(54) Titre : POLYCETIDES POLYENIQUES ET METHODES DE PRODUCTION CONNEXES
(54) Title: POLYENE POLYKETIDES AND METHODS OF PRODUCTION

(57) Abrégé/Abstract:
Novel polyene polyketides, their pharmaceutically acceptable salts, prodrugs and derivatives have been found to have antibiotic activity. One method for obtaining the compounds is by cultivation of Amycolatopsis orientalis ATCC™ 43491 or a mutant or variant such as the strain IDAC-220604-1. Another method for obtaining the compounds is post-biosynthesis chemical modification of the compounds obtained by cultivation. Novel polynucleotide sequences and encoded proteins for the biosynthesis of the polyene polyketides are also presented.

3010-5PCT-7CA

ABSTRACT

Novel polyene polyketides, their pharmaceutically acceptable salts, prodrugs and derivatives have been found to have antibiotic activity. One method for obtaining the compounds is by cultivation of *Amycolatopsis orientalis* ATCC™ 43491 or a mutant or variant such as the strain IDAC-220604-1. Another method for obtaining the compounds is post-biosynthesis chemical modification of the compounds obtained by cultivation. Novel polynucleotide sequences and encoded proteins for the biosynthesis of the polyene polyketides are also presented.

POLYENE POLYKETIDES AND METHODS OF PRODUCTION

RELATED APPLICATIONS:

This application claims priority to U.S. provisional application no. 60/501,821 filed September 11, 2003, U.S. provisional application no. 60/574,922 filed May 28, 2004 and U.S. provisional application no. 60/581,707 filed June 23, 2004, the entire contents of which are incorporated herein by reference.

FIELD OF THE INVENTION:

This invention relates to novel biologically active polyene polyketides, their pharmaceutically acceptable salts and derivatives, and to methods of obtaining them. One method for obtaining the compounds is by cultivation of *Amycolatopsis orientalis* ATCC™ 43491, the *Amycolatopsis orientalis* species having accession number IDAC 220604-01, or a mutant or variant of strain ATCC™ 43491 or strain IDAC 220604-1. Another method of producing these polyene polyketides involves expression of the biosynthetic gene cluster of the invention in transformed host cells. Another method of producing these polyene polyketide is by post-biosynthesis chemical modifications. The present invention further relates to *Amycolatopsis orientalis sp*. strains IDAC 220604-01, to the use of the polyene polyketides and their pharmaceutically acceptable salts and derivatives as pharmaceuticals, in particular to their use as inhibitors of bacterial cell growth and to pharmaceutical compositions comprising a polyene polyketide of the invention or a pharmaceutically acceptable salt or derivative thereof. Finally, the invention relates to novel polynucleotide sequences and their encoded proteins, which are involved in the biosynthesis of the polyene polyketides of the invention.

BACKGROUND OF THE INVENTION:

Polyketides are a diverse class of naturally occurring molecules typically produced by a variety of organisms, including fungi and mycelial bacteria, in particular actinomycetes. Although polyketides have widely divergent structures, they are classified together because they all share a common general biosynthetic pathway in which the carbon backbone of these molecules are assembled by sequential, step-

wise addition of two carbon or substitued two carbon units referred to as ketides. Polyene polyketides comprise a chain of ketide units that have been strung together by a series of enzymatic reactions by multimodular polyketide synthase proteins. Polyketides are usually found in their natural environment in trace amounts. Moreover, due to their structural complexity, poyketides are notoriously difficult to synthesize chemically. Nevertheless, many polyketides have been developed into effective drugs for the treatment of conditions such as bacterial and fungal infections, cancer and high cholesterol. Adriamycin, erythromycin, zocor and nystatin are but a few examples of polyketide molecules, which have been developed into valuable pharmaceuticals. Linearmycin A, having a 60 carbon chain and a degree of unsaturation of 15, is an example of a linear polyene polyketide reported to possess antifungal and antibacterial activity (Sakuda *et al.*, *Tetrahedron Letters*. Vol. 36, No. 16, 2777-2870 (1995); Sakuda *et al.*, *J. Chem Soc., Perkin Trans*. 1,2315-2319 (1996)).

Although large numbers of therapeutically important polyketides have been identified, there remains a need to obtain novel polyketides that have enhanced properties or possess completely novel bioactivities. The complex polyketides produced by modular Type I polyketide synthases (PKSs) are particularly valuable, in that they include compounds with known utility as antihelminthics, insecticides, immunosuppressants, cytotoxic, antifungal or antibacterial agents.

Because of their structural complexity, such novel polyketides are not readily obtainable by total chemical synthesis. The present invention addresses this need by providing a new class of polyketide compounds with therapeutic activity, together with means for their production. The compounds of the invention are prepared by fermentation or by fermentation followed by chemical modifications. The compounds of the invention may also be produced by appropriate application of recombinant DNA technology. A wide variety of polyketides can be prepared in a variety of different host cells provided one has access to nucleic acid compounds that encode PKS proteins and polyketide modification enzymes.

PKSs are large proteins that contain multiple enzymatic activities. PKSs catalyse the biosynthesis of polyketides through repeated, decarboxylative Claisen condensations between acylthioester building blocks, such as acetyl, butyryl, isobutyryl, propionyl, malonyl, hydroxymalonyl, methylmalonyl, and ethylmalonyl CoA.

PKS enzymes are generally classified into Type I or "modular" PKSs and Type II or "iterative" PKSs according to the polyketide synthetized and by the mode of synthesis. Type I PKSs are responsible for producing a large number of 12-, 14- and 16- membered macrolide antibiotics.

Type I or modular PKS enzymes are multifunctional proteins containing catalytic sites for acyl transferases (AT), acyl carrier protein (ACP), ketosynthase (KS), dehydratase (DH), and enoyl reductase (ER) activities. Type I enzymes are formed by a set of separate catalytic active sites for each cycle of carbon chain elongation and modification in the polyketide synthesis pathway. Each active site is termed a domain. A set of active sites or domains is termed a module. The typical modular PKS complex is composed of several large PKS polypeptides that act coordinately to achieve polyketide synthesis. Each PKS polypeptide can be segregated from amino to carboxy terminus into a loading module (found only in the first PKS polypeptide of the complex), multiple extender modules, and a releasing or thioesterase (TE) domain (generally found only in the final module of the terminal PKS polypeptide of the complex).

Generally, the loading module is responsible for binding the first building block used to synthesize the polyketide and transferring it to the first extender module. The AT domain of the loading module recognizes a particular acyl-CoA (usually acetyl or propionyl but sometimes butyryl, isobutyryl or other acyl-CoA) and transfers it as a thiol ester to the ACP domain of the loading module. The loading module may not encode a KS domain, or may encode a KS(Q) domain, a KS-like domain that carries an amino acid substitution at the active site cysteine residue (typically a glutamine residue, single letter code Q). KS(Q) domains decarboxylate the acylthioester of the loading domain before proceeding with chain elongation. For example, the loader module of the oleandomycin PKS complex initiates deoxyoleandolide synthesis by loading the ACP with a malonyl unit and performing a decarboxylation to generate acetyl-ACP (Shah, (2000), *J. Antibiotics*, Vol. 53, pp. 502-508).

The AT domain on each of the extender modules recognizes a particular extender-CoA (typically malonyl or alpha-substituted malonyl, i.e. methylmalonyl, ethylmalonyl, and 2-hydroxymalonyl) and transfers it to the ACP domain of that extender module to form a thioester. Each extender module is responsible for accepting a compound from a prior module, binding a building block, attaching the building block to the

compound from the prior module, optionally performing one or more additional functions, and transferring the resulting compound to the next module.

Each extender module of a modular PKS contains a KS, AT, ACP, and zero, one, two or three domains that modify the beta-carbon of the growing polyketide chain. A typical (non-loading) minimal Type I PKS extender module may contain a KS domain, an AT domain, and an ACP domain. Such domains are sufficient to activate a 2-carbon extender unit and attach it to the growing polyketide molecule. The next extender module, in turn, is responsible for attaching the next building block and transferring the growing compound to the next extender module until synthesis of the polyketide is complete.

Once the PKS is primed with acyl- and malonyl-ACPs, the acyl group of the loading module is transferred to form a thiol ester (trans-esterification) at the KS of the first extender module; at this stage, extender module one possesses an acyl-KS and a malonyl (or substituted malonyl)-ACP. The acyl group derived from the loading module is then covalently attached to the alpha-carbon of the malonyl group to form a carbon-carbon bond, driven by concomitant decarboxylation, and generating a new acyl-ACP that carries a backbone two carbons longer than the loading building block (elongation or extension) and side chains if a substituted malonyl unit is used for extension.

The polyketide chain, growing by two or more carbons with each extender module, is sequentially passed as covalently bound thiol esters from extender module to extender module, in an assembly line-like process. The carbon chain produced by this process alone would possess a ketone at every other carbon atom, producing a polyketone, from which the name polyketide arises. Most commonly, however, additional enzymatic activities modify the beta keto group of each two carbon unit just after it has been added to the growing polyketide chain but before it is transferred to the next module.

After traversing the final extender module, the polyketide encounters a releasing domain (TE) that cleaves the polyketide from the PKS and typically cyclizes the polyketide. Further, tailoring enzymes can modify the polyketide; these tailoring enzymes add carbohydrate groups, methyl groups, or make other modifications, i.e. oxidation or reduction, on the polyketide core molecule.

Type I PKSs displays a one-to-one correlation between the number and clustering of active sites in the primary sequence of the PKS and the structure of the polyketide backbone. The activities catalyzed by the domains within a type I PKS are often apparent in the structure of the growing polyketide chain; consequently, nucleotide sequence has become a predictive tool for deducing the biosynthetic route for these compounds (Rangaswamy et al, *Proc. Natl. Acad. Sci. USA,* (1998) Vol. 95, pp. 15469-15474).

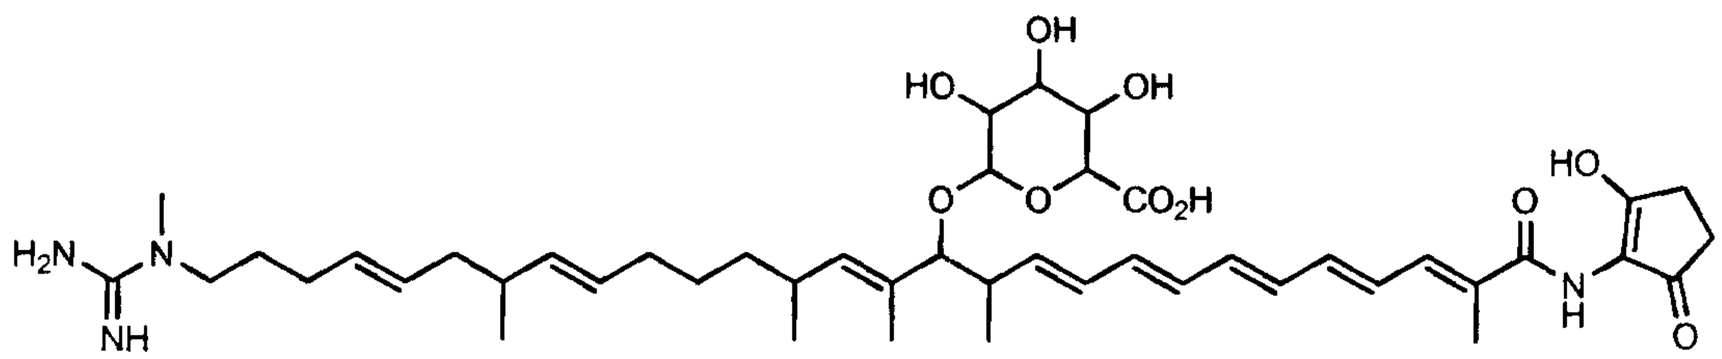
In Type I PKS polypeptides, the order of catalytic domains is conserved. When all beta-keto processing domains are present in a module, the order of domains in that module from N-to-C-terminus is always KS, AT, DH, ER, KR, and ACP. Some or all of the beta-keto processing domains may be missing in particular modules, but the order of the domains present in a module remains the same. The order of domains within modules is believed to be important for proper folding of the PKS polypeptides into an active complex. Importantly, there is considerable flexibility in PKS enzymes, this flexibility provides a means for genetically engineering novel catalytic complexes. By manipulating the polynucleotide sequences encoding the PKS polypeptide, genetically engineered novel PKSs can be achieved. Genetically engineering PKS enzymes can be achieved by the modification, addition or deletion of domains, or by replacing domains with domains taken from other Type I PKS enzymes. As well, this can also be achieved by deletion, addition or replacement of entire modules with modules taken from other sources. A genetically engineered PKS complex should, of course, have the ability to catalyze the synthesis of the product predicted from the genetic alterations made.

Alignment of the many available amino acid sequences for Type I PKS enzymes has approximately defined the boundaries of the various catalytic domains. Sequence alignments also have revealed linker regions between the catalytic domains and at the N- and C-termini of individual PKS polypeptides. The sequences of these linker regions are less well conserved than are those for the catalytic domains, which is in part how linker regions are identified. Linker regions can be important for proper association between domains and between the individual polypeptides that comprise the PKS complex. One can thus view the linkers and domains together as creating a scaffold on which the domains and modules are positioned in the correct orientation to be active. This organization and positioning, if retained, permits PKS domains of

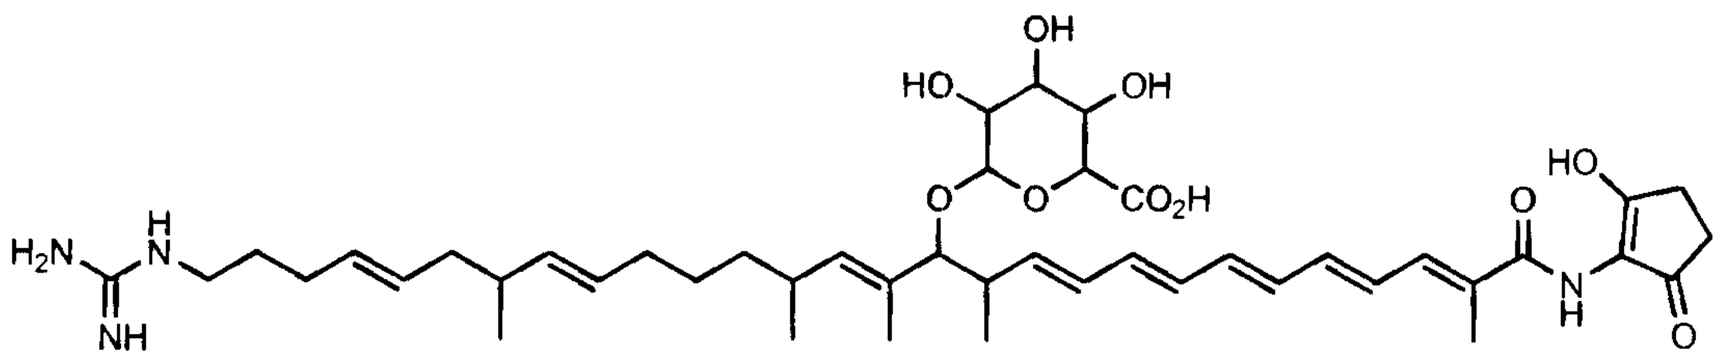
different or identical substrate specificities to be substituted (usually at the DNA level) between PKS enzymes by various available methodologies. In selecting the boundaries of, for example, an AT domain replacement, one can thus make the replacement so as to retain the linkers of the recipient PKS or to replace them with the linkers of the donor PKS AT domain, or, preferably, make both constructs to ensure that the correct linker regions between the KS and AT domains have been included in at least one of the engineering enzymes. Thus, there is considerable flexibility in the design of new PKS enzymes with the result that known polyketides can be produced more effectively, and novel polyketides can be made.

SUMMARY OF THE INVENTION:

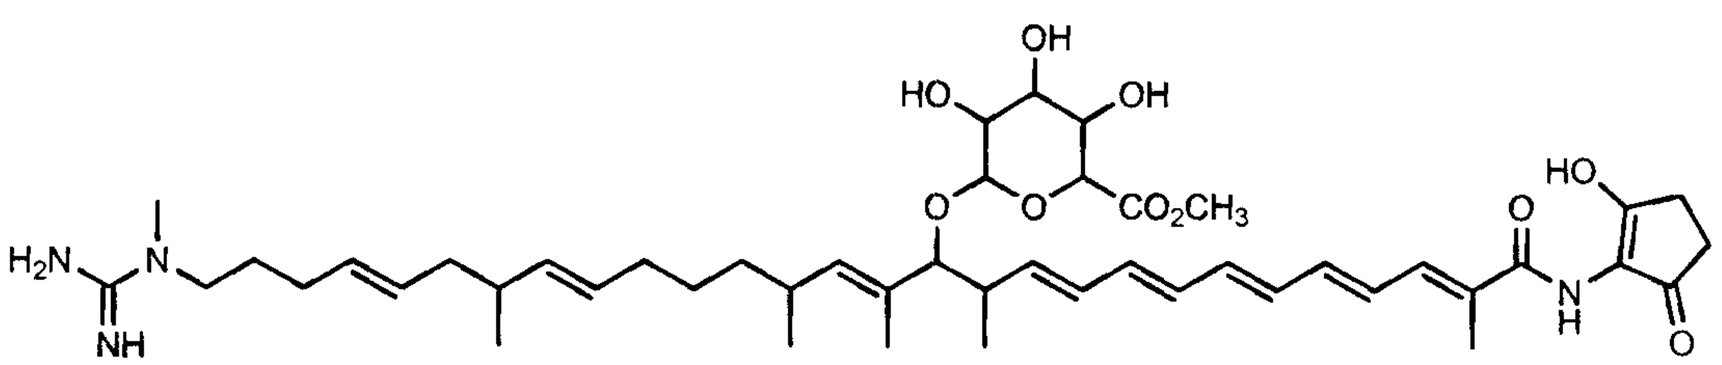
In one aspect of this embodiment the invention relates to novel polyene polyketides Compounds 1, 2, 3, 4, 5, 6 and 7:



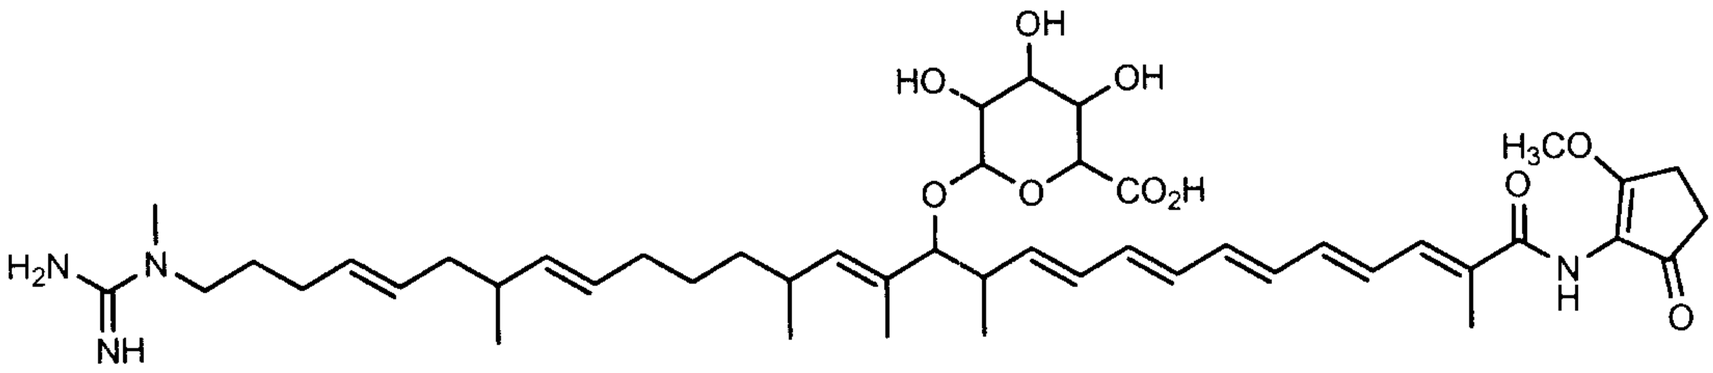
Compound 1;



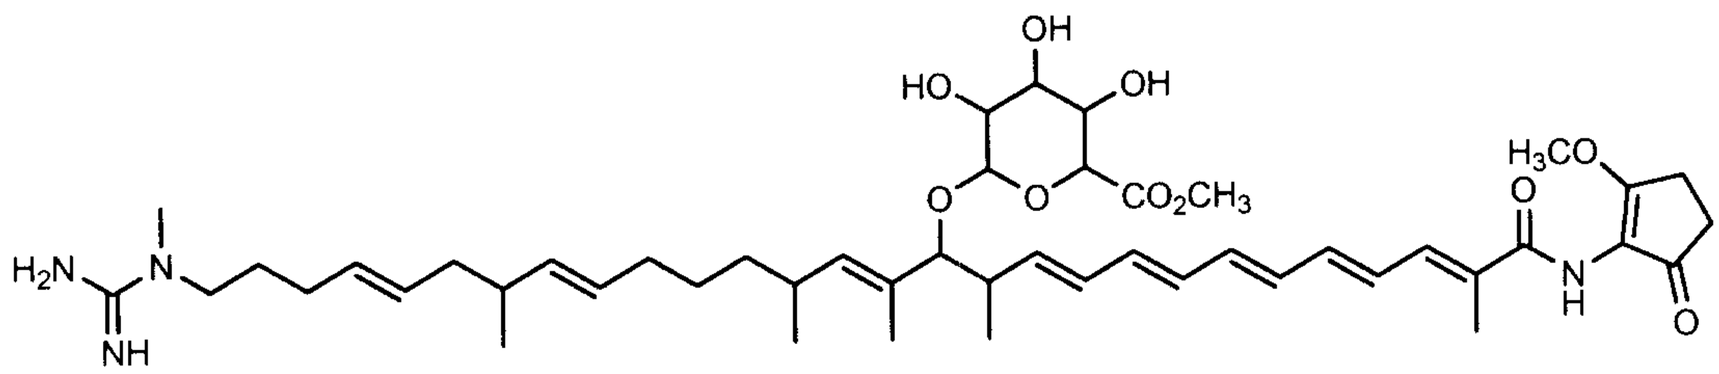
Compound 2;



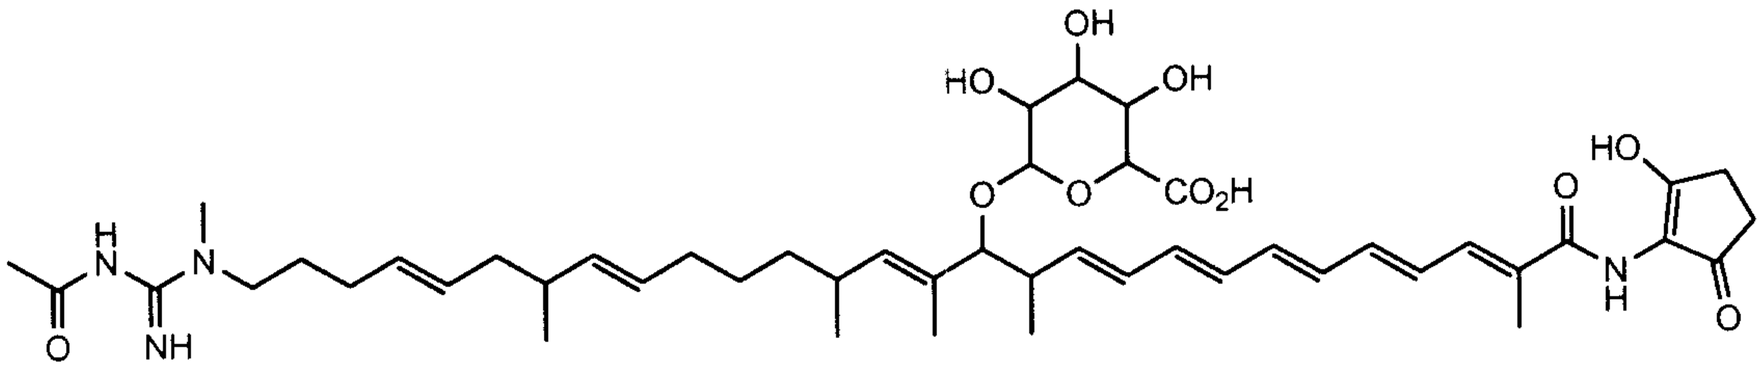
Compound 3;



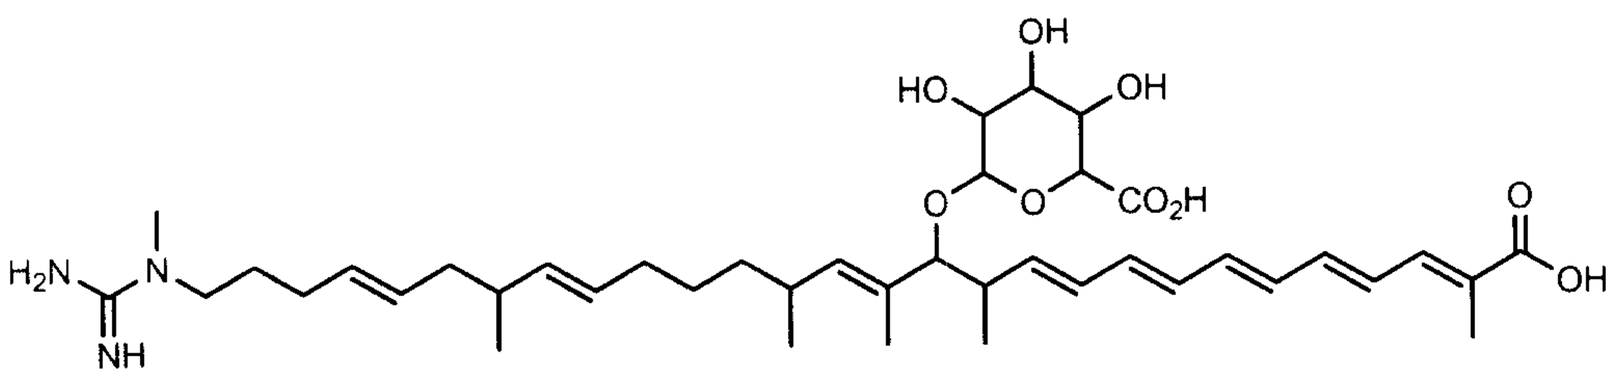
Compound 4;



Compound 5;



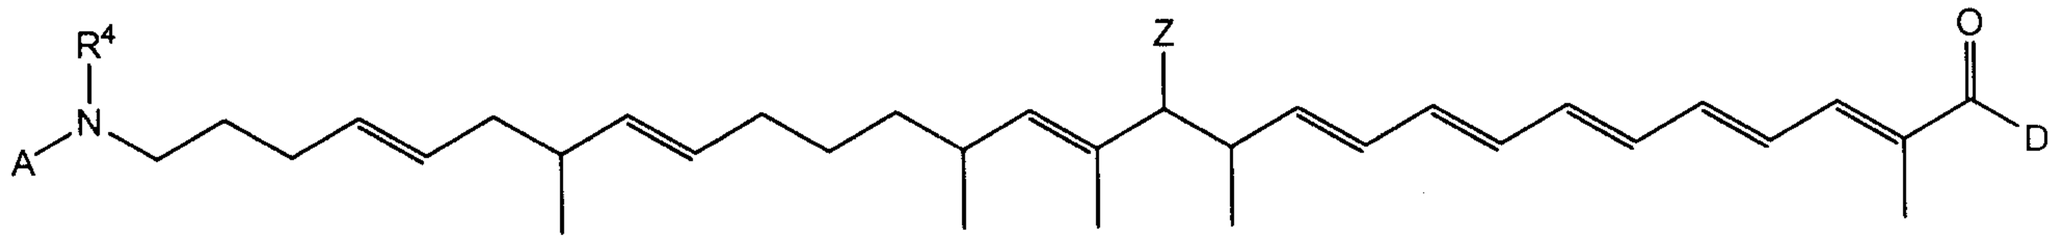
Compound 6;



Compound 7;

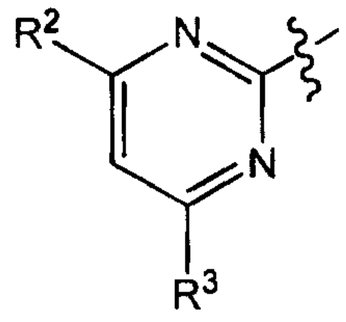
or a pharmaceutically acceptable salt or prodrug thereof.

In another aspect the invention provides polyene polyketides of Formula I, as illustrated below, which compounds may be derived by chemical modification of Compounds 1 to 7.



Formula I

wherein,
A is selected from $-C(NH)NHR^1$, CH_3, H or



;

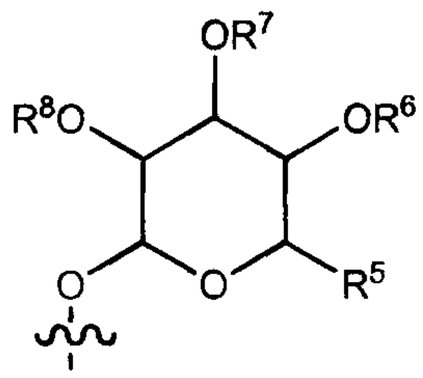
R^1 is selected from H, C_{1-6}alkyl, C_{6-10}aryl, $C(O)C_{1-6}$alkyl and $C(O)C_{6-10}$aryl;

R^2 and R^3 are each independently selected from H, C_{1-6} alkyl, C_{2-7} alkene and C_{6-10} aryl;

R^4 is selected from H or CH_3;

Z is OH or O when taken with adjacent carbon atom to form a carbonyl; or

Z may be a tetrahydropyranoxy of formula:



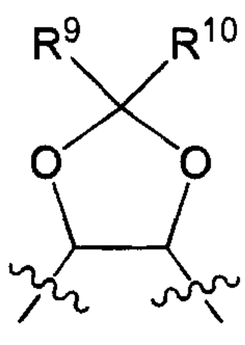
;

R^5 is selected from H, COOH, C_{1-6} alkyl or $C(O)OC_{1-6}$ alkyl;

R^6, R^7 and R^8 are each independently selected from H, C_{1-6} alkyl and $C(O)C_{1-6}$ alkyl; or

R^6 , R^7 and R^8 may each independently be absent when the adjacent oxygen and carbon atoms are taken together to form a carbonyl; or

R^6 , R^7 and R^8 may each independently be a bond when any of two neighboring R^6 , R^7 and R^8 are taken together with attached oxygen and carbon atoms to form a 1,3-dioxolane ring of formula:

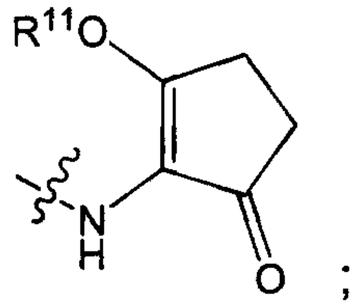


;

R^9 and R^{10} are each independently selected from H, C_{1-6} alkyl, C_{2-7} alkene and C_{6-10} aryl; or

R^9 and R^{10} are taken together with adjacent carbon atom to form a ring having from 5 to 7 carbons;

D is selected from OH, NH_2, $NH(C_{1-3}alkyl)$, $N(C_{1-3}alkyl)_2$, $OC_{1-3}alkyl$ or



;

R^{11} is selected from H or C_{1-3} alkyl;

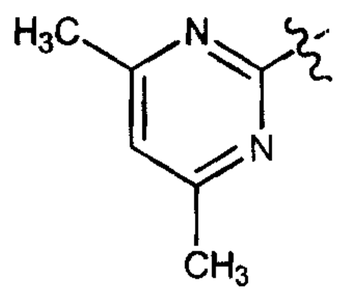
or a pharmaceutically acceptable salt or prodrug thereof.

In one embodiment the invention provides compounds of Formula I, wherein A is —$C(NH)NH_2$; and all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof.

In a further embodiment of the invention provides compounds of Formula I, wherein A is H; and all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof.

In a further embodiment the invention provides compounds of Formula I, wherein A is —$C(NH)NHC(O)CH_3$; and all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof.

In a further embodiment the invention provides compounds of Formula I, wherein A is



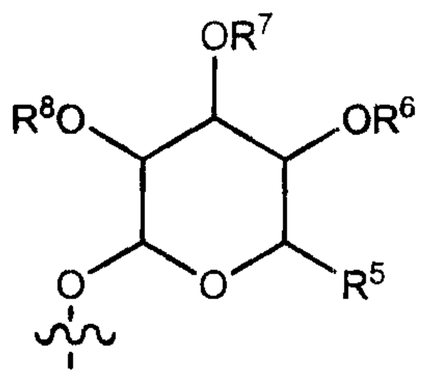
;

and all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof.

In a further embodiment the invention provides compounds of Formula I, wherein R^4 is CH_3; and all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof.

In a further embodiment the invention provides compounds of Formula I, wherein R^4 is H; and all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof.

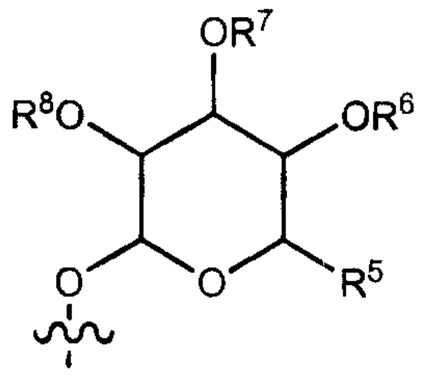
In a further embodiment the invention provides compounds of Formula I, wherein Z is



;

and all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof. In a subclass of this embodiment R^6, R^7 and R^8 are each H, and R^5 is COOH, all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof.

In a further embodiment the invention provides compounds of Formula I, wherein Z is

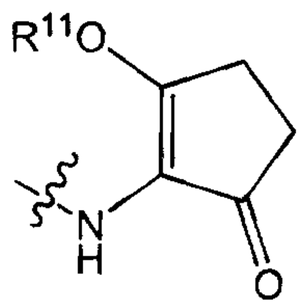


;

and all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof. In a subclass of this embodiment R^6, R^7 and R^8 are each H, and R^5 is CO_2CH_3, all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof.

In a further embodiment the invention provides compounds of Formula I, wherein Z is OH and all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof.

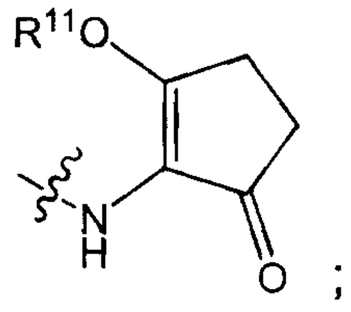
In a further embodiment the invention provides compounds of Formula I, wherein D is



;

and all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof. In a subclass of this embodiment R^{11} is H and all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof.

In a further embodiment the invention provides compounds of Formula I, wherein D is

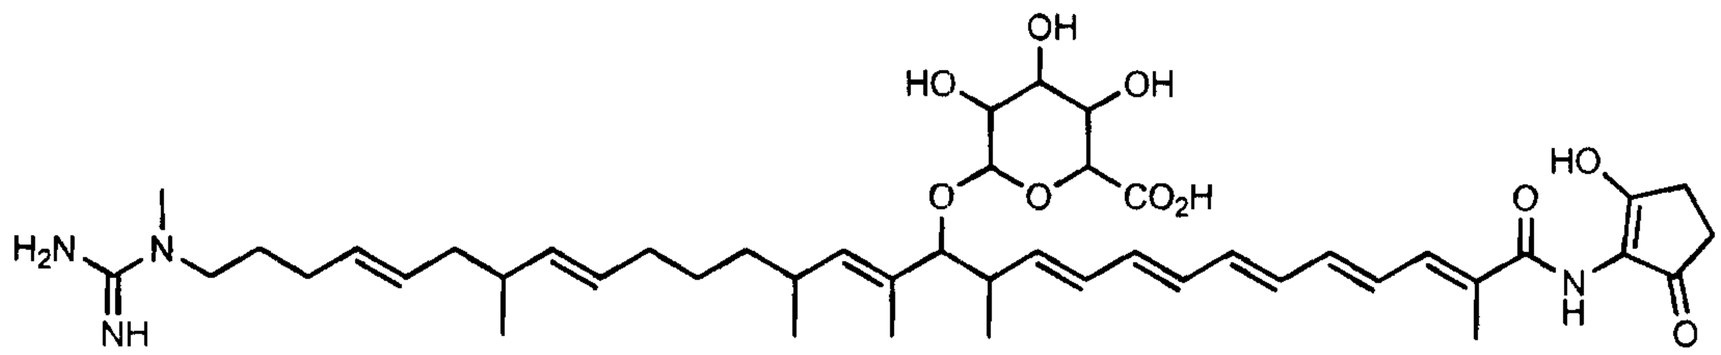


;

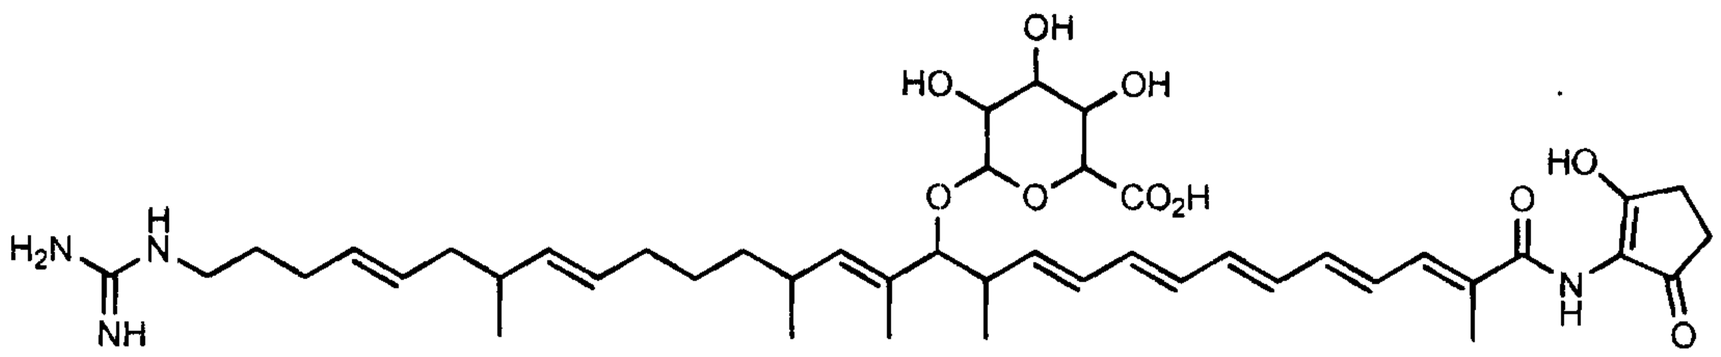
and all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof. In a subclass of this embodiment R^{11} is CH_3 and all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof.

In another embodiment the invention provides compounds of Formula I, wherein D is OH; and all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof.

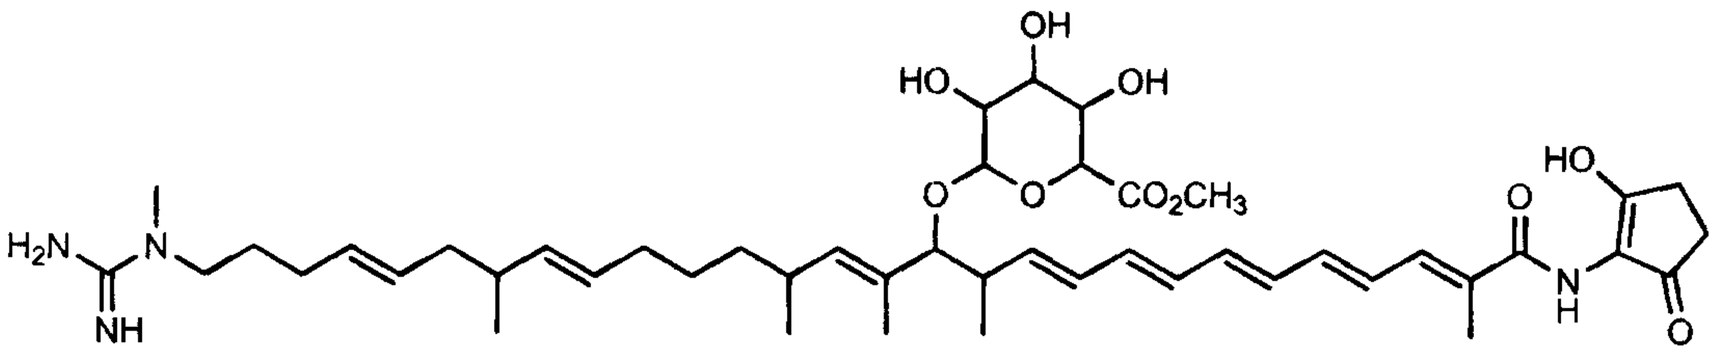
The following are exemplary compounds of the invention:



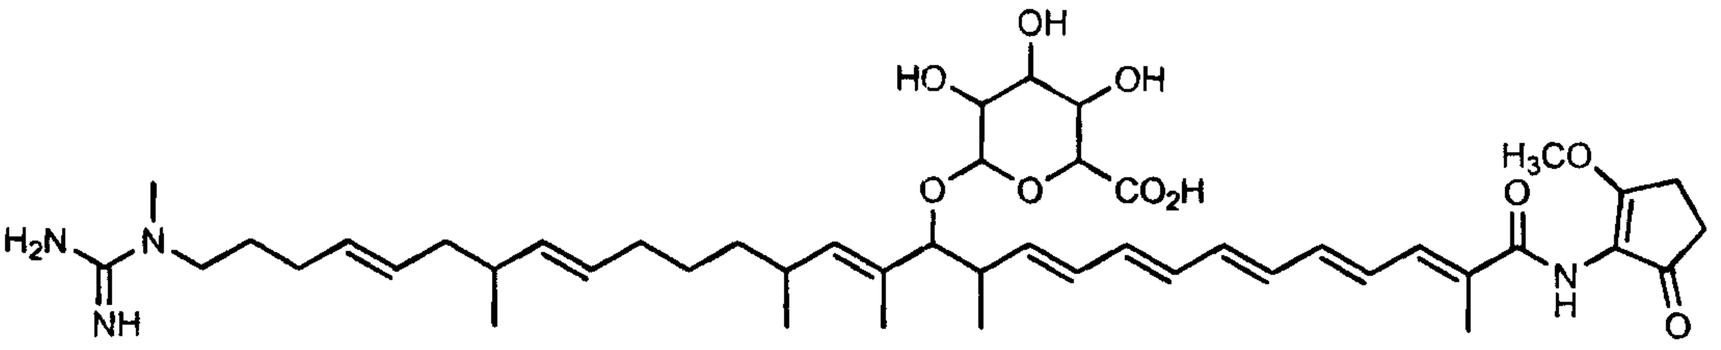
Compound 1;



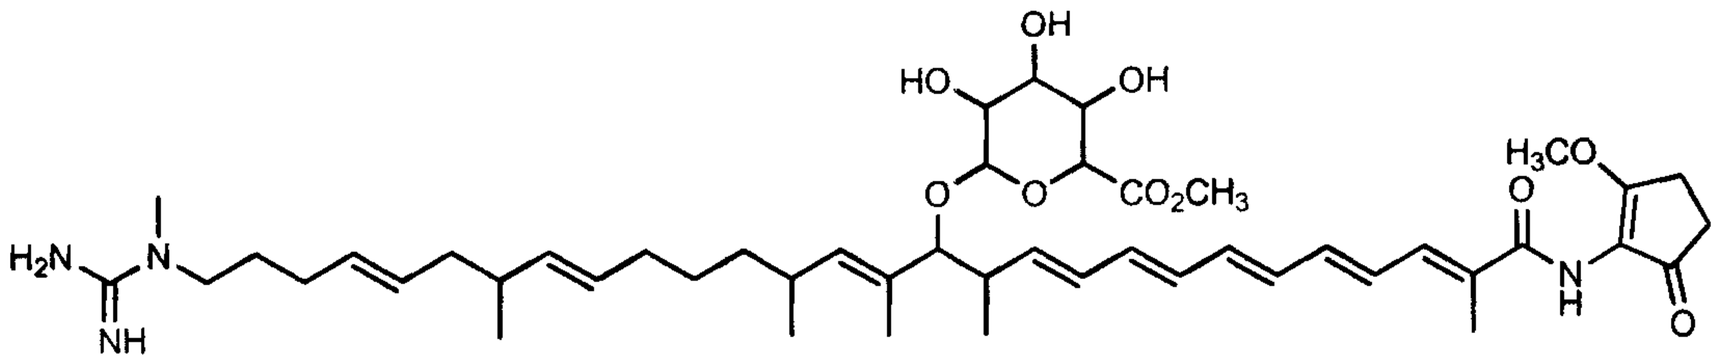
Compound 2;



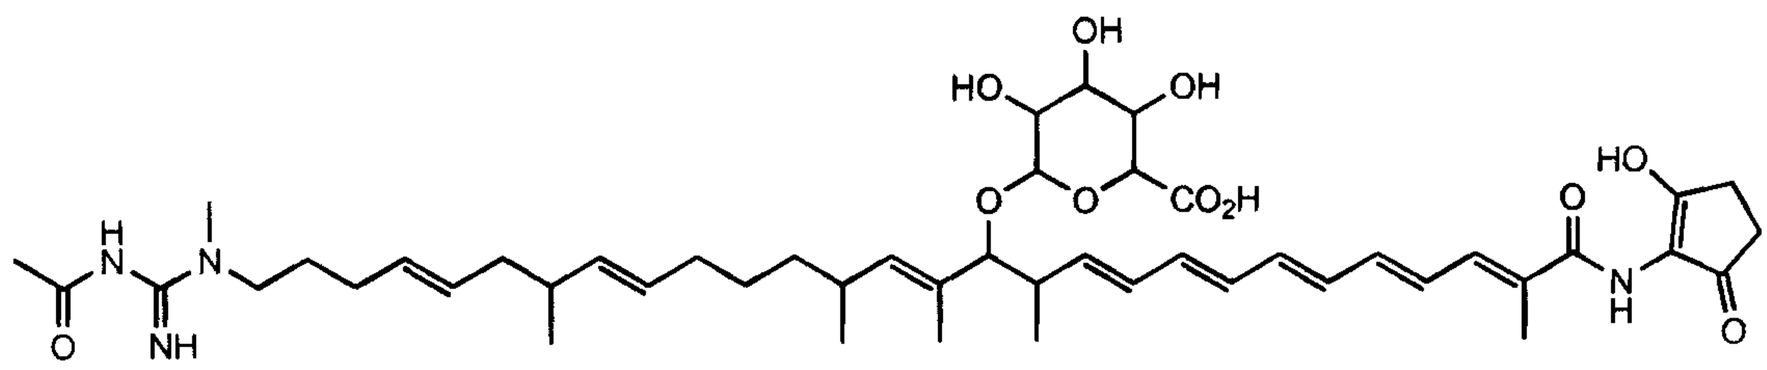
Compound 3;



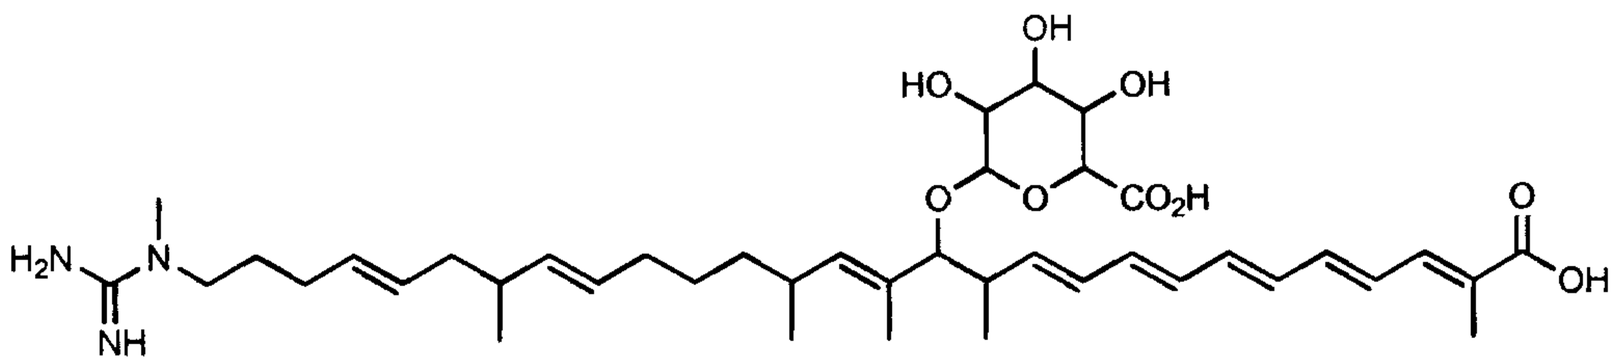
Compound 4;



