or in a tissue or organ for a prolonged time period. Sustained release oral dosage forms include diffusion-controlled systems such as reservoir devices and matrix devices, dissolution-controlled systems, osmotic systems, and erosion-controlled systems.

Sustained release oral dosage forms and methods of preparing the same are well known in the art.

[00161] In certain embodiments, pharmaceutical compositions provided by the present disclosure may include any systemic dosage form of the MMF and/or a prodrug of MMF, and wherein, when administered to a patient, the maximum average concentration of MMF in the blood plasma of the patient is less than 500 ng/ml. In one embodiment, the maximum average concentration is less than 400 ng/ml. In another embodiment, the maximum average concentration is less than 350 ng/ml. In another embodiment, the maximum average concentration is less than 300 ng/ml. In another embodiment, the maximum average concentration is less than 250 ng/ml. In another embodiment, the maximum average concentration is less than 200 ng/ml. In another embodiment, the maximum average concentration is less than 150 ng/ml. In some embodiments, the prodrug of MMF is a compound of Formulae (I)-(IV).

[00162] In certain embodiments, pharmaceutical compositions provided by the present disclosure may include any systemic dosage form of the MMF and/or a prodrug of MMF, and
wherein, when administered to a patient, the average maximum rate of rise in MMF concentration in the blood plasma of the patients is less than 0.25 wt% ng-eq of MMF dosed/ml/hr. In one embodiment, the average maximum rate of rise is less than 0.20 wt% ng-eq of MMF dosed/ml/hr. In one embodiment, the average maximum rate of rise is less than 0.15 wt% ng-eq of MMF dosed/ml/hr. In one embodiment, the average maximum rate of rise is less than 0.10 wt% ng-eq of MMF dosed/ml/hr.

[00163] In certain embodiments, pharmaceutical compositions provided by the present disclosure may include any systemic dosage form of the MMF and/or a prodrug of MMF, and wherein, when administered to a patient, the average maximum rate of rise in MMF concentration in the blood plasma of the patients is less than 0.25 wt% ng-eq of MMF dosed/ml/hr; and an average MMF concentration in the blood plasma of the patients, measured at a time of said maximum rate of rise, is less than 200 ng/ml.

[00164] In certain embodiments, pharmaceutical compositions provided by the present disclosure may include any systemic dosage form of the MMF and/or a prodrug of MMF, and wherein, when administered to a patient, the average maximum rate of rise in MMF concentration in the blood plasma of the patients is less than 0.20 wt% ng-eq of MMF dosed/ml/hr; and an average MMF concentration in the blood plasma of the patients, measured at a time of said maximum rate of rise, is less than 200 ng/ml or less than 150 ng/ml.

[00165] In certain embodiments, pharmaceutical compositions provided by the present disclosure may include any systemic dosage form of the MMF and/or a prodrug of MMF, and wherein, when administered to a patient, the average maximum rate of rise in MMF concentration in the blood plasma of the patients is less than 0.15 wt% ng-eq of MMF dosed/ml/hr; and an average MMF concentration in the blood plasma of the patients, measured at a time of said maximum rate of rise, is less than 180 ng/ml.

[00166] In certain embodiments, pharmaceutical compositions provided by the present disclosure may include any systemic dosage form of the MMF and/or a prodrug of MMF, and wherein, when administered to a patient, the average maximum rate of rise in MMF concentration in the blood plasma of the patients is less than 0.10 wt% ng-eq of MMF dosed/ml/hr; and an average MMF concentration in the blood plasma of the patients, measured at a time of said maximum rate of rise, is less than 140 ng/ml.

[00167] In another embodiment, the prodrug of MMF is a compound of Formulae (I)-(IV).
In certain embodiments, pharmaceutical compositions provided by the present disclosure may include any enteric-coated sustained release oral dosage form of the MMF and/or a prodrug of MMF, and wherein, when subjected to an in vitro dissolution test employing as a dissolution medium 750 mL of 0.1 N hydrochloric acid, at pH 1.2, for a period of 2 hours, followed by addition of 250 mL of 200 mM tribasic sodium phosphate buffer resulting in an adjustment of the pH of the dissolution medium to 6.8, the dissolution medium being maintained at 37 °C and stirred at 100 rpm, the dosage form releases:

(i) less than 10 wt% of the dose over an initial 2 hours of the in vitro dissolution test; (ii) at least 90 wt% of the dose over not less than an initial 8 hours of the in vitro dissolution test;

(iii) no more than 30 wt% of the dose in any one hour during the in vitro dissolution test; and

(iv) no more than 40 wt% of the dose in any consecutive two hours during the in vitro dissolution test.

In one embodiment, the prodrug of MMF is a compound of Formulae (I)-(IV). In another embodiment, the enteric-coated oral dosage form is administered to a patient at a dosing frequency of not more than twice per day.

In certain embodiments, pharmaceutical compositions provided by the present disclosure may include any non-enteric-coated sustained release oral dosage form of the MMF and/or a prodrug of MMF, and wherein, when subjected to an in vitro dissolution test employing as a dissolution medium 750 mL of 0.1 N hydrochloric acid, at pH 1.2, for a period of 2 hours, followed by addition of 250 mL of 200 mM tribasic sodium phosphate buffer resulting in an adjustment of the pH of the dissolution medium to 6.8, the dissolution medium being maintained at 37 °C and stirred at 100 rpm, the dosage form releases:

(i) at least 90 wt% of the dose over not less than an initial 8 hours of the in vitro dissolution test;

(ii) no more than 30 wt% of the dose in any one hour during the in vitro dissolution test; and

(iii) no more than 40 wt% of the dose in any consecutive two hours during the in vitro dissolution test.

In one embodiment, the prodrug of MMF is a compound of Formulae (I)-(IV). In another embodiment, the non-enteric-coated oral dosage form is administered to a patient at a dosing frequency of not more than twice per day.
In certain embodiments, pharmaceutical compositions provided by the present disclosure may include any suitable dosage forms that achieve the above described in vitro release profiles. Such dosage forms may be any systemic dosage forms, including sustained release enteric-coated oral dosage form and sustained release non-enteric-coated oral dosage form. Examples of suitable dosage forms are described herein. Those skilled in the formulation art can develop any number of acceptable dosage forms given the dosage forms described in the examples as a starting point.

An appropriate dose of MMF and/or a compound of Formulae (I)-(IV) or pharmaceutical composition comprising MMF and/or a compound of Formulae (I)-(IV) may be determined according to any one of several well-established protocols. For example, animal studies such as studies using mice, rats, dogs, and/or monkeys may be used to determine an appropriate dose of a pharmaceutical compound. Results from animal studies may be extrapolated to determine doses for use in other species, such as for example, humans.

Uses

Compounds of Formulae (I)-(IV) are prodrugs of MMF. Thus, compounds of Formulae (I)-(IV) and pharmaceutical compositions thereof may be administered to a patient suffering from diseases, disorders, conditions, and symptoms of any of the foregoing for which alkyl hydrogen fumarates, such as MMF, are known to provide or are later found to provide therapeutic benefit. MMF and/or a compound of Formulae (I)-(IV) can be used to treat a disease chosen from adrenal leukodystrophy, AGE-induced genome damage, Alexander's Disease, Alper's Disease, Alzheimer's disease, amyotrophic lateral sclerosis, angina pectoris, arthritis, asthma, balo concentric sclerosis, Canavan disease, cardiac insufficiency including left ventricular insufficiency, central nervous system vasculitis, Charcot-Marie-Tooth Disease, childhood ataxia with central nervous system hypomyelination, chronic idiopathic peripheral neuropathy, chronic obstructive pulmonary disease, Crohn's disease, diabetic retinopathy, graft versus host disease, hepatitis C viral infection, herpes simplex viral infection, human immunodeficiency viral infection, Huntington's disease, irritable bowel disorder, ischemia, Krabbe Disease, lichen planus, macular degeneration, mitochondrial encephalomyopathy, monomelic amyotrophy, multiple sclerosis, myocardial infarction, neurodegeneration with brain iron accumulation, neuromyelitis optica, neurosarcoidosis, NF-κB mediated diseases, optic neuritis, pareneoplastic syndromes, Parkinson's disease, Pelizaeus-Merzbacher disease, primary lateral sclerosis, progressive supranuclear palsy, psoriasis, reperfusion injury, retinopathy...
pigmentosa, Schilders Disease, subacute necrotizing myelopathy, susac syndrome, transplantation rejection, transverse myelitis, a tumor, ulcerative colitis, Zellweger's syndrome, granulomas including annulaire, pemphigus, bullous pemphigoid, behcet's, contact dermatitis, acute dermatitis, chronic dermatitis, alopecia areata (totalis and universalis), sarcoidosis, cutaneous sarcoidosis, pyoderma gangrenosum, cutaneous lupus, Crohn's disease or cutaneous Crohn's disease.