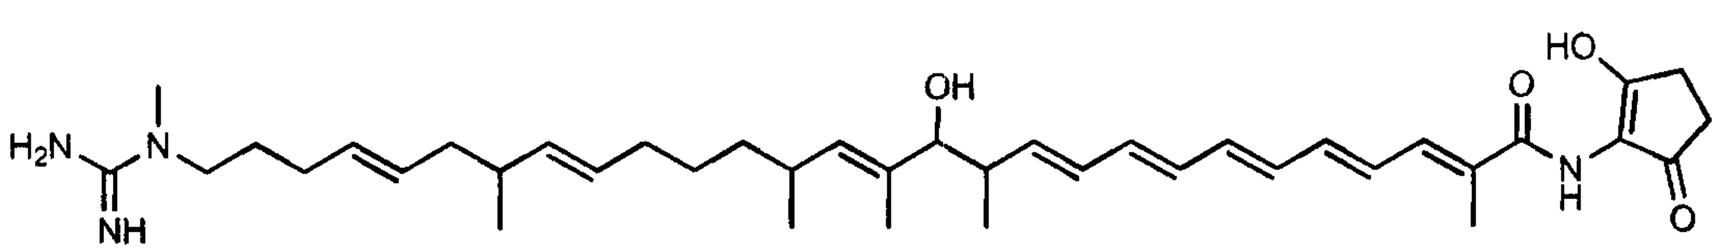
Compound 5;



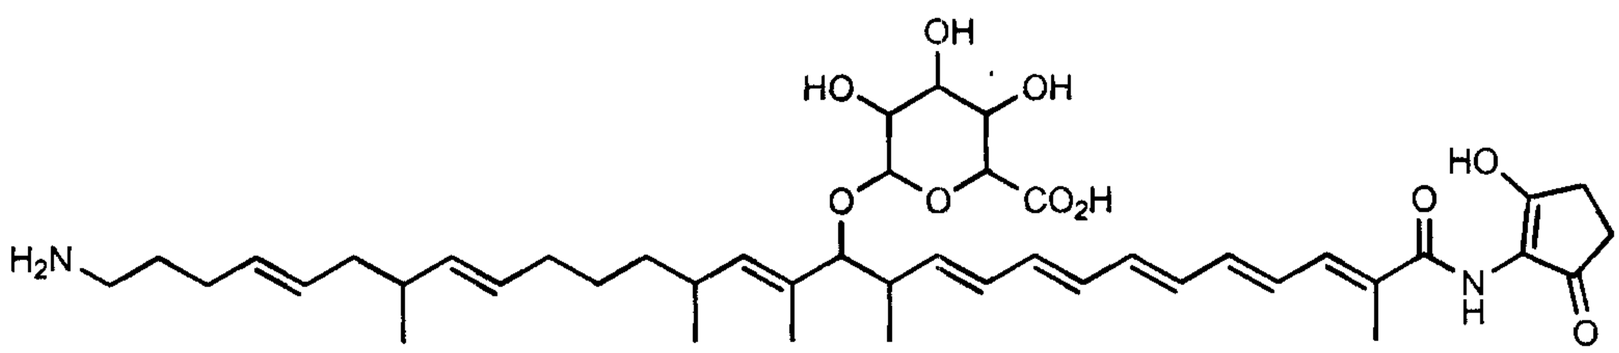
Compound 6;



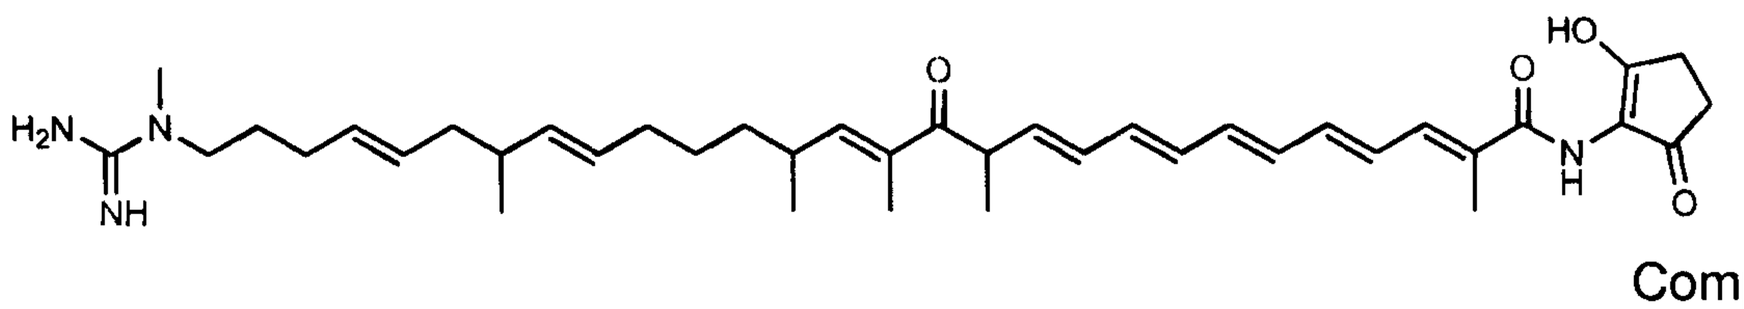
Compound 7;



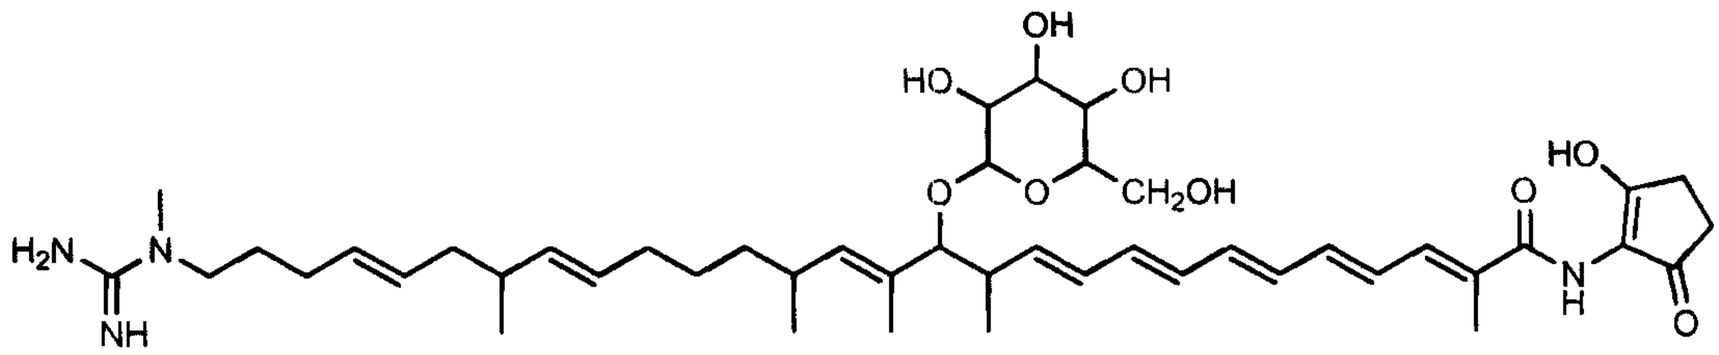
Compound 8;



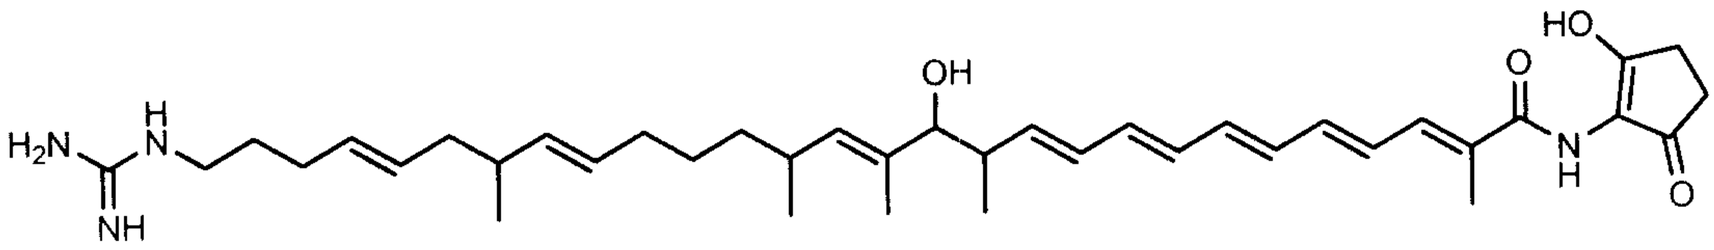
Compound 9;



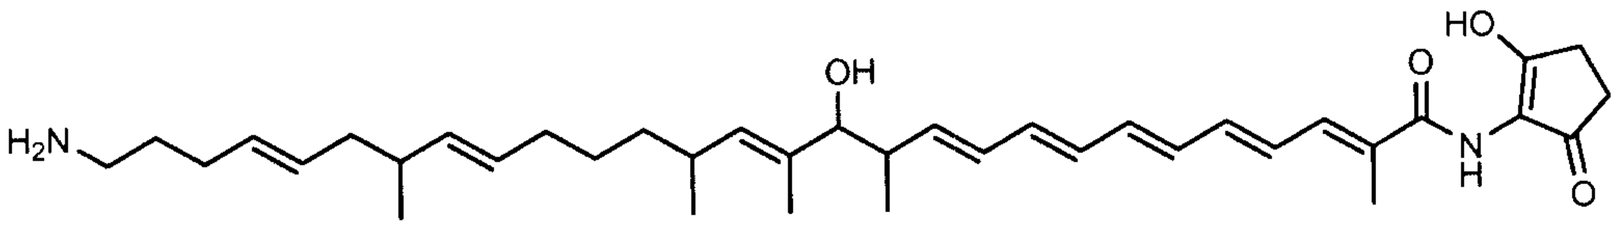
Compound 10;



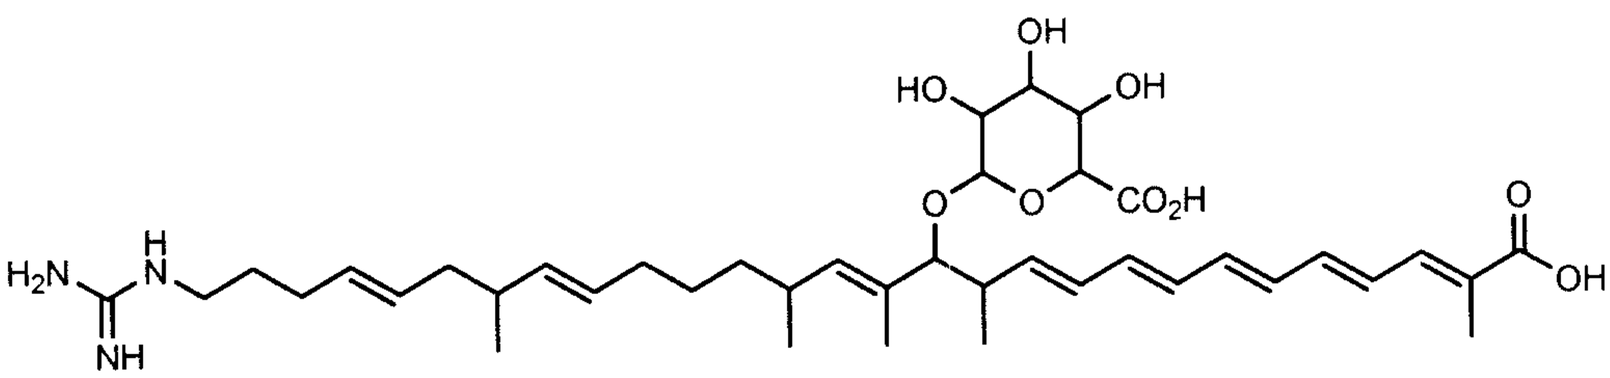
Compound 11;



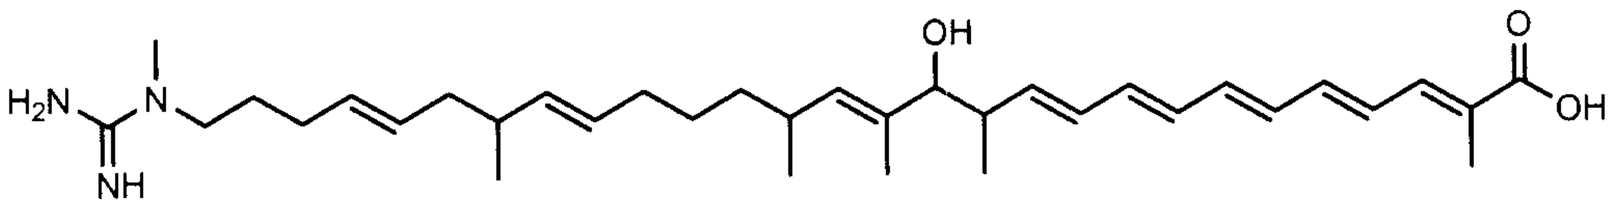
Compound 12;



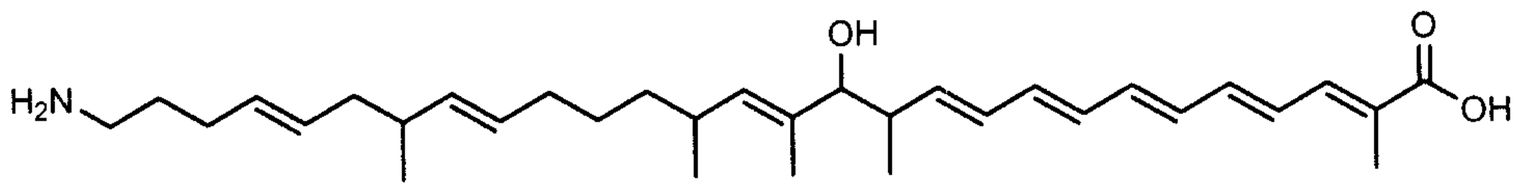
Compound 13;



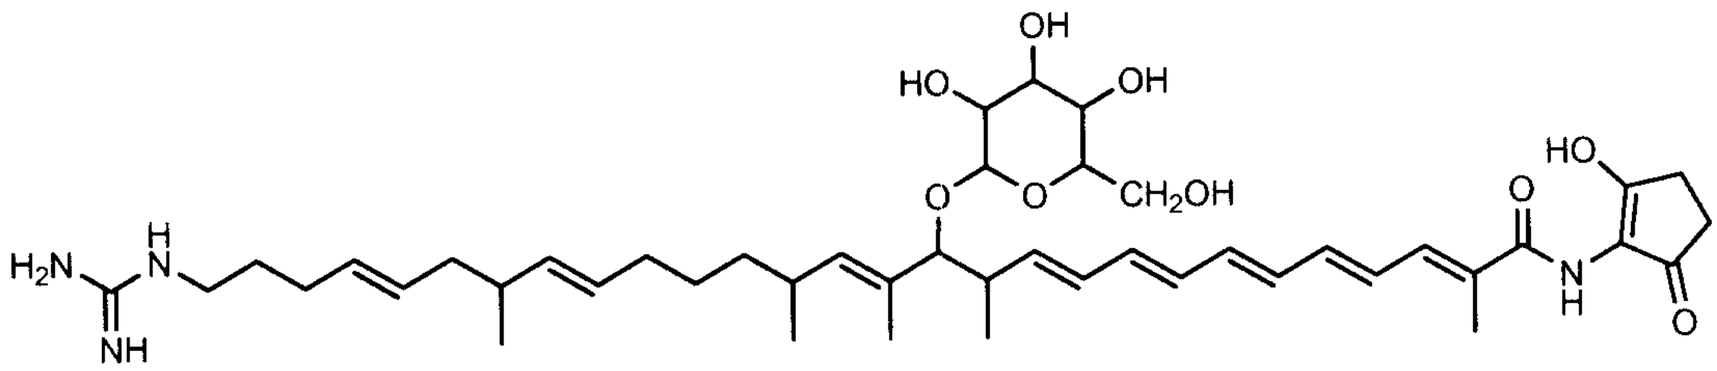
Compound 14;



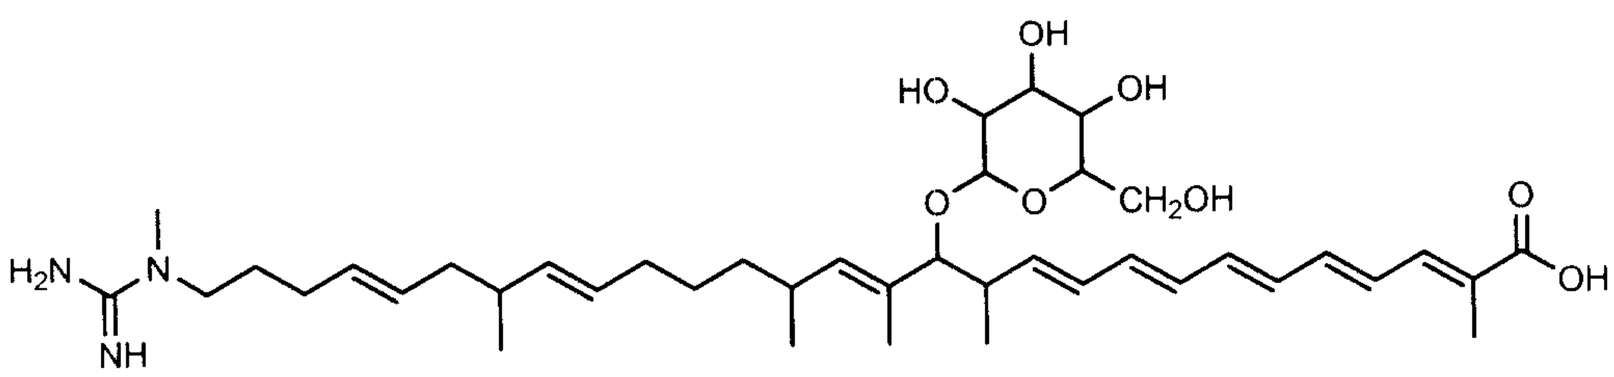
Compound 15;



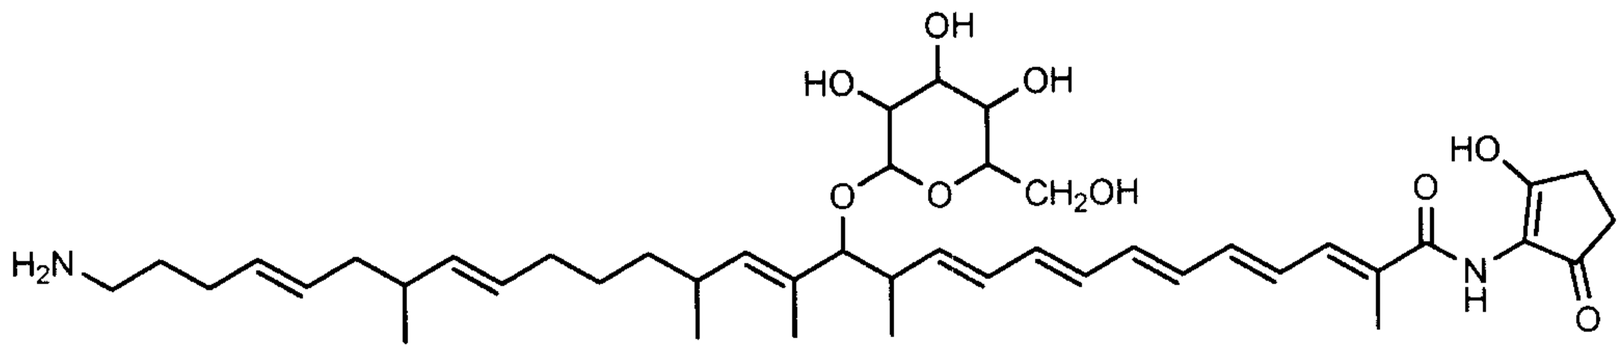
Compound 16;



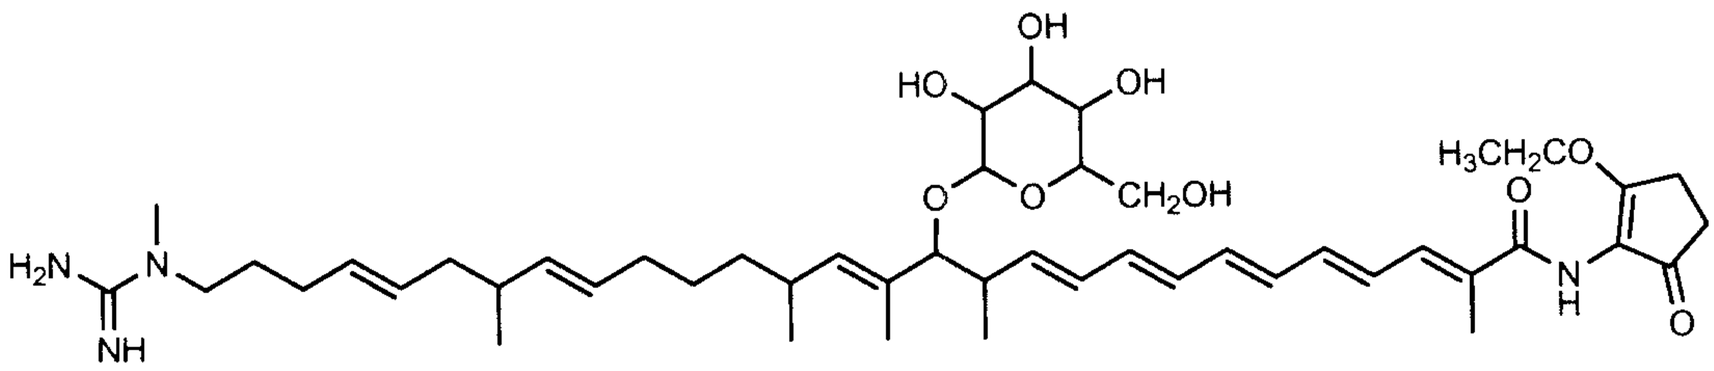
Compound 17;



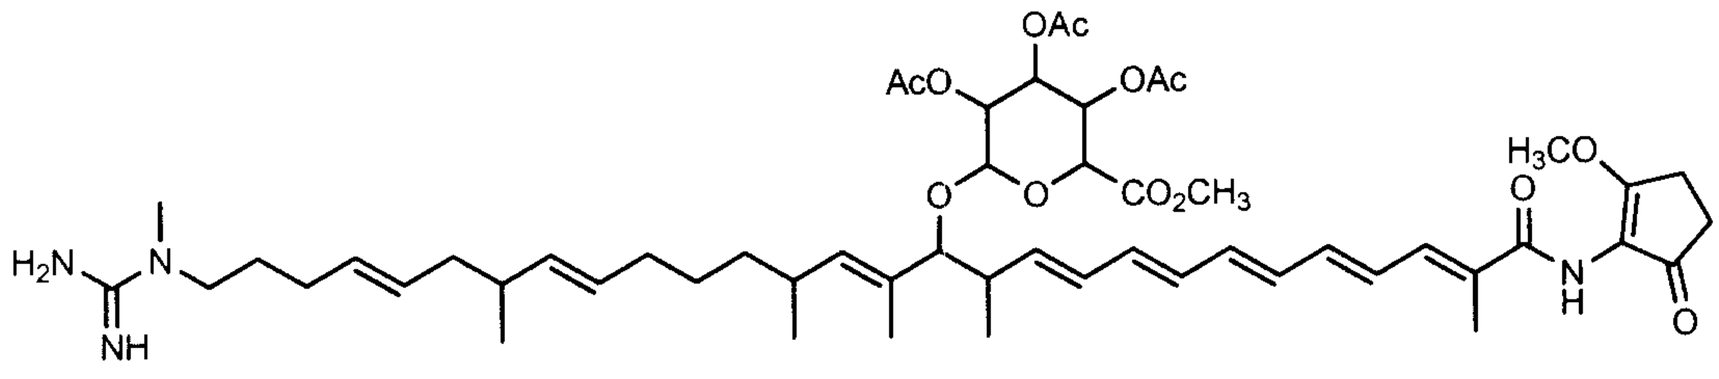
Compound 18;



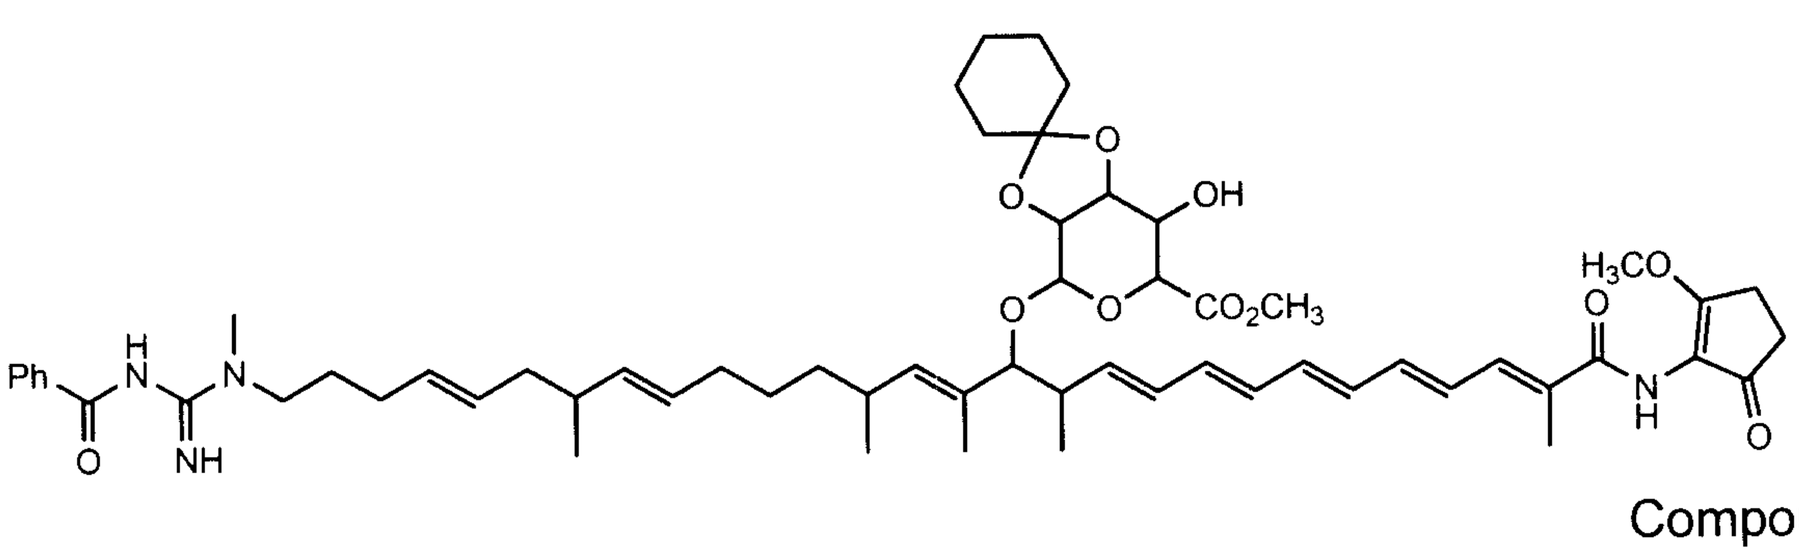
Compound 19;



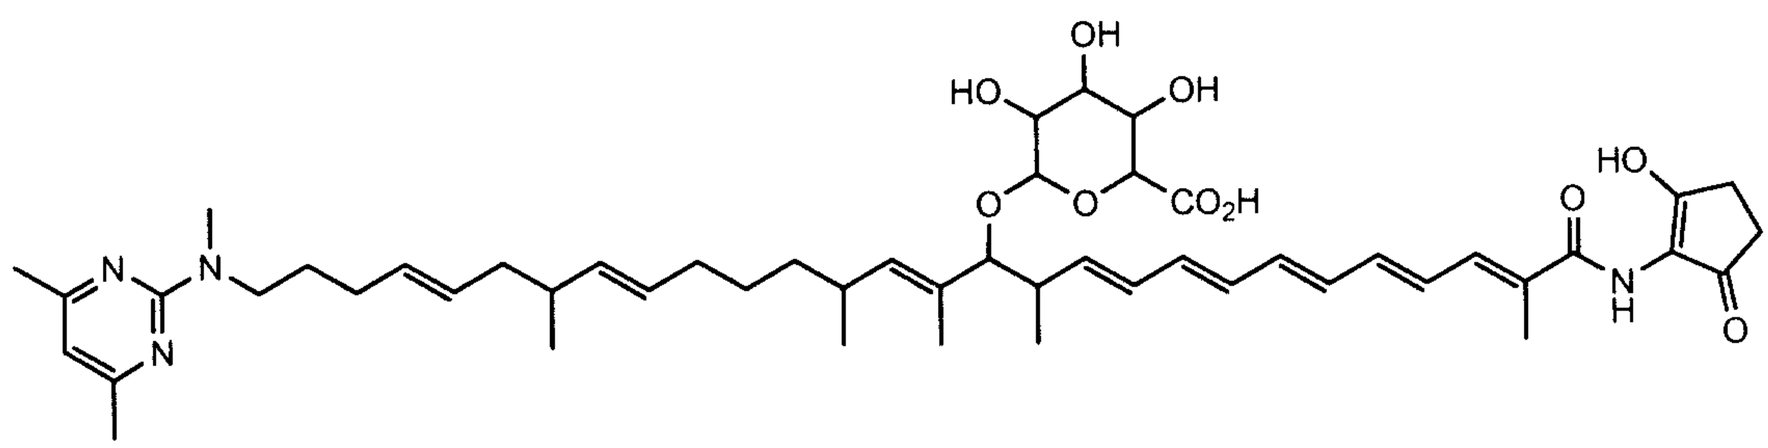
Compound 20;



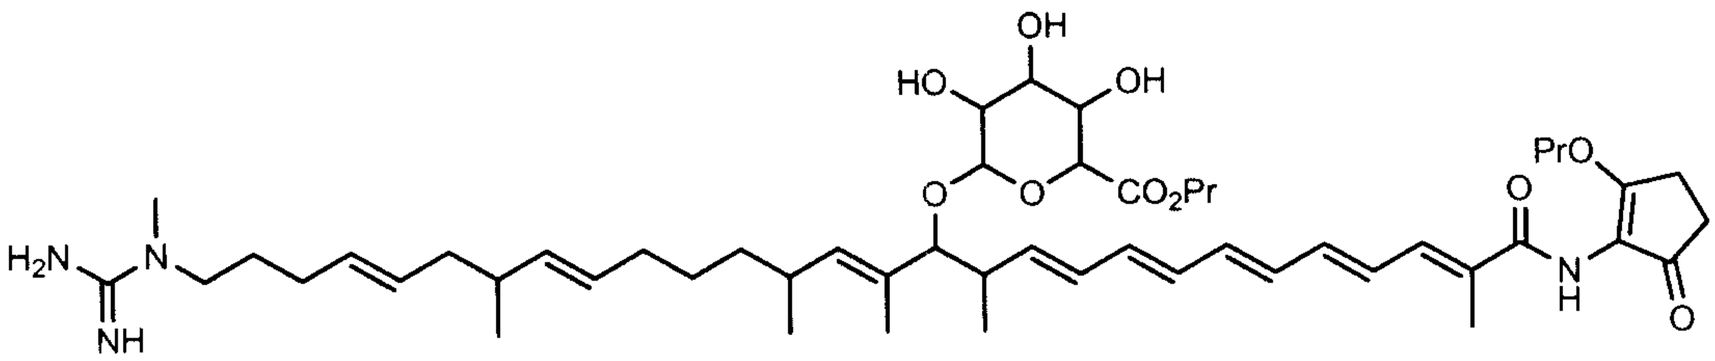
Compound 21;



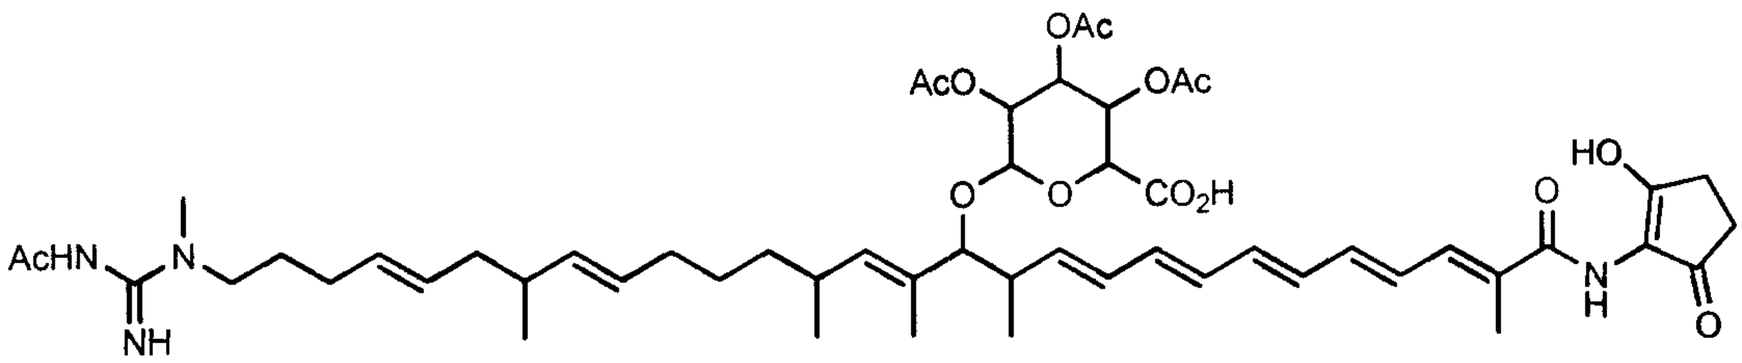
Compound 22;



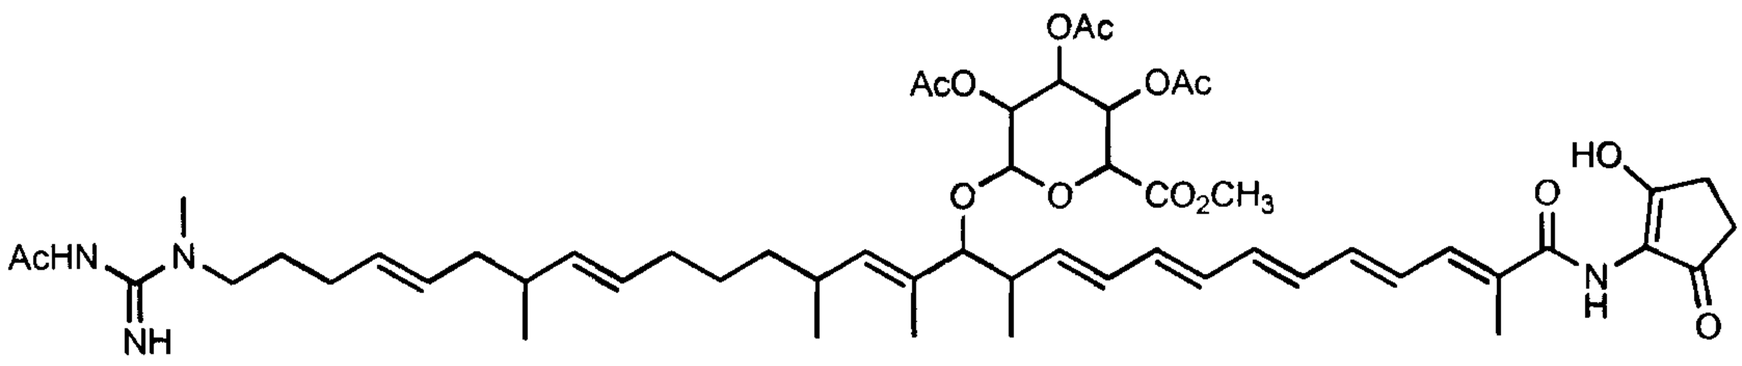
Compound 23;



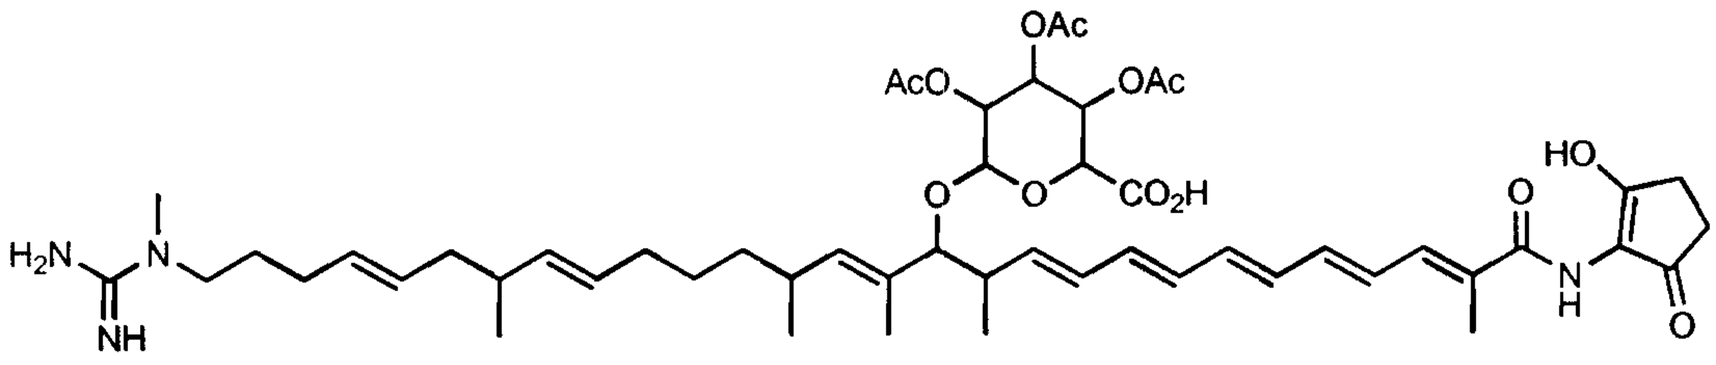
Compound 24;



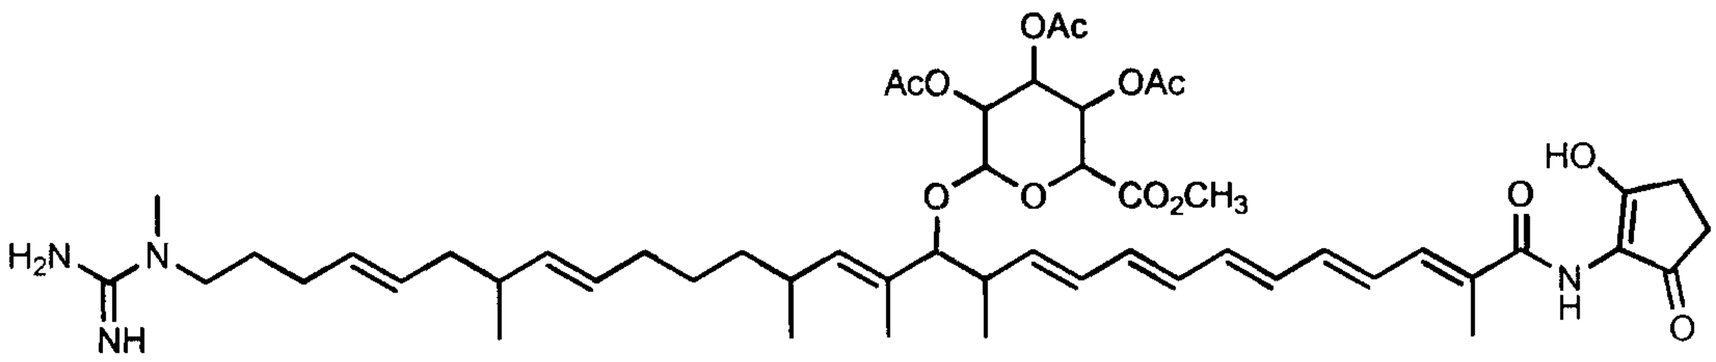
Compound 25;



Compound 26;



Compound 27 and



Compound 28;

or a pharmaceutically acceptable salt or prodrug of any one of Compound 1-28.

In a further aspect, the invention relates to a pharmaceutical composition comprising of a compound of Formula I, or a pharmaceutically acceptable salt or prodrug thereof, with a pharmaceutically acceptable carrier.

In an additional embodiment the invention relates to pharmaceutical compositions of polyene polyketides of the invention, comprising a therapeutically effective amount of the compound of Formula I, or a pharmaceutically acceptable salt or prodrug thereof, and a pharmaceutically acceptable carrier.

The present invention further encompasses methods for producing the compounds of Formula I and related compounds, the method comprising: (a) cultivating

Amycolatopsis sp. strain under aerobic conditions in a nutrient medium comprising at least one source of carbon atoms and at least one source of nitrogen atoms, (b) isolating a compound of Formula I, from the bacteria cultivated in (a). In an aspect of the invention, the *Amycolatopsis orientalis* strain useful in the methods of the invention may be ATCC™ 43491 or a mutant thereof. In another embodiment, the strain is the *Amycolatopsis orientalis* strain deposited at the International Depositary Authority of Canada (IDAC), Bureau of Microbiology, Health Canada, 1015 Arlington Street, Winnipeg, Manitoba, Canada R3E 3R2, and having accession no. 220604-01.

In another aspect of the invention, the method of producing the compounds of Formula I comprises: (a) and (b) as described above and (c) chemically modifying the compound isolated in (b). In a further embodiment, the polyene polyketide generates a ^{1}H NMR spectra essentially as shown in any one of Figures 4 to 10. In a further embodiment, the polyene polyketide is any one of Compounds 1 to 7. In a further embodiment, the nutrient medium is selected from the media of Table 1.

The invention further provides a process for producing a polyene polyketide of the invention comprising cultivation of an *Amycolatopsis* strain in a nutrient medium comprising at least one source of carbon atoms and at least one source of nitrogen atoms, and isolation and purification of the polyene polyketide. In another embodiment, the strain is an *Amycolatopsis orientalis*. In a further embodiment, the strain is *Amycolatopsis orientalis* ATCC™ 43491 or a mutant thereof. In a further embodiment, the strain is the *Amycolatopsis orientalis* strain having accession no. 220604-01 deposited at the International Depositary Authority of Canada. In one embodiment, the carbon and nitrogen atoms sources are chosen from the components of Table 1. In a further embodiment, the nutrient medium is selected from the media of Table 1. In a further embodiment, the cultivation is carried out under aerobic conditions. In another embodiment, the cultivation is carried out at a temperature ranging from about 18°C to about 40°C. In another embodiment, the temperature range is 18°C to 29°C. In another embodiment, the cultivation is carried out at a pH ranging from about 6 to about 9.

The invention further provides polyene polyketides of Formula I that are a derivative or structural analog of any one of Compounds 1 to 7. In one embodiment the polyene polyketides of Formula I are produced by post-biosynthesis chemical modification of any one of Compounds 1 to 7. In another embodiment, the polyene

polyketides generate a ^{1}H NMR spectra essentially as shown in any one of Figures 4 to 10.

The invention further provides an *Amycolatopsis orientalis* strain having accession no. 220604-01 deposited at the International Depositary Authority of Canada.

The invention further provides Compounds 1 to 7, compounds of Formula I, or pharmaceutically acceptable salts or prodrugs thereof, for use as pharmaceuticals for the treatment of a bacterial infection in a subject. In another aspect, the invention provides the use of any one of Compounds 1 to 7, compounds of Formula I, or pharmaceutically acceptable salts or prodrugs thereof, for the manufacture of a medicament for the treatment of a bacterial infection in a subject.

The invention also provides methods of inhibiting bacterial cell growth, which comprise contacting said bacterial cell with a compound of Formula I, or a pharmaceutically acceptable salt or prodrug thereof. The invention further encompasses methods for treating a bacterial infection in a subject, comprising administering to said subject suffering from said bacterial infection, a therapeutically effective amount of a compound of Formula I, or a pharmaceutically acceptable salt or prodrug thereof. Examples of bacteria organisms that may be treated or inhibited according to the methods of the invention include: *Streptococcus pneumoniae, Streptococcus pyogenes, Enterococcus faecalis*, *Enterococcus faecium, Klebsiella pneumoniae, Enterobacter spp., Proteus spp., Pseudomonas aeruginosa, E. coli, Serratia marcesens, Staphylococcus aureus,* Coagulase negative *Staphylococcus, Haemophilus infuenzae, Bacillus anthracis, Mycoplasma pneumoniae*, and *Staphylococcus epidermidis*.

The present invention also provides the biosynthetic locus responsible for producing the compounds of Formula I. Thus the invention provides polynucleotides and polypeptides useful in the production and engineering of compounds of Formula I. The present invention provides recombinant DNA vectors that encode all or part of the PKS enzymes useful for the production of polyketide compounds of Formula I. The invention also provides nucleic acid compounds that encode the specific domains of the PKS system useful for the production of polyketides of compound of Formula I. The recombinant DNA vectors, PKS enzymes, PKS systems and nucleic acid compounds encoding the domains of the PKS systems of the invention can be readily used, alone or in combination with nucleic acids encoding other PKS

domains, as intermediates in the construction of recombinant vectors that encode all or part of PKS enzymes that make novel polyketides selected from the compounds of Formula I.