[00175] Methods of treating a disease in a patient provided by the present disclosure comprise administering to a patient in need of such treatment a therapeutically effective amount of MMF and/or a compound of Formulae (I)-(IV). These compounds, and pharmaceutical compositions thereof, provide therapeutic or prophylactic plasma and/or blood concentrations of MMF following administration to a patient. MMF and/or a compound of Formulae (I)-(IV) may be administered in an amount and using a dosing schedule as appropriate for treatment of a particular disease. Daily doses of MMF and/or a compound of Formulae (I)-(IV) may range from about 0.01 mg/kg to about 50 mg/kg, from about 0.1 mg/kg to about 50 mg/kg, from about 1 mg/kg to about 50 mg/kg, and in certain embodiments, from about 5 mg/kg to about 25 mg/kg. In certain embodiments, MMF and/or a compound of Formulae (I)-(IV) may be administered at a dose over time from about 1 mg to about 5 g per day, from about 10 mg to about 4 g per day, and in certain embodiments from about 20 mg to about 2 g per day. An appropriate dose of MMF and/or a compound of Formulae (I)-(IV) may be determined based on several factors, including, for example, the body weight and/or condition of the patient being treated, the severity of the disease being treated, the incidence and/or severity of side effects, the manner of administration, and the judgment of the prescribing physician. Appropriate dose ranges may be determined by methods known to those skilled in the art.

[00176] MMF and the compounds of Formulae (I)-(IV) may be assayed in vitro and in vivo for the desired therapeutic or prophylactic activity prior to use in humans. In vivo assays, for example using appropriate animal models, may also be used to determine whether administration of MMF and/or a compound of Formulae (I)-(IV) is therapeutically effective.

[00177] In certain embodiments, a therapeutically effective dose of MMF and/or a compound of Formulae (I)-(IV) may provide therapeutic benefit without causing substantial toxicity including adverse side effects. Toxicity of MMF and/or a compound of Formulae (I)-(IV) and/or metabolites thereof may be determined using standard pharmaceutical procedures and may be ascertained by those skilled in the art. The dose ratio between toxic and therapeutic effect is the therapeutic index. A dose of MMF and/or a compound of
Formulae (I)-(IV) may be within a range capable of establishing and maintaining a therapeutically effective circulating plasma and/or blood concentration of MMF and/or a compound of Formulae (I)-(IV) that exhibits little or no toxicity.

[00178] MMF and compounds of Formulae (I)-(IV) may be used to treat a disease chosen from adrenal leukodystrophy, AGE-induced genome damage, Alexander's Disease, Alper's Disease, Alzheimer's disease, amyotrophic lateral sclerosis, angina pectoris, arthritis, asthma, balo concentric sclerosis, Canavan disease, cardiac insufficiency including left ventricular insufficiency, central nervous system vasculitis, Charcott-Marie-Tooth Disease, childhood ataxia with central nervous system hypomyelination, chronic idiopathic peripheral neuropathy, chronic obstructive pulmonary hypomyelination, Behcet's, Canavan disease, cutaneous sarcoidosis, pyoderma gangrenosum, cutaneous lupus, Crohn's disease or cutaneous Crohn's disease. The underlying etiology of any of the foregoing diseases being treated may have a multiplicity of origins. Further, in certain embodiments, a therapeutically effective amount of MMF and/or the compound of Formulae (I)-(IV) may be administered to a patient, such as a human, as a preventative measure against the foregoing diseases and disorders. Thus, a therapeutically effective amount of MMF and/or a compound of Formulae (I)-(IV) may be administered as a preventative measure to a patient having a predisposition for and/or history of adrenal leukodystrophy, AGE-induced genome damage, Alexander's Disease, Alper's Disease, Alzheimer's disease, amyotrophic lateral sclerosis, angina pectoris, arthritis, asthma, balo concentric sclerosis, Canavan disease, cardiac insufficiency including left ventricular insufficiency, central nervous system vasculitis, Charcott-Marie-Tooth Disease, childhood ataxia with central nervous system hypomyelination, chronic idiopathic peripheral neuropathy, chronic obstructive pulmonary...
disease, Crohn's disease, diabetic retinopathy, graft versus host disease, hepatitis C viral
infection, herpes simplex viral infection, human immunodeficiency viral infection,
Huntington's disease, irritable bowel disorder, ischemia, Krabbe Disease, lichen planus,
macular degeneration, mitochondrial encephalomyopathy, monomelic amyotrophy, multiple sclerosis, myocardial infarction, neurodegeneration with brain iron accumulation,
neuromyelitis optica, neurosarcoidosis, NF-κB mediated diseases, optic neuritis,
paraneoplastic syndromes, Parkinson's disease, Pelizaeus-Merzbacher disease, primary lateral sclerosis, progressive supranuclear palsy, psoriasis, reperfusion injury, retinopathy pigmentosa, Schilders Disease, subacute necrotizing myelopathy, susac syndrome,
transplantation rejection, transverse myelitis, a tumor, ulcerative colitis, Zellweger's syndrome, granulomas including annulaire, pemphigus, bullous pemphigoid, behcet's, contact dermatitis, acute dermatitis, chronic dermatitis, alopecia areata (totalis and universalis), sarcoidosis, cutaneous sarcoidosis, pyoderma gangrenosum, cutaneous lupus, Crohn's disease and/or cutaneous Crohn's disease.

Administration

[00179] MMF and/or a prodrug of MMF and pharmaceutical compositions thereof may
be administered orally or by any other appropriate route suitable for systemic, as opposed to
local, administration. For example, systemic administration can be by infusion or bolus
injection, by absorption through epithelial or mucocutaneous linings (e.g., oral mucosa,
rectal, and intestinal mucosa, etc.). Other suitable routes of systemic administration include,
but are not limited to, intradermal, intramuscular, intraperitoneal, intravenous, subcutaneous,
intranasal, epidural, oral, sublingual and inhalation.

[00180] The amount of MMF and/or a prodrug of MMF that will be effective in the
treatment of a disease in a patient will depend, in part, on the nature of the condition and can
be determined by standard clinical techniques known in the art. In addition, in vitro or in vivo assays may be employed to help identify optimal dosage ranges. A therapeutically effective amount of MMF and/or a prodrug of MMF to be administered may also depend on,
among other factors, the subject being treated, the weight of the subject, the severity of the
disease, the manner of administration, and the judgment of the prescribing physician. In the case of an MMF prodrug, for which MMF is the pharmacologically active metabolite, the
amount of prodrug to be administered is generally determined by calculating the weight of
any pharmacologically inactive promoiety that is cleaved during metabolism of the prodrug
and then administering a MMF equivalent amount of the prodrug.
[00181] For systemic administration, a therapeutically effective dose may be estimated initially from in vitro assays. For example, a dose may be formulated in animal models to achieve a beneficial circulating composition concentration range. Initial doses may also be estimated from in vivo data, e.g., animal models, using techniques that are known in the art. Such information may be used to more accurately determine useful doses in humans. One having ordinary skill in the art may optimize administration to humans based on animal data.

[00182] A dose may be administered in a single dosage form or in multiple dosage forms. When multiple dosage forms are used the amount of compound contained within each dosage form may be the same or different. The amount of MMF and/or a prodrug of MMF contained in a dose may depend on the route of administration and whether the disease in a patient is effectively treated by acute, chronic, or a combination of acute and chronic administration.

[00183] In certain embodiments an administered dose is less than a toxic dose. Toxicity of the compositions described herein may be determined by standard pharmaceutical procedures in cell cultures or experimental animals, e.g., by determining the LD$_{50}$ (the dose lethal to 50% of the population) or the LD$_{100}$ (the dose lethal to 100% of the population). The dose ratio between toxic and therapeutic effect is the therapeutic index. In certain embodiments, MMF and/or a prodrug of MMF may exhibit a high therapeutic index. The data obtained from these cell culture assays and animal studies may be used in formulating a dosage range that is not toxic for use in humans. A dose of MMF and/or a prodrug of MMF provided by the present disclosure may be within a range of circulating concentrations in for example the blood, plasma, or central nervous system, that include the effective dose and that exhibits little or no toxicity. A dose may vary within this range depending upon the dosage form employed and the route of administration utilized. In certain embodiments, an escalating dose may be administered.

**Combination Therapy**

[00184] Methods provided by the present disclosure further comprise administering one or more pharmaceutically active compounds in addition to MMF and/or a prodrug of MMF. Such compounds may be provided to treat the same disease or a different disease than the disease being treated with the MMF and/or MMF prodrug.

[00185] In certain embodiments, MMF and/or an MMF prodrug may be used in combination with at least one other therapeutic agent. In certain embodiments, MMF and/or a MMF prodrug may be administered to a patient together with another compound for treating diseases and conditions including: adrenal leukodystrophy, Alexanders Disease,
Alper's Disease, balo concentric sclerosis, Canavan disease, central nervous system vasculitis, Charcott-Marie-Tooth Disease, childhood ataxia with central nervous system hypomyelination, diabetic retinopathy, graft versus host disease, hepatitis C viral infection, herpes simplex viral infection, human immunodeficiency viral infection, Krabbe Disease, lichen planus, macular degeneration, monomelic amyotrophy, neurodegeneration with brain iron accumulation, neuromyelitis optica, neurosarcoïdosis, optic neuritis, pareneoplastic syndromes, Pelizaeus-Merzbacher disease, primary lateral sclerosis, progressive supranuclear palsy, Schilders Disease, subacute necrotizing myelopathy, susac syndrome, transverse myelitis, a tumor and Zellweger's syndrome.

[00186] MMF and/or an MMF prodrug and the at least one other therapeutic agent may act additively or, and in certain embodiments, synergistically. The at least one additional therapeutic agent may be included in the same dosage form as MMF and/or the MMF prodrug or may be provided in a separate dosage form. Methods provided by the present disclosure can further include, in addition to administering MMF and/or an MMF prodrug, administering one or more therapeutic agents effective for treating the same or different disease than the disease being treated by MMF and/or the MMF prodrug. Methods provided by the present disclosure include administration of MMF and/or an MMF prodrug and one or more other therapeutic agents provided that the combined administration does not inhibit the therapeutic efficacy of the MMF and/or the MMF prodrug and/or does not typically produce significant and/or substantial adverse combination effects.

[00187] In certain embodiments, dosage forms comprising MMF and/or a prodrug of MMF may be administered concurrently with the administration of another therapeutic agent, which may be part of the same dosage form as, or in a different dosage form than that comprising MMF and/or a prodrug of MMF. MMF and/or a prodrug of MMF may be administered prior or subsequent to administration of another therapeutic agent. In certain embodiments of combination therapy, the combination therapy may comprise alternating between administering MMF and/or a prodrug of MMF and a composition comprising another therapeutic agent, e.g., to minimize adverse drug effects associated with a particular drug. When MMF and/or a prodrug of MMF is administered concurrently with another therapeutic agent that potentially may produce an adverse drug effect including, but not limited to, toxicity, the other therapeutic agent may advantageously be administered at a dose that falls below the threshold at which the adverse drug reaction is elicited.

[00188] In certain embodiments, dosage forms comprising MMF and/or a prodrug of MMF may be administered with one or more substances to enhance, modulate and/or control
release, bioavailability, therapeutic efficacy, therapeutic potency, stability, and the like of MMF and/or a prodrug of MMF. For example, to enhance the therapeutic efficacy of a MMF and/or a prodrug of MMF, the MMF and/or a prodrug of MMF may be co-administered with or a dosage form comprising MMF and/or a prodrug of MMF may comprise one or more active agents to increase the absorption or diffusion of MMF and/or a prodrug of MMF from the gastrointestinal tract to the systemic circulation, or to inhibit degradation of the MMF and/or a prodrug of MMF in the blood of a patient. In certain embodiments, MMF and/or a prodrug of MMF may be co-administered with an active agent having pharmacological effects that enhance the therapeutic efficacy of a MMF and/or a prodrug of MMF.

Examples

[00189] The following examples illustrate various aspects of the disclosure. It will be apparent to those skilled in the art that many modifications, both to materials and methods, may be practiced without departing from the scope of the disclosure.

[00191] The tablets were made according to the following steps. The core tablets were prepared using a wet granulation process. The granulation was performed in two batches at 456 g per batch. Compound (1) and hydroxypropyl cellulose were passed through a conical mill with a 610 micron round holed screen. Compound (1) and hydroxypropyl cellulose were then combined in a Key KG-5 granulator bowl and mixed with water addition for approximately 7 minutes. The wet granules were dried in a Glatt GPCG-1 fluid bed dryer at 40 °C. The two portions of dried granules were sized by passing through a conical mill with an approximately 1300 micron grater type screen. The milled granules were blended with the hypromellose 2208, silicon dioxide, and lactose monohydrate for 10 minutes in an 8 quart (7.6 l) V-blender. This blend was passed through an 850 micron mesh screen. The magnesium stearate was passed through a 600 micron mesh screen and blended with the additional core materials in the V-blender for 5 minutes. Core tablets (299.69 mg) were compressed using a GlobePharma Minipress II rotary tablet press with 8.6 mm round concave tooling. The core tablets had a final mean hardness of approximately 12 kp. For the coating, an aqueous suspension was prepared by mixing with an impeller 63.8 g Opadry 03019184 with 770.7 g of purified water. The water contained in the suspension is removed during the film coating process and therefore not included in the final formulation in Table 3. The tablets were coated with the aqueous suspension in an O’ Hara Technologies Labcoat M coater with a 12” (30.5 cm) diameter perforated pan until the desired weight gain of barrier coat was achieved. The coating process occurred at an inlet temperature of approximately 52 °C and an outlet temperature of 36 °C. After coating, the tablets were dried for 2 hours at 40 °C. An aqueous suspension was prepared by mixing with an impeller 405.1 g methacrylic acid copolymer dispersion, 6.3 g triethyl citrate, 60.6 g PlasACRYL™ T20 with 228.1 g water. The water contained in the methacrylic acid copolymer dispersion and the PlasACRYL™ T20 is removed during the film coating process and therefore not included in the final formulation in Table 3. The tablets were coated with the aqueous suspension in the O’ Hara Technologies Labcoat M coater until the desired weight gain of enteric film was
achieved. The coating process occurred at an inlet temperature of approximately 40 °C and an outlet temperature of 30 °C. After coating, the tablets were dried for 2 hours at 40 °C.

**Example 2**

*In Vitro* Dissolution Profile of Example 1 Dosage Form

[00192] A two-stage dissolution method was used to determine the *in vitro* dissolution profile of dosage forms prepared according to Example 1. The 2-stage dissolution test was used to better approximate the pH conditions experienced by a dosage form after swallowing by a patient, i.e., low pH of the stomach followed by near neutral pH of the intestines. The dosage forms were first placed into a dissolution vessel (USP, Type I, basket) containing 750 mL of 0.1 N hydrochloric acid (pH 1.2). After 2 hours, 250 mL of 200 mM tribasic sodium phosphate was added to the vessel resulting in a pH adjustment from 1.2 to 6.8. The dissolution medium was kept at 37 °C and was agitated at 100 rpm.

[00193] For the Example 1 dosage forms, samples of the dissolution medium were withdrawn after 1 and 2 hours in the low pH stage, and at 0.5, 2, 4, 7, 10, and 14 hours following buffer addition. The released amount of the MMF prodrug in the samples was determined by reverse phase HPLC using a C18 column and a 7 minute gradient method according to Table 4 where Mobile Phase A is water/0.1% H3PO4 10/90/0.1 by volume) with UV detection at 210 nm.

[00196] The tablets were made according to the following steps. The core tablets were prepared using a wet granulation process. The granulation was performed in two batches at 463.9 g per batch. Compound (1) and hydroxypropyl cellulose were passed through a conical mill with a 610 micron round holed screen. Compound (1) and hydroxypropyl cellulose were then combined in a Key KG-5 granulator bowl and mixed with water addition for approximately 10 minutes. The wet granules were dried in a Glatt GPCG-1 fluid bed dryer at 40 °C. The two portions of dried granules were blended with silicon dioxide and sized by passing through a conical mill with an approximately 1300 micron grater type screen. The milled granules were blended with the hypromellose 2208 and lactose monohydrate for 10 minutes in an 8 quart (7.6 l) V-blender. This blend was passed through an 850 micron mesh
screen. The magnesium stearate was passed through a 600 micron mesh screen and blended with the additional core materials in the V-blender for 5 minutes. Core tablets (299.68 mg) were compressed using a GlobePharma Minipress II rotary tablet press with 11/32” round concave tooling. The core tablets had a final mean hardness of approximately 11 kp. For the coating, an aqueous suspension was prepared by mixing with an impeller 578.7 g methacrylic acid copolymer dispersion, 9.0 g triethyl citrate, 86.5 g PlasACRYL™ T20 with 325.8 g water. The water contained in the methacrylic acid copolymer dispersion and the PlasACRYL™ T20 is removed during the film coating process and therefore not included in the final formulation in Table 4. The tablets were coated with the aqueous suspension in the O’ Hara Technologies Labcoat M coater until the desired weight gain of enteric film was achieved. The coating process occurred at an inlet temperature of approximately 41 °C and an outlet temperature of 31 °C. After coating, the tablets were dried for 2 hours at 40 °C.