The invention also provides isolated nucleic acids that encode all or part of one or more modules of the PKSs of the invention, each module comprising a ketosynthase activity, an acyl transferase activity, and an acyl carrier protein activity. The invention also provides isolated nucleic acids that encode all or part of a PKS loader module comprising an acyl transferase activity and an acyl carrier protein activity. Thus, in one aspect, the invention provides an isolated, purified or enriched nucleic acid encoding a domain of a polyketide synthase system for production of a polyene polyketide of claim 1, said nucleic acid comprising a sequence selected from the group consisting of: a nucleic acid encoding the acyl carrier protein of residues 47-109 of SEQ ID NO: 38; a nucleic acid encoding an acyl carrier protein having at least 69% identity to residues 47-109 of SEQ ID NO: 38; a nucleic acid encoding the acyl carrier protein of residues 1691-1753 of SEQ ID NO: 38; a nucleic acid encoding an acyl carrier protein having at least 73% identity to residues 1691-1753 of SEQ ID NO: 38; a nucleic acid encoding the acyl carrier protein of residues 3696-3758 of SEQ ID NO: 38; a nucleic acid encoding an acyl carrier protein having at least 77% identity to residues 3696-3758 of SEQ ID NO: 38; a nucleic acid encoding the acyl carrier protein of residues 1574-1636 of SEQ ID NO: 40; a nucleic acid encoding an acyl carrier protein having at least 78% identity to residues 1574-1636 of SEQ ID NO: 40; a nucleic acid encoding the acyl carrier protein of residues 3545-3607 of SEQ ID NO: 40; a nucleic acid encoding an acyl carrier protein having at least 76% identity to residues 3545-3607 of SEQ ID NO: 40; a nucleic acid encoding the acyl carrier protein of residues 5577-5639 of SEQ ID NO: 40; a nucleic acid encoding an acyl carrier protein having at least 78% identity to residues 5577-5639 of SEQ ID NO: 40; a nucleic acid encoding the acyl carrier protein of residues 1593-1655 of SEQ ID NO: 42; a nucleic acid encoding an acyl carrier protein having at least 76% identity to 1593-1655 of SEQ ID NO: 42; a nucleic acid encoding the acyl carrier protein of residues 1444-1506 of SEQ ID NO: 44; a nucleic acid encoding an acyl carrier protein having at least 82% identity to residues 1444-1506 of SEQ ID NO: 44; a nucleic acid encoding the acyl carrier protein of residues 3122-3184 of SEQ ID NO: 44; a nucleic acid encoding an acyl carrier protein having at least 69% identity to

residues 3122-3184 of SEQ ID NO: 44; a nucleic acid encoding the acyl carrier protein of residues 1597-1659 of SEQ ID NO: 46; a nucleic acid encoding an acyl carrier protein having at least 73% identity to residues 1597-1659 of SEQ ID NO: 46; a nucleic acid encoding the acyl carrier protein of residues 3235-3297 of SEQ ID NO: 46; a nucleic acid encoding an acyl carrier protein having at least 71% identity to residues 3235-3297 of SEQ ID NO: 46; a nucleic acid encoding the acyl carrier protein of residues 4956-5018 of SEQ ID NO: 46; a nucleic acid encoding an acyl carrier protein having at least 72% identity to residues 4956-5018 of SEQ ID NO: 38; a nucleic acid encoding the acyl carrier protein of residues 1582-1644 of SEQ ID NO: 48; a nucleic acid encoding an acyl carrier protein having at least 75% identity to residues 1582-1644 of SEQ ID NO: 48; a nucleic acid encoding the ketosynthase domain of residues 130-554 of SEQ ID NO: 38; a nucleic acid encoding a ketosynthase domain having at least 76% identity to residues 130-554 of SEQ ID NO: 38; a nucleic acid encoding the ketosynthase domain of residues 1771-2195 of SEQ ID NO: 38, a nucleic acid encoding a ketosynthase domain having at least 78% identity to residues 1771-2195 of SEQ ID NO: 38; a nucleic acid encoding the ketosynthase domain of residues 39-463 of SEQ ID NO: 40; a nucleic acid encoding a ketosynthase domain having at least 77% identity to residues 39-463 of SEQ ID NO: 40; a nucleic acid encoding the ketosynthase domain of residues 1657-2082 of SEQ ID NO: 40; a nucleic acid encoding a ketosynthase domain having at least 80% identity to residues 1657-2082 of SEQ ID NO: 40; a nucleic acid encoding the ketosynthase domain of residues 3628-4052 of SEQ ID NO: 40; a nucleic acid encoding a ketosynthase domain having at least 78% identity to residues 3628-4052 of SEQ ID NO: 40; a nucleic acid encoding the ketosynthase domain of residues 34-458 of SEQ ID NO: 42; a nucleic acid encoding a ketosynthase domain having at least 77% identity to residues 34-458 of SEQ ID NO: 42; a nucleic acid encoding the ketosynthase domain of residues 34-461 of SEQ ID NO: 44; a nucleic acid encoding a ketosynthase domain having at least 78% identity to residues 34-461of SEQ ID NO: 44; a nucleic acid encoding the ketosynthase domain of residues 1528-1952 of SEQ ID NO: 44; a nucleic acid encoding a ketosynthase domain having at least 76% identity to residues 1528-1952 of SEQ ID NO: 44; a nucleic acid encoding the ketosynthase domain of residues 34-460 of SEQ ID NO: 46; a nucleic acid encoding a ketosynthase domain having at least 77% identity to residues 34-460 of SEQ ID

NO: 46; a nucleic acid encoding the ketosynthase domain of residues 1682-2104 of SEQ ID NO: 46; a nucleic acid encoding a ketosynthase domain having at least 79% identity to residues 1682-2104 of SEQ ID NO: 46; a nucleic acid encoding the ketosynthase domain of residues 3317-3741 of SEQ ID NO: 46; a nucleic acid encoding a ketosynthase domain having at least 79% identity to residues 3317-3741 of SEQ ID NO: 46; a nucleic acid encoding the ketosynthase domain of residues 34-461 of SEQ ID NO: 48; a nucleic acid encoding a ketosynthase domain having at least 78% identity to residues 35-461of SEQ ID NO: 48; a nucleic encoding the acyl transferase domain of residues 567-990 of SEQ ID NO: 38; a nucleic acid encoding an acyl transferase domain having at least 58%identity to residues 567-990 of SEQ ID NO: 38; a nucleic acid encoding the acyl transferase domain of residues 2211-2638 of SEQ ID NO: 38; a nucleic acid encoding an acyl transferase domain having at least 57% identity to residues 2211-2638 of SEQ ID NO: 38; a nucleic encoding the acyl transferase domain of residues 474-872 of SEQ ID NO: 40; a nucleic acid encoding an acyl transferase domain having at least 60%identity to residues 474-872 of SEQ ID NO: 38; a nucleic encoding the acyl transferase domain of residues 2093-2495 of SEQ ID NO: 40; a nucleic acid encoding an acyl transferase domain having at least 61%identity to residues 2093-2495 of SEQ ID NO: 40; a nucleic encoding the acyl transferase domain of residues 4068-4489 of SEQ ID NO: 40; a nucleic acid encoding an acyl transferase domain having at least 59%identity to residues 4068-4489 of SEQ ID NO: 40; a nucleic encoding the acyl transferase domain of residues 475-892 of SEQ ID NO: 42; a nucleic acid encoding an acyl transferase domain having at least 57% identity to residues 475-892 of SEQ ID NO: 42; a nucleic encoding the acyl transferase domain of residues 478-905 of SEQ ID NO: 44; a nucleic acid encoding an acyl transferase domain having at least 58% identity to residues 478-905 of SEQ ID NO: 44; a nucleic encoding the acyl transferase domain of residues 1963-2383 of SEQ ID NO: 44; a nucleic acid encoding an acyl transferase domain having at least 58% identity to residues 1963-2383 of SEQ ID NO: 44; a nucleic encoding the acyl transferase domain of residues 472-883 of SEQ ID NO: 46; a nucleic acid encoding an acyl transferase domain having at least 61% identity to residues 472-883 of SEQ ID NO: 46; a nucleic encoding the acyl transferase domain of residues 2115-2523 of SEQ ID NO: 46; a nucleic acid encoding an acyl transferase domain having at least 63% identity to residues 2115-

2523 of SEQ ID NO: 46; a nucleic encoding the acyl transferase domain of residues 3752-4181 of SEQ ID NO: 46; a nucleic acid encoding an acyl transferase domain having at least 59% identity to residues 3752-4181 of SEQ ID NO: 46; a nucleic encoding the acyl transferase domain of residues 475-883 of SEQ ID NO: 48; a nucleic acid encoding an acyl transferase domain having at least 57% identity to residues 475-883 of SEQ ID NO: 48; a nucleic acid encoding the dehydratase domain of residues 1001-1101 of SEQ ID NO: 38; a nucleic acid encoding a dehydratase domain of having at least 64% identity to residues 1001-1101 of SEQ ID NO: 38; a nucleic acid encoding the dehydratase domain of residues 2647-2753 of SEQ ID NO: 38; a nucleic acid encoding a dehydratase domain of residues 2647-2753 of SEQ ID NO: 38; a nucleic acid encoding the dehydratase domain of residues 883-990 of SEQ ID NO: 40; a nucleic acid encoding a dehydratase domain of having at least 67% identity to residues 883-990 of SEQ ID NO: 40; a nucleic acid encoding the dehydratase domain of residues 2507-2614 of SEQ ID NO: 40; a nucleic acid encoding a dehydratase domain of having at least 69% identity to residues 2507-2614 of SEQ ID NO: 40; a nucleic acid encoding the dehydratase domain of residues 4497-4604 of SEQ ID NO: 40; a nucleic acid encoding a dehydratase domain of having at least 56% identity to residues 4497-4604 of SEQ ID NO: 40; a nucleic acid encoding the dehydratase domain of residues 901-1006 of SEQ ID NO: 42; a nucleic acid encoding a dehydratase domain of having at least 64% identity to residues 901-1006 of SEQ ID NO: 42; a nucleic acid encoding the dehydratase domain of residues 2395-2502 of SEQ ID NO: 44; a nucleic acid encoding a dehydratase domain of having at least 63% identity to residues 2395-2502 of SEQ ID NO: 44; a nucleic acid encoding the dehydratase domain of residues 895-1002 of SEQ ID NO: 46; a nucleic acid encoding a dehydratase domain of having at least 65% identity to residues 895-1002 of SEQ ID NO: 46; a nucleic acid encoding the dehydratase domain of residues 2534-2641 of SEQ ID NO: 46; a nucleic acid encoding a dehydratase domain of having at least 66% identity to residues 2534-2641 of SEQ ID NO: 46; a nucleic acid encoding the dehydratase domain of residues 4193-4300 of SEQ ID NO: 46; a nucleic acid encoding a dehydratase domain of having at least 65% identity to residues 4193-4300 of SEQ ID NO: 46; a nucleic acid encoding the dehydratase domain of residues 892-999 of SEQ ID NO: 48; a nucleic acid encoding a dehydratase domain of having at least 61% identity to residues 892-999 of SEQ ID

NO: 61; a nucleic acid encoding the ketoreductase domain of residues 1421-1628 of SEQ ID NO: 38; a nucleic acid encoding a ketoreductase domain having at least 62% identity to residues 1421-1628 of SEQ ID NO: 38; a nucleic acid encoding the ketoreductase domain of residues 3405-3622 of SEQ ID NO: 38; a nucleic acid encoding a ketoreductase domain having at least 69% identity to residues 3405-3622 of SEQ ID NO: 38; a nucleic acid encoding the ketoreductase domain of residues 1291-1501 of SEQ ID NO: 40; a nucleic acid encoding a ketoreductase domain having at least 64% identity to residues 1291-1501 of SEQ ID NO: 40; a nucleic acid encoding the ketoreductase domain of residues 3253-3470 of SEQ ID NO: 40; a nucleic acid encoding a ketoreductase domain having at least 69% identity to residues 3253-3470 of SEQ ID NO: 40; a nucleic acid encoding the ketoreductase domain of residues 5285-5502 of SEQ ID NO: 40; a nucleic acid encoding a ketoreductase domain having at least 71% identity to residues 5285-5502 of SEQ ID NO: 40; a nucleic acid encoding the ketoreductase domain of residues 1309-1517 of SEQ ID NO: 42; a nucleic acid encoding a ketoreductase domain having at least 62% identity to residues 1309-1517 of SEQ ID NO: 42; a nucleic acid encoding the ketoreductase domain of residues 1157-1366 of SEQ ID NO: 44; a nucleic acid encoding a ketoreductase domain having at least 69% identity to residues 1157-1366 of SEQ ID NO: 44; a nucleic acid encoding the ketoreductase domain of residues 2837-3048 of SEQ ID NO: 44; a nucleic acid encoding a ketoreductase domain having at least 67% identity to residues 2837-3048 of SEQ ID NO: 44; a nucleic acid encoding the ketoreductase domain of residues 1323-1523 of SEQ ID NO: 46; a nucleic acid encoding a ketoreductase domain having at least 63% identity to residues 1323-1523 of SEQ ID NO: 46; a nucleic acid encoding the ketoreductase domain of residues 2957-3166 of SEQ ID NO: 46; a nucleic acid encoding a ketoreductase domain having at least 65% identity to residues 2957-3166 of SEQ ID NO: 46; a nucleic acid encoding the ketoreductase domain of residues 4669-4879 of SEQ ID NO: 46; a nucleic acid encoding a ketoreductase domain having at least 66% identity to residues 4669-4879 of SEQ ID NO: 66; a nucleic acid encoding the ketoreductase domain of residues 1305-1512 of SEQ ID NO: 48; a nucleic acid encoding a ketoreductase domain having at least 61% identity to residues 1305-1512 of SEQ ID NO: 48; a nucleic acid encoding the enoyl reductase domain of residues 3060-3401 of SEQ ID NO: 38; a nucleic acid encoding an enoyl reductase domain

having at least 62% identity to residues 3060-3401 of SEQ ID NO: 38; a nucleic acid encoding the enoyl reductase domain of residues 2908-3249 of SEQ ID NO: 40; a nucleic acid encoding an enoyl reductase domain having at least 65% identity to residues 2908-3249 of SEQ ID NO: 40; a nucleic acid encoding the enoyl reductase domain of residues 4933-5281 of SEQ ID NO: 40; a nucleic acid encoding an enoyl reductase domain having at least 64% identity to residues 4933-5281 of SEQ ID NO: 40; a nucleic acid encoding the thioesterase domain of residues 1709-1921 of SEQ ID NO: 48; a nucleic acid encoding a thioesterase domain having at least 47% identity to residues 1709-1921 of SEQ ID NO: 48.

The invention provides an isolated nucleic acid that encodes one or more open reading frames of PKS genes of the invention. Thus, in one aspect, the invention provides an isolated, purified or enriched nucleic acid encoding a polyketide synthase, useful in the production of polyene polyketide, said nucleic comprising a sequence selected from the group consisting of SEQ ID NOS: 38, 40, 42, 44, 46, 48 and a nucleic acid encoding a polyketide synthase selected from SEQ ID NOS: 37, 39, 41, 43, 45, 47 and a nucleic acid having at least 80% identity to a nucleic acid of a) or b). The invention also provides recombinant expression vectors containing these nucleic acids.

The invention provides a method of preparing polyketide compounds of Formula I, said method comprising transforming a host cell with a recombinant DNA vector that encodes at least one module of a PKS, said method comprising transforming a host cell with a recombinant DNA vector that encodes at least one module of a PKS, said module comprising at least one PKS domain of the invention, and culturing said host cell under conditions such that said PKS is produced and catalyzes synthesis of said polyketide. The invention also provides a method of preparing polyketide compounds of Formula I, said method comprising transforming a host cell with a recombinant DNA vector that encodes at least one gene of the invention, and culturing said host cell under conditions such that said polyketide is produced. In one aspect, the method is practiced with a *Streptomyces* host cell. In another aspect, the polyketide produced is a compound of Formula I. In another aspect, the polyketide produced is a polyketide related in structure to a compound described in any one of Examples 17 to 20.

The invention provides a set of genes in recombinant form sufficient for the synthesis of a compound of Formula I in a heterologous host cell. These genes and the methods of the invention enable one to create recombinant host cells with the ability to produce polyketides.

The invention provides recombinant PKS genes that produce a variety of polyketides that cannot be readily synthesized by chemical methodology alone. Moreover the present invention provides polyketides, some of which are produced only by fermentation and others of which are produced by fermentation and chemical modification. The invention allows direct manipulation of the genes and proteins for production of the compounds of Formula I via genetic engineering of the enzymes involved in the biosynthesis of a polyketide according to the invention.

The present invention provides recombinant DNA vectors that encode all or part of the PKS enzymes useful for the production of a polyketide of Formula I. The invention also provides nucleic acid compounds that encode the various domains of PKS systems useful for the production of a polyketide of Formula I. The recombinant DNA vectors, PKS enzymes, PKS systems and nucleic acid compounds encoding the domains of the PKS systems of the invention can be readily used, alone or in combination with nucleic acids encoding other PKS domains, as intermediates in the construction of recombinant vectors that encode all or part of PKS enzymes that make novel polyketides selected from the compounds of Formula I.

The invention also provides isolated nucleic acids that encode all or part of one or more modules of the PKSs of the invention, each module comprising a ketosynthase activity, an acyl transferase activity, and an acyl carrier protein activity. The invention also provides isolated nucleic acids that encode all or part of a PKS loader module comprising an acyl transferase activity and an acyl carrier protein activity. The invention provides an isolated nucleic acid that encodes one or more open reading frames of PKS genes of the invention. The invention also provides recombinant expression vectors containing these nucleic acids.

The invention provides a method of preparing a polyketide of Formula I, said method comprising transforming a host cell with a recombinant DNA vector that encodes at least one module of a PKS, said method comprising transforming a host cell with a recombinant DNA vector that encodes at least one module of a PKS, said module comprising at least one PKS domain from the PKS system of the invention, and

culturing said host cell under conditions such that said PKS is produced and catalyzes synthesis of said polyketide. In one aspect, the method is practiced using an *Amycolatopsis orientalis* organism for homologous expression of the modified endogenous gene cluster. In another aspect, the method is practiced with a *Streptomyces* host cell. The invention further provides a set of genes in recombinant form sufficient for the synthesis of a compound of Formula I. In one aspect the genes reside in an Amycolatopsis orientalis organism for homologous expression of the endogenous gene cluster. In another aspect, a Streptomyces host cell is transformed with a recombinant DNA vector containing the set of genes.

Thus, the invention provides recombinant PKS genes that produce a variety of polyketides that cannot be readily synthesized by chemical methodology alone. Moreover the present invention provides polyketides, some of which are produced only by fermentation and others of which are produced by fermentation and chemical modification.

Figure 11: biosynthetic locus producing compounds of Formula I in *Amycolatopsis orientalis*, showing a scale in base pairs units; the position of the three sequence of contiguous nucleic acids of SEQ ID NOS: 1, 24 and 49; the position and orientation of the 27 open reading frames of the biosynthetic locus identified by ORF number with the six polyketide synthase ORFs identified with PKSE designation; and the coverage of the biosynthetic locus by cosmids having deposit accession nos: IDAC 050903-01, IDAC 050903-02, IDAC 050903-03 and IDAC 050903-04.

Figures 12 to 18: multiple amino acid alignments comparing the domains of the polyketide synthase system of the biosynthetic locus for the production of the compounds of Formula I, wherein the asterisks (*) indicate positions which have a single, fully conserved residue, colons (:) indicate that one of the following strong groups is fully conserved: STA, NEQK, NHQK, NDEQ, QHRK, MILV, MILF, HY, and FYW, and periods (.) indicate that one of the following weaker groups is fully conserved: CSA, ATV, SAG, STNK, STPA, SGND, SNDEQK, NDEQHK, NEQHRK, FVLIM, and HFY.

Figures 12a and 12b: amino acid alignment comparing the twelve ketosynthase (KS) domains present in the polyketide synthase (PKS) system of ORFs 18 to 23 (SEQ ID NOS: 37, 39, 41, 43, 45 and 47). The boundaries and key residues of the KS domains were chosen as described by Kakavas *et al.*, *J. Bacteriol.*,179, 7515-7522 (1997) and indicated in black.

Figures 13a, 13b and 13c: amino acid alignment comparing the twelve acyl transferase (AT) domains present in the polyketide synthase system of ORFs 18 to 23 (SEQ ID NOS: 37, 39 41, 43, 45 and 47). The boundaries and key residues of the AT domains were chosen as described by Kakavas *et al.*, *supra* and indicated in black.

Figure 14: amino acid alignment comparing the eleven dehydratase (DH) domains present in the polyketide synthase system of ORFs 18 to 23 (SEQ ID NOS: 37, 39, 41, 43, 45 and 47). The boundaries and key residues of the DH domains were chosen as described by Kakavas *et al. supra* and indicated in black.

Figure 15: amino acid alignment comparing the three enoyl reductase (ER) domains present in ORFs 18 and 19 (SEQ ID NOS: 37 and 39) with the ER domains from

modules 5 and 15 of the nystatin biosynthetic locus as described by Brautaset *et al.*, *Chem. Biol.*, 7, 395-403 (2000). The boundaries and key residues of the ER domain were chosen as described by Kakavas *et al. supra* and indicated in black.

Figure 16: amino acid alignment comparing the twelve ketoreductase (KR) domains present in ORFs 18 to 23 (SEQ ID NOS: 37, 39, 41, 43, 45 and 47). The boundaries and key residues of the KR domains were chosen as described by Kakavas *et al. supra*, and Fisher *et al. Structure Fold Des.*, 8, 339-347 (2000) and indicated in black.

Figure 17: amino acid alignment comparing the thirteen acyl carrier proteins (ACP) domains present in ORFs 18 to 23 (SEQ ID NOS: 37, 39, 41, 43, 45 and 47). The boundaries and key serine residues of the ACP domains were chosen as described by Kakavas *et al. supra* and indicated in black.

Figure 18: amino acid alignment comparing the TE domain present in ORF 23 (SEQ ID NO: 47) with the TE domain from module 7 in the nystatin biosynthetic locus as described by Brautaset *et al. supra*. The boundaries and key residues of the TE domain were chosen as described by Kakavas *et al. supra* and indicated in black.

Figure 19: phylogenetic analysis of the twelve acyl transferase (AT) domains present in ORFs 18 to 23 (SEQ ID NOS: 37, 39, 41, 43, 45 and 47) along with a malonyl-specific and a methylmalonyl-specific AT domain present in modules 3 and 11 respectively of the nystatin PKS system as described by Brautaset *et al. supra*.

Figure 20a: biosynthesis of the 4-guanidino butyryl-CoA component of compounds of Formula I from arginine and involving ORF 7 (SEQ ID NO: 14) and ORF 25 (SEQ ID NO: 52). Figure 20b: biosynthesis of the polyketide core structure of compounds of Formula I involving the polyketide synthase system of ORFs 18 to 23 (SEQ ID NOS: 37, 39, 41, 43, 45 and 47) and incorporation of the 4-guanidino butyryl-CoA component of Figure 20a using ORF 24 (SEQ ID NO: 50).

Figure 21a: biosynthesis of the aminohydroxy-cyclopentenone moiety of compounds of Formula I using ORF 16 (SEQ ID NO: 33) and ORF 17 (SEQ ID NO: 35). Figure 21b: biosynthesis of the glucuronic acid component of compounds of Formula I using ORF 13 (SEQ ID NO: 27). Figure 21c: methylation, glycosylation and amide condensation of the polyketide core structure of compounds of Formula I using ORF 5 (SEQ ID NO: 10), ORF 14 (SEQ ID NO: 29) and ORF 15 (SEQ ID NO: 31) respectively.

Figure 22: inactivation of glycosyltransferase ORF 14 (SEQ ID NO: 29) and sugar oxidoreductase ORF 13 (SEQ ID NO: 27). Figure 22a: inactivation of the glycosyltransferase gene (SEQ ID NO: 30) disrupting the transfer of the sugar moiety onto the backbone of the polyketide core and producing the non-glycosylated Compound 8. Figure 22b: inactivation of sugar oxidoreductase gene product of ORF 13 (SEQ ID NO: 28) followed by transfer of the glucose onto the polyketide backbone chain by the glycosyltransferase gene product of ORF 14 (SEQ ID NO: 29) producing Compound 11.

Figure 23: inactivation of acyltransferase ORF 16 (SEQ ID NO: 33), acyl CoA ligase ORF 17 (SEQ ID NO: 35), or adenylating/condensing synthetase ORF 15 (SEQ ID NO: 31) so as to produce Compound 7.

Figure 24: incorporation of an amidino hydrolase to catalyze the conversion of 4-guanidinobutanamide to γ-amino butanamide resulting in production of Compound 9.

DETAILED DESCRIPTION OF THE INVENTION:

The present invention relates to novel polyene polyketides, exemplified herein as Compound 1, Compound 2 and Compound 7, which are isolated from strains of actinomycetes, *Amycolatopsis* sp. such as *Amycolatopsis orientalis* ATCC™ 43491, or a mutant or a variant thereof.

The invention further relates to pharmaceutically acceptable salts and derivatives of Compound 1, Compound 2 and Compound 7, and to methods for obtaining such compounds. One method of obtaining the compounds is by cultivating *Amycolatopsis orientalis* ATCC™ 43491, or a mutant or a variant thereof, under suitable *Amycolatopsis sp.* culture conditions preferably using the fermentation protocol described herein below.

The invention also relates to polyene polyketides of Formula I, exemplified herein as Compounds 3, 4, 5 and 6, produced from Compound 1, Compound 2 or Compound 7 by selective chemical modification of Compound 1, Compound 2 or Compound 7 using techniques described herein and well known to those skilled in the synthesis of natural products.

The present invention also relates to pharmaceutical compositions comprising a polyene polyketide selected from any one of Compounds 1 to 7, pharmaceutically acceptable salts or prodrugs of any one of Compounds 1 to 7, and derivatives of any

one of Compounds 1 to 7 as defined by Formula I. In another aspect of the invention, Compounds 1 to 7 are each useful as antibacterial agents, and for use as inhibitors of bacterial cell growth. Accordingly, in an aspect the present invention relates to pharmaceutical compositions comprising any one of Compounds 1 to 7 of the invention together with a pharmaceutically acceptable carrier and methods of using the compositions as antibacterial agents to inhibit bacterial cell growth.

The following detailed description discloses how to make and use any of Compounds 1 to 7, compounds of Formula I and compositions containing these compounds to inhibit microbial growth.

Accordingly, certain aspects of the present invention relate to pharmaceutical compositions comprising the polyene polyketide compounds of the present invention together with a pharmaceutically acceptable carrier, methods of using the compositions to inhibit bacterial growth, and methods of using the pharmaceutical compositions to treat diseases, including cancer, and chronic and acute inflammation.

The present invention also provides the biosynthetic locus from *Amycolatopsis orientalis* strain ATCC™ 43491 which biosynthetic locus is responsible for producing the compounds of Formula I. Thus the invention provides polynucleotides and polypeptides useful in the production and engineering of compounds of Formula I.

Definitions

Molecular terms, when used in this application, have their common meaning unless otherwise specified.

Abreviations, as used herein, have the following meaning: Me refers to methyl (CH_3), Et refers to ethyl (CH_2CH_3), Pr refers to *n*-propyl ($CH_2CH_2CH_3$) and Ac refers to acetyl ($C(O)CH_3$).

The term alkyl refers to a linear or branched hydrocarbon groups. Examples of alkyl groups include, without limitation, methyl, ethyl, n-propyl, isopropyl, n-butyl, pentyl, hexyl, heptyl, cyclopentyl, cyclohexyl, cyclohexymethyl, and the like. Alkyl may optionally be substituted with substituents selected from acyl, amino, acylamino, acyloxy, carboalkoxy, carboxy, carboxyamido, cyano, halo, hydroxyl, nitro, thio, alkyl, alkenyl, alkynyl, cycloalkyl, heterocyclyl, aryl, heteroaryl, alkoxy, aryloxy, sulfinyl, sulfonyl, oxo, guanidino and formyl.

The term alkenyl refers to linear, branched or cyclic hydrocarbon groups containing at least one carbon-carbon double bond. Examples of alkenyl groups include, without limitation, vinyl, 1-propene-2-yl, 1-butene-4-yl, 2-butene-4-yl, 1-pentene-5-yl and the like. Alkenyl may optionally be substituted with substituents selected from acyl, amino, acylamino, acyloxy, carboalkoxy, carboxy, carboxyamido, cyano, halo, hydroxyl, nitro, thio, alkyl, alkenyl, alkynyl, cycloalkyl, heterocyclyl, aryl, alkoxy, aryloxy, sulfinyl, sulfonyl, formyl, oxo and guanidino. The double bond portion(s) of the unsaturated hydrocarbon chain may be either in the cis or trans configuration.

The term cycloalkyl or cycloalkyl ring refers to a saturated or partially unsaturated carbocyclic ring in a single or fused carbocyclic ring system having from three to fifteen ring members. Examples of cycloalkyl groups include, without limitation, cyclopropyl, cyclobutyl, cyclohexyl, and cycloheptyl. Cycloalkyl may optionally be substituted with substituents selected from acyl, amino, acylamino, acyloxy, carboalkoxy, carboxy, carboxyamido, cyano, halo, hydroxyl, nitro, thio, alkyl, alkenyl, alkynyl, cycloalkyl, heterocyclyl, aryl, heteroaryl, alkoxy, aryloxy, sulfinyl, sulfonyl and formyl.

The term heterocyclyl, heterocyclic or heterocyclyl ring refers to a saturated or partially unsaturated ring containing one to four hetero atoms or hetero groups selected from O, N, NH, NR^x, PO_2, S, SO or SO_2 in a single or fused heterocyclic ring system having from three to fifteen ring members. Examples of a heterocyclyl, heterocyclic or heterocyclyl ring include, without limitation, morpholinyl, piperidinyl, and pyrrolidinyl. Heterocyclyl, heterocyclic or heterocyclyl ring may optionally be substituted with substituents selected from acyl, amino, acylamino, acyloxy, oxo, thiocarbonyl, imino, carboalkoxy, carboxy, carboxyamido, cyano, halo, hydroxyl, nitro, thio, alkyl, alkenyl, alkynyl, cycloalkyl, heterocyclyl, aryl, alkoxy, aryloxy, sulfinyl, sulfonyl and formyl.

The term amino acid refers to any natural amino acid, all natural amino acids are well known to a person skilled in the art.

The term halo is defined as a bromine, chlorine, fluorine or iodine.

The term aryl or aryl ring refers to common aromatic groups having “4n+2” electrons, wherein n is an integer from 1 to 3, in a monocyclic or conjugated polycyclic system and having from five to fifteen ring atoms. Aryl ring may include from 1 to 3 heteroatoms such as nitrogen, oxygen and sulphur atoms. Examples of aryl include,

without limitation, phenyl, naphthyl, biphenyl, terphenyl, furyl, pyrrollyl, thienyl, pyridyl, oxazolyl, imidazolyl, pyrazolyl and indolyl groups. Aryl may optionally be substituted with one or more substituent group selected from acyl, amino, acylamino, acyloxy, azido, alkythio, carboalkoxy, carboxy, carboxyamido, cyano, halo, hydroxyl, nitro, thio, alkyl, alkenyl, alkynyl, cycloalkyl, heterocyclyl, aryl, heteroaryl, alkoxy, aryloxy, sulfinyl, sulfonyl and formyl.

The compounds of the present invention can possess one or more asymetric carbon atoms and can exist as optical isomers forming mixtures of racemic or non-racemic compounds. The compounds of the present invention are useful as a single isomer or as a mixture of stereochemical isomeric forms. Diastereoisomers, i.e., nonsuperimposable stereochemical isomers, can be separated by conventional means such as chromatography, distillation, crystallization or sublimation. The optical isomers can be obtained by resolution of the racemic mixtures according to conventional processes.

The invention embraces isolated compounds. An isolated compound refers to a compound which represents at least 10%, 20%, 50% and 80% of the compound of the present invention present in a mixture, provided that the mixture comprising the compound of the invention has demonstrable (i.e. statistically significant) biological activity including antimicrobial activity when tested in conventional biological assays known to a person skilled in the art.

As used herein, the term “treatment” refers to the application or administration of a therapeutic agent to a patient, or application or administration of a therapeutic agent to an isolated tissue or cell line from a patient, who has a disorder, e.g., a disease or condition, a symptom of disease, or a predisposition toward a disease, with the purpose to cure, heal, alleviate, relieve, alter, remedy, ameliorate, improve, or affect the disease, the symptoms of disease, or the predisposition toward disease.

As used herein, a “pharmaceutical composition” comprises a pharmacologically effective amount of a compound of the invention and a pharmaceutically acceptable carrier. As used herein, “pharmacologically effective amount,” “therapeutically effective amount” or simply “effective amount” refers to that amount of polyene polyketide effective to produce the intended pharmacological, therapeutic or preventive result. For example, if a given clinical treatment is considered effective when there is at least a 25% reduction in a measurable parameter associated with a

disease or disorder, a therapeutically effective amount of a drug for the treatment of that disease or disorder is the amount necessary to effect at least a 25% reduction in that parameter.

The term "pharmaceutically acceptable carrier" refers to a carrier for administration of a therapeutic agent. Such carriers include, but are not limited to, saline, buffered saline, dextrose, water, glycerol, ethanol, and combinations thereof. The term specifically excludes cell culture medium. For drugs administered orally, pharmaceutically acceptable carriers include, but are not limited to pharmaceutically acceptable excipients such as inert diluents, disintegrating agents, binding agents, lubricating agents, sweetening agents, flavoring agents, coloring agents and preservatives. Suitable inert diluents include sodium and calcium carbonate, sodium and calcium phosphate, and lactose, while corn starch and alginic acid are suitable disintegrating agents. Binding agents may include starch and gelatin, while the lubricating agent, if present, will generally be magnesium stearate, stearic acid or talc. If desired, the tablets may be coated with a material such as glyceryl monostearate or glyceryl distearate, to delay absorption in the gastrointestinal tract.

The term "pharmaceutically acceptable salts" include acid addition salts and base addition salts. The nature of the salt is not critical, provided that it is pharmaceutically-acceptable. Without being limited, examples of acid addition salts include hydrochloric, hydrobromic, hydroiodic, nitric, carbonic, sulphuric, phosphoric, formic, acetic, citric, tartaric, succinic, oxalic, malic, glutamic, propionic, glycolic, gluconic, maleic, embonic (pamoic), methanesulfonic, ethanesulfonic, 2-hydroxyethanesulfonic, pantothenic, benzenesulfonic, toluenesulfonic, sulfanilic, mesylic, cyclohexylaminosulfonic, stearic, algenic, β-hydroxybutyric, malonic, galactantic, galacturonic acid and the like. Suitable pharmaceutically-acceptable base addition salts of compounds of the invention include, but are not limited to, metallic salts made from aluminium, calcium, lithium, magnesium, potassium, sodium and zinc or organic salts made from N,N'-dibenzylethylenediamine, chloroprocaine, choline, diethanolamine, ethylenediamine, N-methylglucamine, lysine, procaine and the like. Additional examples of pharmaceutically acceptable salts are listed in Berge SM et al., *Journal of Pharmaceutical Sciences*, (1977) Vol. 66 no 1, pp. 1-19. All of these salts may be prepared by conventional means form the corresponding compounds of Formula I by treating with the appropriate acid or base.

The term "isolated" polynucleotide or polypeptide means that the material is removed from its original environment, *e.g.* the natural environment if it is naturally-occurring. For example, a naturally-occurring polynucleotide or polypeptide present in a living organism is not isolated, but the same polynucleotide or polypeptide, separated from some or all of the coexisting materials in the natural system, is isolated. Such polynucleotides could be part of a vector and/or such polynucleotides or polypeptides could be part of a composition, and still be isolated in that such vector or composition is not part of its natural environment.

The term "purified" polynucleotide or polypeptide does not require absolute purity; rather, it is intended as a relative definition. Individual nucleic acids obtained from a library have been conventionally purified to electrophoretic homogeneity. The purified nucleic acids of the present invention have been purified from the remainder of the genomic DNA in the organism by at least 10^4 to 10^6 fold. However, the term "purified" also includes nucleic acids which have been purified from the remainder of the genomic DNA or from other sequences in a library or other environment by at least one order of magnitude, preferably two or three orders of magnitude, and more preferably four or five orders of magnitude.

"Recombinant" nucleic acid means that the nucleic acid is adjacent to "backbone" nucleic acid to which it is not adjacent in its natural environment. "Enriched" nucleic acids represent 5% or more of the number of nucleic acid inserts in a population of nucleic acid backbone molecules. "Backbone" molecules include nucleic acids such as expression vectors, self-replicating nucleic acids, viruses, integrating nucleic acids, and other vectors or nucleic acids used to maintain or manipulate a nucleic acid of interest. Preferably, the enriched nucleic acids represent 15% or more, more preferably 50% or more, and most preferably 90% or more, of the number of nucleic acid inserts in the population of recombinant backbone molecules.

"Recombinant" polypeptides or proteins refer to polypeptides or proteins produced by the reassortment of sections of DNA or RNA sequences between at least two DNA or RNA molecules that are created by recombinant DNA techniques that are well known in the art. An extensive guide to such techniques is described in Sambrook *et al.*, (1989), Molecular Cloning: A Laboratory Manual, second edition, Cold Spring Harbor Laboratory Press. "Synthetic" polypeptides or proteins are those prepared by chemical synthesis.

A "coding sequence" or "sequence encoding" a particular polypeptide or protein, is a DNA sequence which is transcribed and translated into a polypeptide or protein when placed under the control of appropriate regulatory sequences.

Thus, as used herein, the term "polynucleotide encoding a polypeptide" encompasses a polynucleotide that includes only coding sequence for the polypeptide as well as a polynucleotide that includes additional coding and/or non-coding sequence.

The term "complement" and "complementary", refers to the ability of two single stranded nucleic acid fragments to sufficiently base pair with each other or to "hybridize" under certain stringent conditions. By way of example, and not limitation, a procedure of using high stringency is as follows: Prehybridizaion of filters containing DNA is carried out for 2 hrs. to overnight at 65^0 C in buffer composed of 6X SSC, 5X Denhardt's solution and 100 µg/ml denatured salmon sperm DNA. Filters are hybridized for 12 to 48 hrs at 65^0 C in prehybridization buffer mixture containing a labeled probe (e.g. 5-20 X 10^6 ^{32}P labeled probe). Washing of the hybridized filters is conducted at 37^0 C for 1 hr. in a solution of containing 2 X SSC, 0.1 % SDS. This is followed by a wash in 0.1 X SSC, 0.1 % SDS at 50^0 C for 45 min. followed by autoradiography. Other conditions for stringency are described in Sambrook *et al.*,*supra*.

Expression "control sequences" refers collectively to promoter sequences, ribosomal binding sites, polyadenylation signals, transcription termination sequences, regulatory regions, enhancers, and the like, which collectively provide for the transcription and translation of a coding sequence in a host cell. Not all these control sequences need always be present in a recombinant vector so long as the desired gene is capable of being transcribed or translated.

"Oligonucleotide" refers to a nucleic acid, generally of at least 10 to about 100 nucleotides, that are hybridizable to a genomic DNA molecule, a cDNA molecule, or an mRNA molecule encoding a gene or other nucleic acid of interest.

A promoter sequence is "operably linked to" a coding sequence recognized by RNA polymerase which initiates transcription at the promoter and transcribes the coding sequence into mRNA.

"Plasmids" are designated herein by a lower case p preceded or followed by capital letters and/or numbers. The starting plasmids herein are commercially available,

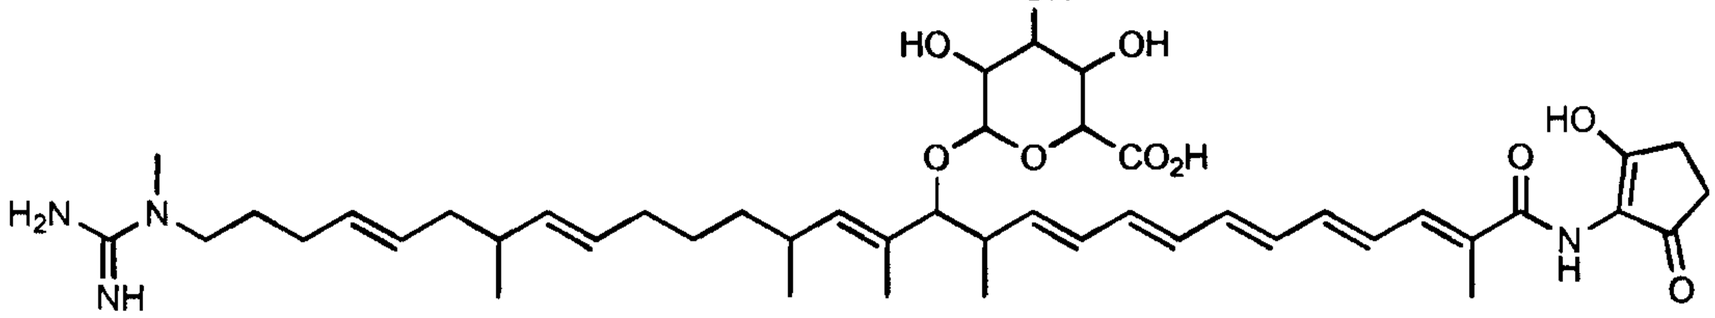
publicly available on an unrestricted basis, or can be constructed from available plasmids in accord with published procedures. In addition, equivalent plasmids to those described herein are known in the art and will be apparent to the skilled artisan.

"Digestion" of DNA refers to enzymatic cleavage of the DNA with a restriction enzyme that acts only at certain sequences in the DNA. The various restriction enzymes used herein are commercially available and their reaction conditions, cofactors and other requirements were used as would be known to the ordinary skilled artisan. For analytical purposes, typically 1 µg of plasmid or DNA fragment is used with about 2 units of enzyme in about 20 µl of buffer solution. For the purpose of isolating DNA fragments for plasmid construction, typically 5 to 50 µg of DNA are digested with 20 to 250 units of enzyme in a larger volume. Appropriate buffers and substrate amounts for particular enzymes are specified by the manufacturer. Incubation times of about 1 hour at 37°C are ordinarily used, but may vary in accordance with the supplier's instructions. After digestion the gel electrophoresis may be performed to isolate the desired fragment.

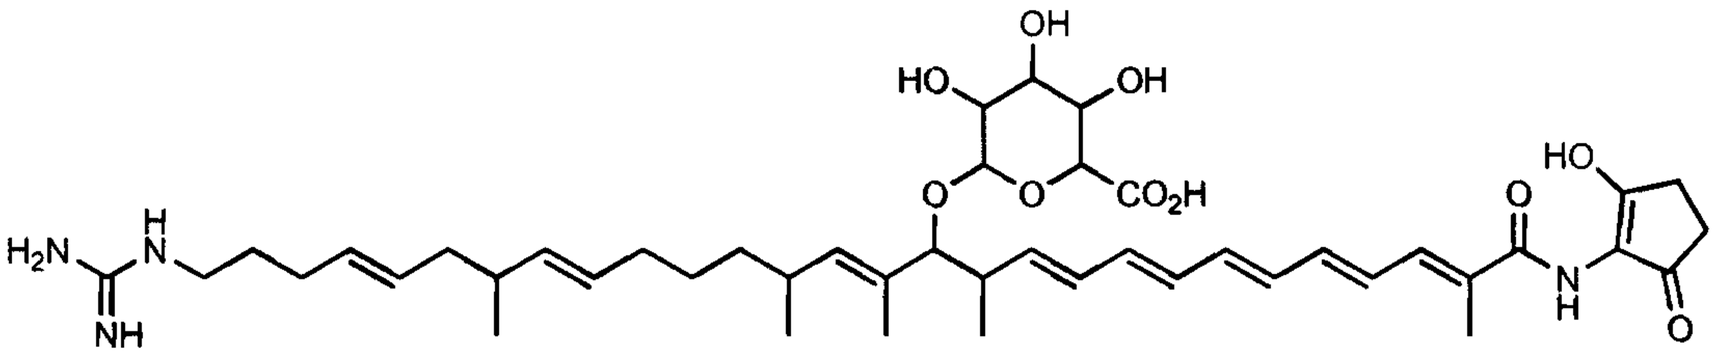
Unless otherwise indicated, all numbers expressing quantities of ingredients and properties such as molecular weight, reaction conditions, MIC and so forth used in the specification and claims are to be understood as being modified in all instances by the term "about". Accordingly, unless indicated to the contrary, the numerical parameters set forth in the present specification and attached claims are approximations. At the very least, and not as an attempt to limit the application of the doctrine of equivalents to the scope of the claims, each numerical parameter should at least be construed in light of the number of significant figures and by applying ordinary rounding techniques. Notwithstanding that the numerical ranges and parameters setting forth the broad scope of the invention are approximations, the numerical values set forth in the examples, tables and figures are reported as precisely as possible. Any numerical values may inherently contain certain errors resulting from variations in experiments, testing measurements, statistical analysis and such.

Compounds of the invention

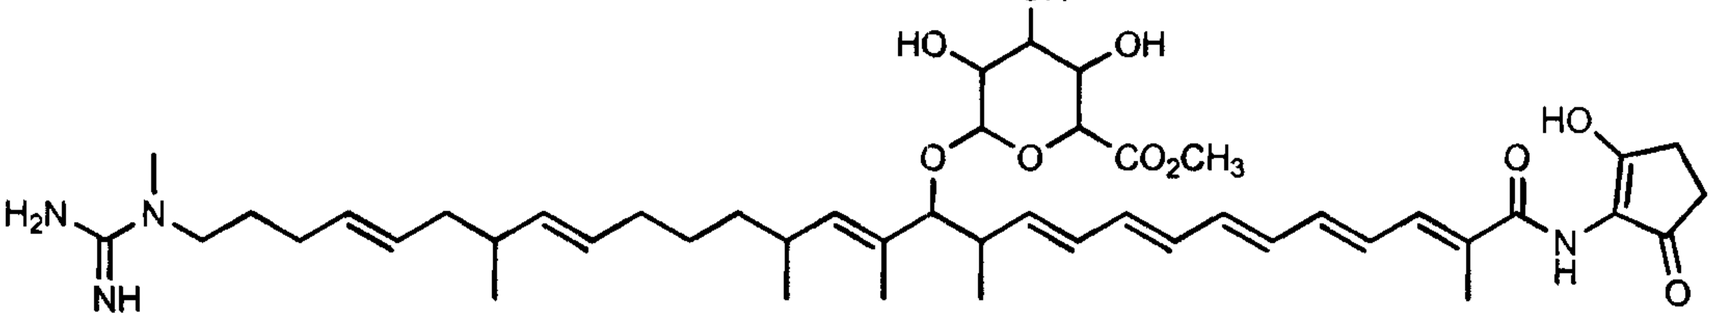
In one aspect of this embodiment the invention relates to novel polyene polyketides, referred to herein as Compounds 1 to Compound 7:



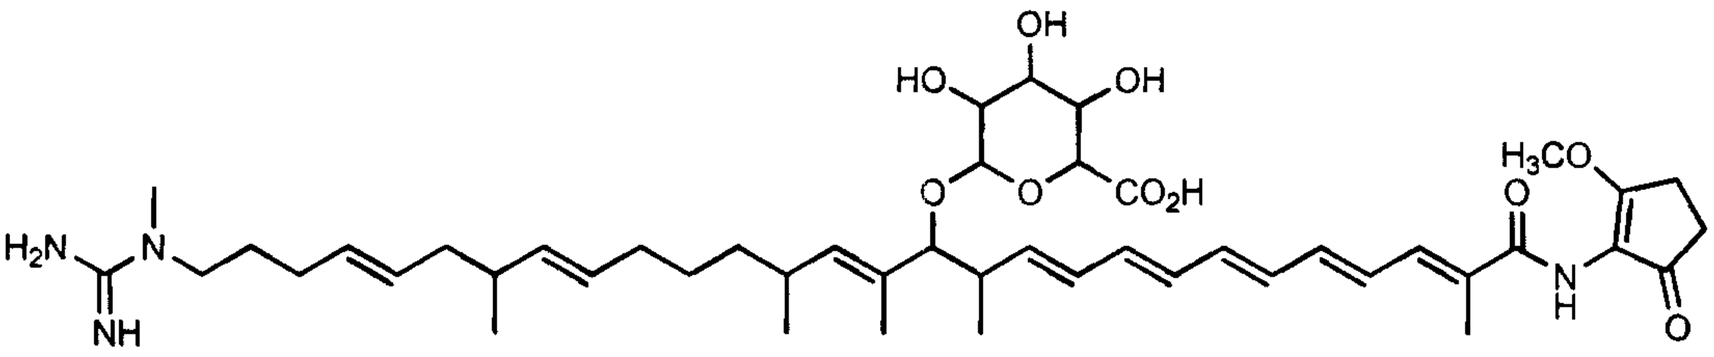
Compound 1;



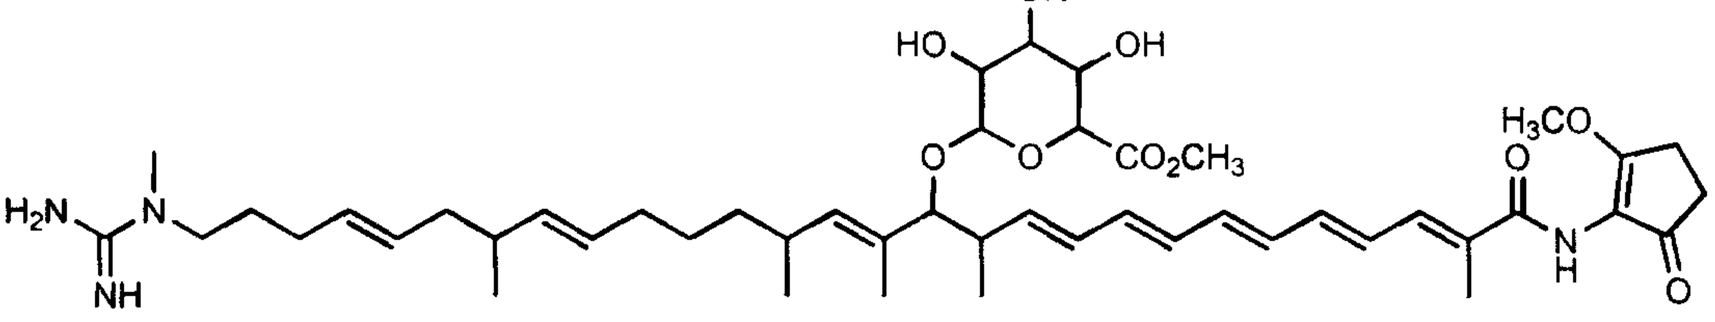
Compound 2;



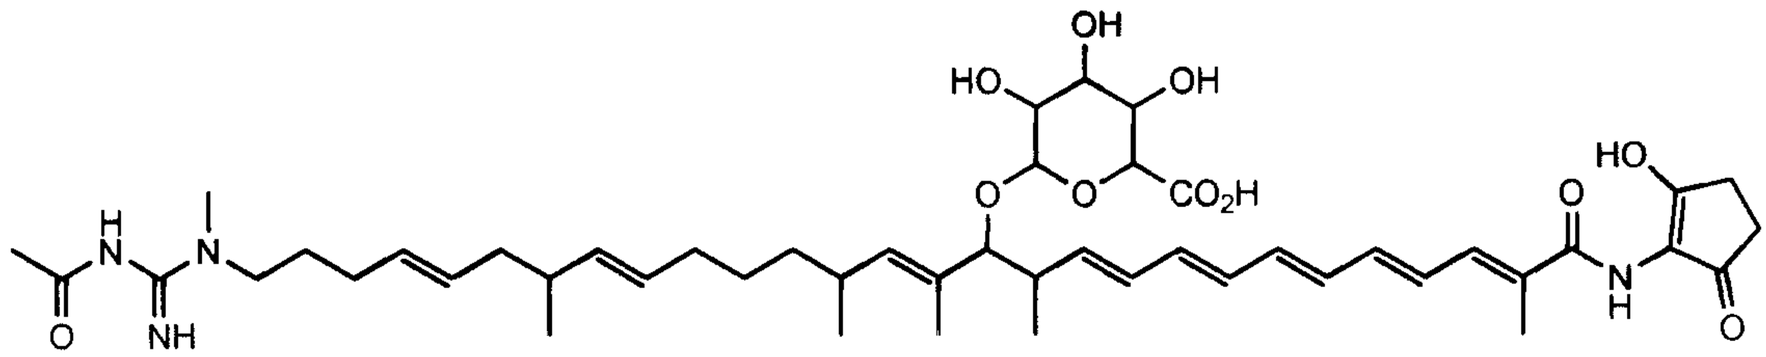
Compound 3;



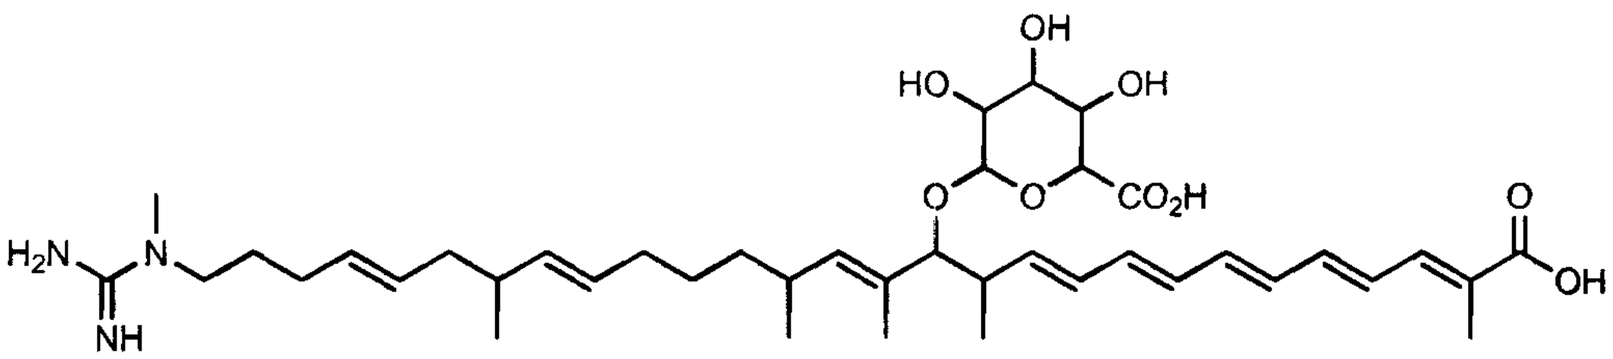
Compound 4;



Compound 5;



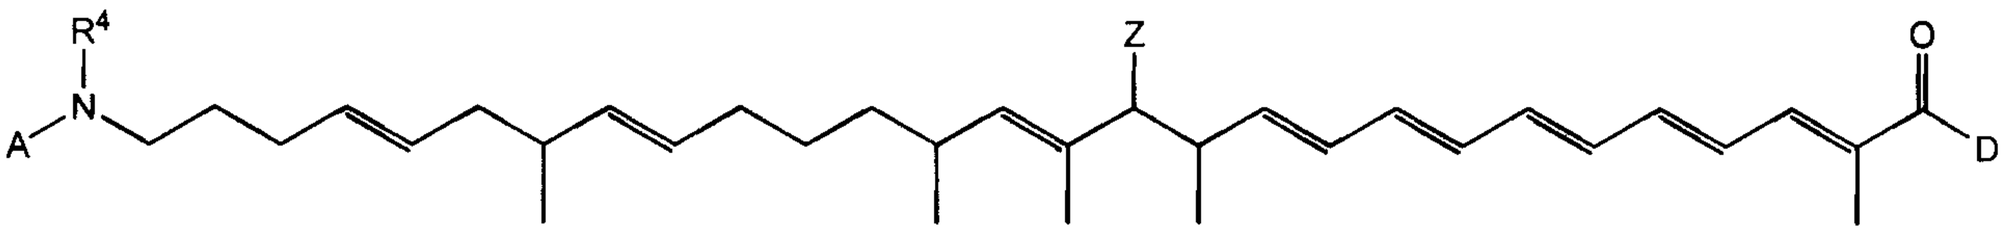
Compound 6;



Compound 7;

or, to a pharmaceutically acceptable salt or prodrug of any of Compounds 1 to 7. Compounds 1 to 7 may be characterized by any one or more of their physicochemical and spectral properties given below, such as mass, UV, and NMR spectroscopic data.