Example 4

Safety, Tolerability, and Pharmacokinetics of Example 3 Dosage Form

[00197] A randomized, double-blind crossover, food effect, single-dose study of the safety, tolerability, and pharmacokinetics of an oral dosage form of (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate in healthy adult subjects was conducted. Twenty-four healthy adult volunteers (males and females) participated in the study. Twelve of the subjects received a dosage form of Example 3, once in a fed condition and once in a fasted condition, with a two-week washout between treatments. The fasted dosing was achieved by dosing the subject following an overnight fast while the fed dosing was achieved by dosing the subject after consuming a high fat-content breakfast. The tested dosage forms contained 200 mg of (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate (107 mg equivalents of methyl hydrogen fumarate).

[00198] Blood samples were collected from all subjects prior to dosing, and at 0.5, 1, 1.5, 2, 3, 4, 5, 6, 7, 8, 10, 12, 16, 24, 30, 36, 48, 60, 72, 84, 96, 108 and 120 hours after dosing. Urine samples were collected from all subjects prior to dosing, and complete urine output was obtained at the 0-4, 4-8, 8-12, 12-24, 24-36, 36-48, 48-72, 72-96 and 96-120 hour intervals after dosing. Blood samples were quenched immediately with acetonitrile and frozen. Sample aliquots were prepared for analysis of (i) methyl hydrogen fumarate, (ii) (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate, (iii) N,N diethyl-2-hydroxy acetamide and (iv) (2S,3S,4S,5R,6R)-6-[(N,N-diethylcarbamoyl)methoxy]-3,4,5-trihydroxy-
2H-3,4,5,6-tetrahydropyran-2-carboxylic acid, the latter two being other potential metabolites of (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate, using sensitive and specific LC/MS/MS methods.

[00199] The plasma concentration of MMF following oral dosing of the formulation prepared according to Example 3 to fasted and fed healthy adult patients is shown in FIG. 2. Table 6 shows the preliminary mean (SD) pharmacokinetic data for (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate [Compound (1)] in fed and fasted patients.

</tbody>
</table>

*Cmax and Tmax measured in all 12 subjects, **based on 8 out of 12 subjects with a defined terminal phase, ***based on 5 out of 12 subjects with a defined terminal phase

[00200] The formulation produced mean (SD) maximum MMF concentrations (average Cmax) of 95 (26) ng/mL fasted and 80 (39) ng/mL fed. MMF AUC was 400 (160) ng*h/mL fasted and 377 (132) ng*h/mL fed. The time to peak concentration (Tmax) was 4.17 (0.84) hr fasted and 9.92 (5.50) hr fed. Promoiety was cleared from blood with a half-life around 3 hours.

[00201] (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate was well tolerated during the trial. All 12 subjects completed the dosing period. All adverse events were mild. One subject in the (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate fed group reported flushing more frequently than in the fed placebo group. No subjects in the fasted (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate group reported flushing, and no subjects in either the fed or fasted (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate groups reported feeling hot more than for placebo. A comparison of these adverse events of the formulation to placebo is shown in Table 7.

[00203] The capsules were manufactured according to the following process. An extrusion / spherization process was selected for the manufacture of the core pellets for the capsules. The (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate was first screened then mixed with microcrystalline cellulose. This blend was then formed into a wet
mass with the addition of aqueous acetate buffer (pH 3.5) and the mass then extruded through a 1.0 mm screen and the extrudates were spheronized (at 1200 rpm for 3 minutes) to form the core pellets. These core pellets are then classed to retain the pellets within 0.85 mm to 1.4 mm before the next processing step. The pellets were then coated with the target amount of the sustained release membrane using a hydroalcoholic mixture of ethylcellulose and hydroxypropyl cellulose. This coating was performed in a Wurster-type coater (product temperature at 30 °C and spray rate at 10 g/minute). The overall coating time was approximately 2 hours. The coated pellets were dried further in an oven to remove any residual solvent. The dried sustained release film-coated pellets were then enteric coated to the target amount by aqueous film coating in a Wurster-type coater (product temperature at 30 °C and a spray rate at 10 g/min). The overall coating time was approximately 2 hours. The capsules were then filled with the appropriate amount of pellets to achieve the desired dose strength.

**Example 6**

*In Vitro* Dissolution Profile of VCaps Plus Capsule Dosage Form

[00204] A two-stage dissolution method was used to determine the *in vitro* dissolution profile of dosage forms prepared according to Example 5 in order to mimic the conditions of a dosage form as it transits the gastrointestinal tract. Thus, the dosage forms were first placed into a dissolution medium having a pH of 1.2, to mimic the conditions of the stomach, and then placed into a dissolution medium of pH 6.8, to mimic the conditions of the intestines. The dissolution vessel (USP, Type I, basket) initially contained 750 mL of 0.1 N hydrochloric acid (pH 1.2). After 2 hours of dissolution, 250 mL of 200 mM tribasic sodium phosphate was added to the vessel resulting in a pH adjustment from 1.2 to 6.8. The dissolution medium was kept at 37 °C and was agitated at 100 rpm.

[00205] Samples of the dissolution medium were withdrawn at 1 and 2 hours following the start of the low pH stage, and at 0.5, 2, 4, 7, 10, and 14 hours following start of the near-neutral pH stage. The concentration of (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate in solution was determined using reverse phase HPLC using a C18 column and a phosphoric acid/acetonitrile/water isocratic mobile phase with photodiode detection at 210 nm.

[00206] The percent of prodrug released from the Example 5 dosage forms over time is shown in FIG. 3. These dosage forms showed no prodrug release in the first 2 hours (acid
stage) of testing. Slow prodrug release was observed after the dissolution medium pH was adjusted to 6.8. Full prodrug release was achieved after about 20 hours in pH 6.8.

**Example 7**

Safety, Tolerability, and Pharmacokinetics of Capsule Dosage Form

A randomized, double-blind crossover, food effect, single-dose study of the safety, tolerability, and pharmacokinetics of a sustained release oral dosage form of (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate in healthy adult subjects was conducted. Twelve healthy adult volunteers (males and females) participated in the study. All twelve subjects received a dosage form of Example 5, once in a fed condition and once in a fasted condition, with a two-week washout between treatments. The fasted dosing was achieved by dosing the subject following an overnight fast while the fed dosing was achieved by dosing the subject after consuming a high fat-content breakfast. The dosage form contains 200 mg of (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate (107 mg equivalents of methyl hydrogen fumarate).

Blood samples were collected from all subjects prior to dosing, and at 0.5, 1, 1.5, 2, 3, 4, 5, 6, 7, 8, 10, 12, 16, 24, 30, 36, 48, 60, 72, 84, 96, 108 and 120 hours after dosing. Urine samples were collected from all subjects prior to dosing, and complete urine output was obtained at the 0-4, 4-8, 8-12, 12-24, 24-36, 36-48, 48-72, 72-96 and 96-120 hour intervals after dosing. Blood samples were quenched immediately with acetonitrile and frozen. Sample aliquots were prepared for analysis of (i) methyl hydrogen fumarate, (ii) (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate, (iii) N,N diethyl-2-hydroxy acetamide and (iv) [2S,3S,4S,5R,6R]-6-[(N,N-diethylcarbamoyl)methoxy]-3,4,5-trihydroxy-2H-3,4,5,6-tetrahydropyran-2-carboxylic acid, the latter two being other potential metabolites of (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate, using sensitive and specific LC/MS/MS methods.

The plasma concentration of MMF following oral dosing of the formulation prepared according to Example 5 to fasted and fed healthy adult patients is shown in FIG. 4. Table 9 shows the preliminary mean (SD) pharmacokinetic data for (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate in fed and fasted patients.