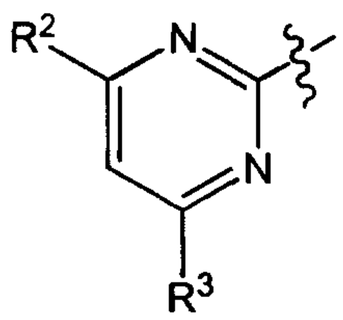
In another aspect the invention relates to derivatives of Compound 1 to 7, as represented by the polyene polyketides of Formula I:



Formula I

wherein,

A is selected from $-C(NH)NHR^1$, CH_3, H or



;

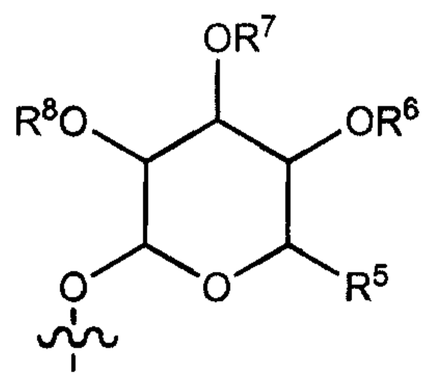
R^1 is selected from H, C_{1-6}alkyl, C_{6-10}aryl, $C(O)C_{1-6}$alkyl and $C(O)C_{6-10}$aryl;

R^2 and R^3 are each independently selected from H, C_{1-6} alkyl, C_{2-7} alkene and C_{6-10} aryl;

R^4 is selected from H or CH_3;

Z is OH or O when taken with adjacent carbon atom to form a carbonyl; or

Z may be a tetrahydropyranoxy of formula:



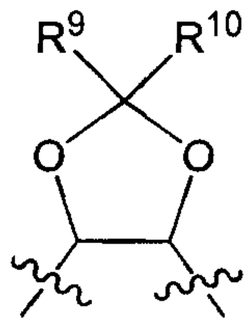
;

R^5 is selected from H, COOH, C_{1-6} alkyl or $C(O)OC_{1-6}$ alkyl;

R^6, R^7 and R^8 are each independently selected from H, C_{1-6} alkyl and $C(O)C_{1-6}$ alkyl; or

R^6 , R^7 and R^8 may each independently be absent when the adjacent oxygen and carbon atoms are taken together to form a carbonyl; or

R^6 , R^7 and R^8 may each independently be a bond when any of two neighboring R^6 , R^7 and R^8 are taken together with attached oxygen and carbon atoms to form a 1,3-dioxolane ring of formula:



;

R^9 and R^{10} are each independently selected from H, C_{1-6} alkyl, C_{2-7} alkene and C_{6-10} aryl; or

R^9 and R^{10} are taken together with adjacent carbon atom to form a ring having from 5 to 7 carbons;

D is selected from OH, NH_2, $NH(C_{1-3}alkyl)$, $N(C_{1-3}alkyl)_2$, $OC_{1-3}alkyl$ or

;

R^{11} is selected from H or C_{1-3} alkyl;

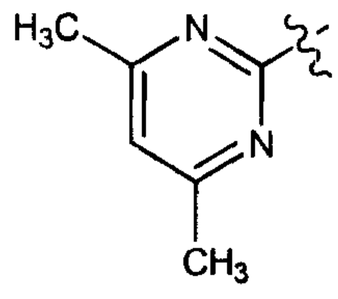
or a pharmaceutically acceptable salt or prodrug thereof.

In an embodiment the invention provides compounds of Formula I, wherein A is —C(NH)NH_2; and all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof.

In a further embodiment of the invention provides compounds of Formula I, wherein A is H; and all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof.

In a further embodiment the invention provides compounds of Formula I, wherein A is —C(NH)NHC(O)CH_3; and all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof.

In a further embodiment the invention provides compounds of Formula I, wherein A is



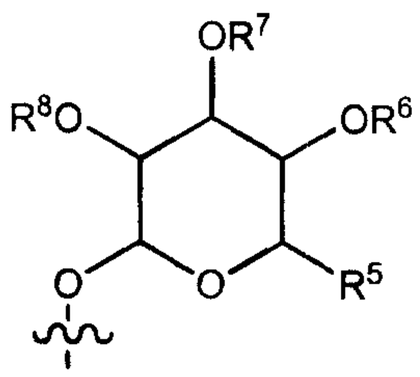
;

and all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof.

In a further embodiment the invention provides compounds of Formula I, wherein R^4 is CH_3; and all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof.

In a further embodiment the invention provides compounds of Formula I, wherein R^4 is H; and all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof.

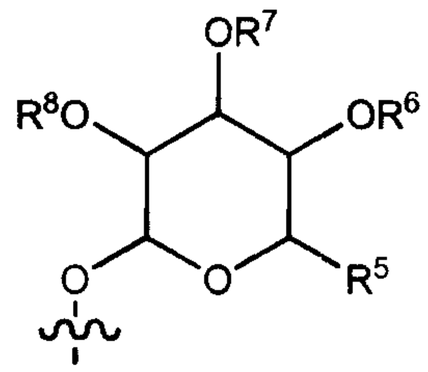
In a further embodiment the invention provides compounds of Formula I, wherein Z is



;

and all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof. In a subclass of this embodiment R^6, R^7 and R^8 are each H, and R^5 is COOH, all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof.

In a further embodiment the invention provides compounds of Formula I, wherein Z is

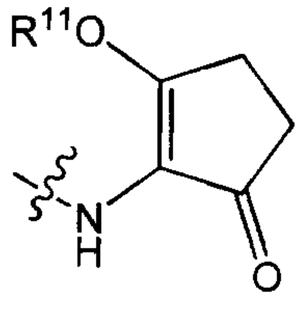


;

and all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof. In a subclass of this embodiment R^6, R^7 and R^8 are each H, and R^5 is CO_2CH_3, all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof.

In a further embodiment the invention provides compounds of Formula I, wherein Z is OH and all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof.

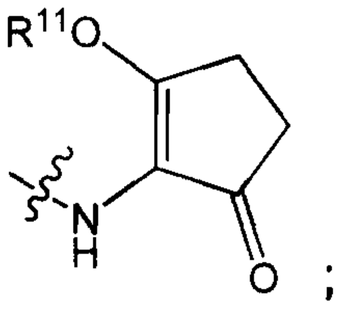
In a further embodiment the invention provides compounds of Formula I, wherein D is



;

and all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof. In a subclass of this embodiment R^{11} is H and all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof.

In a further embodiment the invention provides compounds of Formula I, wherein D is

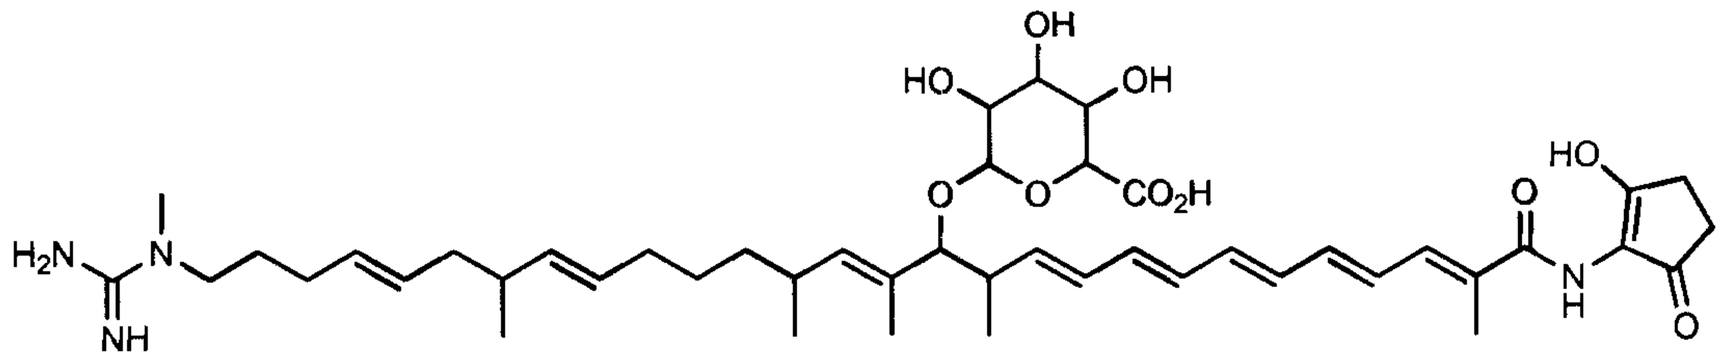


;

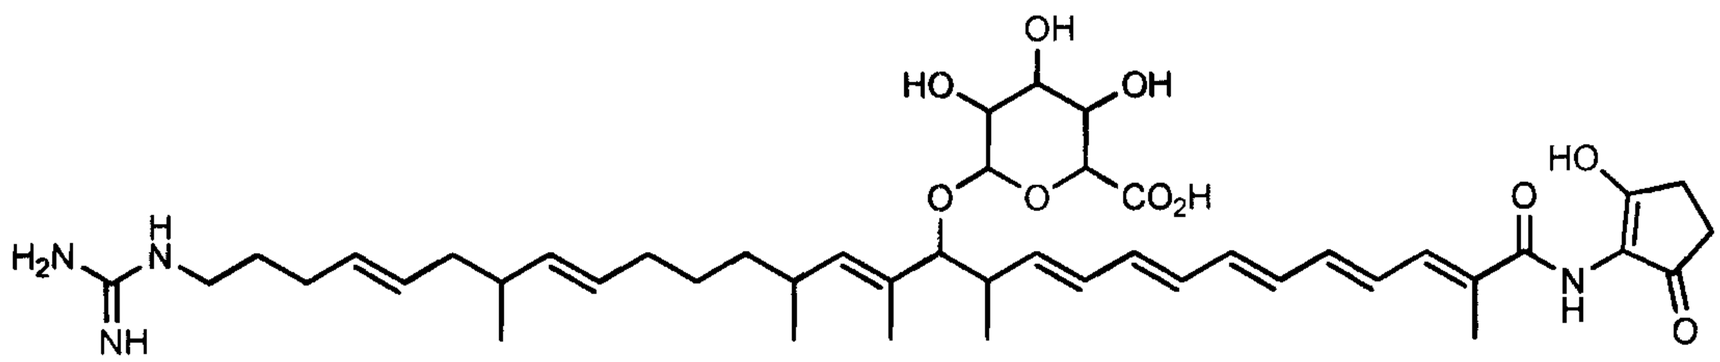
and all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof. In a subclass of this embodiment R^{11} is CH_3 and all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof.

In another embodiment the invention provides compounds of Formula I, wherein D is OH; and all other groups are as previously defined; or a pharmaceutically acceptable salt or prodrug thereof.

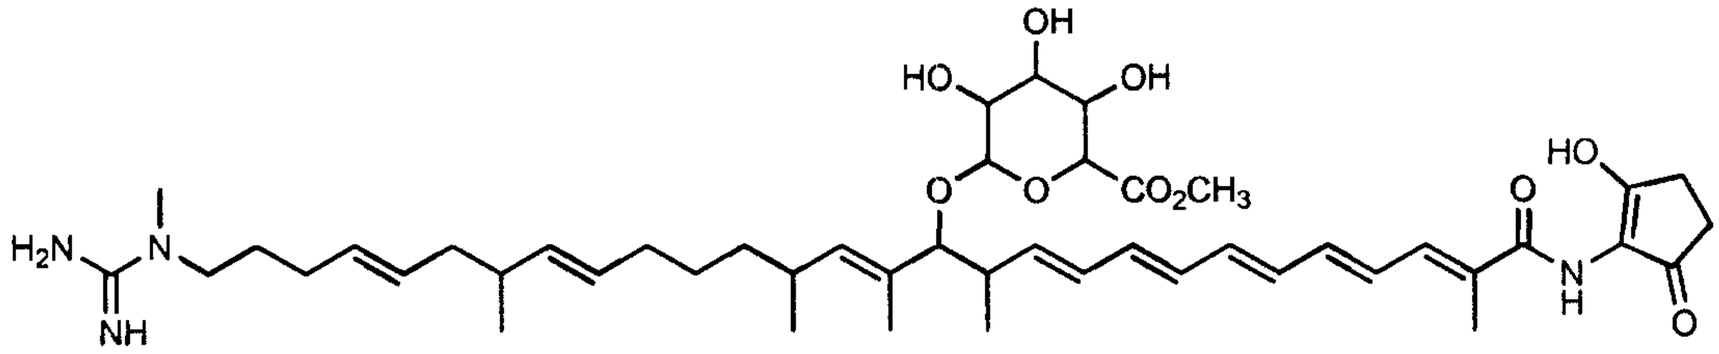
The following are exemplary compounds of the invention:



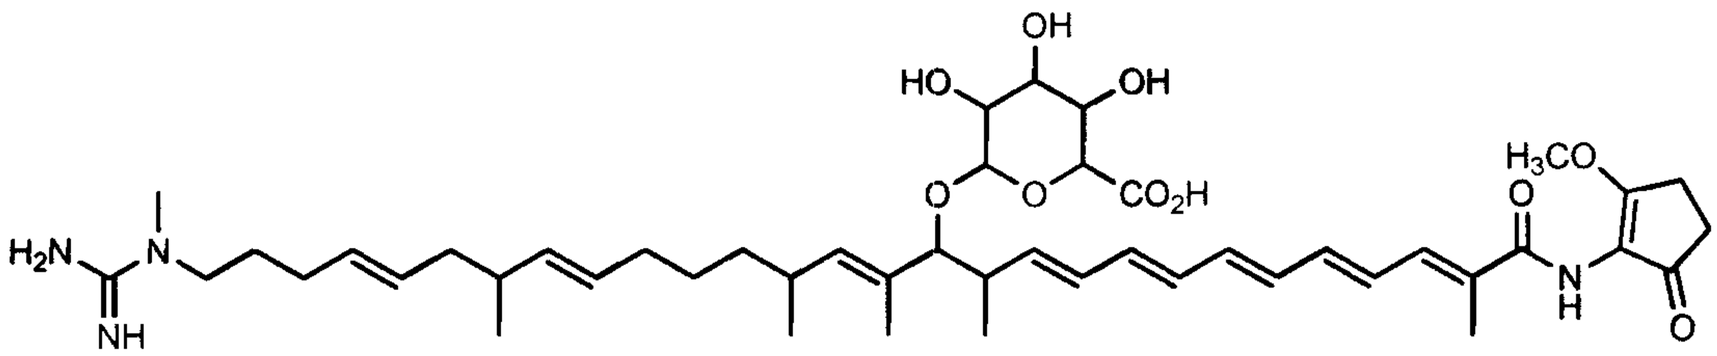
Compound 1;



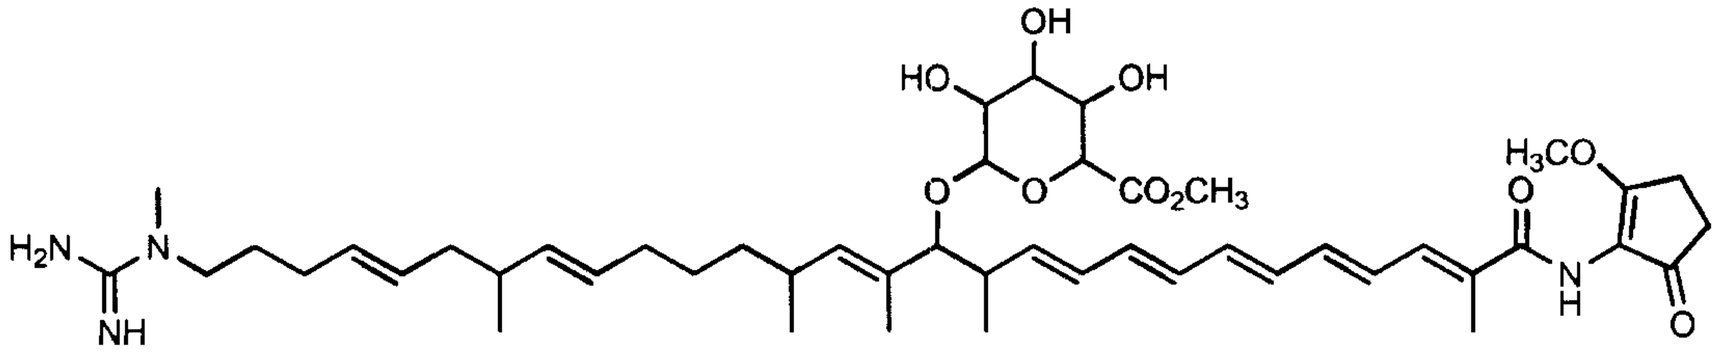
Compound 2;



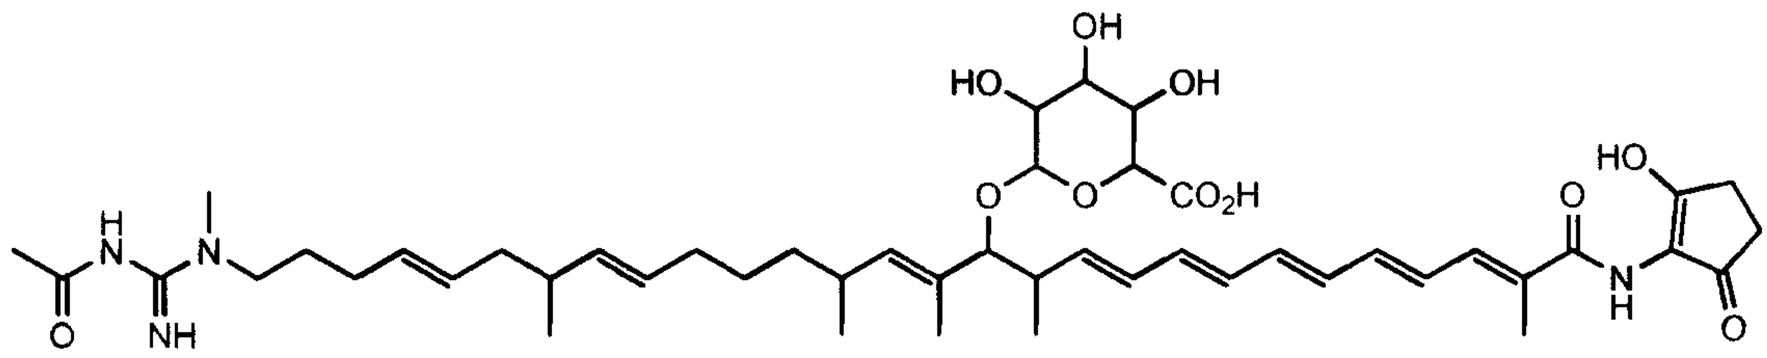
Compound 3;



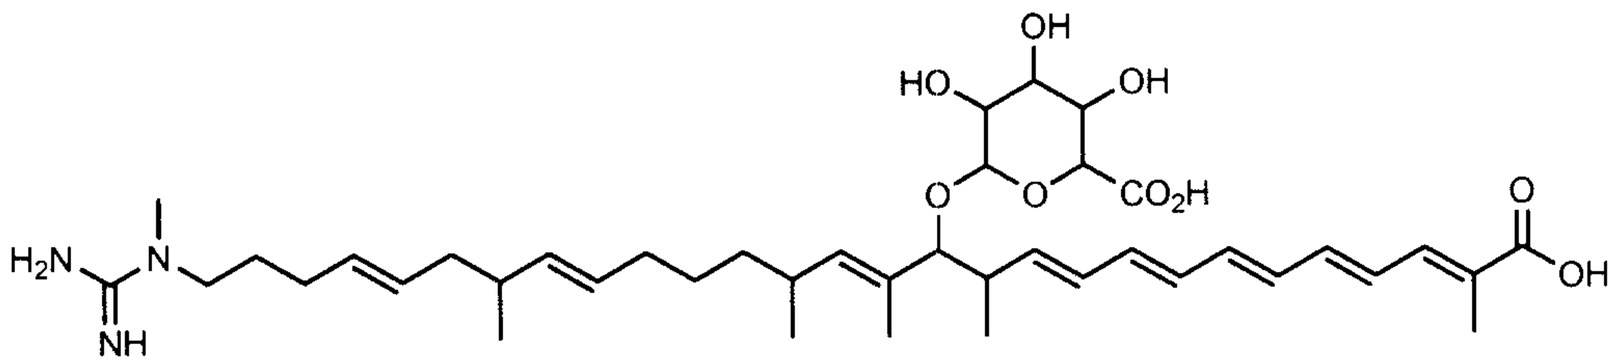
Compound 4;



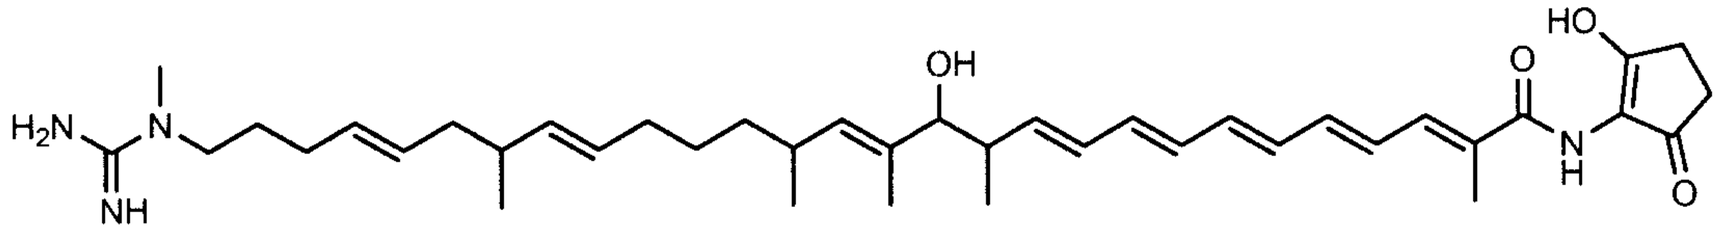
Compound 5;



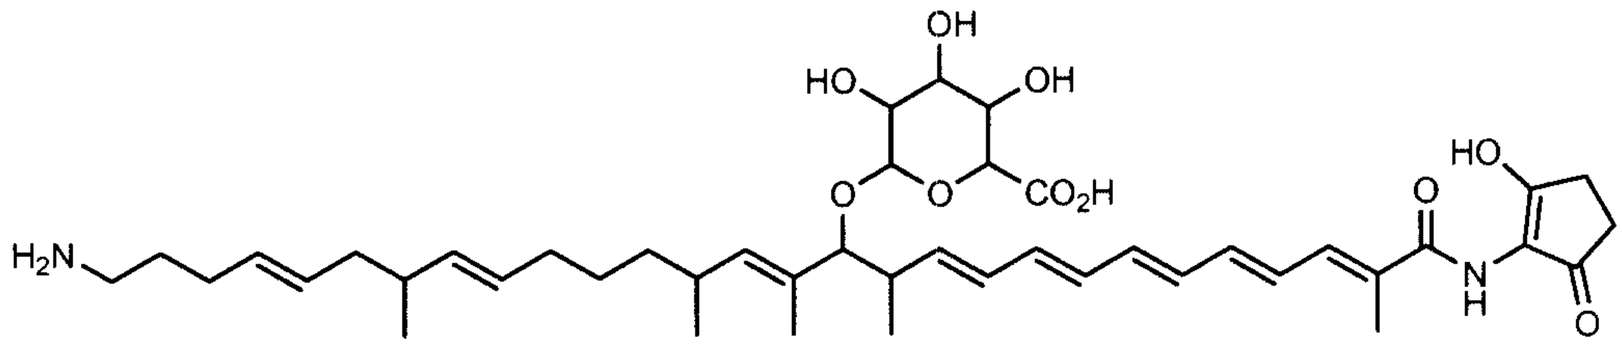
Compound 6;



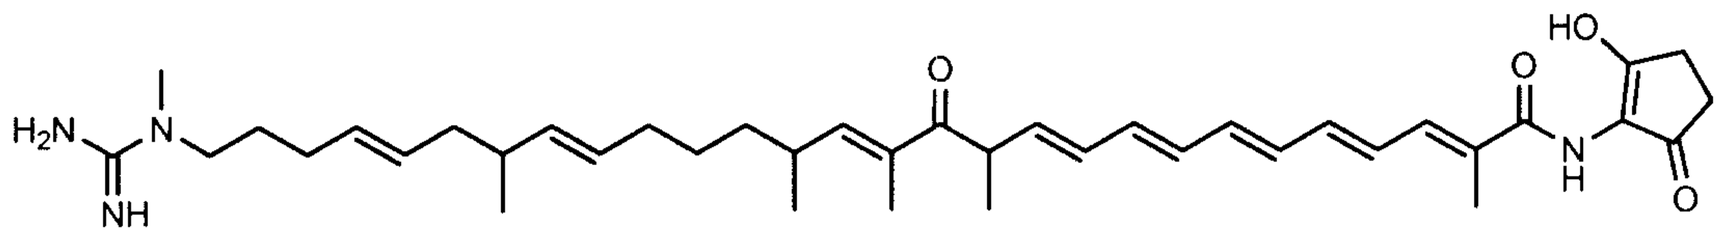
Compound 7;



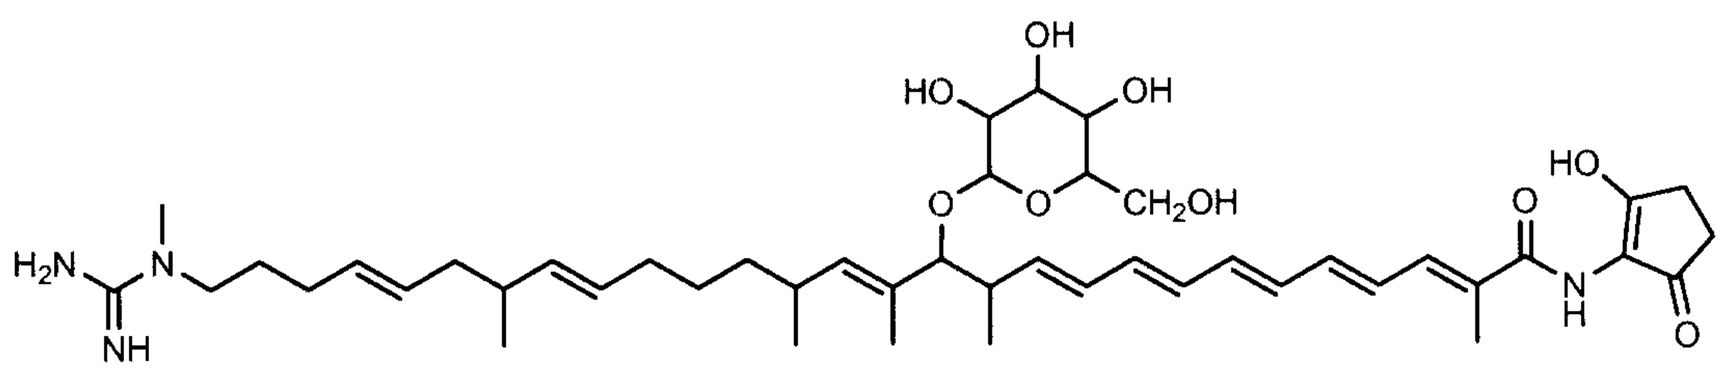
Compound 8;



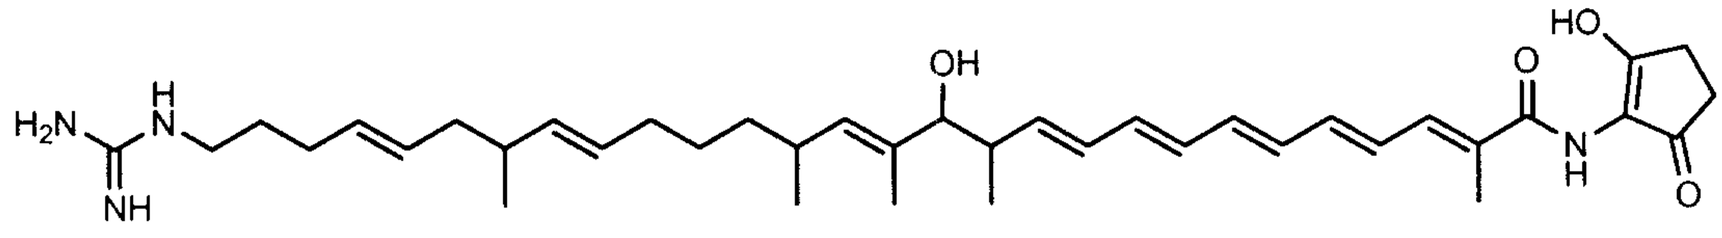
Compound 9;



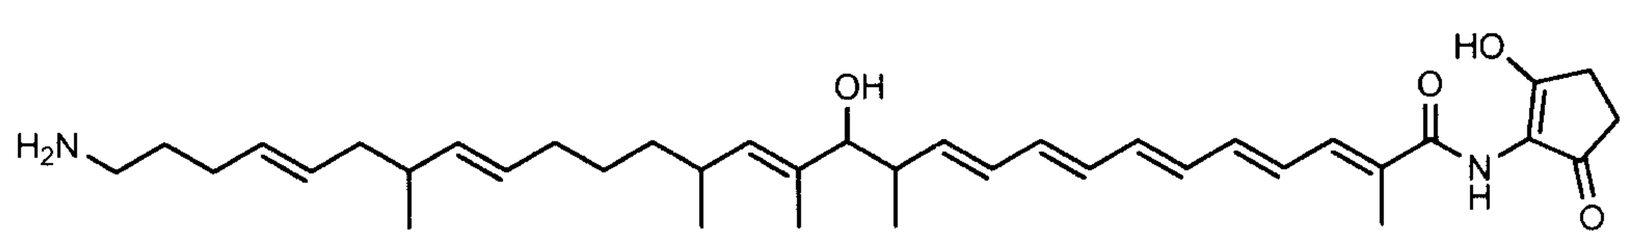
Compound 10;



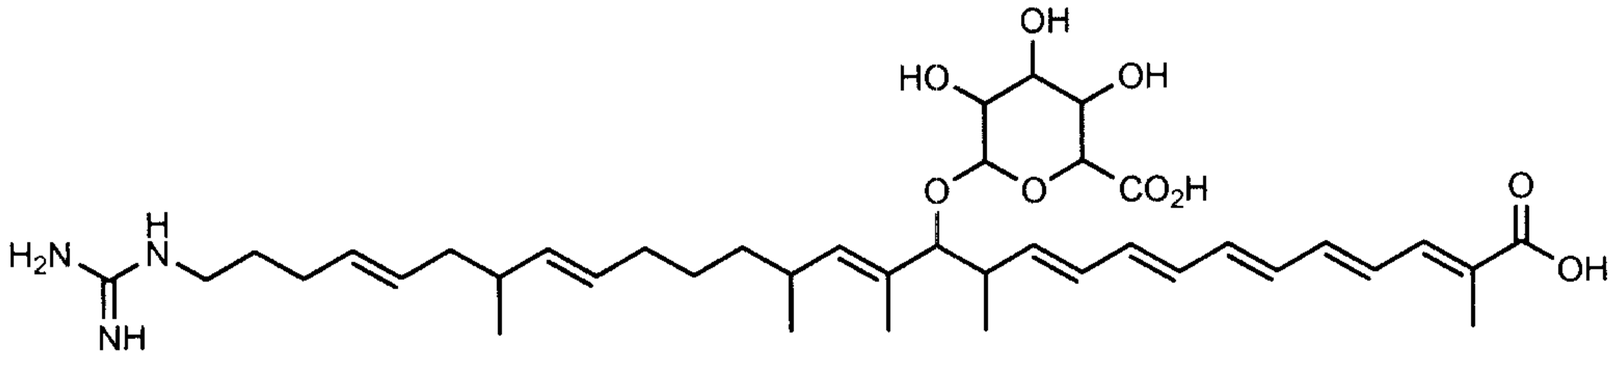
Compound 11;



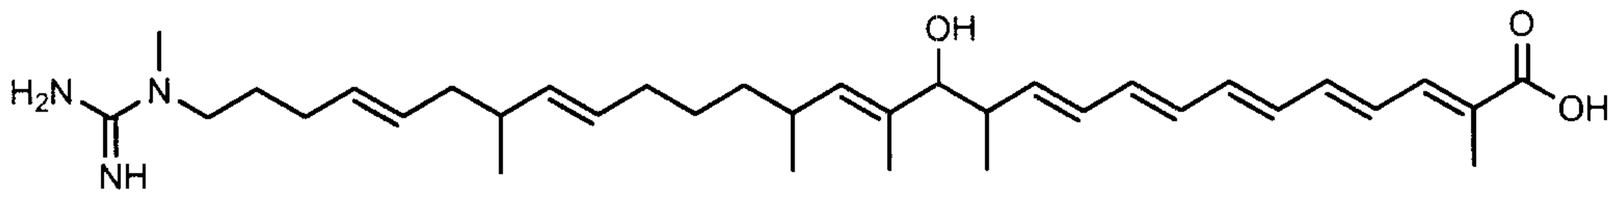
Compound 12;



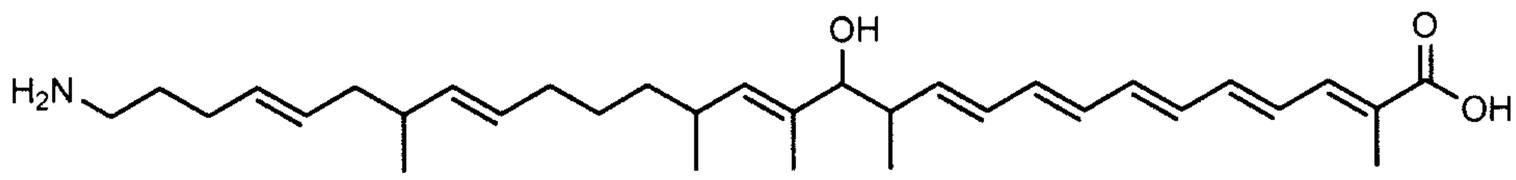
Compound 13;



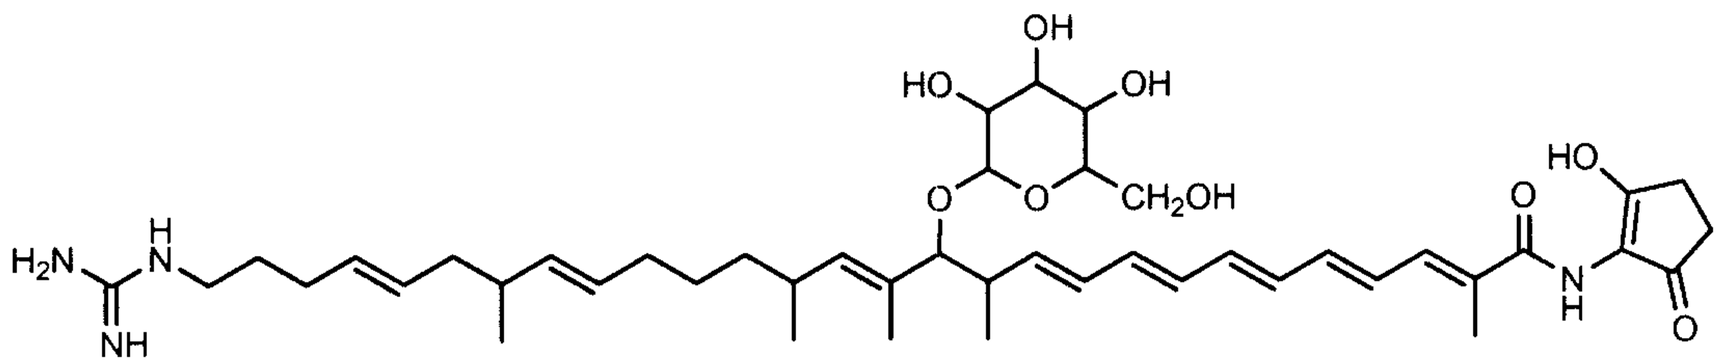
Compound 14;



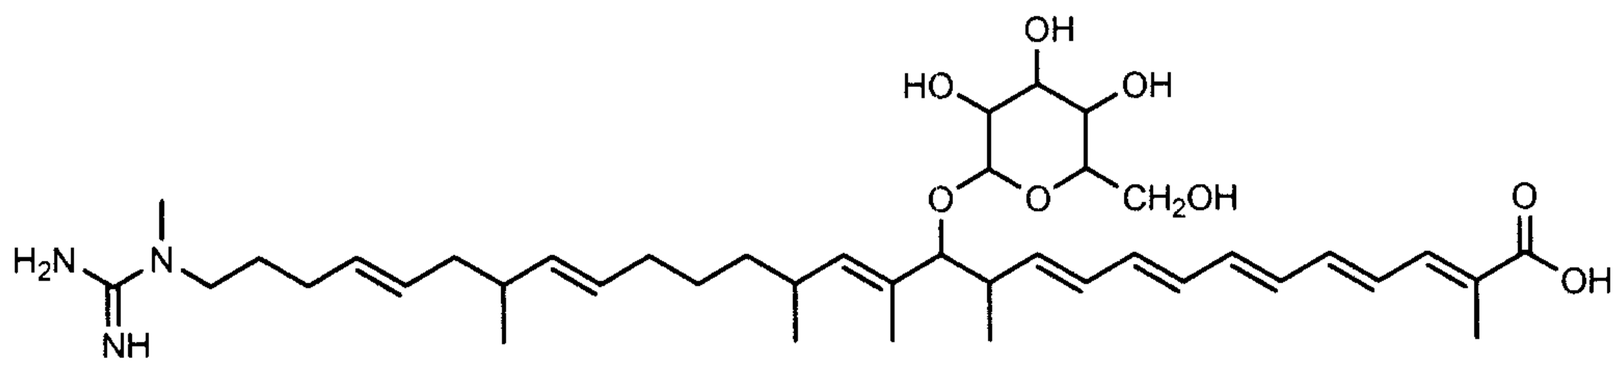
Compound 15;



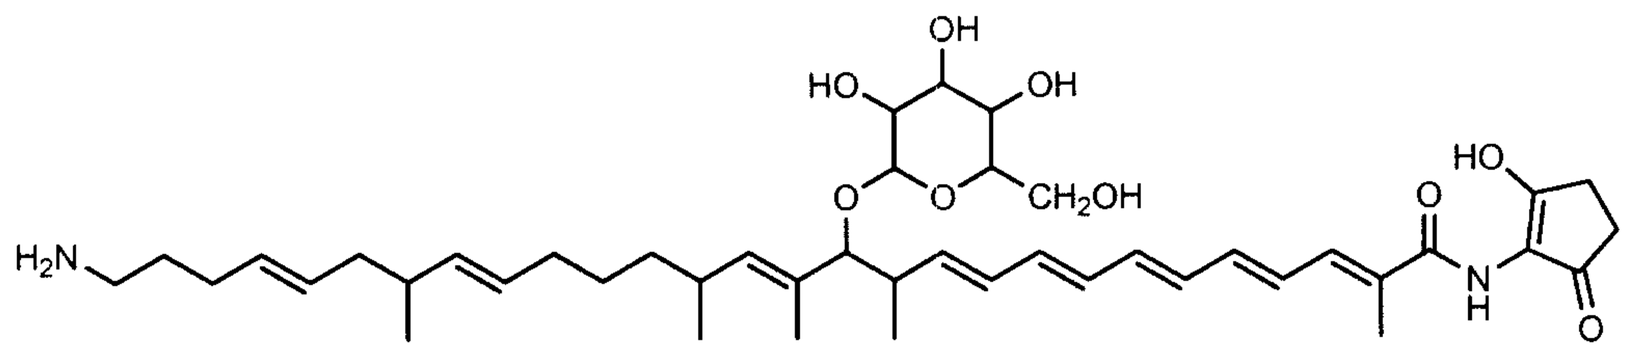
Compound 16;



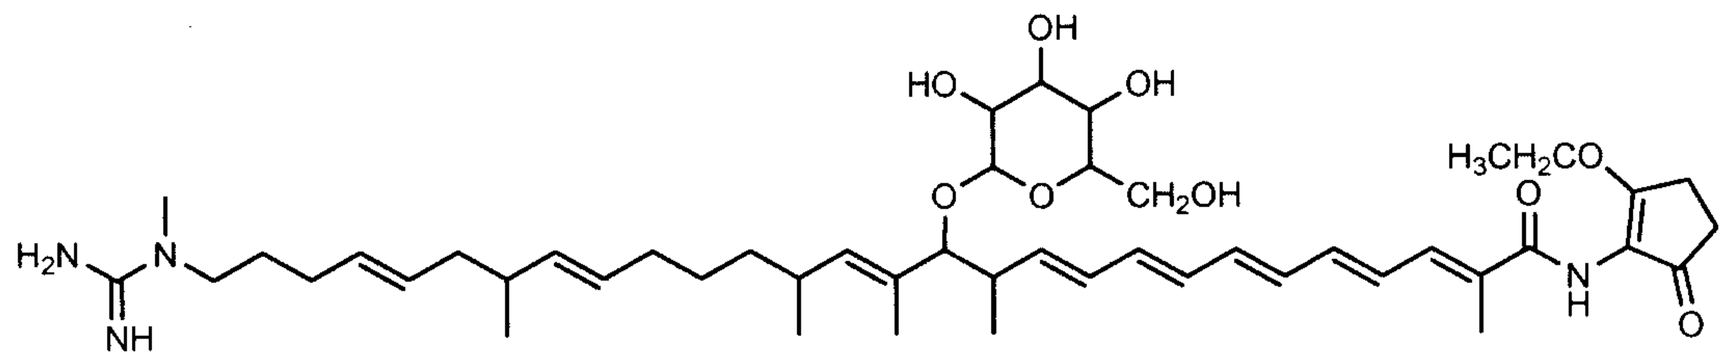
Compound 17;



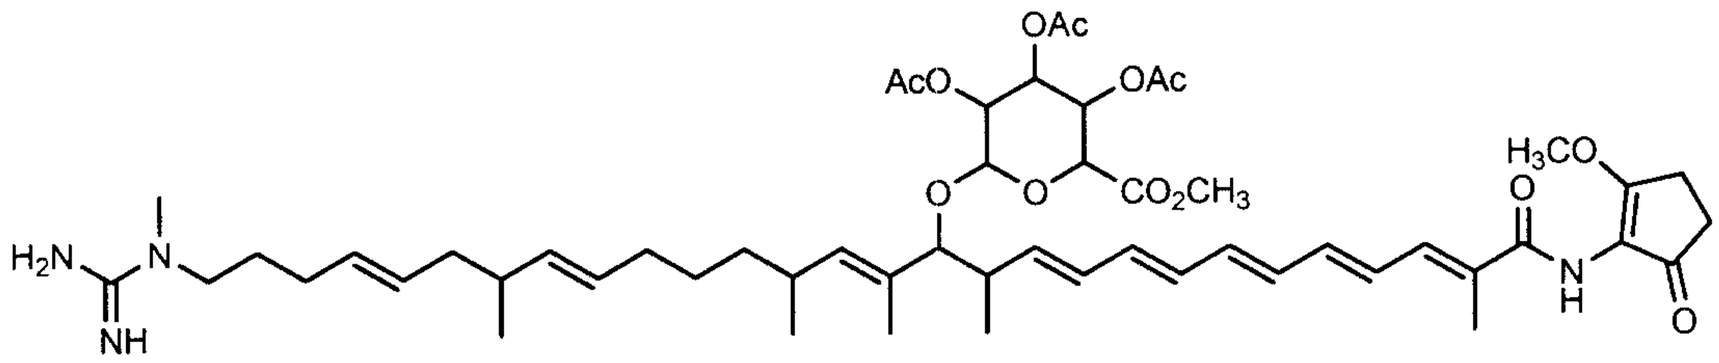
Compound 18;