The formulation produced mean (SD) maximum MMF concentrations (average Cmax) of 64 (34) ng/mL fasted and 106 (37) ng/mL fed. MMF AUC was 257 (116) ng*h/mL fasted and 398 (123) ng*h/mL fed. The time to peak concentration (Tmax) was 3.08 (0.79) hr fasted and 6.42 (1.98) hr fed. Promoiety was cleared from blood with a half-life around 3 hours. (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate was well tolerated during the trial. All 12 subjects completed the dosing period. All adverse events were mild. Two subjects in the (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate fed group reported flushing more frequently than in the fed placebo group. No subjects in the fasted (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate group reported flushing, and no subjects in either the fed or fasted (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate groups reported feeling hot more than for placebo. A comparison of these adverse events of the formulation to placebo is shown in Table 10.

[00212] The tablets were made according to the following steps. The core tablets were prepared using a wet granulation process. The granulation batch size was 680 g. (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate was passed through the Quadro Comil U5 with an 813 micron screen at 2000 rpm. Hydroxypropyl cellulose was passed through a 600 micron mesh screen. (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate and hydroxypropyl cellulose were granulated with purified water using a Diosna Pl/6 equipped with a 4 L bowl. The wet granules were screened through an 1180 micron mesh screen and dried on trays in an oven at 30 °C for 6 hours.

[00213] The core blend batch size was 5 g. The dried granules, hydroxypropylmethylcellulose (i.e., hypromellose 2208 having 100000 mPa-s viscosity), and the silicon dioxide were then passed through a 600 micron mesh screen, combined in a glass jar and blended in a Turrula mixer for 5 minutes. Magnesium stearate was passed through a 250 micron screen and added to the blend before blending for an additional 1.5 minutes. Core tablets (114.2 mg) were compressed using a Carver Press with 1/4 inch (6.35 mm) round standard concave tooling at 0.4 metric ton (MT) force. The core tablets had a final hardness of approximately 7.6 kp (74 Newtons).

[00214] The mantle blend was prepared using a direct compression process and a batch size of 10 g. The hypromellose 2208 (100 MPa-s viscosity) and lactose hydrate were passed through a 600 micron mesh screen, combined in a glass jar and blended in a Turrula mixer for 5 minutes. Magnesium stearate was passed through a 250 micron screen and added to the blend and blended an additional 1.5 minutes. The mantle blend was then applied to the core
tablets using the Carver Press with 3/8 inch (9.53 mm) round standard concave tooling. Half the mantle blend (114.2 mg) was weighed out, added to the die, and tamped slightly to flatten. Then, the core tablet was placed into the die and pressed down gently into the mantle blend. The second half of the mantle blend (114.2 mg) was then added on top of the core tablet and the mantle was compressed using 1.5 MT force. The final compression coated tablets had a total weight of 342.6 mg with a (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate loading of 100 mg (29.19%). The tablets had a final hardness around 14.7 kp (-144 Newtons).

[00216] The tablets were made according to the following steps. The core tablets were prepared using a wet granulation process. The granulation batch size was 680 g. (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate was passed through the Quadro Comil U5 with an 813 micron screen at 2000 rpm. Hydroxypropyl cellulose was passed
through a 600 micron mesh screen. (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate and hydroxypropyl cellulose were granulated with purified water using a Diosna Pl/6 equipped with a 4 L bowl. The wet granules were screened through an 1180 micron mesh screen and dried on trays in an oven at 30 °C for 6 hours.

[00217] The core blend batch size was 5 g. The dried granules and the silicon dioxide were then passed through a 600 micron mesh screen, combined in a glass jar and blended in a Turbula mixer for 5 minutes. Magnesium stearate was passed through a 250 micron screen and added to the blend before blending an additional 1.5 minutes. Core tablets (104.9 mg) were compressed using a Carver Press with 1/4 inch (6.35 mm) round standard concave tooling at 0.4 metric ton (MT) force. The core tablets had a final hardness of approximately 6.1 kp (-60 Newtons).

[00218] The mantle blend was prepared using a direct compression process and a batch size of 100 g. The hydroxypropylmethylcellulose (i.e., hypromellose 2208 having 100000 MPa-s viscosity) and lactose hydrate were passed through a 600 micron mesh screen, combined in a 1 quart (0.95 l) V-blender and blended for 10 minutes. Magnesium stearate was passed through a 250 micron screen and added to the blend and blended an additional 4 minutes. The mantle blend was then applied to the core tablets using the Carver Press with 3/8 inch (9.53 mm) round standard concave tooling. Half the mantle blend (104.9 mg) was weighed out, added to the die, and tamped slightly to flatten. Then, the core tablet was placed into the die and pressed down gently into the mantle blend. The second half of the mantle blend (104.9 mg) was then added on top of the core tablet, and the mantle was compressed using 1.5 MT force. The final compression coated tablets had a total weight of 314.7 mg with a (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate loading of 100 mg (31.78%). The tablets had a final hardness around 13.1 kp (-128 Newtons).

[00220] The tablets were made according to the following steps. The core tablets were prepared using a wet granulation process. The granulation was performed in 2 batches at 494.88 g each. (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate was passed through a 1.0 mm mesh screen. Hydroxypropyl cellulose was passed through a 600 micron mesh screen. (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate and hydroxypropyl cellulose were combined in a 3 L bowl and mixed for 10 minutes using the Quintech granulator. The mixture was then transferred to a 2 L bowl granulated with purified water using the Quintech granulator. The wet granules were screened through a 2000 micron mesh screen and dried on trays in an oven at 30 °C for 4 hours 20 minutes. The dried granules were then passed through an 850 micron screen.

[00221] The core blend batch size was 1099.2 g. The hydroxypropylmethyl-cellulose (i.e., Hypromellose 2208 having 100000 mPa-s viscosity) and the silicon dioxide were combined, passed through a 600 micron mesh screen, and added to the dry granules in a 5 L cube blender and blended for 10 minutes at 25 rpm. Magnesium stearate was passed through a 600 micron screen and added to the blend before blending an additional 4 minutes at 25 rpm. Core tablets (114.5 mg) were compressed using a Manesty F3 tablet press with 6.0 mm round concave tooling. The core tablets had a final mean hardness between 8.1 to 10.2 kp (79-100 Newtons).
[00222] The mantle blend was prepared using a direct compression process and a batch size of 5.0 kg. The hypromellose 2208 (100 MPa-s viscosity) and lactose hydrate were combined and passed through a 600 micron mesh screen, placed in and blended on the Tumblemix 18 L Bin Blender for 8.5 minutes at 30 rpm. Magnesium stearate was passed through a 600 micron screen and added to the blend and blended an additional 3.5 minutes. The mantle blend was then applied to the core tablets using a Kikusui tablet press (Kikusui Seisakusho Ltd., Kyoto, Japan) specially designed for the manufacture of compression coated tablets. Compression was completed using 9.5 mm round concave tooling and approximately 1000 kp force. The final compression coated tablets had a total weight of 362.4 mg with a (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate loading of 100 mg (27.59%). The compression coated tablets had a final mean hardness between 10.9 to 14.0 kp (107-137 Newtons).

Example 11

In Vitro Dissolution Profile of Compression Coated Tablet Dosage Forms

[00223] A two-stage dissolution method was used to determine the in vitro dissolution profile of dosage forms prepared according to Examples 8, 9, and 10 in order to mimic the conditions of a dosage form as it transits the gastrointestinal tract. Thus, the dosage forms were first placed into a dissolution medium having a pH of 1.2, to mimic the conditions of the stomach, and then placed into a dissolution medium of pH 6.8, to mimic the conditions of the intestines. The dissolution vessel (USP, Type I, basket) initially contained 750 mL of 0.1 N hydrochloric acid (pH 1.2). After 2 hours of dissolution, 250 mL of 200 mM tribasic sodium phosphate was added to the vessel resulting in a pH adjustment from 1.2 to 6.8. The dissolution medium was kept at 37 °C and was agitated at 100 rpm.

[00224] For the tested dosage forms, samples of the dissolution medium were withdrawn at the indicated time points shown in the respective figures. The amount of (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate in the dissolution medium samples was determined by reverse phase HPLC using a C18 column and a 7 minute gradient method according to Table 14 where Mobile Phase A is water/0.1% H3PO4 and Mobile Phase B is water/acetonitrile/FLPCU (10/90/0.1 by volume) with UV detection at 210 nm.