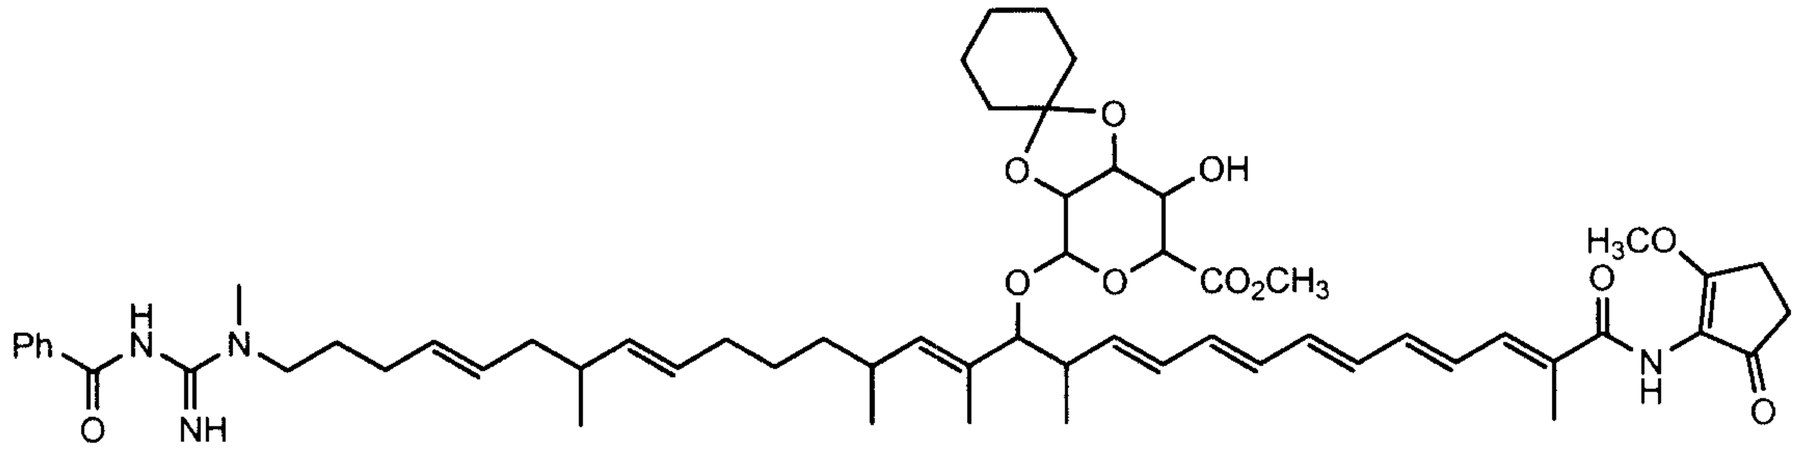
Compound 19;



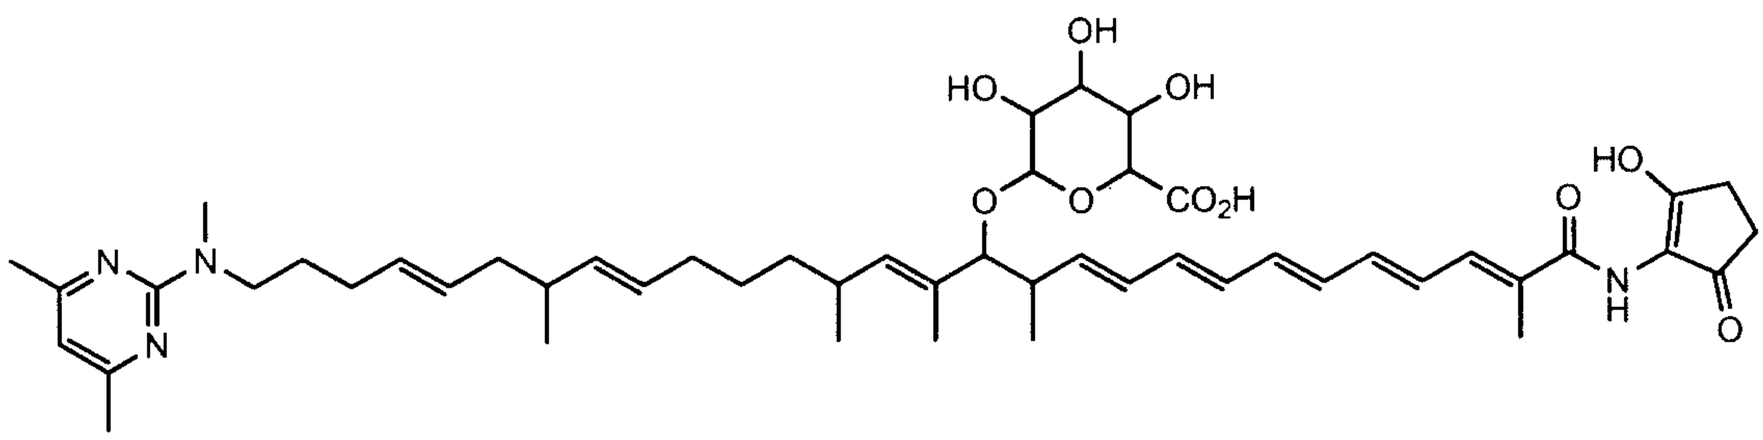
Compound 20;



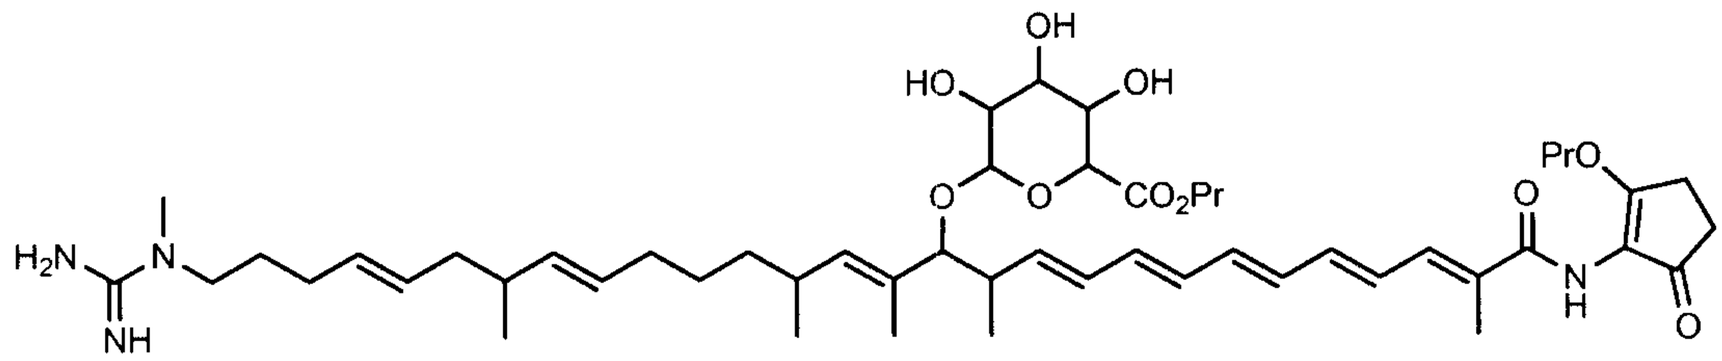
Compound 21;



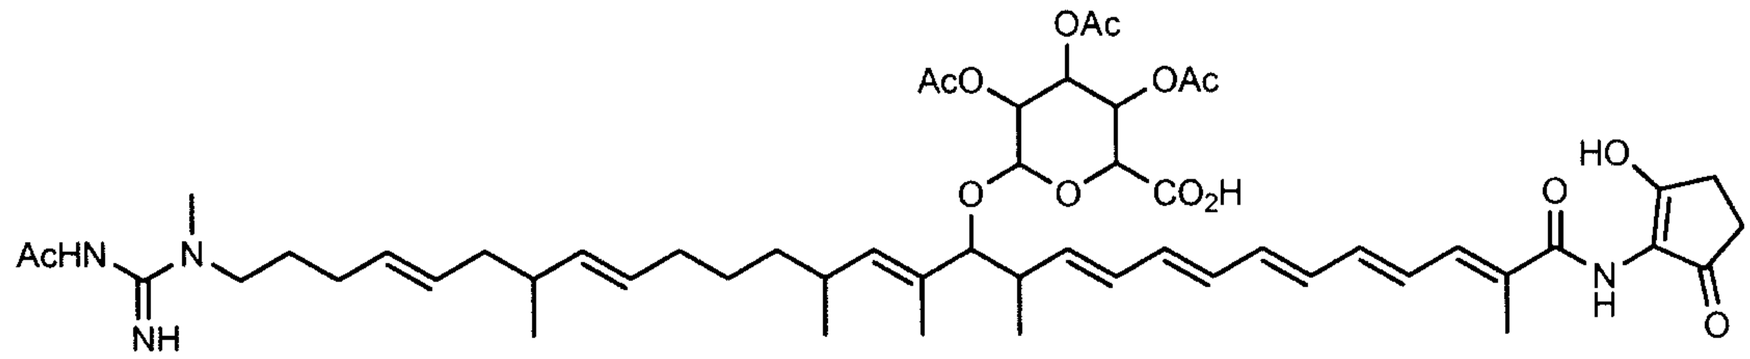
Compound 22;



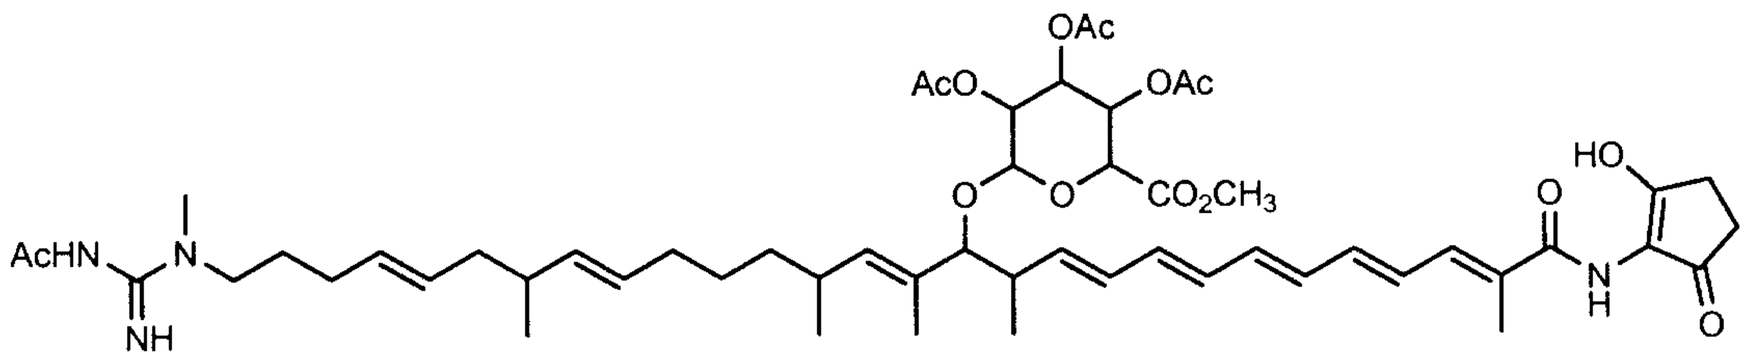
Compound 23;



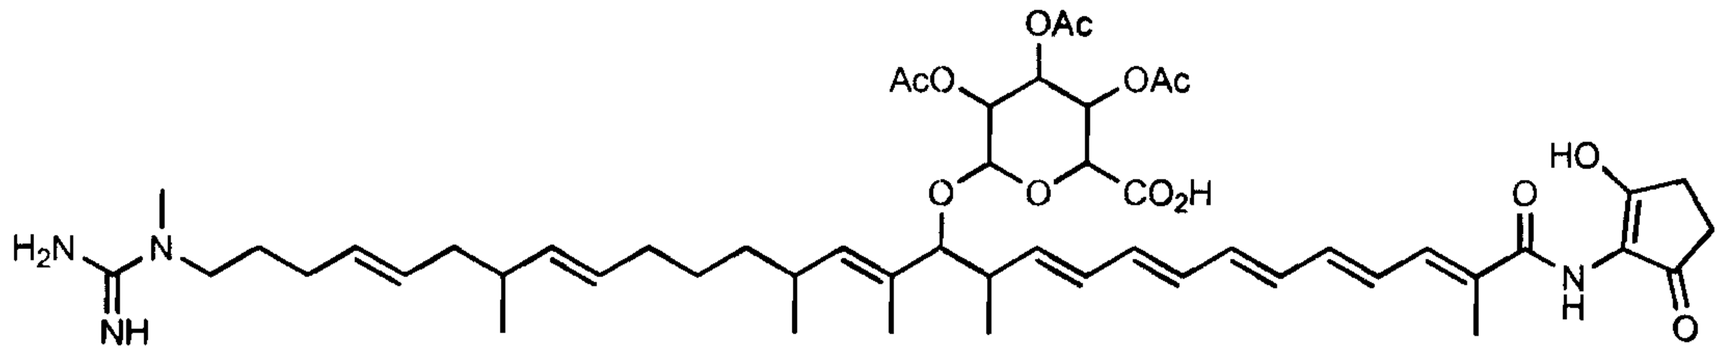
Compound 24;



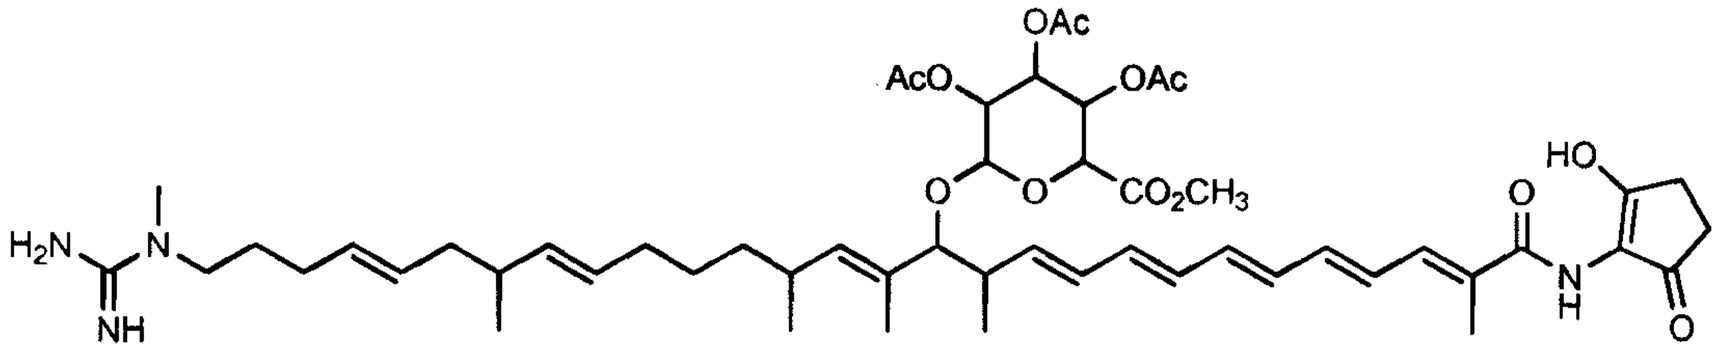
Compound 25;



Compound 26;



Compound 27 and



Compound 28;

or a pharmaceutically acceptable salt or prodrug of any one of Compound 1-28. Certain embodiments may exclude one or more of the compounds of Formula I.

III. Methods for producing the compounds of the invention by fermentation

The compounds of Formula I may be biosynthesized by various microorganisms. Microorganisms that may synthesize the compounds of the present invention include but are not limited to bacteria of the order Actinomycetales, also referred to as actinomycetes. Non-limiting examples of members belonging to the genera of Actinomycetes include *Nocardia, Geodermatophilus, Actinoplanes, Micromonospora, Nocardioides, Saccharothrix, Amycolatopsis, Kutzneria, Saccharomonospora, Saccharopolyspora, Kitasatospora, Streptomyces, Microbispora, Streptosporangium, Actinomadura*. The taxonomy of actinomycetes is complex and reference is made to Goodfellow (1989) Suprageneric classification of actinomycetes, *Bergey's Manual of Systematic Bacteriology,* Vol. 4, Williams and Wilkins, Baltimore, pp 2322-2339, and to Embley and Stackebrandt, (1994), and *The molecular phylogeny and systematics of the actinomycetes*, *Annu. Rev. Microbiol.* 48, 257-289 (1994), for genera that may synthesize the compounds of the invention, incorporated herein in its entirety by reference.

Microorganisms biosynthetically producing compounds of Formula I are cultivated in culture media containing known nutritional sources for actinomycetes having assimilable sources of carbon, nitrogen plus optional inorganic salts and other known

growth factors at a pH of about 6 to about 9, non-limiting examples of growth media are provided in Table 1. Microorganisms are cultivated at incubation temperatures of about 20^0 C to about 40^0 C for about 3 to about 40 days.

The culture media inoculated with the microorganisms, which biosynthetically produce compounds of Formula I, may be aerated by incubating the inoculated culture media with agitation, for example shaking on a rotary shaker, or a shaking water bath. Aeration may also be achieved by the injection of air, oxygen or an appropriate gaseous mixture to the inoculated culture media during incubation.

After cultivation and production of compounds of Formula I, the compounds can be extracted and isolated from the cultivated culture media by techniques known to a skilled person in the art and/or disclosed herein, including for example centrifugation, chromatography, adsorption. For example, the cultivated culture media can be mixed with a suitable organic solvent such as n-butanol, n-butyl acetate and 4-methyl-2-pentanone, the organic layer can be separated for example, by centrifugation followed by the removal of the solvent, by evaporation to dryness or by evaporation to dryness under vacuum. The resulting residue can optionally be reconstituted with for example water, ethyl ether, ethanol acetate, methanol or a mixture thereof, and re-extracted in a two-phase system with a suitable organic solvent such as hexane, carbon tetrachloride, methylene chloride or a mixture thereof. After removal of the solvent, the compound of Formula I can be further purified by the use of standard techniques such as chromatography.

TABLE 1: Fermentation media

Component	CA	CB	GA[a]	JA	NA	OA	RM
pH[b]	**7**	**7**		**7.3**	**7**	**7**	**6.9**
Glucose	10		10			10	10

$FeSO_4.7H_2O$		0.1					
KI		0.5					
MOPS							21
Trace Elements Solution[c] ml/L			2				2

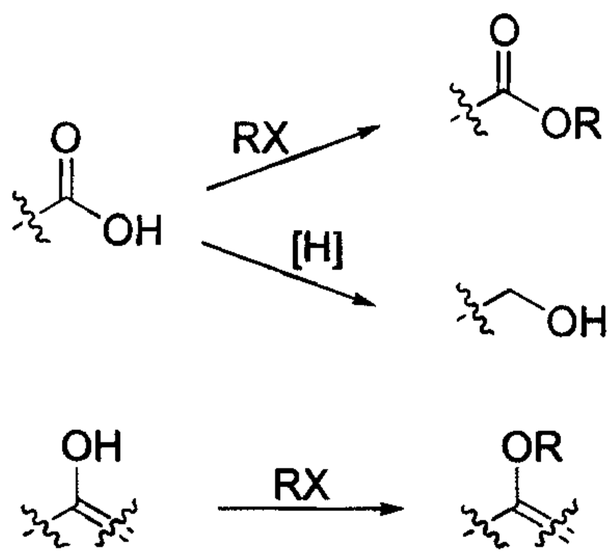
Unless otherwise indicated, all the components are in gm/L
To a liter of media GA add: 10 ml KH_2PO_4 (0.5% solution); 80 ml $CaCl_2.2H_2O$ (3.68% solution); 15 ml L-proline (20% solution); 100 ml TES buffer (5.73% solution, pH 7.2); 5 ml NaOH (1N solution).
The pH is adjusted as marked prior to the addition of $CaCO_3$.
Solution of trace elements contains: $ZnCl_2$ 40 mg; $FeCl_3.6H_2O$ (200 mg); $CuCl_2.2H_2O$ (10 mg); $(NH_4)_6Mo_7O_{24}.4H_2O$ (10 mg) per litre.

IV. Chemical modifications of Compounds 1 to 7

The compounds of Formula I that are biosynthesized by microorganisms may optionally be subjected to chemical modifications to form compounds that are derivatives or structural analogs of compounds of Formula I. Derivatives or structural analogs of compounds of Formula I having similar functional activities are within the scope of the present invention. Compounds of Formula I may optionally be modified using methods known in the art and described herein.

General principles of organic chemistry including functional moieties, reactivity and common protocols are described, for example, in Advanced Organic Chemistry 3rd Edition by Jerry March (1985), which is incorporated herein by reference in its entirety. In addition, it will be appreciated by one of ordinary skill in the art that the synthetic methods described herein may use a variety of protecting groups, whether or not they are explicitly described. A "protecting group" as used herein means a moiety used to block one or more functional moieties such as reactive groups including oxygen, sulfur or nitrogen, so that a reaction can be carried out selectively at another reactive site in a polyfunctional compound. General principles for the use of protective groups, their applicability to specific functional groups and their uses are described for example in T. H. Greene and P. G. M. Wuts, Protective Groups in Organic Synthesis, 3rd Edition, John Wiley & Sons, New York (1999),

Scheme 1: Modifications of acidic functions:

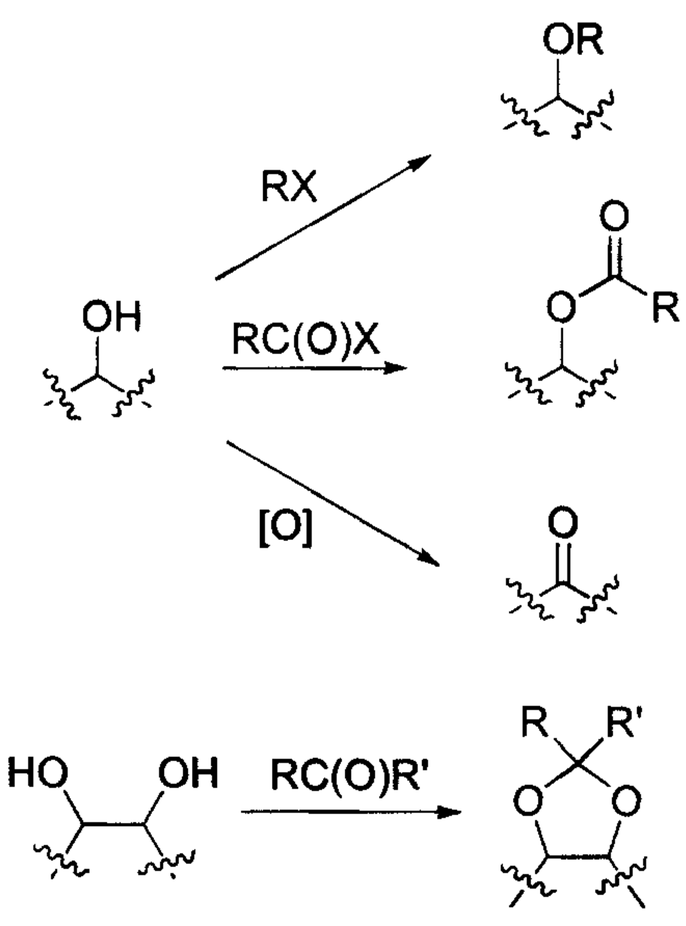


Scheme 1

wherein R is alkyl or aryl and X is a suitable leaving group

In Scheme 1, acidic functional groups are alkylated either individually or together. Simple ester is prepared from treatment of the carboxylic acid by an RX reagent such as diazoalkanes in the appropriate solvent. In Scheme 1, hydroxycyclopentenone is converted to alkoxycyclopentenone by similar treatment with the suitable RX reagent. In Scheme 1, carboxylic acids are also converted to alcohol by a reducing agent [H] such as lithiumaluminum hydride. Scheme 1 is used to obtain Compounds 3, 4, 5, 11 and 24 from Compound 1, Compounds 17, 18, 20, 26 and 28 respectively from Compounds 2, 7, 11, 25 and 27.

Scheme 2: Modifications to alcohol functions:



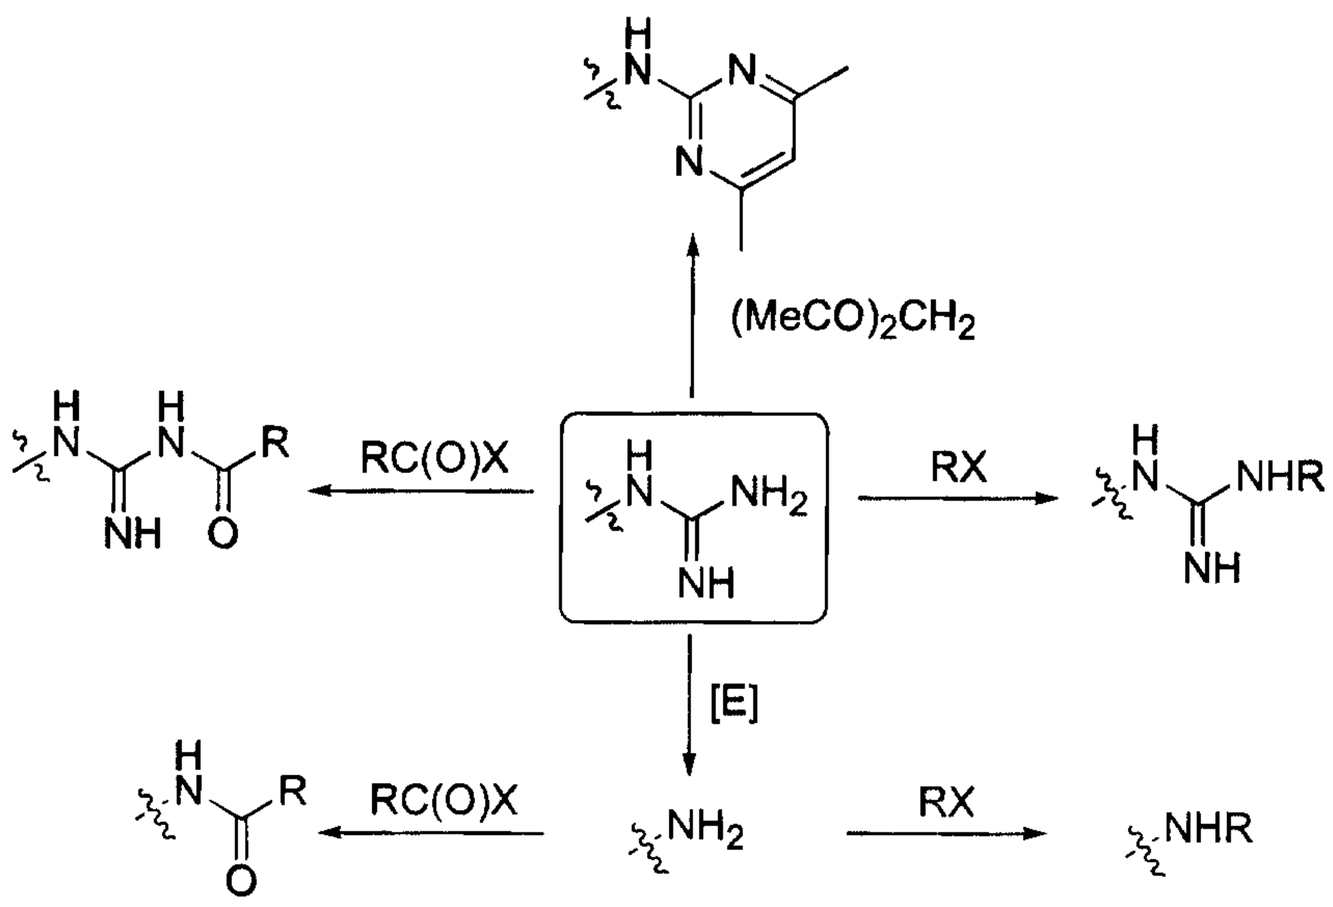
Scheme 2

wherein R and X are as in Scheme 1 and R' is alkyl, aryl or H

In Scheme 2, an alkylating agent such as methyliodide, converts alcohol to ether in the presence of a base such as potassium *tert*-butoxide. In Scheme 2, ester is obtained from the reaction of the alcohol with an activated carboxylic acid such as acid halides or anhydrides and N-hydroxysuccinimide esters in the presence of a base like diisopropylethylamine. In Scheme 2, a ketone is obtained from the oxidation of the alcohol by an oxidating agent [O] such as Dess-Martin (1,1,1-triacetoxy-1,1-dihydro-1,2-benziodoxol-3(1H)one) or Swern (oxalyl chloride and methylsulfoxide) reagents. In

scheme 2, a vicinal diol is converted to a 1,3-dioxolane ring by reaction with a ketone or an aldehyde (when R' is H) using an acid catalyst such as p-toluenesulfonic acid with removal of the water formed (like: Dean-Stark or molecular sieves). Scheme 2 is used to obtain Compound 10 from Compound 8, Compound 28 form Compound 3, Compounds 21 and 22 from Compound 5 and Compounds 25 and 27 from Compound 1.

Scheme 3: Modifications of guanidine group:



Scheme 3

wherein R and X are as in Scheme 1

In Scheme 3, a pyrimidine ring is obtained from the condensation of the guanidine group with a diketone, such as 2,4-pentadione in a solvent like ethanol under reflux. In Scheme 3, the guanidine functional group is enzymatically [E] hydrolyzed to amine in the appropriate conditions. In Scheme 3, the guanidine group or the amine group are alkylated by a suitable RX or acylated by a suitable RC(O)X in the presence of a base. Scheme 3 is used to produce Compounds 9, 13, 19 and 22 respectively from Compounds 2, 12, 17 and 5 and Compounds 6, 23 and 25 from Compound 1.

The following examples illustrate the invention but are not to be construed as limiting. Unless otherwise noted, all reagents were purchased from Sigma Chemical Co. (St. Louis, MO), (Aldrich).

Genes and proteins for producing the compounds of the invention

The invention also provides the genes and proteins forming the biosynthetic locus for the production of the compounds of Formula I.

Nucleic acid sequences encoding proteins involved in the biosynthesis of compounds of Formula I are provided in the accompanying sequence listing as SEQ ID NOS: 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 26, 28, 30, 32, 34, 36, 38, 40, 42, 44, 46, 48, 51, 53, 55, 57.

Polypeptides involved in the biosynthesis of compounds of Formula I are provided in the accompanying sequence listing as SEQ ID NOS: 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 47, 50, 52, 54, 56.

One aspect of the present invention is an isolated, purified, or enriched nucleic acid comprising one of the sequences of SEQ ID NOS: 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 26, 28, 30, 32, 34, 36, 38, 40, 42, 44, 46, 48, 51, 53, 55, 57, the sequences complementary thereto, and isolated, purified or enriched nucleic acids having at least 70%, 75%, 80%, 85%, 90%, 95%, 97% or 99% identity to the above sequences as determined by analysis with BLASTN™ version 2.0 with the default parameters.

The isolated, purified or enriched nucleic acids may comprise DNA, including cDNA, genomic DNA, and synthetic DNA. The DNA may be double stranded or single stranded, and if single stranded may be the coding (sense) or non-coding (anti-sense) strand. Alternatively, the isolated, purified or enriched nucleic acids may comprise RNA. As discussed in more detail below, the isolated, purified or enriched nucleic acids of one of SEQ ID NOS: 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 26, 28, 30, 32, 34, 36, 38, 40, 42, 44, 46, 48, 51, 53, 55, 57 may be used to prepare one of the polypeptides of SEQ ID NOS: 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 47, 50, 52, 54, 56 respectively or an isolated or purified polypeptide having at least 70%, 75%, 80%, 85%, 90%, 95%, 97%, or 99% homology to the polypeptide of SEQ ID NOS: 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 47, 50, 52, 54, 56 as determined by analysis with BLASTP™ version 2.2.2 with the default parameters.

Accordingly, another aspect of the present invention is an isolated, purified or enriched nucleic acid which encodes one of the polypeptides of SEQ ID NOS: 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 47, 50, 52, 54, 56 or an isolated or purified polypeptide having at least 70%, 75%, 80%, 85%, 90%, 95%, 97%, or 99% homology to the polypeptide of SEQ ID NOS: 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 47, 50, 52, 54, 56 as determined by analysis with BLASTP™ version 2.2.2 with the default parameters. The coding sequences of these nucleic acids may be identical to one of the coding sequences of one of the nucleic acids of SEQ ID NOS: 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 26, 28, 30, 32, 34, 36, 38, 40, 42, 44, 46, 48, 51, 53, 55, 57 or may be different coding sequences which encode one of the polypeptides of SEQ ID NOS: 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 47, 50, 52, 54, 56 or fragments comprising at least 50, 75, 100, 150, 200, 300 consecutive amino acids of one of the polypeptides of SEQ ID NOS: 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 47, 50, 52, 54, 56 as a result of the redundancy or degeneracy of the genetic code. The genetic code is well known to those of skill in the art and can be obtained, for example, from Stryer, *Biochemistry*, 3rd edition, W. H. Freeman & Co., New York (1998).

The isolated, purified or enriched nucleic acid which encodes one of the polypeptides of SEQ ID NOS: 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 47, 50, 52, 54, 56, may include, but is not limited to: (1) only the coding sequences of one of SEQ ID NOS: 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 26, 28, 30, 32, 34, 36, 38, 40, 42, 44, 46, 48, 51, 53, 55, 57; (2) the coding sequences of SEQ ID NOS: 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 26, 28, 30, 32, 34, 36, 38, 40, 42, 44, 46, 48, 51, 53, 55, 57 and additional coding sequences, such as leader sequences or proprotein; and (3) the coding sequences of SEQ ID NOS: 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 26, 28, 30, 32, 34, 36, 38, 40, 42, 44, 46, 48, 51, 53, 55, 57 and non-coding sequences, such as introns or non-coding sequences 5' and/or 3' of the coding sequence.

The invention relates to polynucleotides based on SEQ ID NOS: 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 26, 28, 30, 32, 34, 36, 38, 40, 42, 44, 46, 48, 51, 53, 55, 57 but having polynucleotide changes that are "silent", for example changes which do not alter the amino acid sequence encoded by the polynucleotides of SEQ ID NOS: 3, 5, 7, 9, 11, 13,

15, 17, 19, 21, 23, 26, 28, 30, 32, 34, 36, 38, 40, 42, 44, 46, 48, 51, 53, 55, 57. The invention also relates to polynucleotides which have nucleotide changes which result in amino acid substitutions, additions, deletions, fusions and truncations of the polypeptides of SEQ ID NOS: 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 47, 50, 52, 54, 56. Such nucleotide changes may be introduced using techniques such as site directed mutagenesis, random chemical mutagenesis, exonuclease III deletion, and other recombinant DNA techniques.

The isolated, purified or enriched nucleic acids of SEQ ID NOS: 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 26, 28, 30, 32, 34, 36, 38, 40, 42, 44, 46, 48, 51, 53, 55, 57, the sequences complementary thereto may be used as probes to identify and isolate DNAs encoding the polypeptides of SEQ ID NOS: 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 47, 50, 52, 54, 56 respectively. In such procedures, a genomic DNA library is constructed from a sample microorganism or a sample containing a microorganism capable of producing a polyketide. The genomic DNA library is then contacted with a probe comprising a coding sequence or a fragment of the coding sequence, encoding one of the polypeptides of SEQ ID NOS: 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 47, 50, 52, 54, 56, or a fragment thereof under conditions which permit the probe to specifically hybridize to sequences complementary thereto. In a preferred embodiment, the probe is an oligonucleotide of about 10 to about 30 nucleotides in length designed based on a nucleic acid of SEQ ID NOS: 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 26, 28, 30, 32, 34, 36, 38, 40, 42, 44, 46, 48, 51, 53, 55, 57. Genomic DNA clones which hybridize to the probe are then detected and isolated. Procedures for preparing and identifying DNA clones of interest are disclosed in Ausubel *et al.*, Current Protocols in Molecular Biology, John Wiley 503 Sons, Inc. (1997); and Sambrook *et al.*, Molecular Cloning: A Laboratory Manual 2d Ed., Cold Spring Harbor Laboratory Press, (1989). In another embodiment, the probe is a restriction fragment or a PCR amplified nucleic acid derived from SEQ ID NOS: 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 26, 28, 30, 32, 34, 36, 38, 40, 42, 44, 46, 48, 51, 53, 55, 57.

The isolated, purified or enriched nucleic acids of SEQ ID NOS: 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 26, 28, 30, 32, 34, 36, 38, 40, 42, 44, 46, 48, 51, 53, 55, 57, the sequences

complementary thereto may be used as probes to identify and isolate related nucleic acids. In some embodiments, the related nucleic acids may be genomic DNAs (or cDNAs) from potential polyketide producers. In such procedures, a nucleic acid sample containing nucleic acids from a potential microbial producer of a compound of Formula I is contacted with the probe under conditions that permit the probe to specifically hybridize to related sequences. The nucleic acid sample may be a genomic DNA (or cDNA) library from the potential polyketide-producer. Hybridization of the probe to nucleic acids is then detected using any of the methods described above.

Hybridization may be carried out under conditions of low stringency, moderate stringency or high stringency. As an example of nucleic acid hybridization, a polymer membrane containing immobilized denatured nucleic acids is first prehybridized for 30 minutes at 45 °C in a solution consisting of 0.9 M NaCl, 50 mM NaH_2PO_4, pH 7.0, 5.0 mM Na_2EDTA, 0.5% SDS, 10X Denhardt's, and 0.5 mg/ml polyriboadenylic acid. Approximately 2 x 10^7 cpm (specific activity 4-9 x 10^8 cpm/ug) of ^{32}P end-labeled oligonucleotide probe are then added to the solution. After 12-16 hours of incubation, the membrane is washed for 30 minutes at room temperature in 1X SET (150 mM NaCl, 20 mM Tris hydrochloride, pH 7.8, 1 mM Na_2EDTA) containing 0.5% SDS, followed by a 30 minute wash in fresh 1X SET at Tm-10°C for the oligonucleotide probe where Tm is the melting temperature. The membrane is then exposed to autoradiographic film for detection of hybridization signals.

By varying the stringency of the hybridization conditions used to identify nucleic acids, such as genomic DNAs or cDNAs, which hybridize to the detectable probe, nucleic acids having different levels of homology to the probe can be identified and isolated. Stringency may be varied by conducting the hybridization at varying temperatures below the melting temperatures of the probes. The melting temperature of the probe may be calculated using the following formulas:

For oligonucleotide probes between 14 and 70 nucleotides in length the melting temperature (Tm) in degrees Celcius may be calculated using the formula: Tm=81.5+16.6(log [Na+]) + 0.41(fraction G+C)-(600/N) where N is the length of the oligonucleotide.

If the hybridization is carried out in a solution containing formamide, the melting temperature may be calculated using the equation Tm=81.5+16.6(log [Na +]) + 0.41(fraction G + C)-(0.63% formamide)-(600/N) where N is the length of the probe. Prehybridization may be carried out in 6X SSC, 5X Denhardt's reagent, 0.5% SDS, 0.1 mg/ml denatured fragmented salmon sperm DNA or 6X SSC, 5X Denhardt's reagent, 0.5% SDS, 0.1 mg/ml denatured fragmented salmon sperm DNA, 50% formamide. The composition of the SSC and Denhardt's solutions are listed in Sambrook et al., *supra*. Hybridization is conducted by adding the detectable probe to the hybridization solutions listed above. Where the probe comprises double stranded DNA, it is denatured by incubating at elevated temperatures and quickly cooling before addition to the hybridization solution. It may also be desirable to similarly denature single stranded probes to eliminate or diminish formation of secondary structures or oligomerization. The filter is contacted with the hybridization solution for a sufficient period of time to allow the probe to hybridize to cDNAs or genomic DNAs containing sequences complementary thereto or homologous thereto. For probes over 200 nucleotides in length, the hybridization may be carried out at 15-25 °C below the Tm. For shorter probes, such as oligonucleotide probes, the hybridization may be conducted at 5-10 °C below the Tm. Preferably, the hybridization is conducted in 6X SSC, for shorter probes. Preferably, the hybridization is conducted in 50% formamide containing solutions, for longer probes.

All the foregoing hybridizations would be considered to be examples of hybridization performed under conditions of high stringency.

Following hybridization, the filter is washed for at least 15 minutes in 2X SSC, 0.1% SDS at room temperature or higher, depending on the desired stringency. The filter is then washed with 0.1X SSC, 0.5% SDS at room temperature (again) for 30 minutes to 1 hour. Nucleic acids which have hybridized to the probe are identified by conventional autoradiography and non-radioactive detection methods.

The above procedure may be modified to identify nucleic acids having decreasing levels of homology to the probe sequence. For example, to obtain nucleic acids of decreasing homology to the detectable probe, less stringent conditions may be used. For example, the hybridization temperature may be decreased in increments of 5 °C from 68 °C to 42

°C in a hybridization buffer having a Na+ concentration of approximately 1M. Following hybridization, the filter may be washed with 2X SSC, 0.5% SDS at the temperature of hybridization. These conditions are considered to be "moderate stringency" conditions above 50°C and "low stringency" conditions below 50°C. A specific example of "moderate stringency" hybridization conditions is when the above hybridization is conducted at 55°C. A specific example of "low stringency" hybridization conditions is when the above hybridization is conducted at 45°C.

Alternatively, the hybridization may be carried out in buffers, such as 6X SSC, containing formamide at a temperature of 42 °C. In this case, the concentration of formamide in the hybridization buffer may be reduced in 5% increments from 50% to 0% to identify clones having decreasing levels of homology to the probe. Following hybridization, the filter may be washed with 6X SSC, 0.5% SDS at 50 °C. These conditions are considered to be "moderate stringency" conditions above 25% formamide and "low stringency" conditions below 25% formamide. A specific example of "moderate stringency" hybridization conditions is when the above hybridization is conducted at 30% formamide. A specific example of "low stringency" hybridization conditions is when the above hybridization is conducted at 10% formamide.

Nucleic acids which have hybridized to the probe are identified by conventional autoradiography and non-radioactive detection methods.

For example, the preceding methods may be used to isolate nucleic acids having a sequence with at least 97%, at least 95%, at least 90%, at least 85%, at least 80%, or at least 70% homology to a nucleic acid sequence selected from the group consisting of the sequences of SEQ ID NOS: 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 26, 28, 30, 32, 34, 36, 38, 40, 42, 44, 46, 48, 51, 53, 55, 57, fragments comprising at least 10, 15, 20, 25, 30, 35, 40, 50, 75, 100, 150, 200, 300, 400, or 500 consecutive bases thereof, and the sequences complementary thereto. Homology may be measured using BLASTN™ version 2.0 with the default parameters. For example, the homologous polynucleotides may have a coding sequence that is a naturally occurring allelic variant of one of the coding sequences described herein. Such allelic variant may have a substitution, deletion or addition of one or more nucleotides when compared to the nucleic acids of

SEQ ID NOS: 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 26, 28, 30, 32, 34, 36, 38, 40, 42, 44, 46, 48, 51, 53, 55, 57, or the sequences complementary thereto.

Additionally, the above procedures may be used to isolate nucleic acids which encode polypeptides having at least 99%, 95%, at least 90%, at least 85%, at least 80%, or at least 70% homology to a polypeptide having the sequence of one of SEQ ID NOS: 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 47, 50, 52, 54, 56, or fragments comprising at least 50, 75, 100, 150, 200, 300 consecutive amino acids thereof as determined using the BLASTP™ version 2.2.2 algorithm with default parameters.

Another aspect of the present invention is an isolated or purified polypeptide comprising the sequence of one of SEQ ID NOS: 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 47, 50, 52, 54, 56 or fragments comprising at least 50, 75, 100, 150, 200 or 300 consecutive amino acids thereof. As discussed herein, such polypeptides may be obtained by inserting a nucleic acid encoding the polypeptide into a vector such that the coding sequence is operably linked to a sequence capable of driving the expression of the encoded polypeptide in a suitable host cell. For example, the expression vector may comprise a promoter, a ribosome binding site for translation initiation and a transcription terminator. The vector may also include appropriate sequences for modulating expression levels, an origin of replication and a selectable marker.

Promoters suitable for expressing the polypeptide or fragment thereof in bacteria include the *E.coli lac* or *trp* promoters, the lacI promoter, the lacZ promoter, the T3 promoter, the T7 promoter, the gpt promoter, the lambda P_R promoter, the lambda P_L promoter, promoters from operons encoding glycolytic enzymes such as 3-phosphoglycerate kinase (PGK), and the acid phosphatase promoter. Fungal promoters include the α factor promoter. Eukaryotic promoters include the CMV immediate early promoter, the HSV thymidine kinase promoter, heat shock promoters, the early and late SV40 promoter, LTRs from retroviruses, and the mouse metallothionein-I promoter. Other promoters known to control expression of genes in prokaryotic or eukaryotic cells or their viruses may also be used.

Mammalian expression vectors may also comprise an origin of replication, any necessary ribosome binding sites, a polyadenylation site, splice donors and acceptor sites, transcriptional termination sequences, and 5' flanking nontranscribed sequences. In some embodiments, DNA sequences derived from the SV40 splice and polyadenylation sites may be used to provide the required nontranscribed genetic elements.

Vectors for expressing the polypeptide or fragment thereof in eukaryotic cells may also contain enhancers to increase expression levels. Enhancers are cis-acting elements of DNA, usually from about 10 to about 300 bp in length that act on a promoter to increase its transcription. Examples include the SV40 enhancer on the late side of the replication origin bp 100 to 270, the cytomegalovirus early promoter enhancer, the polyoma enhancer on the late side of the replication origin, and the adenovirus enhancers.

In addition, the expression vectors preferably contain one or more selectable marker genes to permit selection of host cells containing the vector. Examples of selectable markers that may be used include genes encoding dihydrofolate reductase or genes conferring neomycin resistance for eukaryotic cell culture, genes conferring tetracycline or ampicillin resistance in *E. coli*, and the *S. cerevisiae* TRP1 gene.

In some embodiments, the nucleic acid encoding one of the polypeptides of SEQ ID NOS: 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 47, 50, 52, 54, 56, or fragments comprising at least 50, 75, 100, 150, 200 or 300 consecutive amino acids thereof is assembled in appropriate phase with a leader sequence capable of directing secretion of the translated polypeptides or fragments thereof. Optionally, the nucleic acid can encode a fusion polypeptide in which one of the polypeptide of SEQ ID NOS: 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 47, 50, 52, 54, 56 or fragments comprising at least 5, 10, 15, 20, 25, 30, 35, 40, 50, 75, 100, or 150 consecutive amino acids thereof is fused to heterologous peptides or polypeptides, such as N-terminal identification peptides which impart desired characteristics such as increased stability or simplified purification or detection.

The appropriate DNA sequence may be inserted into the vector by a variety of procedures. In general, the DNA sequence is ligated to the desired position in the vector following digestion of the insert and the vector with appropriate restriction

endonucleases. Alternatively, appropriate restriction enzyme sites can be engineered into a DNA sequence by PCR. A variety of cloning techniques are disclosed in Ausbel et al. Current Protocols in Molecular Biology, John Wiley 503 Sons, Inc. (1997) and Sambrook et al., Molecular Cloning: A Laboratory Manual 2d Ed., Cold Spring Harbour Laboratory Press, (1989). Such procedures and others are deemed to be within the scope of those skilled in the art.

The vector may be, for example, in the form of a plasmid, a viral particle, or a phage. Other vectors include derivatives of chromosomal, nonchromosomal and synthetic DNA sequences, viruses, bacterial plasmids, phage DNA, baculovirus, yeast plasmids, vectors derived from combinations of plasmids and phage DNA, viral DNA such as vaccinia, adenovirus, fowl pox virus, and pseudorabies. A variety of cloning and expression vectors for use with prokaryotic and eukaryotic hosts are described by Sambrook, et al., Molecular Cloning: A Laboratory Manual, Second Edition, Cold Spring Harbor, N.Y., (1989).

Particular bacterial vectors which may be used include the commercially available plasmids comprising genetic elements of the well known cloning vector pBR322 (ATCC™ 37017), pKK223-3 (Pharmacia Fine Chemicals, Uppsala, Sweden), pGEM1 (Promega Biotec, Madison, WI, USA) pQE70, pQE60, pQE-9 (Qiagen), pD10, phiX174, pBluescript™ II KS, pNH8A, pNH16a, pNH18A, pNH46A (Stratagene), ptrc99a, pKK223-3, pKK233-3, pDR540, pRIT5 (Pharmacia), pKK232-8 and pCM7. Particular eukaryotic vectors include pSV2CAT, pOG44, pXT1, pSG (Stratagene) pSVK3, pBPV, pMSG, and pSVL (Pharmacia). However, any other vector may be used as long as it is replicable and stable in the host cell.

The host cell may be any of the host cells familiar to those skilled in the art, including prokaryotic cells or eukaryotic cells. As representative examples of appropriate hosts, there may be mentioned: bacteria cells, such as *E. coli*, *Streptomyces*, *Bacillus subtilis*, *Salmonella typhimurium* and various species within the genera *Pseudomonas*, *Streptomyces*, and *Staphylococcus*, fungal cells, such as yeast, insect cells such as *Drosophila S2* and *Spodoptera Sf9*, animal cells such as CHO, COS or Bowes melanoma, and adenoviruses. The selection of an appropriate host is within the abilities of those skilled in the art.