[00225] As shown in FIG. 5, for dosage forms prepared according to Example 8, drug release is delayed for approximately 2 hours, and thereafter the drug is released gradually, reaching more than 90% released at 16 hours.

[00226] As shown in FIG. 6, for dosage forms prepared according to Example 9, drug release is delayed for approximately 2 hours, followed by near zero order release, reaching more than 90% released at 24 hours.

[00227] As shown in FIG. 7, for dosage forms prepared according to Example 10, drug release is delayed for approximately 2 hours, and thereafter the drug is released gradually, reaching more than 90% released at 16 hours.

Example 12

Preparation of Compression Coated Tablet Dosage Form

(Non-Enteric Coated, 10% HPMC in the Core)

[00228] To demonstrate the effect of increasing the percentage of sustained release polymer in the core on the in vitro dissolution profile, two different tablet formulations were made according to the procedure outlined in Example 8, but with differing levels of hypromellose 2208 (100000 MPa-s viscosity) in the core, i.e., compared to the Example 8 tablets. Thus, the Example 8 tablets contained 8 wt% HPMC in the core while the Example 12 tablets contained 10 wt% HPMC in the core, respectively. The tablet formulations, including the Example 8 tablet formulation for reference, are shown in Table 15.

[00229] The dissolution profiles from the three compression coated tablets were measured according to the method described in Example 11. FIG. 8 shows that the MHF prodrug release rate slows with increasing percentage of hypromellose 2208 (100000 mPa-s) in the core, but the initial delay before the start of prodrug release stays the same at approximately 2 hours, likely due to the unchanged mantle layer.

**Example 13**

Preparation of Sustained Release Tablet Dosage Forms (Non-Enteric Coated)

[00230] To demonstrate the effect of increasing the viscosity of sustained release polymer in the mantle on the in vitro dissolution profile, tablets were made with hypromellose 2208 of different viscosities in the mantle: Example 13a (4000 mPa-s), and Example 13b (a combination of 100 mPa-s and 4000 mPa-s to give an effective viscosity of -2000 mPa-s). The formulation details are shown in Table 16.

[00231] The tablets were made according to the following steps. The core tablets were prepared using a wet granulation process. The granulation batch size was 170 g. (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate was passed through the Quadro Comil U5 with an 813 micron screen at 2000 rpm. Hydroxypropyl cellulose was passed through a 500 micron mesh screen. (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate and hydroxypropyl cellulose were granulated with purified water using a Diosna Pl/6 equipped with a 1 L bowl. The wet granules were screened through an 1180 micron mesh screen and dried on trays in an oven at 30 °C for 3 hours 48 minutes.

[00232] The core blend batch size was 20.0 g. The dried granules and magnesium stearate were combined in a glass bottle and blended in a Turbula mixer for 2 minutes. Core tablets (208.3 mg) were compressed using a Manesty FlexiTab single station tablet press with 5/16 inch (7.9 mm) round standard concave tooling at forces ranging from 9.9 to 14.0 kN. The core tablets had a final mean hardness of 8.4 kp (-82 Newtons).

[00233] The mantle blend was prepared using a direct compression process and a batch size of either 10 g (Example 13b) or 20 g (Example 13a). The hypermellose 2208 and lactose hydrate were passed through a 600 micron mesh screen, combined in a glass bottle and blended in a Turbula mixer for either 10 (Example 13a), or 5 (Example 13b) minutes. In each case, magnesium stearate was passed through a 250 micron screen and added to the blend and blended an additional 1.5 minutes. The mantle blend was then applied to the core tablets using the Carver Press with 7/16 inch (11.1 mm) round standard concave tooling. Half the mantle blend (208.3 mg) was weighed out, added to the die, and tamped slightly to flatten. Then, the core tablet was placed into the die and pressed down gently into the mantle blend. The second half of the mantle blend (208.3 mg) was then added on top of the core tablet and the mantle was compressed using 2.0 metric ton (MT) force. The final compression coated tablets had a total weight of 624.9 mg with a (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate loading of 200 mg (32.00%). The tablets had a final hardness of about 18.3 to 19.5 kp (-179 to 191 Newtons).
The dissolution profiles from the two compression coated tablets were measured according to the method described in Example 11. FIG. 9 shows that the MHF prodrug release rate slows with increasing hypromellose viscosity and the delay time increases slightly with increasing hypromellose viscosity.

Example 14
Preparation of Sustained Release Tablet Dosage Forms
[Non-Enteric Coated with 5 wt% hypromellose 2208 (100000 mPa-s) in the core and 40% hypromellose 2208 (100 MPa-s) in the mantle]

To demonstrate the effect of increasing the percentage of hypromellose 2208 (100 mPa-s viscosity) in the mantle on the in vitro dissolution profile and reducing the amount of hypromellose 2208 (100000 mPa-s) in the core, tablets were made according to the procedure outlined in Example 8, but with 5 wt% hypromellose 2208 (100000 mPa-s) in the core and 40% of hypromellose 2208 (100 MPa-s) in the mantle: The tablet formulation is shown in Table 17.

Table 17: Composition of SR Tablet Dosage Forms
[Non-Enteric Coated with 5 wt% hypromellose 2208 (100000 mPa-s) in the core and 40% hypromellose 2208 (100 MPa-s) in the mantle]

</table>

The dissolution profile from the Example 14 compression coated tablets was measured according to the method described in Example 11. FIG 10 shows that the delay to drug release is increased with increasing percentage of hypromellose 2208 (100 mPa.s) in the
mantle, and the rate of MHS prodrug increases slightly with decreasing percentage of hypromellose 2208 (100000 mPa.s) in the core.

Example 15

Preparation of Sustained Release Tablet Dosage Forms

[Non-Enteric Coated Formulation with no Hypromellose in the core and thin mantle]

[00237] To demonstrate the effect of decreasing the thickness of the mantle on the in vitro dissolution profile, the mantle to core weight ratio was decreased from 2 to 1.5. The tablet formulation is shown in Table 18.

[00238] The tablets were made according to the following steps. The core tablets were prepared using a wet granulation process. The granulation batch size was 680 g. (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate was passed through the Quadro Comil U5 with an 813 micron screen at 2000 rpm. Hydroxypropyl cellulose was passed through a 600 micron mesh screen. (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate and hydroxypropyl cellulose were granulated with purified water using a Diosna Pl/6 equipped with a 4 L bowl. The wet granules were screened through an 1180 micron mesh screen and dried on trays in an oven at 30 °C for 6 hours.

[00239] The core blend batch size was 30.0 g. The dried granules and the silicon dioxide were then passed through a 600 micron mesh screen, combined in a glass jar and blended in a Turbula mixer for 2 minutes. Magnesium stearate was passed through a 250 micron screen and added to the blend before blending an additional 1.5 minutes. Core tablets
(104.2 mg) were compressed using a Manesty FlexiTab single station tablet press with 1/4 inch (6.35 mm) round standard concave tooling at approximately 3 kN force. The core tablets had a final hardness of 6.2 to 7.0 kp (about 61 to 69 Newtons).

[00240] The mantle blend was prepared using a direct compression process and a batch size of 10 g. The hypromellose 2208 (100000 MPa-s) and lactose hydrate were passed through a 600 micron mesh screen, combined in a glass bottle and blended for 5 minutes in a Turbula mixer. Magnesium stearate was passed through a 250 micron screen and added to the blend and blended an additional 1.5 minutes. The mantle blend was then applied to the core tablets using the Carver Press with 5/16 inch (7.94 mm) round standard concave tooling. Half the mantle blend (78.2 mg) was weighed out, added to the die, and tamped slightly to flatten. Then, the core tablet was placed into the die and pressed down gently into the mantle blend. The second half of the mantle blend (78.2 mg) was then added on top of the core tablet and the mantle was compressed using 1.1 metric ton (MT) force. The final compression coated tablets had a total weight of 260.6 mg with a (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate loading of 100 mg (38.37%). The tablets had a final hardness ranging from 13.1 to 14.0 kp (about 128 to 137 Newtons).

[00241] The dissolution profile from the compression coated tablets was measured according to the method described in Example 11. FIG. 11 shows that the release of drug substance from the tablet increases with decreasing mantle to core weight ratio (compare with Example 9 and FIG. 6).

Example 16

Safety, Tolerability, and Pharmacokinetics of Example 10 Dosage Form

[00242] A randomized, double-blind crossover, food effect, single-dose study of the safety, tolerability, and pharmacokinetics of an oral dosage form of (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate in healthy adult subjects was conducted. Twelve healthy adult volunteers (males and females) participated in the study. All twelve subjects received a dosage form of Example 10, once in a fed condition and once in a fasted condition, with a two-week washout between treatments. The fasted dosing was achieved by dosing the subject following an overnight fast while the fed dosing was achieved by dosing the subject after consuming a high fat-content breakfast. The dosage form contained 100 mg of (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate (54 mg equivalents of methyl hydrogen fumarate).
Blood samples were collected from all subjects prior to dosing, and at 0.5, 1, 1.5, 2, 3, 4, 5, 6, 7, 8, 10, 12, 16, 24, 30, 36, 48, 60, 72, 84, 96, 108 and 120 hours after dosing. Urine samples were collected from all subjects prior to dosing, and complete urine output was obtained at the 0-4, 4-8, 8-12, 12-24, 24-36, 36-48, 48-72, 72-96 and 96-120 hour intervals after dosing. Blood samples were quenched immediately with acetonitrile and frozen. Sample aliquots were prepared for analysis of (i) methyl hydrogen fumarate, (ii) (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate, (iii) N,N diethyl-2-hydroxy acetamide and (iv) (2S,3S,4S,5R,6R)-6-[(N,N-diethylcarbamoyl)methoxy]-3,4,5-trihydroxy-2H-3,4,5,6-tetrahydropyran-2-carboxylic acid, the latter two being other potential metabolites of (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate, using sensitive and specific LC/MS/MS methods.

The plasma concentration of MMF following oral dosing of the formulation prepared according to Example 10 to fasted and fed healthy adult patients is shown in FIG. 12. Table 19 shows the preliminary mean (SD) pharmacokinetic data for (N,N-diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate in fed and fasted patients.

MMF release from the formulation was sustained and minimally affected by food. The formulation produced mean (SD) maximum MMF concentrations (average C<sub>max</sub>) 143 (61) ng/mL fasted and 217 (89) ng/mL fed. MMF AUC was 625 (216) ng•h/mL fasted and 750 (242) ng•h/mL fed. Promoiety was cleared from blood with a half-life around 3 hours. (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate was well tolerated during the trial. All 12 subjects completed the dosing period. All adverse events were mild. Adverse events that were reported in more than one subject and that were more frequently for (N,N-Diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate than for placebo were flushing and feeling hot. A comparison of these adverse events to placebo is shown in Table 20.

[00246] Finally, it should be noted that there are alternative ways of implementing the embodiments disclosed herein. Accordingly, the present embodiments are to be considered as illustrative and not restrictive, and the claims are not to be limited to the details given herein, but may be modified within the scope and equivalents thereof.
Claims

1. A method of systemically administering a therapeutically effective amount of a compound selected from (i) monomethyl fumarate (MMF), (ii) a prodrug of monomethyl fumarate, and (iii) a combination thereof, to treat a disease in each patient of a population of patients in need of such treatment, comprising administering the compound(s) to each patient to achieve across the population a maximum average concentration of monomethyl fumarate in the blood plasma of the patients of less than 500 ng/ml.

2. The method of claim 1, wherein the maximum average concentration of monomethyl fumarate in the blood plasma of the patients is less than 400 ng/ml.

3. A method of systemically administering a therapeutically effective amount of a compound selected from (i) monomethyl fumarate (MMF), (ii) a prodrug of monomethyl fumarate, and (iii) a combination thereof, to treat a disease in each patient of a population of patients in need of such treatment, comprising administering the compound(s) to each patient to achieve across the population an average Cmax of monomethyl fumarate in the blood plasma of the patients of less than 1100 ng/ml.

4. The method of claim 3, wherein the average Cmax of monomethyl fumarate in the blood plasma of the patients is less than 600 ng/ml.

5. A method of systemically administering a therapeutically effective amount of a compound selected from (i) monomethyl fumarate (MMF), (ii) a prodrug of monomethyl fumarate, and (iii) a combination thereof, to treat a disease in each patient of a population of patients in need of such treatment, comprising administering the compound(s) to each patient to achieve across the population an average maximum rate of rise in monomethyl fumarate concentration in the blood plasma of the patients of less than 0.25 wt% ng-eq of MMF dosed/ml/hr.

6. The method of claim 5, wherein the average maximum rate of rise in monomethyl fumarate concentration in the blood plasma of the patients is less than 0.20 wt% ng-eq of MMF dosed/ml/hr or is less than 0.15 wt% ng-eq of MMF dosed/ml/hr.

7. The method of claim 5, wherein the average maximum rate of rise in monomethyl fumarate concentration in the blood plasma of the patients is less than 0.10 wt% ng-eq of MMF dosed/ml/hr.

8. The method of claim 5, wherein the average maximum rate of rise in monomethyl fumarate concentration is less than 500 ng/mL/hr.

9. The method of claim 5, wherein the average maximum rate of rise in monomethyl fumarate concentration is less than 400 ng/mL/hr.
10. The method of any one of claims 1, 3, and 5, wherein incidence of flushing in the population of patients is reduced.

11. The method of any one of claims 1, 3, and 5, wherein the disease is selected from multiple sclerosis and psoriasis.

12. The method of any one of claims 1, 3, and 5, wherein the disease is selected from adrenal leukodystrophy, AGE-induced genome damage, Alexanders Disease, Alper's Disease, Alzheimer's disease, amyotrophic lateral sclerosis, angina pectoris, arthritis, asthma, balo concentric sclerosis, Canavan disease, cardiac insufficiency including left ventricular insufficiency, central nervous system vasculitis, Charcott-Marie-Tooth Disease, childhood ataxia with central nervous system hypomyelination, chronic idiopathic peripheral neuropathy, chronic obstructive pulmonary disease, Crohn's disease, diabetic retinopathy, graft versus host disease, hepatitis C viral infection, herpes simplex viral infection, human immunodeficiency viral infection, Huntington's disease, irritable bowel disorder, ischemia, Krabbe Disease, lichen planus, macular degeneration, mitochondrial encephalomyopathy, monomelic amyotrophy, multiple sclerosis, myocardial infarction, neurodegeneration with brain iron accumulation, neuromyelitis optica, neurosarcoidosis, NF-κB mediated diseases, optic neuritis, pareneoplastic syndromes, Parkinson's disease, Pelizaeus-Merzbacher disease, primary lateral sclerosis, progressive supranuclear palsy, psoriasis, reperfusion injury, retinopathy pigmentosa, Schilders Disease, subacute necrotizing myelopathy, susac syndrome, transplantation rejection, transverse myelitis, a tumor, ulcerative colitis, Zellweger's syndrome, granulomas including annulaire, pemphigus, bullus pemphigoid, behcet's, contact dermatitis, acute dermatitis, chronic dermatitis, alopecia areata (totalis and universalis), sarcoidosis, cutaneous sarcoidosis, pyoderma gangrenosum, cutaneous lupus, Crohn's disease and cutaneous Crohn's disease.

13. The method of any one of claims 1, 3, and 5, wherein the administered compound comprises monomethyl fumarate.

14. The method of any one of claims 1, 3, and 5, wherein the administered compound comprises a prodrug of monomethyl fumarate.

15. The method of claim 14, wherein the compound comprises a compound of Formula (I):

```
\begin{align*}
  &O
  \quad \text{R} \quad O
  \quad \text{O}
  \end{align*}
```
16. The method of claim 15, wherein the compound comprises dimethyl fumarate.

17. The method of any one of claims 1, 3, and 5, wherein the administered compound is a compound of Formula (II):

![Formula (II)](I)

18. The method of claim 17, wherein the compound is chosen from:

- (N,N-diethylcarbamoyl)methyl methyl (2E)but-2-ene-1,4-dioate;
- methyl 2-morpholin-4-yl-2-oxoethyl (2E)but-2-ene-1,4-dioate;

and pharmaceutically acceptable salts thereof.