The vector may be introduced into the host cells using any of a variety of techniques, including electroporation transformation, transfection, transduction, viral infection, gene guns, or Ti-mediated gene transfer. Where appropriate, the engineered host cells can be cultured in conventional nutrient media modified as appropriate for activating promoters, selecting transformants or amplifying the genes of the present invention. Following transformation of a suitable host strain and growth of the host strain to an appropriate cell density, the selected promoter may be induced by appropriate means (e.g., temperature shift or chemical induction) and the cells may be cultured for an additional period to allow them to produce the desired polypeptide or fragment thereof. Cells are typically harvested by centrifugation, disrupted by physical or chemical means, and the resulting crude extract is retained for further purification. Microbial cells employed for expression of proteins can be disrupted by any convenient method, including freeze-thaw cycling, sonication, mechanical disruption, or use of cell lysing agents. Such methods are well known to those skilled in the art. The expressed polypeptide or fragment thereof can be recovered and purified from recombinant cell cultures by methods including ammonium sulfate or ethanol precipitation, acid extraction, anion or cation exchange chromatography, phosphocellulose chromatography, hydrophobic interaction chromatography, affinity chromatography, hydroxylapatite chromatography and lectin chromatography. Protein refolding steps can be used, as necessary, in completing configuration of the polypeptide. If desired, high performance liquid chromatography (HPLC) can be employed for final purification steps. Various mammalian cell culture systems can also be employed to express recombinant protein. Examples of mammalian expression systems include the COS-7 lines of monkey kidney fibroblasts (described by Gluzman, Cell, 23:175(1981)), and other cell lines capable of expressing proteins from a compatible vector, such as the C127, 3T3, CHO, HeLa and BHK cell lines.

The constructs in host cells can be used in a conventional manner to produce the gene product encoded by the recombinant sequence. Depending upon the host employed in a recombinant production procedure, the polypeptide produced by host cells containing the vector may be glycosylated or may be non-glycosylated. Polypeptides of the invention may or may not also include an initial methionine amino acid residue.

Alternatively, the polypeptides of SEQ ID NOS: 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 47, 50, 52, 54, 56, or fragments comprising at least 50, 75, 100, 150, 200 or 300 consecutive amino acids thereof can be synthetically produced by conventional peptide synthesizers. In other embodiments, fragments or portions of the polynucleotides may be employed for producing the corresponding full-length polypeptide by peptide synthesis; therefore, the fragments may be employed as intermediates for producing the full-length polypeptides.

Cell-free translation systems can also be employed to produce one of the polypeptides of SEQ ID NOS: 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 47, 50, 52, 54, 56, or fragments comprising at least 50, 75, 100, 150, 200 or 300 consecutive amino acids thereof using mRNAs transcribed from a DNA construct comprising a promoter operably linked to a nucleic acid encoding the polypeptide or fragment thereof. In some embodiments, the DNA construct may be linearized prior to conducting an *in vitro* transcription reaction. The transcribed mRNA is then incubated with an appropriate cell-free translation extract, such as a rabbit reticulocyte extract, to produce the desired polypeptide or fragment thereof.

The present invention also relates to variants of the polypeptides of SEQ ID NOS: 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 47, 50, 52, 54, 56, or fragments comprising at least 50, 75, 100, 150, 200 or 300 consecutive amino acids thereof. The term "variant" includes derivatives or analogs of these polypeptides. In particular, the variants may differ in amino acid sequence from the polypeptides of SEQ ID NOS: 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 47, 50, 52, 54, 56, by one or more substitutions, additions, deletions, fusions and truncations, which may be present in any combination.

The variants may be naturally occurring or created *in vitro*. In particular, such variants may be created using genetic engineering techniques such as site directed mutagenesis, random chemical mutagenesis, Exonuclease III deletion procedures, and standard cloning techniques. Alternatively, such variants, fragments, analogs, or derivatives may be created using chemical synthesis or modification procedures.

Other methods of making variants are also familiar to those skilled in the art. These include procedures in which nucleic acid sequences obtained from natural isolates are

modified to generate nucleic acids that encode polypeptides having characteristics which enhance their value in industrial or laboratory applications. In such procedures, a large number of variant sequences having one or more nucleotide differences with respect to the sequence obtained from the natural isolate are generated and characterized. Preferably, these nucleotide differences result in amino acid changes with respect to the polypeptides encoded by the nucleic acids from the natural isolates. For example, variants may be created using error prone PCR. In error prone PCR, DNA amplification is performed under conditions where the fidelity of the DNA polymerase is low, such that a high rate of point mutation is obtained along the entire length of the PCR product. Error prone PCR is described in Leung, D.W., *et al.*, Technique, 1:11-15 (1989) and Caldwell, R. C. & Joyce G.F., PCR Methods Applic., 2:28-33 (1992). Variants may also be created using site directed mutagenesis to generate site-specific mutations in any cloned DNA segment of interest. Oligonucleotide mutagenesis is described in Reidhaar-Olson, J.F. & Sauer, R.T., *et al.*, Science, 241:53-57 (1988). Variants may also be created using directed evolution strategies such as those described in US patent nos. 6,361,974 and 6,372,497. The variants of the polypeptides of SEQ ID NOS: 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 47, 50, 52, 54, 56, may be (i) variants in which one or more of the amino acid residues of the polypeptides of SEQ ID NOS: 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 47, 50, 52, 54, 56, are substituted with a conserved or non-conserved amino acid residue (preferably a conserved amino acid residue) and such substituted amino acid residue may or may not be one encoded by the genetic code.

Conservative substitutions are those that substitute a given amino acid in a polypeptide by another amino acid of like characteristics. Typically seen as conservative substitutions are the following replacements: replacements of an aliphatic amino acid such as Ala, Val, Leu and Ile with another aliphatic amino acid; replacement of a Ser with a Thr or vice versa; replacement of an acidic residue such as Asp or Glu with another acidic residue; replacement of a residue bearing an amide group, such as Asn or Gln, with another residue bearing an amide group; exchange of a basic residue such

as Lys or Arg with another basic residue; and replacement of an aromatic residue such as Phe or Tyr with another aromatic residue.

Other variants are those in which one or more of the amino acid residues of the polypeptides of SEQ ID NOS: 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 47, 50, 52, 54, 56 includes a substituent group.

Still other variants are those in which the polypeptide is associated with another compound, such as a compound to increase the half-life of the polypeptide (for example, polyethylene glycol).

Additional variants are those in which additional amino acids are fused to the polypeptide, such as leader sequence, a secretory sequence, a proprotein sequence or a sequence which facilitates purification, enrichment, or stabilization of the polypeptide.

In some embodiments, the fragments, derivatives and analogs retain the same biological function or activity as the polypeptides of SEQ ID NOS: 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 47, 50, 52, 54, 56. In other embodiments, the fragment, derivative or analogue includes a fused heterologous sequence which facilitates purification, enrichment, detection, stabilization or secretion of the polypeptide that can be enzymatically cleaved, in whole or in part, away from the fragment, derivative or analogue.

Another aspect of the present invention are polypeptides or fragments thereof which have at least 70%, at least 80%, at least 85%, at least 90%, or more than 95% homology to one of the polypeptides of SEQ ID NOS: 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 47, 50, 52, 54, 56, or a fragment comprising at least 50, 75, 100, 150, 200 or 300 consecutive amino acids thereof. Homology may be determined using a program, such as BLASTP version 2.2.2 with the default parameters, which aligns the polypeptides or fragments being compared and determines the extent of amino acid identity or similarity between them. It will be appreciated that amino acid "homology" includes conservative substitutions such as those described above.

The polypeptides or fragments having homology to one of the polypeptides of SEQ ID NOS: 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 47, 50,

52, 54, 56, or a fragment thereof may be obtained by isolating the nucleic acids encoding them using the techniques described above.

Alternatively, the homologous polypeptides or fragments may be obtained through biochemical enrichment or purification procedures. The sequence of potentially homologous polypeptides or fragments may be determined by proteolytic digestion, gel electrophoresis and/or microsequencing. The sequence of the prospective homologous polypeptide or fragment can be compared to one of the polypeptides of SEQ ID NOS: 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 47, 50, 52, 54, 56, or a fragment thereof using a program such as BLASTP version 2.2.2 with the default parameters.

The PKS system of SEQ ID NOS: 37, 39, 41, 43, 45 and 47 may be modified to produce compounds of Formula I. Genetic modifications of PKS biosynthetic loci are well known in the art. The WO 01/34816 patent publication teaches the construction of a library of structural variants of the macrolide polyketide rapamycin derived from the genetic modification of genes in the locus that directs rapamycin synthesis. The genetic modifications taught include gene inactivations, gene insertions and gene replacements. These modifications, both individually and in combination at different positions within the rapamycin locus, resulted in alteration of polyketide starter units, chain length and hydroxyl sterospecificities in rapamycin. Similarly, McDaniel, *et.al.* [Proc Natl Acad Sci USA, 1999, 96:18646-51] generated a library of over 50 derivatives of the macrolide antibiotic erythromycin using a combination of genetic modifications including gene inactivations, macrolide chain length and hydroxyl sterospecificity modifications of the erythromycin biosynthesis genes. The PKS system of the invention may be genetically modified to produce compounds of Formula I. The biosynthetic locus of Example 1 is modified by deletion, mutagenesis, inactivation or replacement of one or more nucleic acid sequence that encode enzymatic activities. The modified gene locus of Example 1 produces compounds of Formula I that differ in size, degree of saturation and degree of oxidation. Compounds produced by these genetic modifications include, without limitations, Compounds 12, 14 and 16.

Pharmaceutical composition comprising the compounds of the invention

The compounds of the present invention, or pharmaceutically acceptable salts or prodrugs thereof, can be formulated for oral, intravenous, intramuscular, subcutaneous, topical or parenteral administration for the therapeutic or prophylactic treatment of diseases, particularly bacterial infections. For oral or parental administration, compounds of the present invention can be mixed with conventional pharmaceutical carriers and excipients and used in the form of tablets, capsules, elixirs, suspensions, syrups, wafers and the like. The compositions comprising a compound of this present invention will contain from about 0.1% to about 99.9%, about 5% to about 95%, about 10% to about 80% or about 15% to about 60% by weight of the active compound.

The pharmaceutical preparations disclosed herein are prepared in accordance with standard procedures and are administered at dosages that are selected to reduce, prevent, or eliminate bacterial infection (See, e.g., Remington's Pharmaceutical Sciences, Mack Publishing Company, Easton, PA and Goodman and Gilman's the Pharmaceutical Basis of Therapeutics, Pergamon Press, New York, NY, the contents of which are incorporated herein by reference, for a general description of the methods for administering various antimicrobial agents for human therapy). The compositions of the present invention can be delivered using controlled (e.g., capsules) or sustained release delivery systems (e.g., bioerodable matrices). Exemplary delayed release delivery systems for drug delivery that are suitable for administration of the compositions of the invention (preferably of Formula I) are described in U.S. Patent Nos 4,452,775 (issued to Kent), 5,039,660 (issued to Leonard), 3,854,480 (issued to Zaffaroni).

The pharmaceutically-acceptable compositions of the present invention comprise one or more compounds of the present invention in association with one or more non-toxic, pharmaceutically-acceptable carriers and/or diluents and/or adjuvants and/or excipients, collectively referred to herein as "carrier" materials, and if desired other active ingredients. The compositions may contain common carriers and excipients, such as corn starch or gelatin, lactose, sucrose, microcrystalline cellulose, kaolin, mannitol, dicalcium phosphate, sodium chloride and alginic acid. The compositions may contain crosarmellose sodium, microcrystalline cellulose, sodium starch glycolate and alginic acid.

Tablet binders that can be included are acacia, methylcellulose, sodium carboxymethylcellulose, polyvinylpyrrolidone (Providone), hydroxypropyl methylcellulose, sucrose, starch and ethylcellulose.

Lubricants that can be used include magnesium stearate or other metallic stearates, stearic acid, silicon fluid, talc, waxes, oils and colloical silica. Flavouring agents such as peppermint, oil of wintergreen, cherry flavouring or the like can also be used. It may also be desirable to add a coloring agent to make the dosage form more esthetic in appearance or to help identify the product comprising a compound of the present invention.

For oral use, solid formulations such as tablets and capsules are particularly useful. Sustained released or enterally coated preparations may also be devised. For pediatric and geriatric applications, suspension, syrups and chewable tablets are especially suitable. For oral administration, the pharmaceutical compositions are in the form of, for example, a tablet, capsule, suspension or liquid. The pharmaceutical composition is preferably made in the form of a dosage unit containing a therapeutically-effective amount of the active ingredient. Examples of such dosage units are tablets and capsules. For therapeutic purposes, the tablets and capsules which can contain, in addition to the active ingredient, conventional carriers such as binding agents, for example, acacia gum, gelatin, polyvinylpyrrolidone, sorbitol, or tragacanth; fillers, for example, calcium phosphate, glycine, lactose, maize-starch, sorbitol, or sucrose; lubricants, for example, magnesium stearate, polyethylene glycol, silica or talc: disintegrants, for example, potato starch, flavoring or coloring agents, or acceptable wetting agents. Oral liquid preparations generally are in the form of aqueous or oily solutions, suspensions, emulsions, syrups or elixirs may contain conventional additives such as suspending agents, emulsifying agents, non-aqueous agents, preservatives, coloring agents and flavoring agents. Examples of additives for liquid preparations include acacia, almond oil, ethyl alcohol, fractionated coconut oil, gelatin, glucose syrup, glycerin, hydrogenated edible fats, lecithin, methyl cellulose, methyl or propyl *para*-hydroxybenzoate, propylene glycol, sorbitol, or sorbic acid.

For intravenous (IV) use, compounds of the present invention can be dissolved or suspended in any of the commonly used intravenous fluids and administered by

infusion. Intravenous fluids include, without limitation, physiological saline or Ringer's solution.

Formulations for parental administration can be in the form of aqueous or non-aqueous isotonic sterile injection solutions or suspensions. These solutions or suspensions can be prepared from sterile powders or granules having one or more of the carriers mentioned for use in the formulations for oral administration. The compounds can be dissolved in polyethylene glycol, propylene glycol, ethanol, corn oil, benzyl alcohol, sodium chloride, and/or various buffers.

For intramuscular preparations, a sterile formulation of compounds of the present invention or suitable soluble salts forming the compound, can be dissolved and administered in a pharmaceutical diluent such as Water-for-Injection (WFI), physiological saline or 5% glucose. A suitable insoluble form of the compound may be prepared and administered as a suspension in an aqueous base or a pharmaceutically acceptable oil base, e.g. an ester of a long chain fatty acid such as ethyl oleate.

For topical use the compounds of present invention can also be prepared in suitable forms to be applied to the skin, or mucus membranes of the nose and throat, and can take the form of creams, ointments, liquid sprays or inhalants, lozenges, or throat paints. Such topical formulations further can include chemical compounds such as dimethylsulfoxide (DMSO) to facilitate surface penetration of the active ingredient.

For application to the eyes or ears, the compounds of the present invention can be presented in liquid or semi-liquid form formulated in hydrophobic or hydrophilic bases as ointments, creams, lotions, paints or powders.

For rectal administration the compounds of the present invention can be administered in the form of suppositories admixed with conventional carriers such as cocoa butter, wax or other glyceride.

Alternatively, the compound of the present invention can be in powder form for reconstitution in the appropriate pharmaceutically acceptable carrier at the time of delivery. In another embodiment, the unit dosage form of the compound can be a solution of the compound or a salt thereof in a suitable diluent in sterile, hermetically sealed ampoules.

The amount of the compound of the present invention in a unit dosage comprises a therapeutically-effective amount of at least one active compound of the present invention which may vary depending on the recipient subject, route and frequency of administration. A recipient subject refers to a plant, a cell culture or an animal such as an ovine or a mammal including a human.

According to this aspect of the present invention, the novel compositions disclosed herein are placed in a pharmaceutically acceptable carrier and are delivered to a recipient subject (including a human subject) in accordance with known methods of drug delivery. In general, the methods of the invention for delivering the compositions of the invention in vivo utilize art-recognized protocols for delivering the agent with the only substantial procedural modification being the substitution of the compounds of the present invention for the drugs in the art-recognized protocols.

Likewise, the methods for using the claimed composition for treating cells in culture, for example, to eliminate or reduce the level of bacterial contamination of a cell culture, utilize art-recognized protocols for treating cell cultures with antibacterial agents with the only substantial procedural modification being the substitution of the compounds of the present invention for the agents used in the art-recognized protocols.

The compounds of the present invention provide a method for treating microbial infections. As used herein the term unit dosage refers to a quantity of a therapeutically-effective amount of a compound of the present invention that elicits a desired therapeutic response. As used herein the phrase therapeutically-effective amount means an amount of a compound of the present invention that prevents the onset, alleviates the symptoms, or stops the progression of a bacterial infection. The term treating is defined as administering, to a subject, a therapeutically-effective amount of at least one compound of the present invention, both to prevent the occurrence of a bacterial infection, or to control or eliminate a bacterial infection. The term desired therapeutic response refers to treating a recipient subject with a compound of the present invention such that a bacterial infection is reversed, arrested or prevented in a recipient subject.

The compounds of the present invention can be administered as a single daily dose or in multiple doses per day. The treatment regime may require administration over extended

periods of time, e.g., for several days or for from two to four weeks. The amount per administered dose or the total amount administered will depend on such factors as the nature and severity of the infection, the age and general health of the recipient subject, the tolerance of the recipient subject to the compound and the type of the bacterial infection.

A compound according to this invention may also be administered in the diet or feed of a patient or animal. The diet for animals can be normal foodstuffs to which the compound can be added or it can be added to a premix.

The compounds of the present invention may be taken in combination, together or separately with any known clinically approved antibiotic to treat a recipient subject in need of such treatment.

Method of Inhibiting Bacterial Growth

In one embodiment, the present invention relates to a method for treating bacterial infection in a mammalian subject in need thereof, comprising the step of administering to the mammal a therapeutically effective amount of a polyene polyketide of Formula I, a compound as described herein, or a pharmaceutically acceptable derivative or prodrug thereof.

In another embodiment, the present invention relates to the use of a polyene polyketide of Formula I, a compound as described herein, or a pharmaceutical acceptable salt, derivative or prodrug thereof, as a pharmaceutical for treating bacterial infection in a mammalian subject in need thereof.

According to another embodiment, the invention provides a method of decreasing bacterial quantity in a biological sample. This method comprises the step of contacting the biological sample with a polyene polyketide of Formula I, a compound as described herein, or a pharmaceutically acceptable derivative or prodrug thereof. This method is effective if the number of bacteria decreases by at least 10%, and preferably more, e.g., 25%, 50%, 75% or even 100% after contacting the biological sample with a polyene polyketide of Formula I, a compound as described herein, or a pharmaceutically acceptable derivative or prodrug thereof.

These pharmaceutical compositions effective to treat or prevent a bacterial infection which comprise any one of Compounds 1 to 7, a compound of Formula I as described herein, or a pharmaceutically acceptable derivative or prodrug thereof in an amount sufficient to measurably decrease bacterial quantity, and a pharmaceutically acceptable carrier, are another embodiment of the present invention. The term "measurably decrease bacterial quantity", as used herein means a measurable change in the number of bacteria between a sample containing the inhibitor and a sample not containing the inhibitor.

Agents which increase the susceptibility of bacterial organisms to antibiotics are known. For example, U.S. Pat. No. 5,523,288, U.S. Pat. No. 5,783,561 and U.S. Pat. No. 6,140,306 describe methods of using bactericidal/permeability-increasing protein (BPI) for increasing antibiotic susceptibility of gram-positive and gram-negative bacteria. Agents that increase the permeability of the outer membrane of bacterial organisms have been described by Vaara, M. in Microbiological Reviews (1992) pp. 395-411, and the sensitization of gram-negative bacteria has been described by Tsubery, H., et al, in J. Med. Chem . (2000) pp. 3085-3092.

For the method of the invention related to treatment of subjects with a bacterial infection, a typical effective unit dose of any one of Compounds 1 to 7, a compound of Formula I as described herein or a pharmaceutically acceptable derivative or prodrug thereof given orally or parenterally would be from about 5 to about 100 mg/kg of body weight of the subject with a daily dose ranging from about 15 to about 300 mg/kg of body weight of the subject.

Another preferred embodiment of this invention relates to a method, as described above, of treating a bacterial infection in a mammal in need thereof, but further comprising the step of administering to the mammal an agent which increases the susceptibility of bacterial organisms to antibiotics.

According to another preferred embodiment, the invention provides a method, as described above, of decreasing bacterial quantity in a biological sample, but further comprising the step of contacting the biological sample with an agent which increases the susceptibility of bacterial organisms to antibiotics.

Methods of decreasing bacterial quantity are effective if the number of bacteria decreases at least 10%, and preferably more, e.g., 25%, 50%, 75% or even 100% after contacting the biological sample with any one of Compounds 1 to 7, a compound of Formula I as described herein, or a pharmaceutically acceptable derivative or prodrug thereof.

The pharmaceutical compositions and methods of this invention will be useful generally for controlling bacterial infections *in vivo*. Examples of bacterial organisms that may be controlled by the compositions and methods of this invention include, but are not limited to the following organisms: *Streptococcus pneumoniae, Streptococcus pyogenes, Enterococcus faecalis*, *Enterococcus faecium, Klebsiella pneumoniae, Enterobacter spp., Proteus spp., Pseudomonas aeruginosa, Escherichia coli, Serratia marcesens, Staphylococcus aureus, Haemophilus infuenzae, Bacillus anthracis, Mycoplasma pneumoniae*, and Coagulase negative *Staphylococcus* including *Staphylococcus epidermidis*. The compositions and methods will therefore be useful for controlling, treating or reducing the advancement, severity or effects of nosocomial or non-nosocomial infections. Examples of nosocomial uses include, but are not limited to, urinary tract infections, pneumonia, surgical wound infections, bacteremia and therapy for febrile neutropenic patients. Examples of non-nosocomial uses include but are not limited to urinary tract infections, pneumonia, prostatitis, skin and soft tissue infections and intra-abdominal infections.

In addition to the compounds of this invention, pharmaceutically acceptable derivatives or prodrugs of the compounds of this invention may also be employed in compositions to treat or prevent the above-identified disorders.

A "pharmaceutically acceptable derivative or prodrug" means any pharmaceutically acceptable salt, ester, salt of an ester or other derivative of a compound of this invention which, upon administration to a recipient, is capable of providing, either directly or indirectly, a compound of this invention or an inhibitorily active metabolite or residue thereof. Particularly favored derivatives or prodrugs are those that increase the bioavailability of the compounds of this invention when such compounds are administered to a mammal (e.g., by allowing an orally administered compound to be more readily absorbed into the blood) or which enhance delivery of the parent

compound to a biological compartment (e.g., the brain or lymphatic system) relative to the parent species.

Pharmaceutically acceptable prodrugs of the compounds of this invention include, without limitation, esters, amino acid esters, phosphate esters, metal salts and sulfonate esters.

Example 1: Genes and proteins for producing the compounds of the invention

Amycolatopsis orientalis ATCC™ 43491 was obtained from the American Type Culture Collection (P.O. Box 1549, Manassas, VA 20108, USA). The biosynthetic locus for the production of the compound of Formula I was identified in the genome of *Amycolatopsis orientalis* ATCC™ 43491 using the genome scanning method described in USSN 10/232,370, CA 2,352,451 and Zazopoulos *et. al.*, *Nature Biotechnol.*, 21, 187-190 (2003).

The biosynthetic locus spans approximately 100,000 base pairs of DNA and encodes 27 proteins. More than 10 kilobases of DNA sequence were analyzed on each side of the locus and these regions were deemed to contain primary genes or genes unrelated to the synthesis of the compound of Formula I. As illustrated in Figure 11, the locus is contained within three sequences of contiguous base pairs, namely Contig 1 having the 12,647 contiguous base pairs of SEQ ID NO: 1 and comprising ORFs 1 to 11 (SEQ ID NOS: 3, 5, 7, 9, 11, 13, 15, 17, 19, 21 and 23), Contig 2 having the 73,599 contiguous base pairs of SEQ ID NO: 24 and comprising ORFs 12 to 23 (SEQ ID NOS: 26, 28, 30, 32, 34, 36, 38, 40, 42, 44, 46 and 48), and Contig 3 having the 6,995 base pairs of SEQ ID NO: 49 and comprising ORFs 24 to 27 (SEQ ID NOS: 51, 53, 55 and 57). The order, relative position and orientation of the 27 open reading frames representing the proteins of the biosynthetic locus are illustrated schematically in Figure 11. The top line in Figure 11 provides a scale in base pairs. The black bars depict the three DNA contigs (SEQ ID NOS: 1, 24 and 49) that cover the locus. The empty arrows represent the 27 open reading frames of this biosynthetic locus. The black arrows represent the four deposited cosmid clones covering the locus.

The biosynthetic locus will further be understood with reference to the sequence listing which provides contiguous nucleotide sequences and deduced amino acid sequences of

the locus from *Amycolatopsis orientalis* ATCC™ 43491. The contiguous nucleotide sequences are arranged such that, as found within the biosynthetic locus, Contig 1 (SEQ ID NO: 1) is adjacent to the 5' end of Contig 2 (SEQ ID NO: 24), which in turn is adjacent to Contig 3 (SEQ ID NO: 49). The ORFs illustrated in Figure 11 and provided in the sequence listing represent open reading frames deduced from the nucleotide sequences of Contigs 1, 2 and 3 (SEQ ID NOS: 1, 24 and 49). Referring to the Sequence Listing, ORF 1 (SEQ ID NO: 3) is the polynucleotide drawn from residues 1 to 438 (sense/antisense strand) of SEQ ID NO: 1, and SEQ ID NO: 2 represents that polypeptide deduced from SEQ ID NO: 3. ORF 2 (SEQ ID NO: 5) is the polynucleotide drawn from residues 435 to 1544 of SEQ ID NO: 1, and SEQ ID NO: 4 represents the polypeptide deduced from SEQ ID NO: 5. ORF 3 (SEQ ID NO: 7) is the polynucleotide drawn from residues 1656 to 2171 of SEQ ID NO: 1, and SEQ ID NO: 6 represents the polypeptide deduced from SEQ ID NO: 7. ORF 4 (SEQ ID NO: 9) is the polynucleotide drawn from residues 2393 to 5203 of SEQ ID NO: 1, and SEQ ID NO: 8 represents the polypeptide deduced from SEQ ID NO: 9. ORF 5 (SEQ ID NO: 11) is the polynucleotide drawn from residues 6231 to 5419 of SEQ ID NO: 1, and SEQ ID NO: 10 represents the polypeptide deduced from SEQ ID NO: 11. ORF 6 (SEQ ID NO: 13) is the polynucleotide drawn from residues 6415 to 7104 of SEQ ID NO: 1, and SEQ ID NO: 12 represents the polypeptide deduced from SEQ ID NO: 13. ORF 7 (SEQ ID NO: 15) is the polynucleotide drawn from residues 7213 to 8874 of SEQ ID NO: 1, and SEQ ID NO: 14 represents the polypeptide deduced from SEQ ID NO: 15. ORF 8 (SEQ ID NO: 17) is the polynucleotide drawn from residues 9477 to 8938 of SEQ ID NO: 1, and SEQ ID NO: 16 represents the polypeptide deduced from SEQ ID NO: 17. ORF 9 (SEQ ID NO: 19) is the polynucleotide drawn from residues 9655 to 10323 of SEQ ID NO: 1, and SEQ ID NO: 18 represents the polypeptide deduced from SEQ ID NO: 19. ORF 10 (SEQ ID NO: 21) is the polynucleotide drawn from residues 11655 to 10516 of SEQ ID NO: 1, and SEQ ID NO: 20 represents the polypeptide deduced from SEQ ID NO: 21. ORF 11 (SEQ ID NO: 23) is the polynucleotide drawn from residues 11855 to 12610 of SEQ ID NO: 1, and SEQ ID NO: 22 represents the polypeptide deduced from SEQ ID NO: 23. ORF 12 (SEQ ID NO: 26) is the polynucleotide drawn from residues 520 to 32 of SEQ ID NO: 24, and SEQ ID NO: 25 represents the polypeptide deduced from SEQ ID NO: 26.

ORF 13 (SEQ ID NO: 28) is the polynucleotide drawn from residues 840 to 2165 of SEQ ID NO: 24, and SEQ ID NO: 27 represents the polypeptide deduced from SEQ ID NO: 28. ORF 14 (SEQ ID NO: 30) is the polynucleotide drawn from residues 2201 to 3424 of SEQ ID NO: 24, and SEQ ID NO: 29 represents the polypeptide deduced from SEQ ID NO: 30. ORF 15 (SEQ ID NO: 32) is the polynucleotide drawn from residues 3429 to 4994 of SEQ ID NO: 24, and SEQ ID NO: 31 represents the polypeptide deduced from SEQ ID NO: 32. ORF 16 (SEQ ID NO: 34) is the polynucleotide drawn from residues 4991 to 6199 of SEQ ID NO: 24, and SEQ ID NO: 33 represents the polypeptide deduced from SEQ ID NO: 34. ORF 17 (SEQ ID NO: 36) is the polynucleotide drawn from residues 6389 to 7924 of SEQ ID NO: 24, and SEQ ID NO: 35 represents the polypeptide deduced from SEQ ID NO: 36. ORF 18 (SEQ ID NO: 38) is the polynucleotide drawn from residues 8404 to 19908 of SEQ ID NO: 24, and SEQ ID NO: 37 represents the polypeptide deduced from SEQ ID NO: 38. ORF 19 (SEQ ID NO: 40) is the polynucleotide drawn from residues 19910 to 37081 of SEQ ID NO: 24, and SEQ ID NO: 39 represents the polypeptide deduced from SEQ ID NO: 40. ORF 20 (SEQ ID NO: 42) is the polynucleotide drawn from residues 37085 to 42292 of SEQ ID NO: 24, and SEQ ID NO: 41 represents the polypeptide deduced from SEQ ID NO: 42. ORF 21 (SEQ ID NO: 44) is the polynucleotide drawn from residues 42617 to 52411 of SEQ ID NO: 24, and SEQ ID NO: 43 represents the polypeptide deduced from SEQ ID NO: 44. ORF 22 (SEQ ID NO: 46) is the polynucleotide drawn from residues 52438 to 67737 of SEQ ID NO: 24, and SEQ ID NO: 45 represents the polypeptide deduced from SEQ ID NO: 46. ORF 23 (SEQ ID NO: 48) is the polynucleotide drawn from residues 67751 to 73516 of SEQ ID NO: 24, and SEQ ID NO: 47 represents the polypeptide deduced from SEQ ID NO: 48. ORF 24 (SEQ ID NO: 51) is the polynucleotide drawn from residues 939 to 16 of SEQ ID NO: 49, and SEQ ID NO: 50 represents the polypeptide deduced from SEQ ID NO: 51. ORF 25 (SEQ ID NO: 53) is the polynucleotide drawn from residues 2374 to 944 of SEQ ID NO: 49, and SEQ ID NO: 52 represents the polypeptide deduced from SEQ ID NO: 53. ORF 26 (SEQ ID NO: 55) is the polynucleotide drawn from residues 2600 to 2391 of SEQ ID NO: 49, and SEQ ID NO: 54 represents the polypeptide deduced from SEQ ID NO: 55. ORF 27 (SEQ ID NO: 57) is the

polynucleotide drawn from residues 3378 to 2614 of SEQ ID NO: 49, and SEQ ID NO: 56 represents the polypeptide deduced from SEQ ID NO: 57.

Some open reading frames provided in the Sequence Listing, namely ORF 2 (SEQ ID NO: 4), ORF 5 (SEQ ID NO: 10), ORF 12 (SEQ ID NO: 25), ORF 13 (SEQ ID NO: 27), ORF 15 (SEQ ID NO: 31), ORF 17 (SEQ ID NO: 35), ORF 19 (SEQ ID NO: 39), ORF 20 (SEQ ID NO: 41), ORF 22 (SEQ ID NO: 45), ORF 24 (SEQ ID NO: 50), ORF 26 (SEQ ID NO: 54) and ORF 27 (SEQ ID NO: 56) initiate with non-standard initiation codons (eg. GTG – Valine, or CTG – Leucine) rather than standard initiation codon ATG methionine. All ORFs are listed with the appropriate M, V or L amino acids at the amino-terminal position to indicate the specificity of the first codon of the ORF. It is expected, however, that in all cases the biosynthesized protein will contain a methionine residue, and more specifically a formylmethionine residue, at the amino terminal position, in keeping with the widely accepted principle that protein synthesis in bacteria initiates with methionine (formylmethionine) even when the encoding gene specifies a non-standard initiation codon (e.g. Stryer BioChemistry 3rd edition, 1998, W.H. Freeman and Co., New York, pp. 752-754).

Four deposits of E. coli DH10B vectors, each harbouring a cosmid clone of a partial biosynthetic locus for the compound of Formula I from *Amycolatopsis orientalis* (ATCC™ 43491) and together spanning the full biosynthetic locus for production of the compound of Formula I have been deposited with the International Depositary Authority of Canada, Bureau of Microbiology, Health Canada, 1015 Arlington Street, Winnipeg, Manitoba, Canada R3E 3R2 on September 5, 2003 and were assigned deposit accession numbers IDAC 050903-01, IDAC 050903-02, IDAC 050903-03 and IDAC 050903-04 respectively. The cosmid of deposit IDAC 050903-03 covers residue 1 to residue 8800 of Contig 1 (SEQ ID NO: 1). The cosmid of deposit IDAC 050903-01 covers residue 1600 of Contig 1 (SEQ ID NO: 1) to residue 19840 of Contig 2 (SEQ ID NO: 24). The cosmid of deposit IDAC 050903-02 covers the residue 14700 to residue 52230 of Contig 2 (SEQ ID NO: 24). The cosmid of deposit IDAC 050903-04 covers residue 41090 of Contig 2 (SEQ ID NO: 24) to residue 3378 of Contig 3 (SEQ ID NO: 49). The sequence of the polynucleotides comprised in the deposited strains, as well as the amino acid sequence

of any polypeptide encoded thereby are controlling in the event of any conflict with any description of sequences herein.

The deposit of the deposited strains has been made under the terms of the Budapest Treaty on the International Recognition of the Deposit of Micro-organisms for Purposes of Patent Procedure. The deposited strains will be irrevocably and without restriction or condition released to the public upon the issuance of a patent. The deposited strains are provided merely as convenience to those skilled in the art and are not an admission that a deposit is required for enablement, such as that required under 35 U.S.C. §112. A license may be required to make, use or sell the deposited strains, and compounds derived therefrom, and no such license is hereby granted.

In order to identify the function of the proteins coded by the genes forming the biosynthetic locus for the production of the compounds of Formula I the gene products of ORFs 1 to 27, namely SEQ ID NOS: 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 45, 47, 50, 52, 54 and 56, were compared, using the BLASTP version 2.2.6 algorithm with the default parameters, to sequences in the National Center for Biotechnology Information (NCBI) nonredundant protein database and the DECIPHER® database of microbial genes, pathways and natural products (Ecopia BioSciences Inc. St.-Laurent, QC, Canada).

The accession numbers of the top GenBank™ hits of this BLAST analysis are presented in Table 2 along with the corresponding E values. The E value relates the expected number of chance alignments with an alignment score at least equal to the observed alignment score. An E value of 0.00 indicates a perfect homolog. The E values are calculated as described in Altschul *et al. J. Mol. Biol.*, 215, 403-410 (1990). The E value assists in the determination of whether two sequences display sufficient similarity to justify an inference of homology.

CA 02484638 2004-11-18

The ORFs encoding proteins involved in the biosynthesis of compounds of Formula I are assigned a putative function and grouped together in families based on sequence similarity to known proteins. To correlate structure and function, the protein families are given a four-letter designation used throughout the description and figures as indicated in Table 3. The meaning of the four letter designations is as follows: ADSN designates an amide synthetase; AYTF and AYTP designate acyltransferase activities; CALB designates an acylCoA ligase; GTFA designates a glycosyltransferase; MEBA and UNEW designate membrane proteins; MTNA designates a methyltransferase; PKSH designates a type I polyketide synthase system; REGD, REQB and RREB designate transcriptional regulators; SPKF designates a sensory protein kinase; TESA designates a thioesterase activity; TMOA designates an amino acid oxidase; UNIQ, UNBP and UNAC designate proteins of unknown function.

Table 3

Family	**Function**
ADSN	adenylating /condensing synthetase, amide synthetase, enzymes able to activate substrates as acyl adenylates and subsequently transfer the acyl group to an amino group of the acceptor molecule
AYTP	acyltransferase; pyridoxal phosphate dependent
AYTF	acyltransferase; acyl CoA-acyl carrier protein transacylase); includes malonyl CoA-ACP transacylases
CALB	acyl CoA ligase; shows similarity to plant coumarate CoA ligases, other aryl CoA ligases, yeast CoA synthetase and aminocoumarin ligases
GTFA	Glycosyltransferases
MEBA	membrane protein; putative transporter, permease;
MTNA	N-methyltransferase
PKSH	Polyketide synthase, type I
REGD	transcriptional regulator
REBQ	Regulator
RREB	Response regulator
SOXA	sugar oxidoreductase
SPKF	sensory protein kinase
TESA	Thioesterase
TMOA	amino acid monooxygenase
UNIQ	Unknown;
UNBP	Unknown
UNAC	Unknown
UNEW	Similarity to membrane proteins

Biosynthesis of the compounds of Formula I involves the action of a multimodular type I polyketide synthase system (PKS) corresponding to ORFs 18 to 23 (SEQ ID NOS: 37, 39, 41, 43, 45 and 47). Type I PKSs are large modular proteins that condense acyl thioester units in a sequential manner. PKS systems consist of one or more polyfunctional polypeptides each of which is made up of modules. Each type I PKS module contains three domains: a β-ketoacyl protein synthase (KS), an acyltransferase (AT) and an acyl carrier protein (ACP). Domains conferring additional enzymatic activities such as ketoreductase (KR), dehydratase (DH) and enoylreductase (ER) can also be found in the PKS modules. These additional domains result in various degrees of reduction of the β-keto groups of the growing polyketide chain. Each module is responsible for one round of condensation and reduction of the β-ketoacyl units. As a result, there is a direct correlation between the number of modules and the length of the polyketide chain as well as between the domain composition of the modules and the degree of reduction of the polyketide product. The final polyketide product is released from the PKS protein through the action of a thioesterase (TE) domain found in the ultimate module of the PKS system. The genetic organization of most type I PKS enzymes is colinear with the order of biochemical reactions giving rise to the polyketide chain. This feature allows prediction of polyketide core structure based on the architecture of the PKS modules found in a given biosynthetic pathway (Hopwood, *Chem. Rev.*, 97, 2465-2497 (1997)).

The PKS system in the biosynthetic locus for the production of the compounds of Formula I is composed of ORFs 18 to 23 (SEQ ID NOS: 37, 39, 41, 43, 45 and 47) and comprises a total of 12 modules as described below in Table 4. The first module contains only an ACP domain and corresponds to the loading module (module 0) whereas each of the remaining 12 modules contain domains KS, AT and ACP in various combinations with KR, DH and ER domains. The thioesterase domain present in ORF 23/module 12 indicates that this module is the ultimate one in the biosynthesis of the polyketide chain.

Table 4: Domain coordinates for PKS system

ORF Nos.	Amino acid coordinates	Domain	Module No.
18	47-109	ACP	0
	130-554	KS	1
	567-990	AT	
	1001-1101	DH	
	1421-1628	KR

Multiple amino acid alignment of KS domains present in the PKS system, described in Figures 12a and 12b, shows an overall similarity of domains and conservation of amino acid residues and domain regions important for activity indicating that all KS domains are functional. Similarly, multiple amino acid alignment of AT domains (described in Figures 13a, 13b and 13c), DH domains (described in Figure 14), ER domains (described in Figure 15), KR domains (described in Figure 16), ACP domains (described in Figure 17) and TE domains (described in Figure 18) show an overall similarity of related domains and a high conservation of protein regions and of amino acid residues important for catalytic activity. The domains that occur only once in the PKS system, namely the thioesterase (TE) domain in ORF 23 (SEQ ID NO: 47) is compared to prototypical domains from the nystatin type I polyketide system (Brautaset, *supra*). Phylogenetic analysis of the AT domains in the PKS system was conducted to assess the nature of the β-keto acyl units that are incorporated in the growing polyketide chain. The AT domains of the PKS system were compared to two domains, AAF71779mod03 and AAF71766mod11 (National Center for Biotechnology Information (NCBI) nonredundant protein database), derived from the nystatin PKS system (Brautaset, *supra*) and responsible for the incorporation of malonyl-CoA and methylmalonyl-CoA respectively. Figure 19 shows the phylogenetic relatedness of the various AT domains indicating that, in the PKS system for production of compounds of Formula I, module 2 of ORF 18 (SEQ ID NO: 37), module 5 of ORF 19 (SEQ ID NO: 39), module 6 of ORF 20 (SEQ ID NO: 41), module 7 of ORF 21 (SEQ ID NO: 43) and module 12 of ORF 23 (SEQ ID NO: 47) incorporate methylmalonate in the polyketide backbone of compounds of Formula I, whereas all remaining AT domains, namely module 1 of ORF 18 (SEQ ID NO: 37), modules 3 and 4 of ORF 19 (SEQ ID NO: 39), module 8 of ORF 21 (SEQ ID NO: 43) and modules 9, 10 and 11 of ORF 22 (SEQ ID NO: 45) incorporate malonate extender β-keto acyl units in the polyketide backbone of compounds of Formula I.

Type I PKS domains and the reactions they carry out are well known to those skilled in the art and well documented in the literature (see, for example, Hopwood, *supra*). Those skilled in the art will readily appreciate that it is possible to determine the polyketide core structure produced by PKS system through domain analysis. The genes and proteins of the invention provide for biosynthesis of compounds of Formula I.

While not intending to be limited to any particular mode of action or biosynthetic scheme, Figures 20 and 21 describe production of Compound 1 using the genes and proteins of the invention. Figure 20b schematically describes a series of reactions catalyzed by the PKS system based on the correlation between the deduced domain architecture and the polyketide core of compounds of Formula I. Figure 20a describes a biosynthetic pathway for the production of the γ-aminobutyryl-CoA starter unit. Referring to Figure 20a, the amino acid monooxygenase of ORF 7 (SEQ ID NO: 14) catalyzes the decarboxylative oxidation of arginine forming 4-guanidinobutanamide that is further activated by the acyl CoA ligase of ORF 25 (SEQ ID NO: 52) to give 4-guanidinobutyryl-CoA. Referring to Figure 20b, the acyltransferase of ORF 24 (SEQ ID NO: 50) loads the 4-guanidinobutyryl-CoA extender unit onto the ACP domain of the loading module (module 0) of the type I polyketide synthase of ORF 18 (SEQ ID NO: 37). The polyketide chain continues to grow by the sequential condensation of malonyl-CoA and methylmalonyl-CoA extender units that are further reduced by specific domains to various degrees. The mature polyketide chain is then released through the action of the thioesterase domain found in module 12 of the type I polyketide synthase of ORF 23 (SEQ ID NO: 47). The polyketide core structure described in Figure 20b based on the architecture of the PKS system of the biosynthetic locus for the production of Compound 1 is entirely consistent with the polyketide portion of the chemical structure of Compound 1 as determined by MS sprectra data (Figures 1, 2 and 3), ^{1}H NMR (Figure 4) and ^{13}C NMR spectra data, demonstrating that the biosynthetic locus of the invention is responsible for the biosynthesis of Compound 1.

The biosynthetic locus contains genes involved in the synthesis of two other components found in the chemical structure of compounds of Formula I. Figure 21a describes a biosynthetic pathway for the production of the aminohydroxy-cyclopentenone moiety found in compounds of Formula I. Referring to Figure 21a, the pyridoxal phosphate dependent acyltransferase of ORF 16 (SEQ ID NO: 33) condenses glycine with succinyl-CoA forming 5-aminolevulinate. The 5-aminolevulinate intermediate is further activated through the action of the acyl CoA ligase of ORF 17 (SEQ ID NO: 35) forming 5-aminolevulinate-CoA, which in turn, cyclizes to produce aminohydroxycyclopentenone. Referring to Figure 21c, the

aminohydroxycyclopentenone moiety is activated and condensed to the carboxy terminus of the polyketide chain through the action of the adenylating/condensing synthetase of ORF 15 (SEQ ID NO: 31). Figure 21b describes the biosynthesis of the sugar component of compounds of Formula I. The sugar oxidoreductase of ORF 13 (SEQ ID NO: 27) oxidizes D-glucose to form D-glucuronic acid that is subsequently transferred onto a hydroxyl group of the polyketide core structure through the action of the glycosyltransferase of ORF 14 (SEQ ID NO: 29) as shown in Figure 21c. D-glucose derives from the primary metabolism of the microorganism and is expected to be activated by the primary metabolism enzyme nucleotidyl transferase that catalyzes the formation of NDP-D-Glucose. It is expected that the sugar oxidoreductase of ORF 13 (SEQ ID NO: 27) acts on NDP-D-Glucose to generate NDP-D-Glucuronic acid that is subsequently transferred onto the polyketide core structure through the action of the glycosyltransferase of ORF 14 (SEQ ID NO: 29).

The final modification of the polyketide core structure is the methylation reaction catalyzed by the N-methyltransferase of ORF 5 (SEQ ID NO: 10). Referring to Figure 21c, the N-methyltransferase of ORF 5 (SEQ ID NO: 10) catalyzes the transfer of a methyl group derived from S-adenosylmethionine onto the guanidine moiety or the polyketide structure. While Figure 21c describes the reactions catalyzed by the N-methyltransferase of ORF 5 (SEQ ID NO: 10), the adenylating/condensing synthetase of ORF 15 (SEQ ID NO: 31) and the glycosyltransferase of ORF 14 (SEQ ID NO: 29), the invention does not reside in the actual timing and order of the reactions, which may be different than as described in Figure 21c.

In regards to other ORFs forming the biosynthetic locus for production of the compounds of Formula I, the thioesterases of ORFs 11 and 27 (SEQ ID NOS: 22 and 56) are expected to have polyketide-priming editing functions; the regulator of ORF 3 (SEQ ID NO: 6), the transcriptional regulator of ORF 4 (SEQ ID NO: 8), the response regulator of ORF 9 (SEQ ID NO: 18) and the sensory protein kinase of ORF 10 (SEQ ID NO: 20) are expected to regulate synthesis of the compound of Formula I; and the membrane transporters of ORF 2 (SEQ ID NO: 4) and of ORF 8 (SEQ ID NO: 16) are expected to be involved in transmembrane transport.

The genes and proteins of the invention may be used to produce compounds of Formula I as described below in Examples 17 to 20.

Example 2: Production of Compounds 1, 2, 7, 8 and 15 by fermentation

Amycolatopsis orientalis ATCC™ 43491 was cultivated under aerobic conditions in an aqueous nutrient medium containing assimilable sources of carbon, assimilable sources of nitrogen, inorganic salts and vitamins. Preferred carbon sources are glucose, glycerol and the like. Preferred nitrogen sources are beef extract, malt extract, yeast extract, and the like. Representative media are provided in Table 1.

Compounds 1, 2, 7, 8 and 15 were produced by the following procedure: *Amycolatopsis orientalis* ATCC™ 43491 was maintained and sporulated on agar plates of ISP2 medium (Difco). The innoculum for the production phase was prepared by adding two loopfull of the spores obtained from the surface of the ISP2 agar plate to a 125-ml flask containing 25 ml of ITSB medium (Zahn et al. (2001). *Applied and Environmental Microbiology* 76, 377-386) composed of 30 g trypticase soy broth (Bacto), 3 g yeast extract, 2 g $MgSO_4$, 5 g glucose, 4 g maltose made up to one liter with distilled water. The flasks are shaken (250 rpm) for about 60 hours at 28 °C and then 10 ml of the culture is used to inoculate each 2-L flasks containing ten glass beads and 500 ml of sterile production medium OA consisting of glucose 10 g, glycerol 5 g, corn steep liquor 3 g, beef extract 3 g, malt extract 3 g, yeast extract 3 g, calcium carbonate 2 g, thiamine 0.1 g made up to one liter with distilled water (Kanzaki et al. (1998). *Biosci Biotechnol Biochem* 62; 438-442). The medium was adjusted at pH 7.0, and then 1 ml of silicon defoamer-oil (Chem Service) was added to each flask before sterilization. The fermentation batches are incubated aerobically under stirring (200 rpm) at 28°C for a period of 4 days. A fermentation period of 7 days without defoamer-oil was also used to produce Compound 1.

Compounds 1, 2, 7, 8 and 15 could also be produced in other media including JA, GA, RM, NA, CA, and CB (Table 1). Compounds 1 and 2 were further produced as described above using a preferred strain, namely *Amycolatopsis orientalis* IDAC 220604-01.

Example 3: Purification of Compound 1, 2 and 7

Procedure 1: (for 12 x500mL of fermentation)

a) The whole fermentation broth at harvest was centrifuged at 3500 rpm for 20 minutes and the supernatant liquid was decanted and discarded. The residual mycelial pellet was treated with methanol (200 mL/L of original fermentation broth volume), stirred and centrifuged. The methanolic supernatant liquid was removed and the mycelial solid was extracted with acetone, the same manner as the methanol extraction. The combined methanol and acetone extracts are evaporated to dryness to a crude residue.

b) The crude residue of a) was partitioned between 100mL(per litre of fermentation) of chloroform ($CHCl_3$) and 100mL(per litre of fermentation) of methanol (MeOH) in water (3:2) buffered to pH 10 with ammonium hydroxide (NH_4OH) and at 10mM ammonium bicarbonate (NH_4HCO_3) salt concentration. The two layers were separated and the methanol: water layer evaporated to dryness. The residue from the upper phase was partitioned between n-butanol (100 ml/L of fermentation) and water (100 ml/L of fermentation), buffered as above. The butanol layer was concentrated to a orange-brown residue.