19. The method of any one of claims 1, 3, and 5, wherein the administered compound is a compound of Formula (III):

![Formula (III)](II)

or a pharmaceutically acceptable salt thereof, wherein:

- $R_i$ is $C_{6}$alkyl.

or a pharmaceutically acceptable salt thereof, wherein:

- $R^2$ and $R^3$ are independently chosen from hydrogen, $C_{6}$alkyl, and substituted $C_{6}$alkyl;
- $R^4$ and $R^5$ are independently chosen from hydrogen, $C_{6}$alkyl, substituted $C_{6}$alkyl, $C_{1-6}$alkoxy, substituted $C_{6}$alkoxy, $C_{6}$alkoxycarbonyl, substituted $C_{6}$alkoxycarbonyl, $C_{6}$heteroalkyl, substituted $C_{6}$heteroalkyl, $C_{4-12}$cycloalkylalkyl, substituted $C_{4-12}$cycloalkylalkyl, $C_{7-12}$arylalkyl, and substituted $C_{7-12}$arylalkyl; or $R^4$ and $R^5$ together with the nitrogen to which they are bonded form a ring chosen from a $C_{5-10}$heteroaryl, substituted $C_{5-10}$heteroaryl, $C_{5-10}$heterocycloalkyl, and substituted $C_{5-10}$heterocycloalkyl;

- wherein each substituent group is independently chosen from halogen, -OH, -CN, -CF$_3$, =O, -NO$_2$, benzyl, -C(0)NR$_{11}$, -OR$_{11}$, -C(0)R$_{11}$, -COOR$_{11}$, and -NR$_{11}^2$, wherein each $R_{11}$ is independently chosen from hydrogen and $C_{1-4}$alkyl.
or a pharmaceutically acceptable salt thereof, wherein:

\[ R_6 \] is chosen from \( \text{C}_1-6 \) alkyl, substituted \( \text{C}_1-6 \) alkyl, \( \text{C}_1-6 \) heteroalkyl, substituted \( \text{C}_1-6 \) heteroalkyl, \( \text{C}_3-8 \) cycloalkyl, substituted \( \text{C}_3-8 \) cycloalkyl, \( \text{C}_6-8 \) aryl, substituted \( \text{C}_6-8 \) aryl, and

\[ OR^{10} \] wherein \( R^{10} \) is chosen from \( \text{C}_1-6 \) alkyl, substituted \( \text{C}_1-6 \) alkyl, \( \text{C}_3-10 \) cycloalkyl, substituted \( \text{C}_3-10 \) cycloalkyl, \( \text{C}_6-10 \) aryl, and substituted \( \text{C}_6-10 \) aryl; \( R^7 \) and \( R^8 \) are independently chosen from hydrogen, \( \text{C}_1-6 \) alkyl, and substituted \( \text{C}_1-6 \) alkyl; and

wherein each substituent group is independently chosen from halogen, -OH, -CN, -\( \text{CF}_3 \), =O, -NO2, benzyl, -C(0)NR \( ^{11} \) \( 2 \), -R \( ^{11} \), -OR \( ^{11} \), -C(0)R \( ^{11} \), -COOR \( ^{11} \), N(R \( ^{11} \))C(0)C(R \( ^{11} \))\( ^{11} \)R \( ^{11} \), and -NR \( ^{11} \) \( 2 \) wherein each \( R^{11} \) is independently chosen from hydrogen and \( \text{C}_1-4 \) alkyl.

20. The method of claim 19, wherein the compound is chosen from:

1-(ethoxycarbonyloxy) ethyl methyl (2E)but-2-ene-1,4-dioate;

methyl 1-(methylethoxycarbonyloxy)ethyl (2E)but-2-ene-1,4-dioate;

methyl 1-(2-methylpropanoyloxy)ethyl (2E)but-2-ene-1,4-dioate;

methyl 1-(phenylcarbonyloxy)ethyl (2E)but-2-ene-1,4-dioate;

cyclohexylcarbonyloxybutyl methyl (2E)but-2-ene-1,4-dioate;

[(2E)-3-(methoxycarbonyl)prop-2-enoyloxy]ethyl methyl (2E)but-2-ene-1,4-dioate;

1-(cyclohexylcarbonyloxy)ethyl methyl (2E)but-2-ene-1,4-dioate;

methyl 2-methyl-1-phenylcarbonyloxypropyl (2E)but-2-ene-1,4-dioate;

3-({[(2E)-3-(methoxycarbonyl)prop-2-enoyloxy]methyl}oxycarbonyl)(2S)-3-amino propanoic acid;

3-({[(2E)-3-(methoxycarbonyl)prop-2-enoyloxy]methyl}oxycarbonyl)(2S)-2-amino propanoic acid;

3-({[(2E)-3-(methoxycarbonyl)prop-2-enoyloxy]methyl}oxycarbonyl)(3S)-3-(2-amino acetyl amino) propanoic acid;

3-({[(2E)-3-(methoxycarbonyl)prop-2-enoyloxy]methyl}oxycarbonyl)(2S)-2-amino propanoic acid;

3-1-{([(2E)-3-(methoxycarbonyl)prop-2-enoyloxy]ethoxycarbonyl}) (2S)-2-amino propanoic acid; and

a pharmaceutically acceptable salt of any of the foregoing.

21. The method of any one of claims 1, 3, and 5, wherein the administered compound is a compound of Formula (IV):
22. The method of claim 21, wherein the compound is chosen from:
methyl 2-morpholin-4-ylethyl (2E)but-2-ene-1,4-dioate;
methyl 3-morpholin-4-ylpropyl (2E)but-2-ene-1,4-dioate;
methyl 4-morpholin-4-ylbutyl (2E)but-2-ene-1,4-dioate; and

5 a pharmaceutically acceptable salt of any of the foregoing.

23. A method of systemically administering a therapeutically effective amount of
a compound selected from (i) monomethyl fumarate (MMF), (ii) a prodrug of monomethyl
fumarate, and (iii) a combination thereof, to treat a disease in a patient in need of such
treatment, comprising one of a) or b):

5 a) orally administering to the patient, at a dosing frequency of not more than twice per
day, an enteric-coated oral sustained release dosage form containing a therapeutically
effective dose of the compound(s), wherein the dosage form, when subjected to an in vitro
dissolution test employing as a dissolution medium 750 mL of 0.1 N hydrochloric acid, at
pH 1.2, for a period of 2 hours, followed by addition of 250 mL of 200 mM tribasic sodium
phosphate buffer resulting in an adjustment of the pH of the dissolution medium to 6.8, the
dissolution medium being maintained at 37 °C and stirred at 100 rpm,

10 releases: (i) less than 10 wt% of the dose over an initial 2 hours of the in vitro
dissolution test; (ii) at least 90 wt% of the dose over not less than an initial 8 hours of the in
vitro dissolution test; (iii) no more than 30 wt% of the dose in any one hour during the in
vitro dissolution test; and (iv) no more than 40 wt% of the dose in any consecutive two hours
during the in vitro dissolution test; or

b) orally administering to the patient, at a frequency of not more than twice per day, a
non-enteric-coated oral sustained release dosage form containing a therapeutically effective
dose of the compound(s), wherein the dosage form, when subjected to an in vitro dissolution
test employing as a dissolution medium 750 mL of 0.1 N hydrochloric acid, at pH 1.2, for a
period of 2 hours, followed by addition of 250 mL of 200 mM tribasic sodium phosphate buffer resulting in an adjustment of the pH of the dissolution medium to 6.8,

releases (i) at least 90 wt% of the dose over not less than an initial 8 hours of the \textit{in vitro} dissolution test; (ii) no more than 30 wt% of the dose in any one hour during the \textit{in vitro} dissolution test; and (iii) no more than 40 wt% of the dose in any consecutive two hours during the \textit{in vitro} dissolution test.

24. The method of claim 23, wherein the dosing frequency is twice per day.
25. The method of claim 23, wherein the dosing frequency is once per day.
26. The method of claim 25, wherein the dosage form releases at least 90 wt% of the dose over not less than an initial 10 hours of the \textit{in vitro} dissolution test.

**INTERNATIONAL SEARCH REPORT**

**International application No:**
PCT/US2013/056173

**A. CLASSIFICATION OF SUBJECT MATTER**

INV. A61K31/225 A61K31/5375 A61P17/06 A61P29/00 A61P25/00

**ADD.**
According to International Patent Classification (IPC) and both national classification and IPC

**B. FIELDS SEARCHED**

Minimum documentation searched (classification system followed by classification symbols)

A61K A61P

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

EPO-Internal, BIOSIS, CHEM ABS Data, EMBASE, WPI Data

**C. DOCUMENTS CONSIDERED TO BE RELEVANT**

* Special categories of cited documents:

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier application or patent but published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance: the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance: the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

"A" document member of the same patent family

Date of the actual completion of the international search: 30 September 2013

Date of mailing of the international search report: 15/10/2013

Name and mailing address of the ISA:
European Patent Office, P.B. 5818 Patentlaan 2
NL - 2280 HV Rijswijk
Tel. (+31-70) 340-2040;
Fax: (+31-70) 340-3016

Authorized officer:
Lemarchand, Aude