The residue was further purified by HPLC (Waters Autopurification System with ACD), using a Waters Xterra MS C18 column (5μ, 19 x 150 mm), and a gradient of 10mM aqueous NH_4HCO_3, pH 10/ acetonitrile 85:15 to 25:75 over 30 min at 19 mL/min, UV detector set at 261 nm. The sample was loaded as a suspension in DMSO/MeOH (3:1). The pooling of eluate gave samples of Compound 7 (< 1 mg, RT: 16-17 min) and a mixture of Compounds 1 and 2 (1.04 g, non-freezedried, RT: 11.8-12.1 min).

Alternatively, the first purification (step 2) was also accomplished using a Phenomenex Max-RP C12 column (4μ, 21.2 x 250 mm) using the gradient buffer (as above) and acetonitrile 89.5:10.5 to 20:80 over 25 minutes, with the same flow and UV detection. Fractions were collected at a retention time of 16.5-17 minutes (mixture of Compounds 1 and 2) and at RT: 21-22 minutes (Compound 7).

The mixture of Compounds 1 and 2 is further purified by HPLC (Waters Autopurification System with ACD), using a RCM Column (Novapak C-18, 6μ, 40 x 200 mm), and a gradient of 10mM aqueous ammonium acetate (NH_4OAc) to pH 5 with glacial acetic

acid / acetonitrile 80:20 to 20:80 over 25 min at 35 mL/min. Fractions were collected and freeze-dried to give pure Compound 1 (RT: 18.5-18.8 minutes, 224.5 mg) and pure Compound 2 (RT: 17.3-17.6 minutes, 34.6 mg).

Procedure 2:

The crude residue of 1 a) (see Procedure 1) was partitioned between 100mL(per litre of fermentation) of hexanes and 100mL(per litre of fermentation) of methanol (MeOH) in water (3:2) buffered to pH 10 with ammonium hydroxide (NH_4OH) and at 10mM ammonium bicarbonate (NH_4HCO_3) salt concentration. The two layers were separated and the methanol: water layer evaporated to dryness. The procedure was repeated and concentrated to dryness.

The crude residue was purified by solid phase extraction. Methanol washed Diaion® HP-20 resin (30mL) was added to the crude residue. The mixture was added to a column made of 75 mL of methanol washed HP-20 resin and eluted with a mixture of ethanol and pH 10 buffered aqueous ammonium carbonate following the following gradient:

Fraction	Ethanol	Aqueous	Volume
1	10	90	500
2	20	80	200
3	30	70	200
4	40	60	200
5	50	50	200
6	60	40	200
7	80	20	200
8	100	0	200

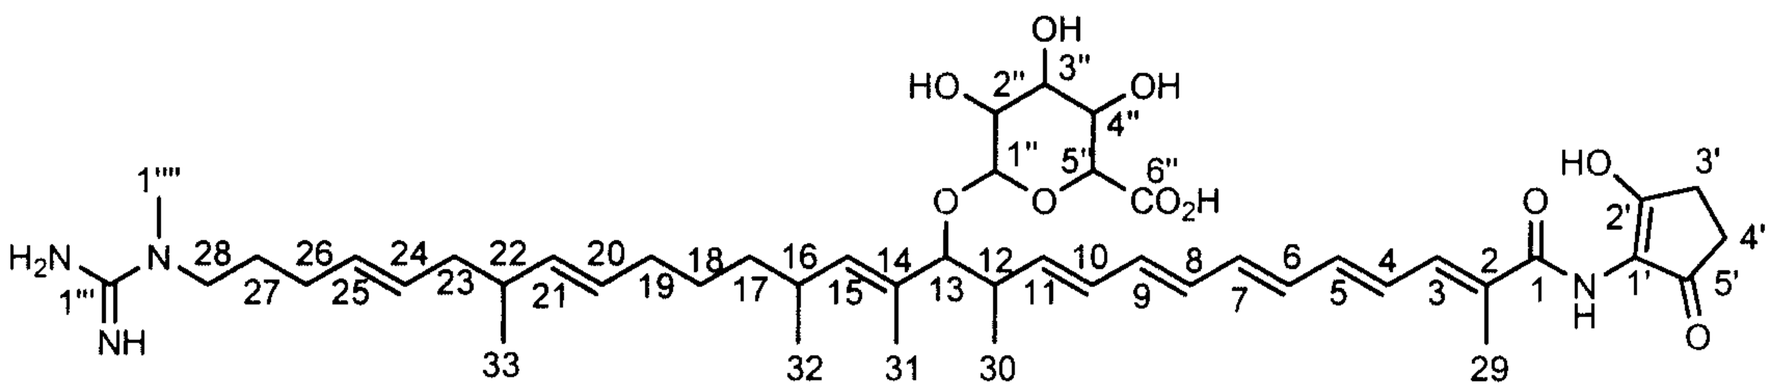
Fractions 4, 5 and 6 were combined and concentrated to give a mixture of Compounds 1 and 2 and Compound 7 was found in the concentrated fraction 7.

The mixture of Compounds 1 and 2 was further purified by HPLC (Waters Autopurification System with ACD), using a Symmetry C18 column (5μ, 30 x 100 mm), and a gradient of 10mM aqueous NH_4OAc, made to pH 5 with glacial acetic acid /

acetonitrile 74:26 to 50:50 over 20 min at 39 mL/min. The collection was triggered by UV 261 nm (PDA). The sample was loaded as a suspension in DMSO: MeOH (3:1). The pooling of eluates gave pure Compound 1 (RT: 14.9-15.2 min) and pure Compound 2 (RT: 14.1-14.2 min), generally with a ratio of 5:1. Compound 7 had a retention time of 13-14 minutes using the same conditions.

Example 4: Structure identification of Compounds 1, 2 and 7

Compounds 1, 2 and 7 were produced by fermentation as described in Example 2 and isolated as described in Example 3.



Compound 1

Compound 1 is named 3,4,5-trihydroxy-6-[1-[11-(2-hydroxy-5-oxocyclopent-1-enylcarbamoyl)-1-methyldodeca-2,4,6,8,10-pentaenyl]-2,4,10-trimethyl-16-(*N*-methyl-guanidino)-hexadeca-2,8,12-trienyloxy]-tetrahydropyran-2-carboxylic acid.

Compound 1 structure determination was based on mass, UV and NMR data. The NMR data detailed in Table 5 was collected at 500 MHz in d_4-MeOH including ^{1}H-NMR spectrum of Figure 4, and the multidimensional pulse sequences gCOSY, gDQCOSY, gHSQC, and gHMBC. The molecular formula of $C_{46}H_{68}N_4O_{10}$ and the chemical structure were established based the ^{1}H-NMR data, the COSY, HSQC and HMBC measured on about 500 μg of very pure material of structure illustrated above. The carbon assignments shown in Table 5 were made by virtue of the HSQC and HMBC. The straight chain nature of Compound 1 was supported by the fact that the two protons on each of the seven methylene groups were of almost indistinguishable chemical shift.

Table 5

^{1}H and ^{13}C NMR (δ, ppm) Data for Compounds 1 in MeOH-D_4			
Assignment	δ_H (ppm)	δ_C (ppm)	Group
1	–	170.1	C
2	–	138.8	C

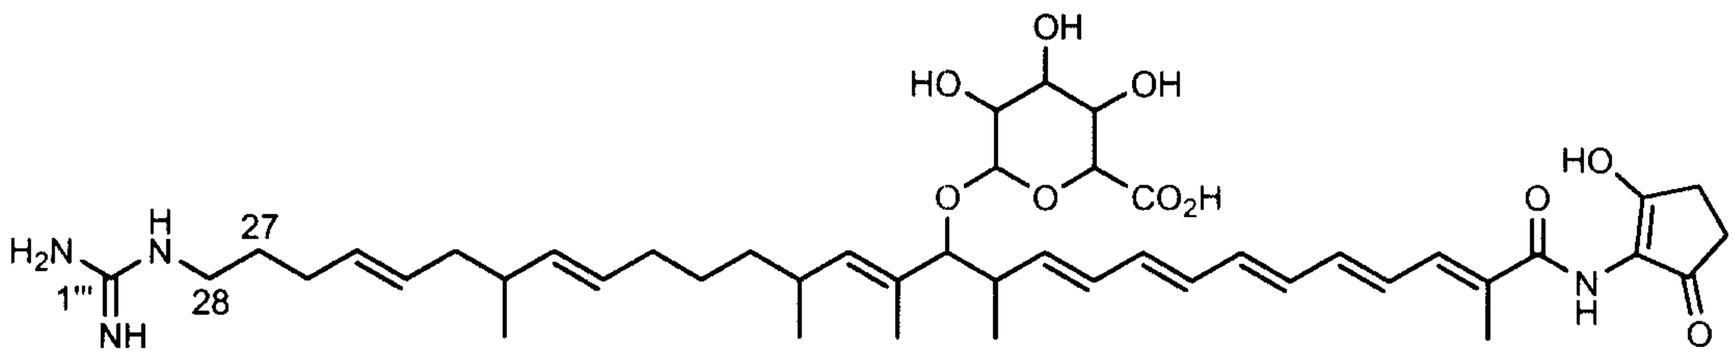
1'''	–	157.7	C
1''''	3.00	35.8	CH_3

Mass spectra (Figures 1, 2, and 3) analysis shown in Table 6 gave a mass (m/z) of 836.4, which confirmed a molecular formula of $C_{46}H_{68}N_4O_{10,}$ and fragments that also confirmed structure assignment of Compound 1 including a sugar moiety.

Table 6

Mass Spectrometry data for Compound 1			
Figure	Ionization	Mass (m/z)	Fragment
1	+ mode (+ Q1)	837.5 823.7	$(M+H)^+$ $(M-CH_3)^+$
2	+ mode (+ EPI)	837.3 662.1 644.1	$(M+H)^+$ $(M\text{-sugar})^+$ $(M\text{-O-sugar})^+$
3	mode (- Q1)	835.3 821.5	$(M-H)^-$ $(M-CH_3)^-$

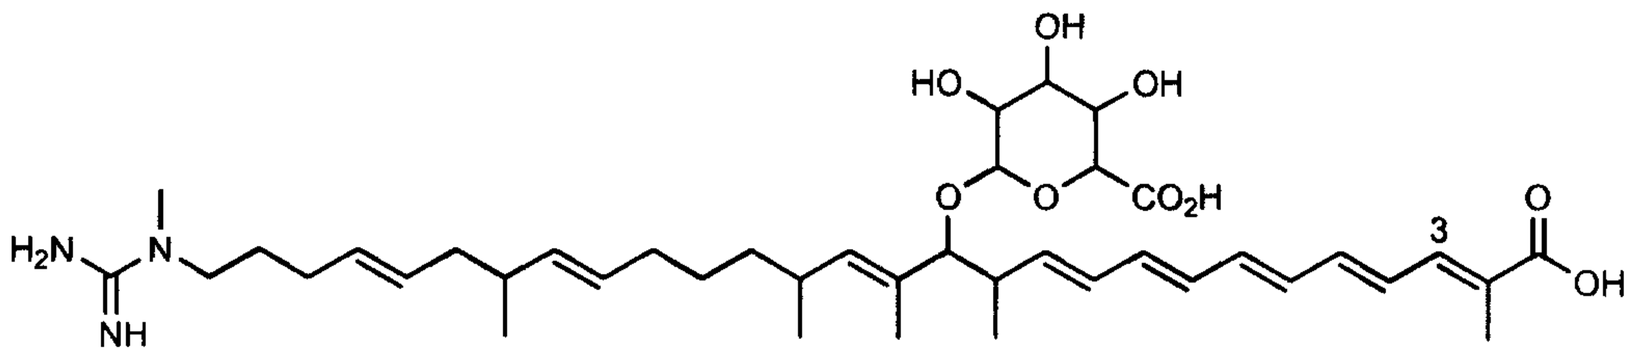
The UV spectrum for Compound 1 exhibited UV λ_{max} at 258.77 and 362.77 nm in methanol in accordance with the methylpentaene amide of the 2-aminocyclopenta-1,3-dione tautomer.



Compound 2

Compound 2 is named 6-{16-guanidino-1-[11-(2-hydroxy-5-oxocyclopent-1-enylcarbamoyl)-1-methyldodeca-2,4,6,8,10-pentaenyl]-2,4,10-trimethylhexadeca-2,8,12-trienyloxy}-3,4,5-trihydroxy-tetrahydro-pyran-2-carboxylic acid.

Structure of Compound 2 was confirmed by ^{1}H (Figure 5) and ^{13}C NMR. The signals of 1'''' carbon (35.8 ppm) and protons (singlet at 3.00 ppm) of Compound 1 (see Table 5) were absent from the spectra, which confirmed the absence of this CH_3 residue. Only small shifts in the guanidine area were observed in the ^{13}C NMR of Compound 2. No further changes from the structure of Compound 1 previously described were present.



Compound 7

Compound 7 is named 6-[1-(11-carboxy-1-methyldodeca-2,4,5,8,10-pentaenyl)-2,4,10-trimethyl-16-(*N*-methylguanidino)-hexadeca-2,8,12-trienyloxy]-3,4,5-trihydroxy-tetrahydropyran-2-carboxylic acid.

Structure analysis of Compound 7 was accomplished by spectral data analysis including ^{1}H NMR (Figure 10) and Mass spectra. The later gave a mass of 739.37 at negative ionization (ES-) and 741.53 at positive ionization (ES+), which is consistent with a molecular formula of $C_{41}H_{63}N_3O_9$ and a calculated mass of 741.95.

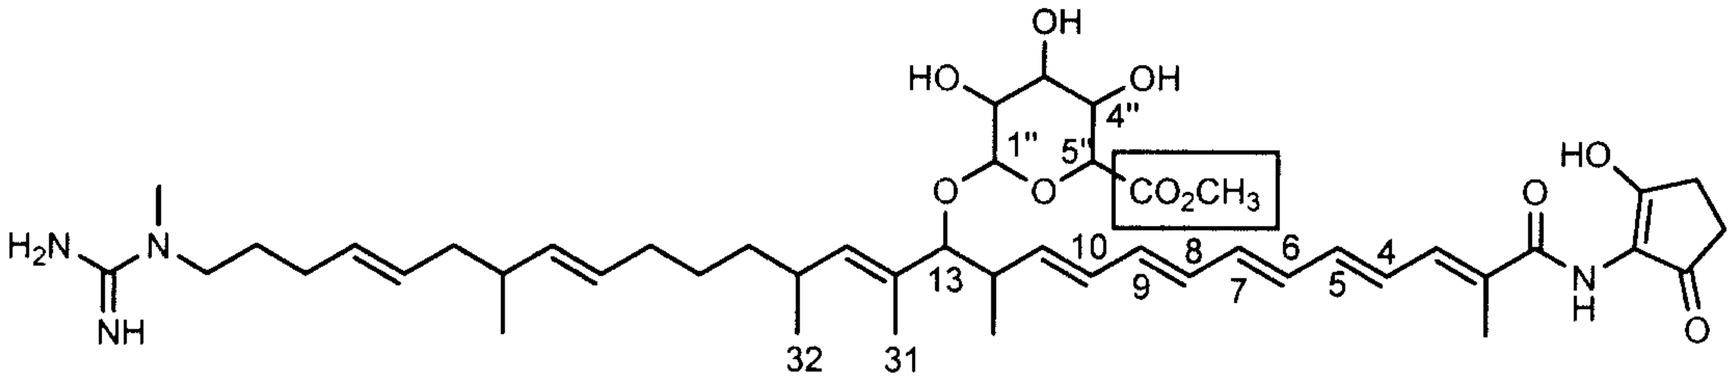
Analysis of the ^{1}H NMR (Figure 10) showed the absence of the signal at δ 2.35 ppm (Table 5) from the NMR spectrum of Compound 1. This signal was previously assigned to the two methylene groups of the cyclopentenone of Compound 1. An effect was also observed at position 3, which doublet (found at about 7.1 ppm in the case of Compound 1) has moved 0.1 ppm (to 7.0 ppm), the rest of the spectra remaining mostly the same.

Example 5: Preparation and identification of Compounds 3, 4 and 5

Compounds 3, 4 and 5 were prepared according to the following procedure. A 0.1M solution of sodium hydroxide in methanol (334 µL, Fisher Chemicals) was added to

Compound 1 (20 mg) in methanol (2 mL). Dimethyl sulfate (5.68 μL, Sigma) was added and the reaction stirred at room temperature for 24 hours. Additional sodium hydroxide in methanol (334 μL) and dimethyl sulfate (10 μL) were added and the reaction stirred for an additional 24 hours. A third portion of sodium hydroxide in methanol (400 μL) and dimethyl sulfate (15 μL) were added and the reaction mixture stirred for an additional 24 hours. The reaction was monitored by TLC (Merck Silica gel 60 F_{254}, eluting with 7 % methanol in chloroform) visualized under UV. The reaction was concentrated *in vacuo*. The crude residue was purified by multiple injection on an HPLC Waters Auto-Purification System using a Symmetry (C-18, 5μ, 30x100 mm) column and the following eluent: A (10mM ammonium acetate in water (10mM NH_4OAc)) and B acetonitrile (MeCN), 74:26 to 50:50 A:B gradient in 20 minutes, 40mL/min. The fractions having retention times 9.4, 11.5 and 15.5 minutes were collected to give respectively Compound 4 (0.53 mg), Compound 3 (5.36 mg) and Compound 5 (4.04 mg).

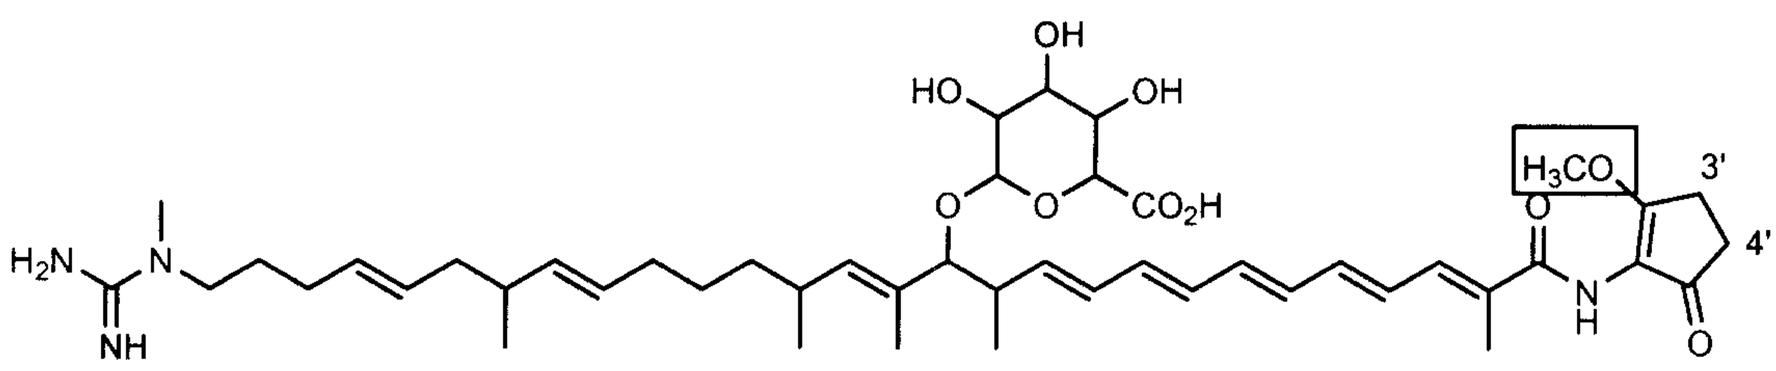
Structures of Compounds 3, 4 and 5:



Compound 3

Compound 3 is named 3,4,5-trihydroxy-6-[1-[11-(2-hydroxy-5-oxocyclopent-1-enylcarbamoyl)-1-methyldodeca-2,4,6,8,10-pentaenyl]-2,4,10-trimethyl-16-(*N*-methyl-guanidino)-hexadeca-2,8,12-trienyloxy]-tetrahydropyran-2-carboxylic acid methyl ester. Structure determination of Compound 3 was accomplished by spectral data analysis including ^1H NMR (Figure 6) and ^{13}C NMR and mass spectrometry. The molecular ion was found at mass 852.03 $(M+H)^+$ and 849.97 $(M-H)^-$, respectively for positive and negative ionization, which confirms a calculated molecular weight of 851.08, for $C_{47}H_{70}N_4O_{10}$ as molecular formula. The methyl group (in the squares) was easily assigned to the carboxylic ester from NMR chemical shifts, of the new methyl group (singlet at δ 3.73 ppm integrating for 3 protons) and of the surrounding proton and carbon atoms. The protons most affected were 4" and 5" (δ 3.40-3.48 ppm (Table 5)

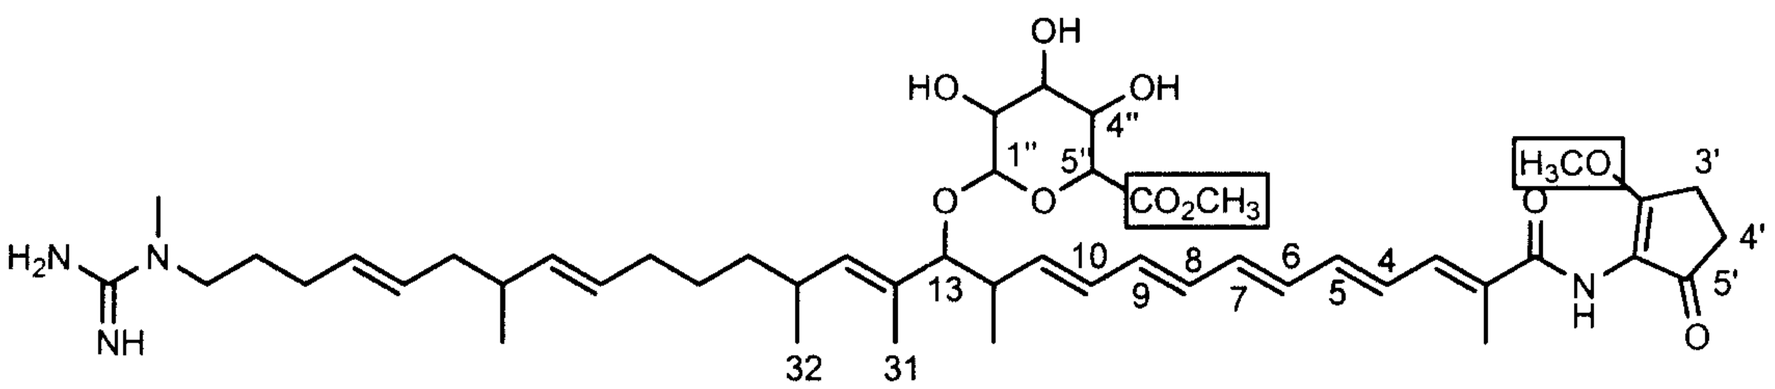
moved to δ 3.50-3.56 ppm), 1" (doublet δ 4.20 ppm (Table 5) moved to δ 4.26 ppm), 13 (doublet δ 4.58 ppm (Table 5) moved to δ 4.68 ppm) and 31 (δ 1.60 ppm (Table 5) moved to δ 1.52 ppm). Smaller effects were also observed at proton positions 4 to 10 and 32. These last effects might be due to a minor change in conformation and polarity difference between the carboxylic acid of Compound 1 and the ester of Compound 3.



Compound 4

Compound 4 is named 3,4,5-trihydroxy-6-[1-[11-(2-methoxy-5-oxo-cyclopent-1-enylcarbamoyl)-1-methyldodeca-2,4,6,8,10-pentaenyl]-2,4,10-trimethyl-16-(N-methyl-guanidino)-hexadeca-2,8,12-trienyloxy]-tetrahydropyran-2-carboxylic acid.

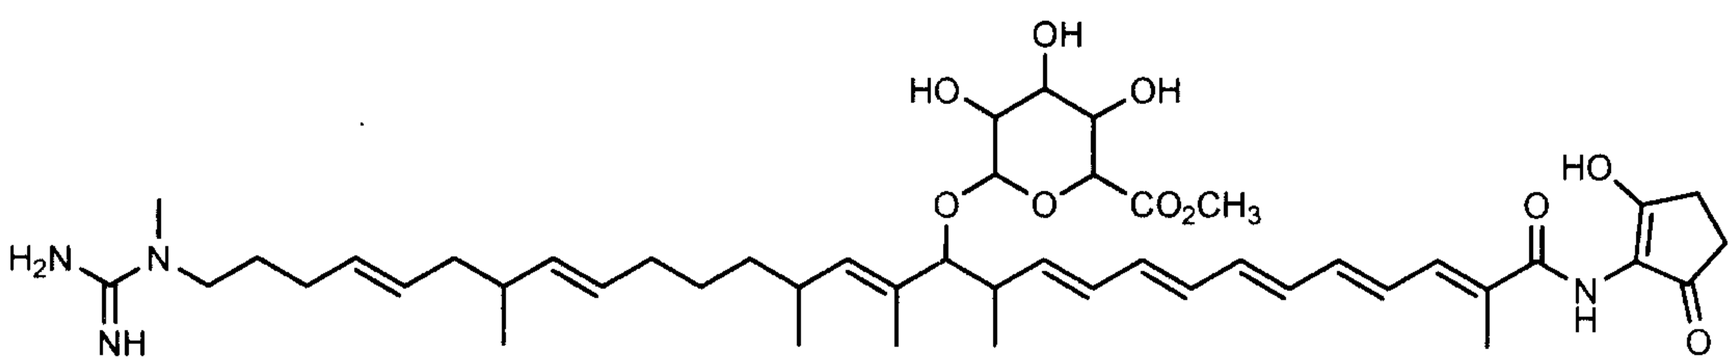
Structure determination of Compound 4 was accomplished by spectral data analysis including ^{1}H NMR (Figure 7) and ^{13}C NMR and mass spectrometry. The molecular ion was found at mass 852.03 $(M+H)^{+}$ and 849.98 $(M-H)^{-}$, respectively for positive and negative ionization, which confirms a calculated molecular weight of 851.08, for $C_{47}H_{70}N_4O_{10}$ as molecular formula. The ^{1}H NMR spectral analysis confirmed the presence of the methyl group (in the square) as a singlet integrating for three protons at 4.07 ppm. This methyl was also confirmed to be on the cyclopentenone as the two methylene groups were non-equivalent. In fact, in Compound 1, the two methylene groups from the cyclopentenone (positions 3' and 4') are equivalent (a 4 proton singlet at 2.35 ppm) due to the symmetry of the tautomeric forms. In Compound 4, the protons of these two positions appear as two separate triplets at 2.84 ppm and 2.52 ppm, integrating for two protons each.



Compound 5

Compound 5 is named 3,4,5-trihydroxy-6-[1-[11-(2-methoxy-5-oxo-cyclopent-1-enylcarbamoyl)-1-methyldodeca-2,4,6,8,10-pentaenyl]-2,4,10-trimethyl-16-(*N*-methyl-guanidino)-hexadeca-2,8,12-trienyloxy]-tetrahydropyran-2-carboxylic acid methyl ester. Structure determination of Compound 5 was accomplished by spectral data analysis including ^{1}H NMR (Figure 8) and ^{13}C NMR and mass spectrometry. The molecular ion was found at mass 866.06 $(M+H)^{+}$ and 863.89 $(M-H)^{-}$, respectively for positive and negative ionization, which confirms a calculated molecular weight of 865.11, for $C_{48}H_{72}N_4O_{10}$ as molecular formula. The ^{1}H NMR spectral analysis confirmed the presence of two methyl groups (in the square) as singlets integrating for three protons at 3.73 ppm and 4.07 ppm. One of the methyl (4.07 ppm) was confirmed to be on the cyclopentenone as the two methylene groups, as in Compound 4, were non-equivalent and appearing as two separate triplets at 2.84 ppm and 2.52 ppm, integrating for two protons each. The other methyl group (3.73 ppm) was confirmed as the methyl ester of the glucoronic acid (see Compound 3 determination above).

<u>Example 6</u>: Preparation of Compound 3 by esterification of Compound 1

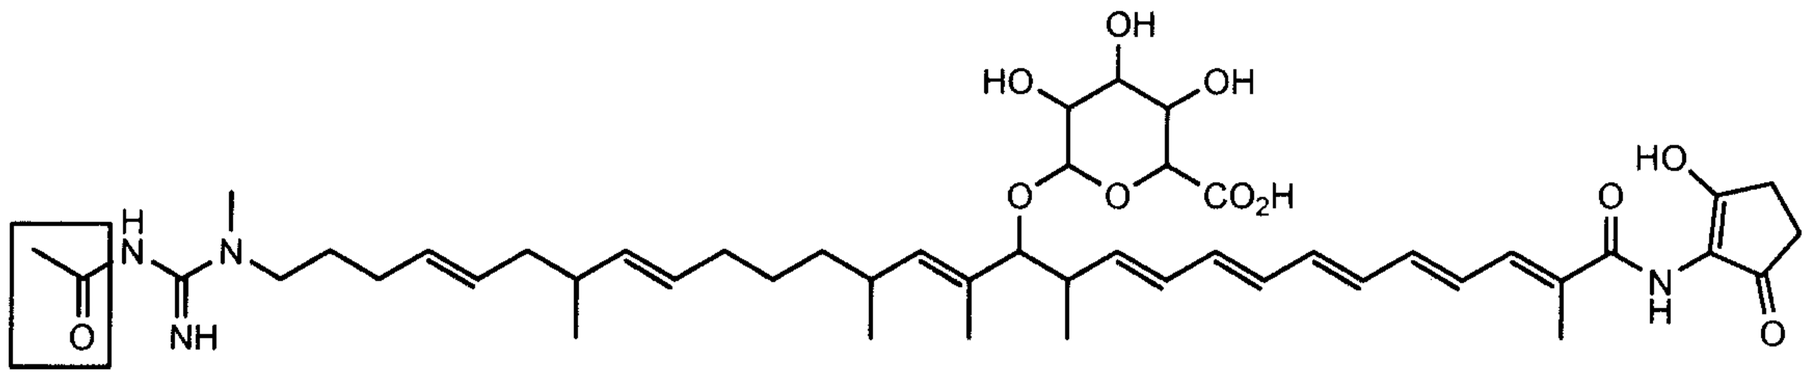


Compound 3

Diazomethane was generated by standard methods in an Aldrich diazomethane-generator [Z41, 173-6]. Approx. 2mL 5N sodium hydroxide was added dropwise to 450mg 1-methyl-3-nitro-1-nitrosoguanidine and the generated gaseous diazomethane

was condensed in 4 mL of diethyl ether at 0°C. The diazomethane solution was added dropwise to a solution of Compound 1 (10 mg) in 6 mL of methanol. The reaction was carried out at room temperature with magnetic stirring maintained for 15 minutes until completion. The reaction product was evaporated at 30°C under a gentle stream of N_2. The crude material was purified by multiple injections on HPLC using a YMC ODS-A 10×250mm column and a gradient of 5mM NH_4OAc / acetonitrile at 5mL/min (90:10 for 1min, 90:10 - 30:70 o. 20min). The combined yield of pure Compound 3 derived from two separate 10 mg batches was 0.99 mg.

Example 7: Preparation and identification of Compound 6



Compound 6

Compound 6 is named 6-{16-(N'-acetyl-*N*-methylguanidino)-1-[11-(2-hydroxy-5-oxocyclopent-1-enylcarbamoyl)-1-methyldodeca-2,4,6,8,10-pentaenyl]-2,4,10-trimethylhexadeca-2,8,12-trienyloxy}-3,4,5-trihydroxytetrahydropyran-2-carboxylic acid. Compound 6 was prepared by acetylation of Compound 1 using the following procedure. Acetic anhydride (3.38 μL, Sigma) was added to a solution of Compound 1 (20 mg) in methanol (2 mL) and the reaction stirred at room temperature for 72 hours. Additional portions of acetic anhydride (20 μL) were added after 24 and 48 hours. The reaction was monitored by TLC (Merck Silica gel 60 F_{254}, eluting with 7 % methanol in chloroform) visualized under UV. The reaction was concentrated *in vacuo*.

The crude residue was purified by multiple injection on an HPLC Waters Auto-Purification System using a Symmetry (C-18, 5μ, 30x100 mm) column and the following eluent: A (10mM ammonium acetate in water (10mM NH_4OAc)) adjusted to pH 5 with glacial acetic acid and B acetonitrile (MeCN), 74:26 to 50:50 A:B gradient in 20 minutes, 40mL/min. The fractions having retention times 9.4, 11.5 and 15.5 minutes were collected to give Compound 6 (6.43 mg).

Structure determination of Compound 6 was accomplished by spectral data analysis including ^{1}H NMR (Figure 9) and ^{13}C NMR and mass spectrometry. The molecular ion was found at mass 880.03 $(M+H)^{+}$ and 877.98 $(M-H)^{-}$, respectively for positive and negative ionization, which confirms a calculated molecular weight of 879.09, for $C_{48}H_{70}N_4O_{11}$ as molecular formula. Analysis of the ^{1}H NMR spectrum also confirmed the presence of an acetyl group as a singlet at 1.95 ppm integrating for 3 protons. No important changes were observed at other positions, which indicate this acetyl group is on the guanidine.

Example 8: Anti-microbial activity of Compounds 1 to 7

Antibacterial activity of Compounds 1 and 2 (Table 7) was measured by determining the minimal inhibitory concentration (MIC) necessary to obtain a complete inhibition of bacteria growth in eight indicator strains, namely *Staphylococcus aureus* (ATCC™ 6538P), , *Staphylococcus aureus MRS3* (ATCC™ 700699), *Staphylococcus epidermidis (ATCC™ 12228), Bacillus subtilis* (ATCC™ 23857), *Bacillus megaterium* (ATCC™ 14581), *Enterococcus faecalis VRE-1* (ATCC™ 29212), *Enterococcus faecalis VRE-2* (ATCC™ 51299) and *Micrococcus luteus* (ATCC™ 9341) . Indicator strains preparation and MIC determination were performed according to the National Committee for Clinical Laboratory Standards (NCCLS) guideline M7-A5 *Methods for Dilution Antimicrobial Susceptibility Tests for Bacteria That Grow Aerobically; Approved Standard-Fifth Edition.* (NCCLS document M7-A5, ISBN 1-56238-394-9; NCCLS, 940 West Valley Road, Suite 1400, Wayne, Pennsylvania 19087-1898 USA), the content of which is incorporated herein by reference.

Compounds 1 and 2 were prepared as 100x stock solution in DMSO, with concentrations ranging from 3.2 mg/ml to 0.003 mg/ml (a two-fold dilution series over 11 points). An aliquot of each 100x stock solution was diluted 50-fold in test medium described below to give a set of eleven (11) 2x solutions. 50 µl of each of the eleven 2x solutions was aliquoted into the corresponding well of a 12-well row, with the final well reserved for medium alone control.

Vancomycin (Sigma™) used as positive control compounds, was prepared as 2x stock solutions in Mueller-Hinton test medium ranging from 64 µg/ml to 0.06 µg/ml (a two-fold

dilution series over 11 points). An aliquot of 50 µl corresponding to each concentration (at 2x) was then transferred to 96-well microplates to obtain a series of eleven two-fold dilutions.

An isolated colony of each of the eight indicator strains was used to inoculate tubes containing 2 ml of test medium. Mueller-Hinton test medium was used for *Staphylococcus aureus* (ATCC™ 6538P), *Staphylococcus aureus MRS3* (ATCC™ 700699), *Staphylococcus epidermidis (ATCC™ 12228), Bacillus subtilis* (ATCC™ 23857), *Bacillus megaterium* (ATCC™ 14581) and *Micrococcus luteus* (ATCC™ 9341) indicator strains, and BHI test medium was used for *Enterococcus faecalis VRE-1* (ATCC™ 29212) and *Enterococcus faecalis VRE-2* (ATCC™ 51299) indicator strains. Cells were grown overnight at 28°C with shaking. Inoculum density for each indicator strain was adjusted to $0D_{600}$ = 0.1 in 5ml 0.85% saline, then further diluted 1/100 in appropriate medium. 50 µl of the final dilution (in test medium) of each indicator strain was added to each well of a 12-well row. This brings the final dilution of the test article or control compound in solution to 1x. The final inoculum is approximately 5 x 10^5 CFU/ml. The indicator strains were incubated with 11 concentrations of each of Compounds 1 and 2, Vancomycin (Sigma™) control compound and one media alone control. For MIC determination, assay plates were incubated at 35°C for 16 to 20 hours. The MIC for each indicator was assessed as the lowest concentration of compound resulting in total absence of growth and is shown below.

Table 7

Antibacterial activity of Compounds 1 and 2, MIC (µg/ml)			
Strain	Compound 1	Compound 2	Vancomycin
S. aureus ATCC™ 6538P	2	1	2
S. aureus ATCC™ 700699	4	2	4
S. epidermidis ATCC™ 12228	4	2	2
B. subtilis ATCC™ 23857	1	2	0.25
B. megaterium ATCC™ 14581	1	1	0.125
E. faecalis ATCC™ 29212	8-16	16	4
E. faecalis ATCC™ 51299	16	16	8-16
M. luteus ATCC™ 9341	4	1-2	1

Antibacterial activitiy of Compounds 3, 4, 5, 6 and 7 are accomplished using the same method in a panel of bacterial strains and Vancomycin as positive control.

Antibacterial efficacy of Compounds 1, 2, 3, 4, 5 and 6 on bacterial strain *Staphylococcus aureus* NRRL B-313 (ATCC™ 6538P) was determined at different pH concentrations. These results are shown in Table 8 together with the antibacterial activity of Compound 7 on the same strain.

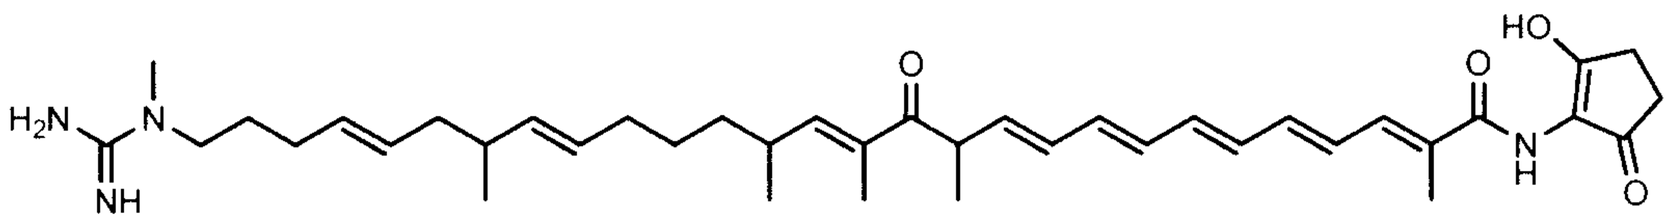
Table 8

Compounds 1 to 7 Antibacterial activity on *S. Aureus (ATCC™ 6538P)*, and effect of pH (MIC (µg/ml))

	1	2	3	4	5	6	7	Vancomycin
pH 5.0	0.125	0.0625	2	2	2	0.25	ND*	1
pH 6.0	0.25	0.125	4-8	2	4	0.5	ND*	1
pH 7.0	1	1	16	2	4	2	32-64	1

*ND: not determined

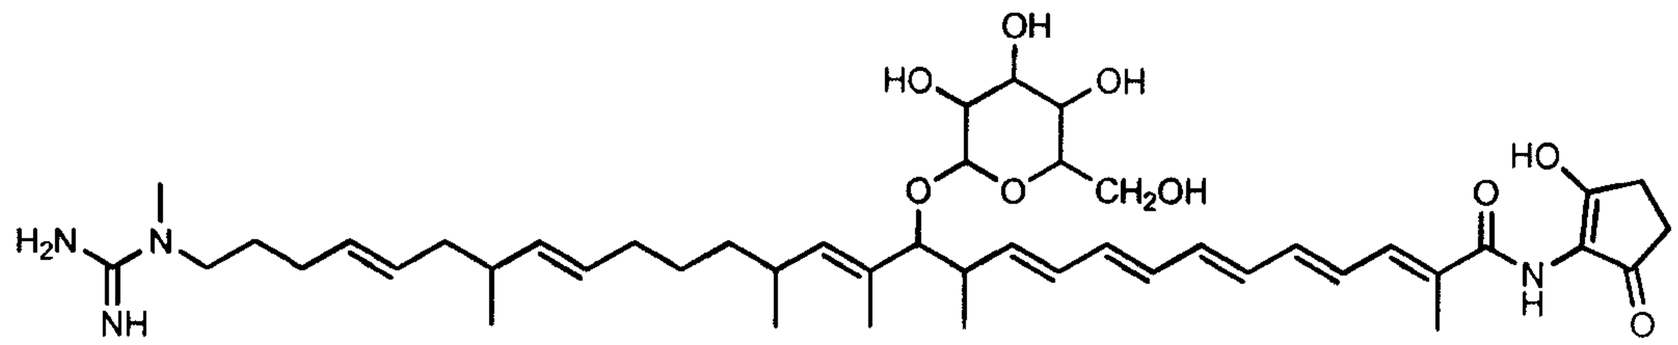
Example 9: Preparation of Compound 10 by oxidation of Compound 8



Compound 10

To a methylene choride solution of Dess-Martin periodinane (1,1,1-triacetoxy-1,1-dihydro-1,2-benziodoxol-3(1H)one, Sigma-Aldrich Co.) is added a solution of Compound 8 in methylene chloride and the reaction stirred at room temperature for 1 hour. The mixture is diluted with diethyl ether and a saturated aqueous sodium bicarbonate solution containing sodium thiosulfate. Organic layer is separated and washed with saturated aqueous sodium bicarbonate, water and brine, dried over magnesium sulfate, filtered and concentrated *in vacuo*. The crude residue is purified by HPLC according to the procedure described in Example 5. Pure Compound 10 is obtained by pooling and concentrating the appropriate eluate fractions.

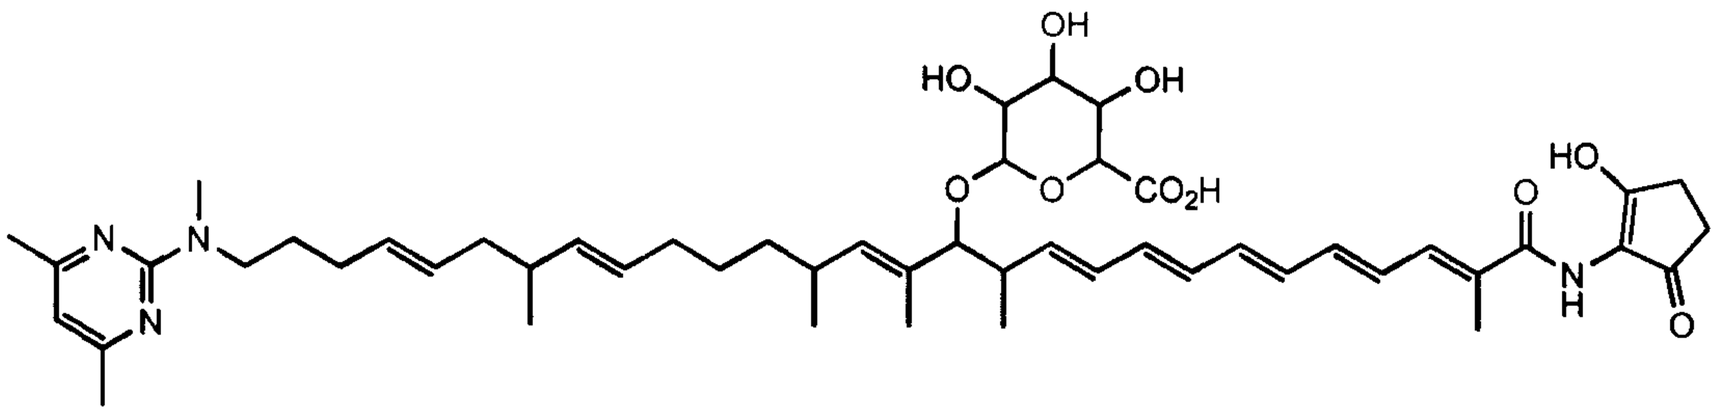
Example 10: Preparation of Compound 11 by reduction of Compound 1



Compound 11

LAH (lithium aluminum hydride) is added to a 0°C solution of Compound 1 in THF (tetrahydrofuran). After hydrogen gas has stopped evolving, the reaction is allowed to warm to room temperature and stirred overnight. Water is slowly added and 1M hydrochloric solution is used to acidify the solution carefully. The mixture is extracted three times with ethyl acetate. Organic layers are combined and washed with saturated aqueous sodium bicarbonate, water and brine, dried over magnesium sulfate, filtered and concentrated *in vacuo*. Pure Compound 11 is obtained by pooling and concentrating the appropriate fractions of HPLC purification according to Example 5.

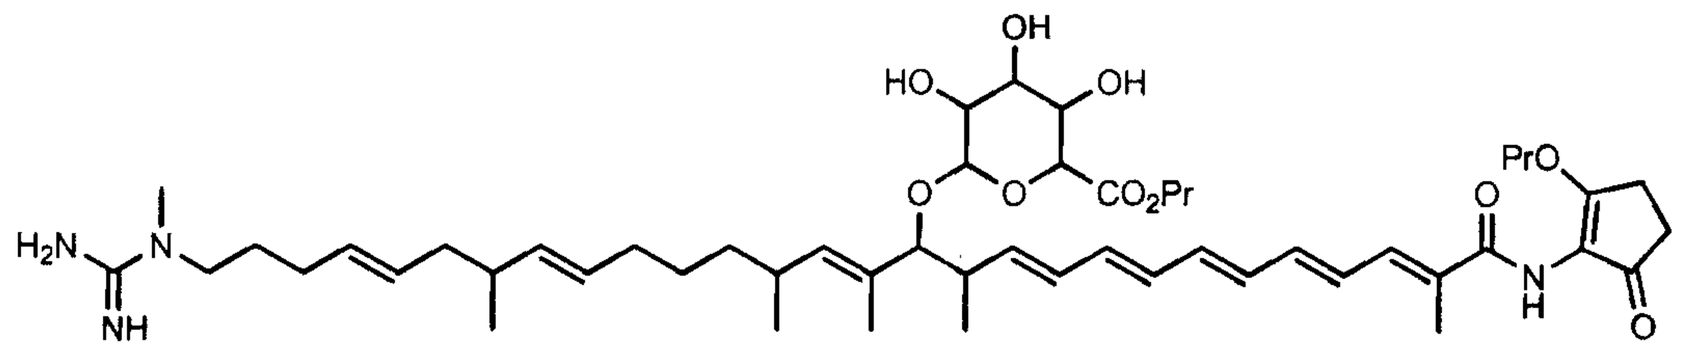
Example 11: Preparation of Compound 23 from Compound 1



Compound 23

Compound 23 is prepared by modification of the guanidino group of Compound 1 according to the procedure described in Argoudelis *et al.*, J. Antibiotics, Vol. XL, No. 6, June 1987, pp 750-760. A mixture of 200 mg of Compound 1 in 1.2 ml water, 1.0 ml of absolute ethanol,1.0 ml of 2,4-pentadione and 120 mg of sodium bicarbonate is stirred at 90 °C for 3 hours. The mixture is allowed to cool to room temperature, concentrated to dryness, dissolved in 5 ml of 2N acetic acid, and purified by HPLC as described in Example 5. Pure Compound 23 is obtained by pooling and concentrating the appropriate eluate fractions.

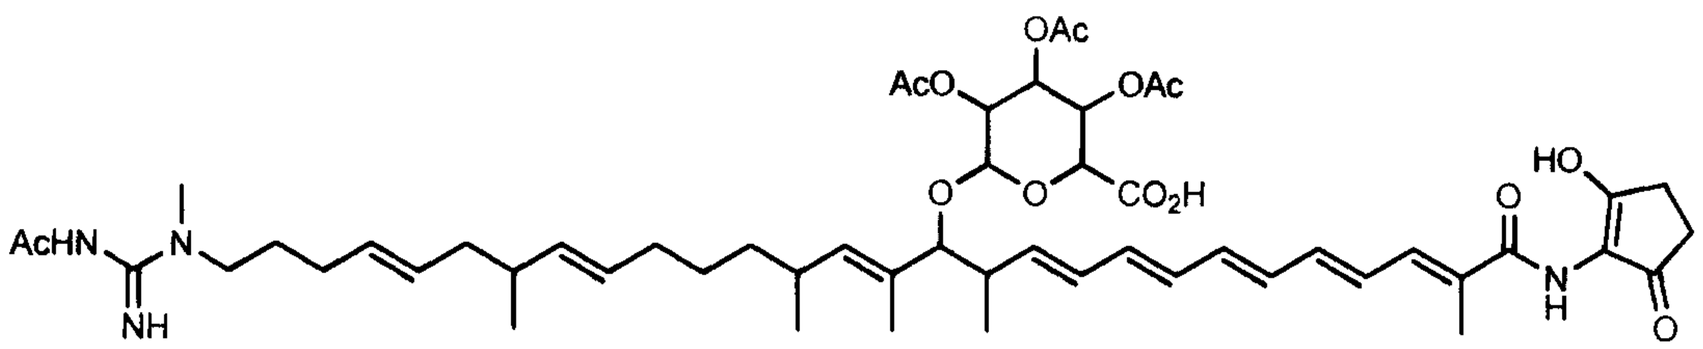
Example 12: Preparation of Compound 24 by alkylation of Compound 1



Compound 24

Compound 24 is prepared as follows. See Bartzatt et al., Biotechnol. Appl. Biochem. (2002) 36, 89-93. A Wheaton-type double-chamber device (Wheaton Co., Millville, NJ, U.S.A.) is utilized to generate diazopropane ($CH_3CH_2CHN_2$). Approx. 5.0 mg of Compound 1 is placed into an organic solvent (ethyl acetate/diethyl ether, 1:1, v/v) and the diazopropane gas formed is allowed to dissolve in the mixture. Diazopropane is generated by mixing 0.15 ml of 5 M NaOH with 0.15 g of 3-nitro-1-nitroso-1-propylguanidine. Excess diazoalkane and the solvent are removed by nitrogen gas flow or under vacuum. The remaining residue is dissolved in methanol, and the methanol solution is purified by HPLC as described in Example 5. Pure Compound 24 is obtained by pooling and concentrating the appropriate eluate fractions.

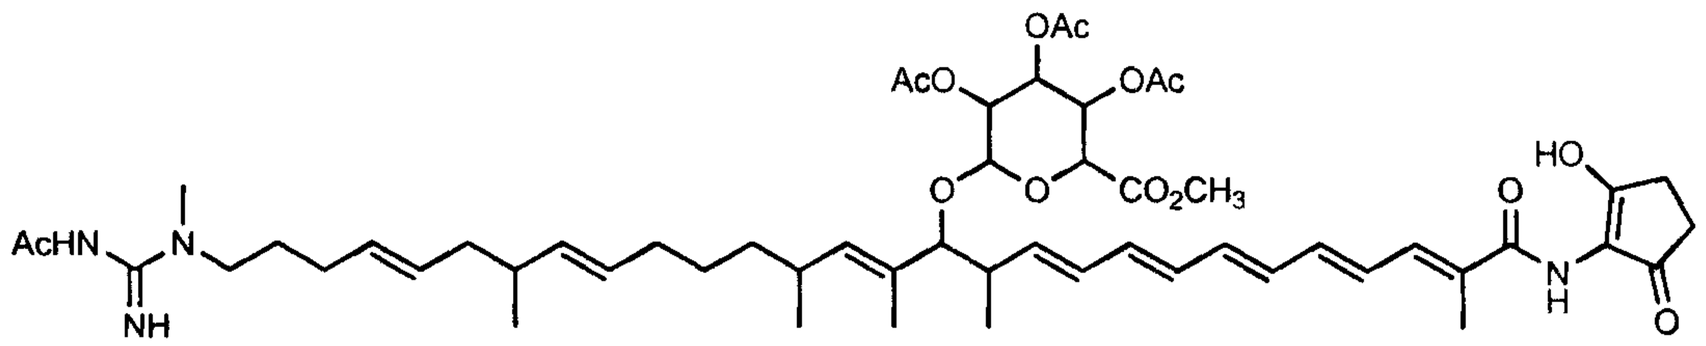
Example 13: Preparation of Compound 25 by acylation of Compound 1



Compound 25

Compound 25 is prepared by acylation of Compound 1 as follows. Acetic anhydride (4.5 equivalents) is added dropwise to a solution of 50 mg/ml of Compound 1 and in acetonitrile and pyridine (9:1). The mixture is stirred under reflux and monitored by TLC (see example 5). The solvent is removed under vacuum and the residue is dissolved in methanol. The methanol solution is purified by HPLC as described in Example 5. Pure Compound 25 is obtained by pooling and concentratin the appropriate eluate fractions.

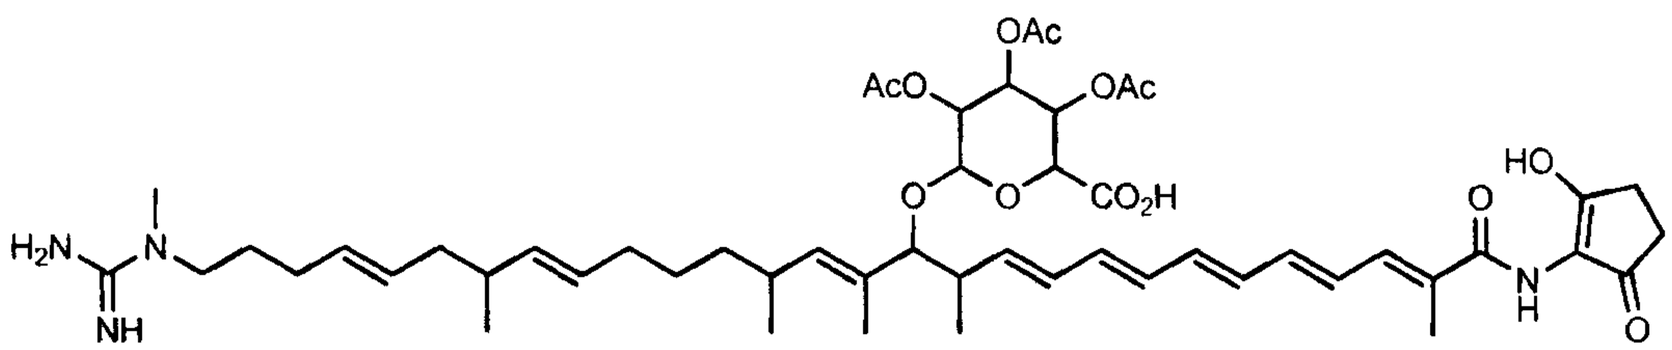
Example 14: Preparation of Compound 26 by esterification of Compound 25



Compound 26

To a solution of Compound 25 in diethyl ether/ethyl acetate (1/1) is added 1 equivalent of diazomethane in diethyl ether. The reaction mixture is allowed to stand at room temperature overnight. Excess diazomethane and the solvent are removed by nitrogen gas flow or under vacuum. The remaining residue is dissolved in methanol, and the methanol solution is purified by HPLC as described in Example 5. Pure Compound 26 is obtained by pooling and concentrating the appropriate eluate fractions.

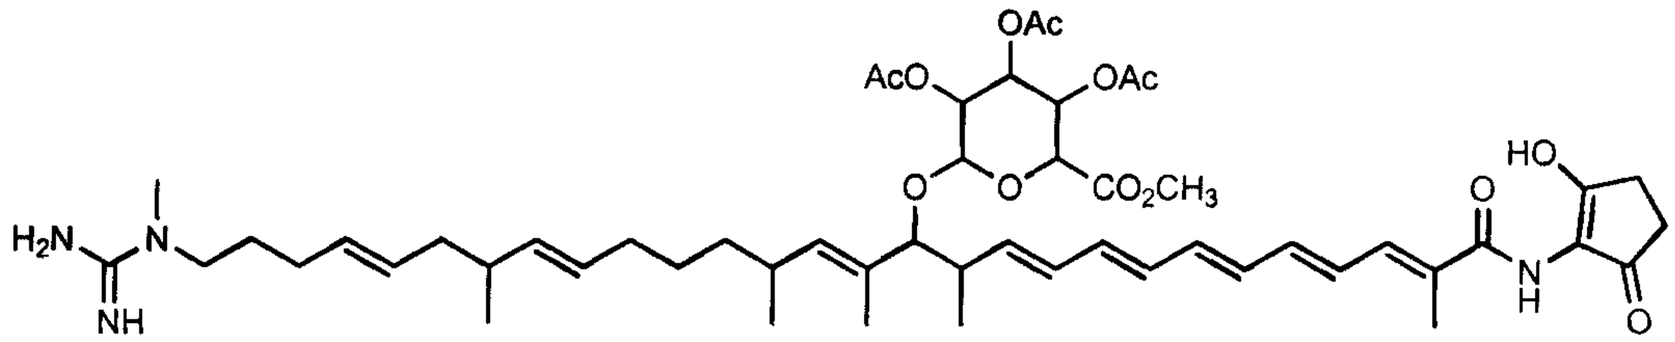
Example 15: Preparation of Compound 27 by acylation of Compound 1



Compound 27

Compound 27 is prepared by acylation of Compound 1 as follows. Acetic anhydride (3.2 equivalents) is added dropwise to a solution of 50 mg/ml of Compound 1 in acetonitrile. The mixture is stirred under reflux and monitored by TLC (see Example 5). The solvent is removed under vacuum and the residue is dissolved in methanol. The methanol solution is purified by HPLC as described in Example 5. Pure Compound 27 is obtained by pooling and concentrating the appropriate eluate fractions.

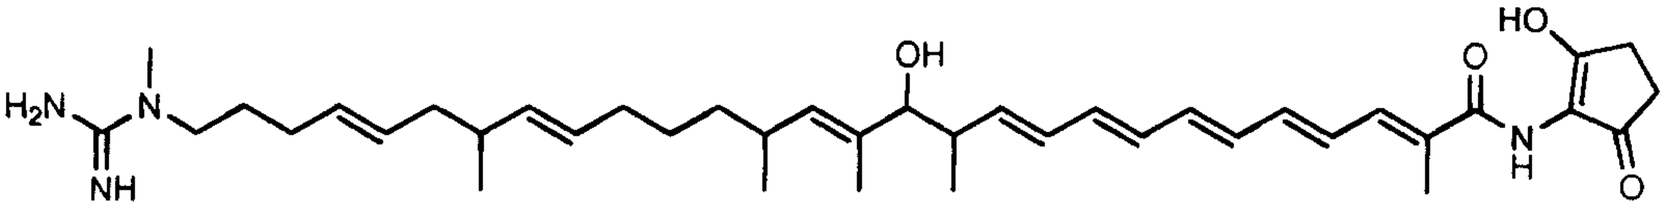
Example 16: Preparation of Compound 28 by esterification of Compound 27



Compound 28

To a solution of Compound 27 in diethyl ether is added 1 equivalent of diazomethane in diethyl ether. The reaction mixture is allowed to stand at room temperature overnight. Excess diazomethane and the solvent is removed by nitrogen gas flow or under vacuum. The remaining residue is dissolved in methanol, and the methanol solution is purified by HPLC as described in Example 5. Pure Compound 28 is obtained by pooling and concentrating the appropriate eluate fractions.

Example 17: Biosynthesis and Isolation of Compound 8



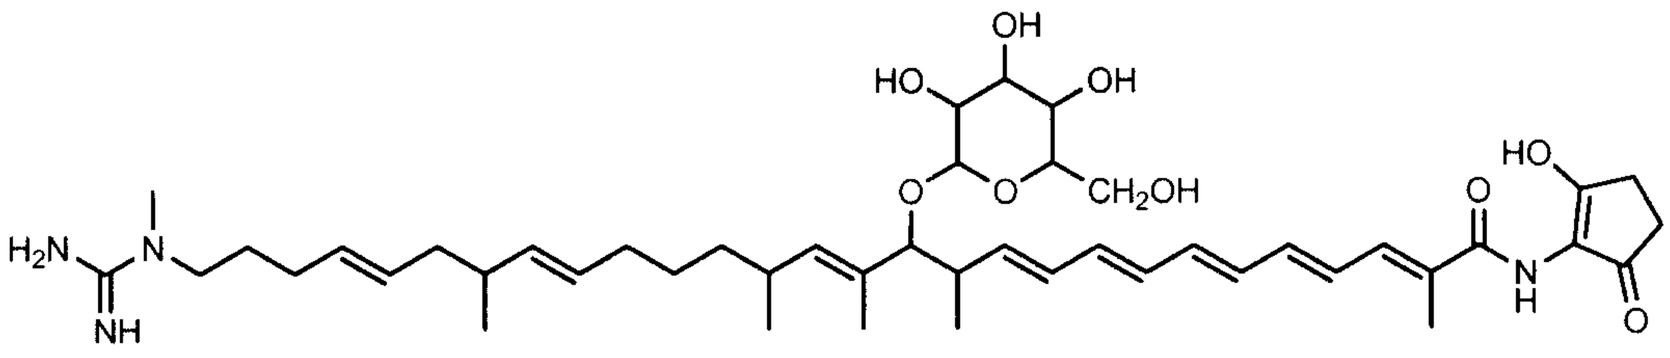
Compound 8

Compound 8 is produced by inactivation of glycosyltransferase ORF 14 (SEQ ID NO: 29) followed by fermentation as described in Example 2 and isolation of the compound as described in Example 3. Targeted inactivation of the gene product of ORF 14 (SEQ ID NO: 29) is achieved by insertional gene disruption using replicative plasmid-mediated homologous recombination. Inactivation of glycosyltransferase ORF 14 (SEQ ID NO: 29) is described in Figure 22a. Referring to Figure 22a, inactivation of the glycosyltransferase gene (SEQ ID NO: 30) disrupts the transfer of the sugar moiety onto the backbone of the polyketide core. The absence of the sugar moiety results in a non-glycosylated Compound 8. Insertional inactivation of glycosyltransferase genes involved in polyketide biosynthesis in streptomyces is known in the art. Blanco *et al.* (*Mol. Gen. Genet*. 262, 991-1000 (2000)), identified two genes of the mithramycin biosynthetic gene cluster as glycosyltransferases by the production of a non-glycosylated mithramycin upon inactivation of these genes. Similarly, Chen *et al.* (*Gene*

263, 255-64 (2001)) investigated genes responsible for glycosylation in the biosynthetic pathways encoding pikromycin, narbomycin, methymycin and neomethymycin by producing non-glycosylated analogs.

A plasmid for homologous recombination is constructed by cloning a kanamycin resistance marker between the left and right flanking regions of SEQ ID NO: 30. The construct is cloned into a delivery plasmid that is marked with thiostrepton resistance producing a disruption plasmid. The plasmid is introduced into *Amycolatopsis orientalis* by either PEG-mediated protoplast transformation or RK2-mediated conjugation. Spores from individual transformants or transconjugants are cultured on non-selective plates to induce recombination. This cycle is repeated three times to enhance the opportunity for recombination. Crossovers yielding targeted gene recombinants are then selected and screened using kanamycin and thiostrepton for single crossovers and kanamycin for double crossovers. Replica plating and southern hybridization are used to confirm the double crossover inactivation in *Amycolatopsis orientalis* transformants. The *Amycolatopsis orientalis* transformant is cultured as described in Example 2 and Compound 8 is isolated using the protocol of Example 3.

Example 18: Biosynthesis and Isolation of Compound 11



Compound 11

Compound 11 is produced by inactivation of inactivation of sugar oxidoreductase gene product of ORF 13 (SEQ ID NO: 27) followed by transfer of the glucose onto the polyketide backbone chain by the glycosyltransferase gene product of ORF 14 (SEQ ID NO: 29) as illustrated in Figure 22b. Referring to Figure 22b, glucuronic acid is synthesised by oxidation of glucose catalyzed by the sugar oxidoreductase gene product of ORF 13 (SEQ ID NO: 27). Inactivation of the ORF 13 (SEQ ID NO: 27) disrupts the conversion of glucose to glucuronic acid producing Compound 11 when the glucose

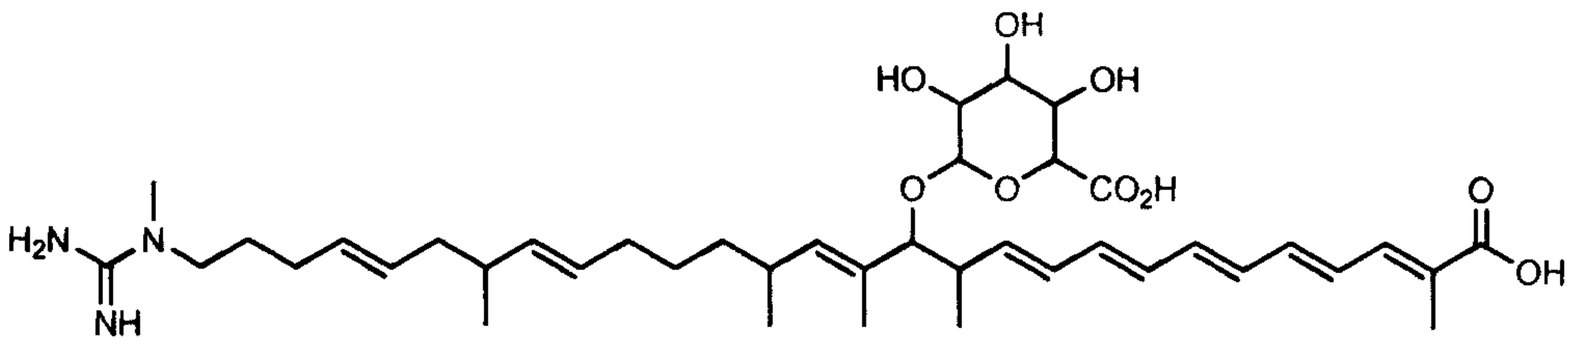
substrate is transferred onto the polyketide backbone chain by the glycosyltransferase gene product of ORF 14 (SEQ ID NO: 29). Targeted inactivation of the sugar oxidoreductase ORF 13 (SEQ ID NO: 27) is achieved by insertional gene disruption using replicative plasmid-mediated homologous recombination.

A plasmid for homologous recombination is constructed by cloning a kanamycin resistance marker between the left and right flanking regions of SEQ ID NO: 28. The construct is cloned into a delivery plasmid that is marked with thiostrepton resistance producing a disruption plasmid. The plasmid is introduced into *Amycolatopsis orientalis* by either PEG-mediated protoplast transformation or RK2-mediated conjugation.

Spores from individual transformants or transconjugants are cultured on non-selective plates to induce recombination. This cycle is repeated three times to enhance the opportunity for recombination. Crossovers yielding targeted gene recombinants are then selected and screened using kanamycin and thiostrepton for single crossovers and kanamycin for double crossovers. Replica plating and southern hybridization are used to confirm the double crossover inactivation in *Amycolatopsis orientalis* transformants.

The *Amycolatopsis orientalis* transformant is cultured as described in Example 2 and Compound 11 is isolated using the protocol of Example 3.

<u>Example 19:</u> Biosynthesis and Isolation of Compound 7



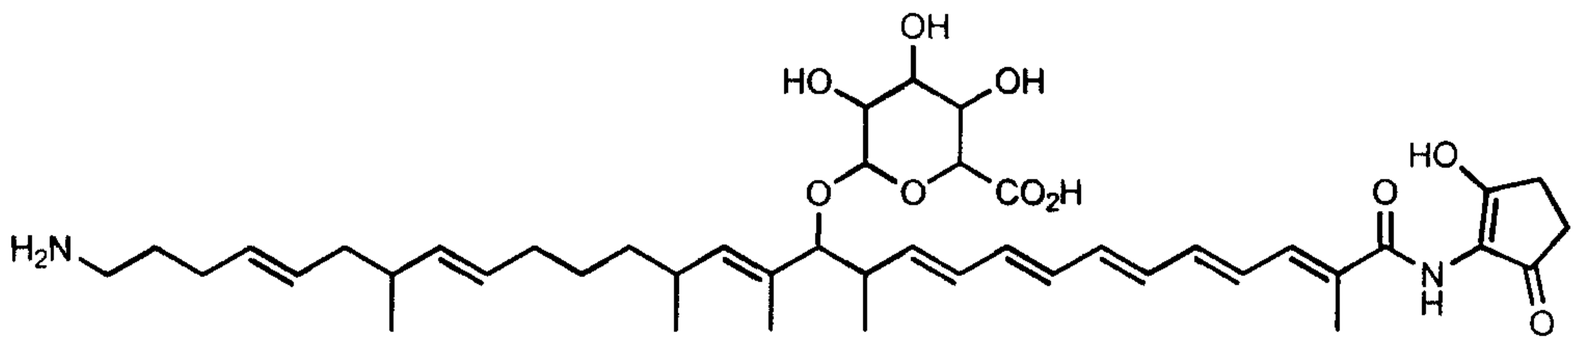
Compound 7

Compound 7 is also produced by inactivation of any one of acyltransferase ORF 16 (SEQ ID NO: 33), acyl CoA ligase ORF 17 (SEQ ID NO: 35), or adenylating/ condensing synthetase ORF 15 (SEQ ID NO: 31) followed by fermentation as described in Example 2 and isolation of the compound as described in Example 3. Referring to Figure 23, gene disruption of ORF 16 (SEQ ID NO: 34) results in the inactivation of the acyltransferase gene product of ORF 16 (SEQ ID NO: 33) preventing condensation of

succinyl-CoA and glycine to form 5-aminolevulinate. Gene disruption of ORF 17 (SEQ ID NO: 36) results in the inactivation of the acyl CoA ligase gene product of ORF 17 (SEQ ID NO: 35) preventing the conversion of 5-aminolevulinate to 5-aminolevulinate-CoA which cyclizes to form aminohydroxycyclopentenone. Gene disruption of ORF 15 (SEQ ID NO: 32) results in the inactivation of the adenylating/condensing synthetase gene product of ORF 15 (SEQ ID NO: 31) preventing transfer of the aminohydroxycyclopentenone unit to the polyketide chain. Compound 7 is provided by targeted inactivation of acyltransferase ORF 16 (SEQ ID NO: 33), acyl CoA ligase ORF 17 (SEQ ID NO: 35), or adenylating/condensing synthetase ORF 15 (SEQ ID NO: 31). Targeted inactivation of ORF 16, ORF 17 or ORF 14 (SEQ ID NO: 29) is achieved by insertional gene disruption using replicative plasmid-mediated homologous recombination.

A plasmid for homologous recombination is constructed by cloning a kanamycin resistance marker between the left and right flanking regions of SEQ ID NOS: 34, 36 or 32. The construct is cloned into a delivery plasmid that is marked with thiostrepton resistance producing a disruption plasmid. The plasmid is introduced into *Amycolatopsis orientalis* by either PEG-mediated protoplast transformation or RK2-mediated conjugation. Spores from individual transformants or transconjugants are cultured on non-selective plates to induce recombination. This cycle is repeated three times to enhance the opportunity for recombination. Crossovers yielding targeted gene recombinants are then selected and screened using kanamycin and thiostrepton for single crossovers and kanamycin for double crossovers. Replica plating and southern hybridization are used to confirm the double crossover inactivation in *Amycolatopsis orientalis* transformants. The *Amycolatopsis orientalis* transformant is cultured as described in Example 2 and Compound 7 is isolated using the protocol of Example 3.

Example 20: Biosynthesis and Isolation of Compound 9



Compound 9

Compound 9 is produced by incorporation of the amidino hydrolase of SEQ ID NO: 65 of co-pending application USSN 60/494,568, the contents and teachings of which are incorporated herein by reference. The amidino hydrolase catalyzes the conversion of 4-guanidinobutanamide to γ-amino butanamide. The supplementation of SEQ ID NO: 65 of co-pending application USSN 60/494,568 effects synthesis of γ-amino butanamide from 4-guanidino butanamide, as described in Figure 24. To promote catalytic activity of the amidinohydrolase enzyme, the N-methyltransferase of ORF 5 (SEQ ID NO: 10) is inactivated by insertional mutagenesis to prevent methylation of the guanidino group and thus avoid interference with the enzymatic activity of the amidino hydrolase SEQ ID NO: 65 of co-pending application USSN 60/494,568. Referring to Figure 24, the γ-amino butanamide is converted by acyl CoA ligase ORF 25 (SEQ ID NO: 52) to form γ-aminobutyryl-CoA which is then tethered onto the ACP domain of module 0 of ORF 18 (SEQ ID NOS: 37) of the polyketide synthase enzyme through the action of acyltransferase ORF 24 (SEQ ID NO: 50).

To supplement amidinohydrolase activity, SEQ IS NO: 65 of co-pending application USSN 60/494,568, *i.e* ORF 32 of a biosynthetic locus for the production of a polyketide in *Streptomyces aizunensis,* is cloned into vector pBW160 as described in Hussain and Ward (*Appl. Environ. Microbiol.* 69, 373-382 (2003)) and the vector transferred into *Amycolatopsis orientalis*. The vector contains inducible promoter elements placed upstream of the cloned amidinohydrolase gene. Transfer of the expression vector to *Amycolatopsis* host strain is achieved by direct transformation of mycelia and electroporation. Development of cloning vectors and transformation methods for amycolatopsis are described in Dhingra *et al*. (*J. Ind. Microbiol. Biotechnol.* 30, 195-204

(2003)). The *Amycolatopsis orientalis* transformant is cultured as described in Example 2 and Compound 9 is isolated using the protocol of Example 3.

All patents, patent applications, and published references cited herein are hereby incorporated by reference in their entirety. While this invention has been particularly shown and described with reference to preferred embodiments thereof, it will be understood by those skilled in the art that various changes in form and details may be made therein without departing from the scope of the invention encompassed by the appended claims.

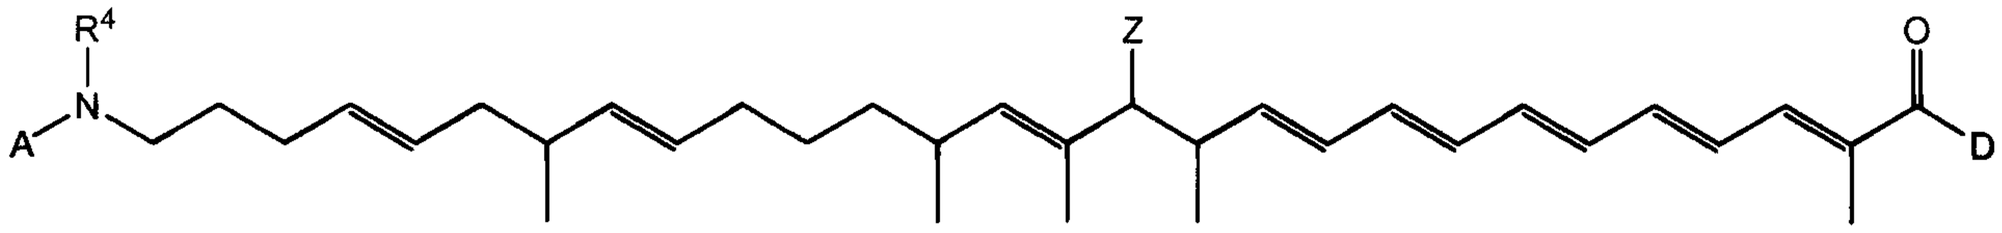
We claim:

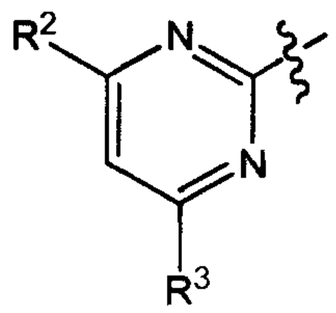
1. A compound of Formula I, or a pharmaceutically acceptable salt thereof:



Formula I

wherein,

A is selected from $-C(NH)NHR^1$, CH_3, H or



;

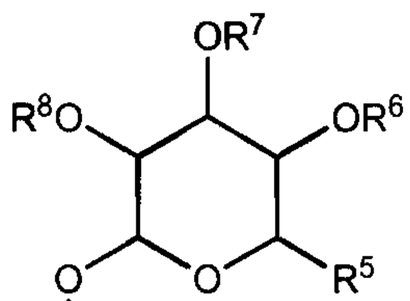
R^1 is selected from H, C_{1-6}alkyl, C_{6-10}aryl, $C(O)C_{1-6}$alkyl and $C(O)C_{6-10}$aryl;

R^2 and R^3 are each independently selected from H, C_{1-6} alkyl, C_{2-7} alkene and C_{6-10} aryl;

R^4 is selected from H or CH_3;

Z is OH or O when taken with adjacent carbon atom to form a carbonyl; or

Z may be a tetrahydropyranoxy of formula:



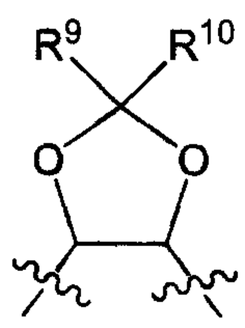
;

R^5 is selected from H, COOH, C_{1-6} alkyl or $C(O)OC_{1-6}$ alkyl;

R^6, R^7 and R^8 are each independently selected from H, C_{1-6} alkyl and $C(O)C_{1-6}$ alkyl; or

R^6 , R^7 and R^8 may each independently be absent when the adjacent oxygen and carbon atoms are taken together to form a carbonyl; or

R^6 , R^7 and R^8 may each independently be a bond when any of two neighboring R^6 , R^7 and R^8 are taken together with attached oxygen and carbon atoms to form a 1,3-dioxolane ring of formula:

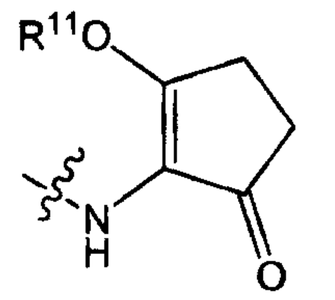


;

R^9 and R^{10} are each independently selected from H, C_{1-6} alkyl, C_{2-7} alkene and C_{6-10} aryl; or

R^9 and R^{10} are taken together with adjacent carbon atom to form a ring having from 5 to 7 carbons;

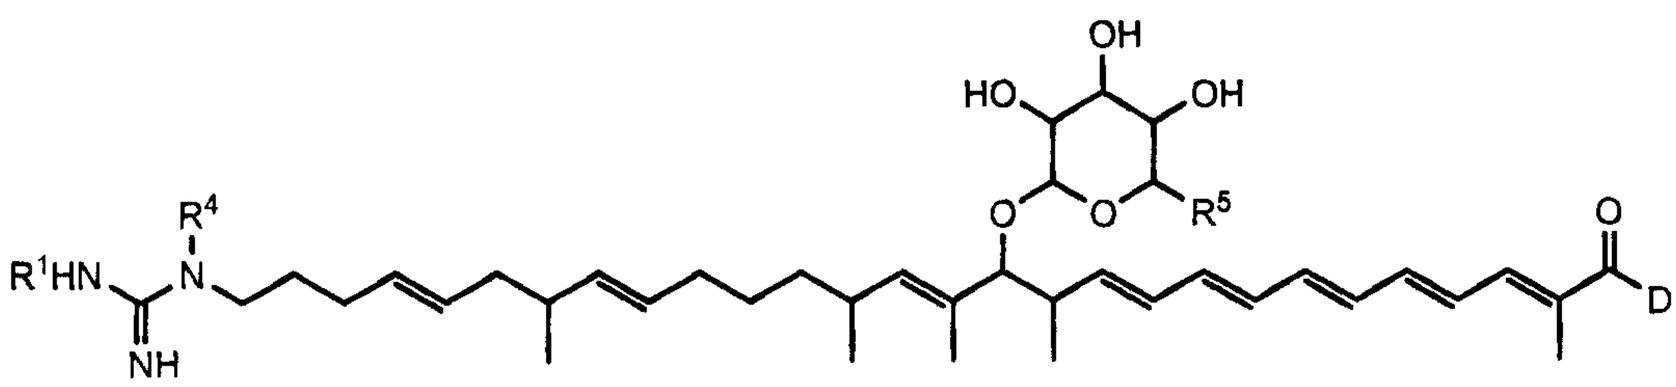
D is selected from OH, NH_2, $NH(C_{1-3}alkyl)$, $N(C_{1-3}alkyl)_2$, $OC_{1-3}alkyl$ or



; and

R^{11} is selected from H or C_{1-3} alkyl.

2. A compound of Formula II, or a pharmaceutically acceptable salt thereof:



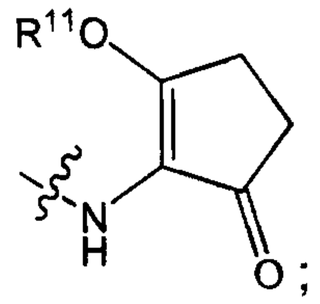
Formula II

wherein, R^1 is selected from H or $C(O)C_{1-3}alkyl$;

R^4 is selected from H or CH_3;

R^5 is selected from C(O)OH or C(O)OC_{1-3}alkyl;

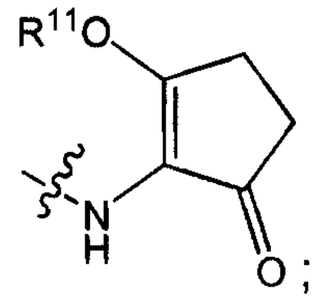
D is selected from OH or the cyclopentenone of the formula:



wherein R^{11} is selected from H or C_{1-3}alkyl.

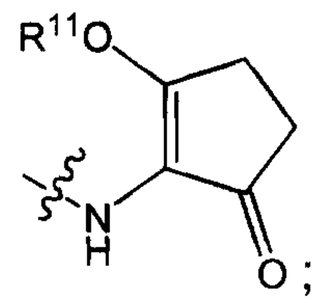
3. A compound of claim 2 wherein

wherein D is



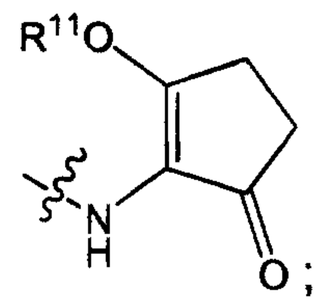
R^1 and R^{11} are H; R^4 is CH_3; and R^5 is C(O)OH, or a pharmaceutically acceptable salt or prodrug thereof.

4. A compound of claim 2 wherein D is



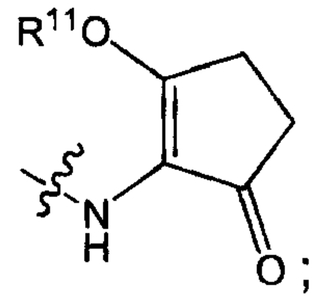
R^1, R^4 and R^{11} are H and R^5 is C(O)OH, or a pharmaceutically acceptable salt or prodrug thereof.

5. A compound of claim 2 wherein D is



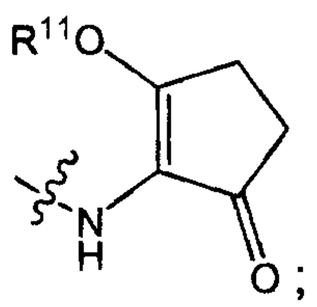
R^1 and R^{11} are H, R^4 is CH_3 and R^5 is $C(O)OCH_3$, or a pharmaceutically acceptable salt or prodrug thereof.

6. A compound of claim 2 wherein D is



R^1 is H; R^4 and R^{11} are CH_3; and R^5 is C(O)OH; or a pharmaceutically acceptable salt or prodrug thereof.

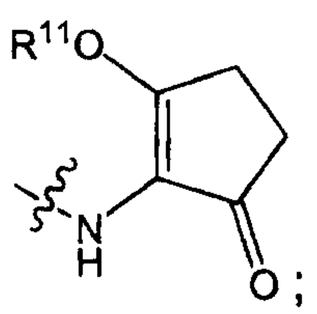
7. A compound of claim 2 wherein D is



R^1 is H; R^4 and R^{11} are CH_3; and R^5 is $C(O)OCH_3$; or a pharmaceutically acceptable salt or prodrug thereof.

8. A compound of claim 2 wherein

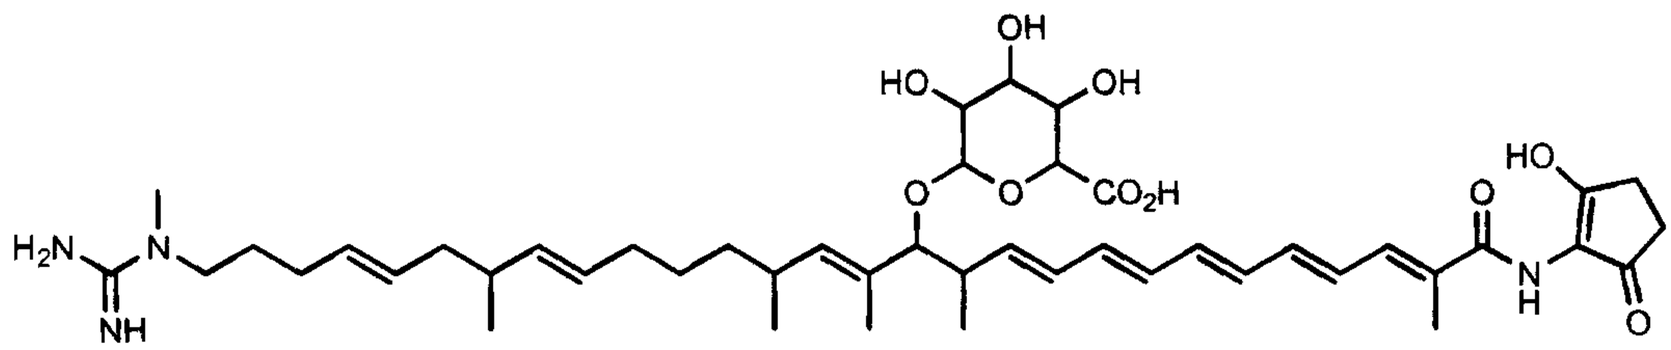
wherein D is



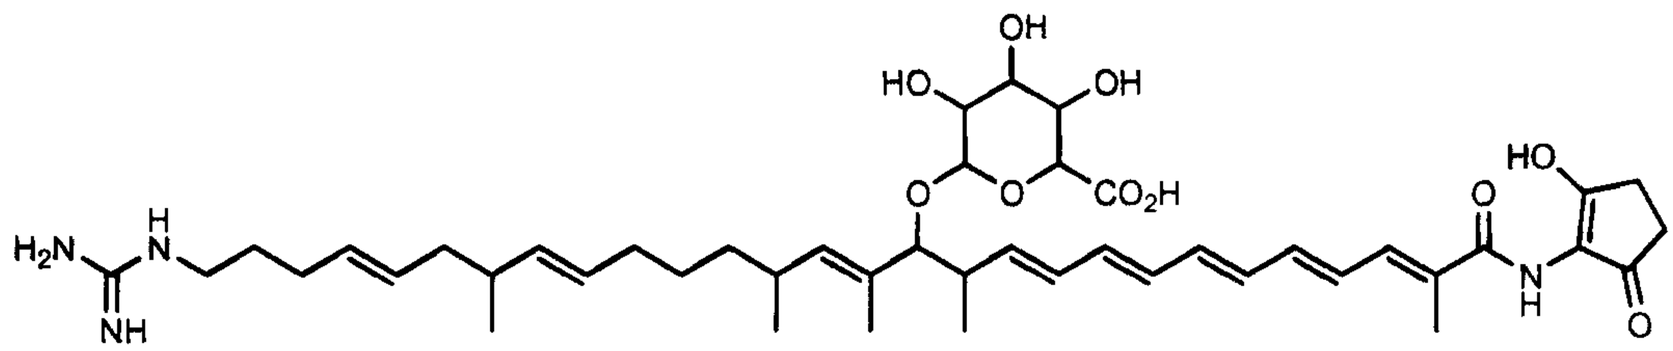
R^1 is $C(O)CH_3$; R^4 is CH_3; R^5 is C(O)OH; and R^{11} is H; or a pharmaceutically acceptable salt or prodrug thereof.

9. The compound of claim 2, wherein D is OH, R^1 is H, R^4 is CH_3, R^5 is C(O)OH and the group, or a pharmaceutically acceptable salt or prodrug thereof.

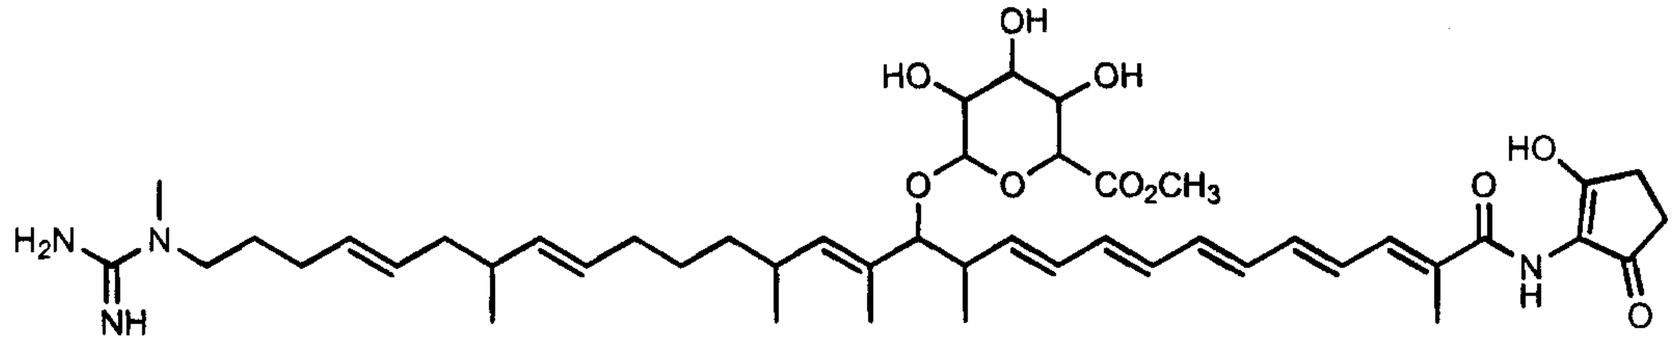
10. A compound of claim 1, or a pharmaceutically acceptable salt or prodrug thereof, selected from the group consisting of:



Compound 1;

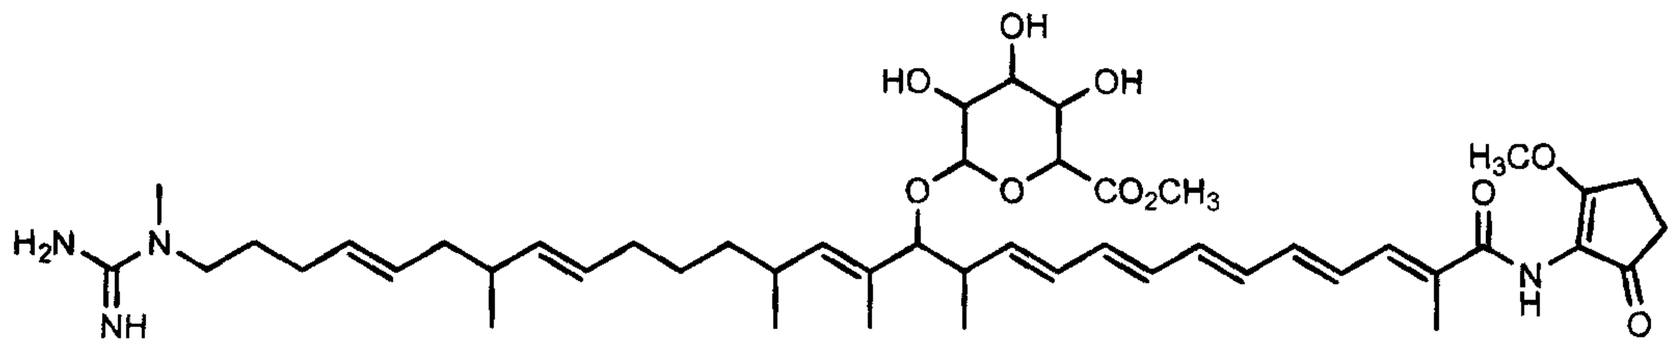


Compound 2;

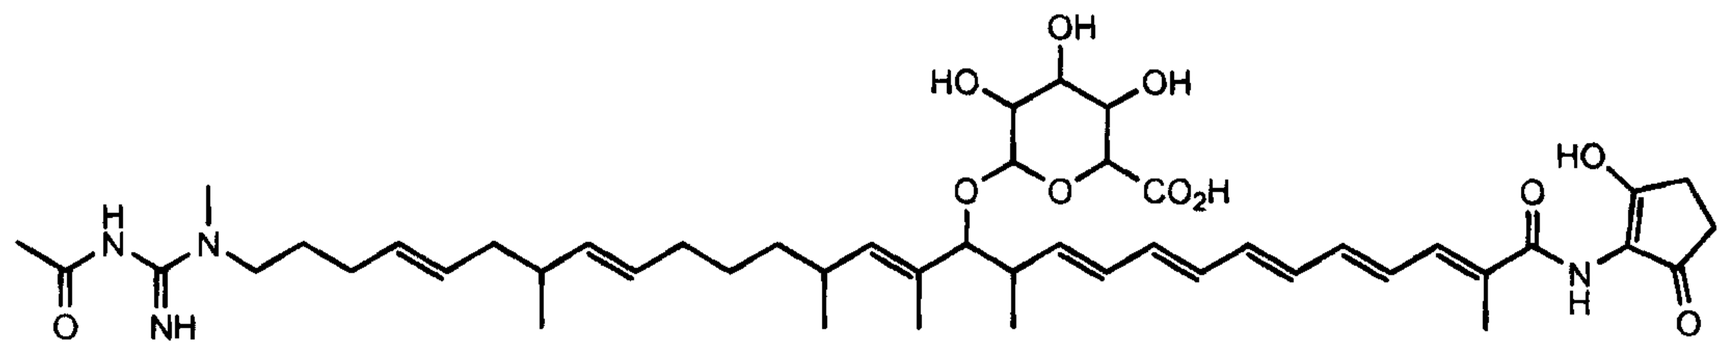


Compound 3;

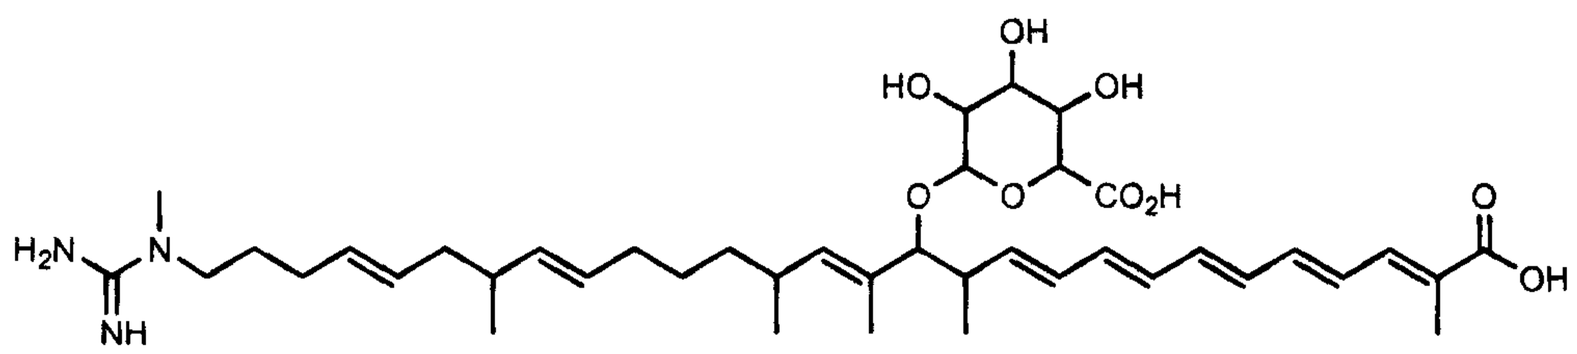
Compound 4;



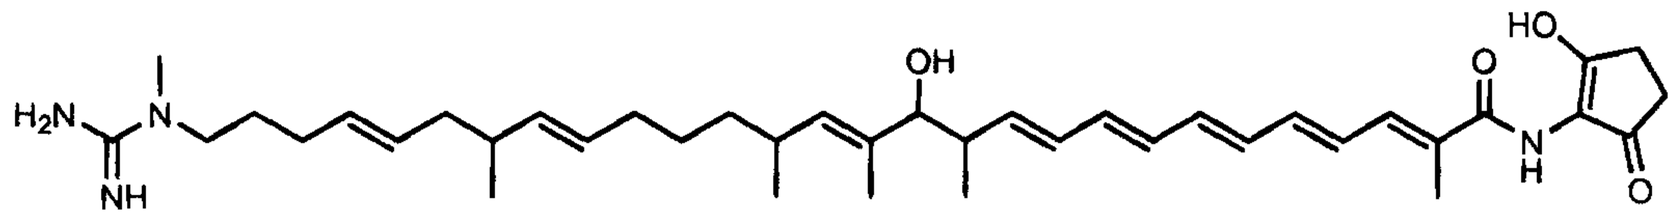
Compound 5;



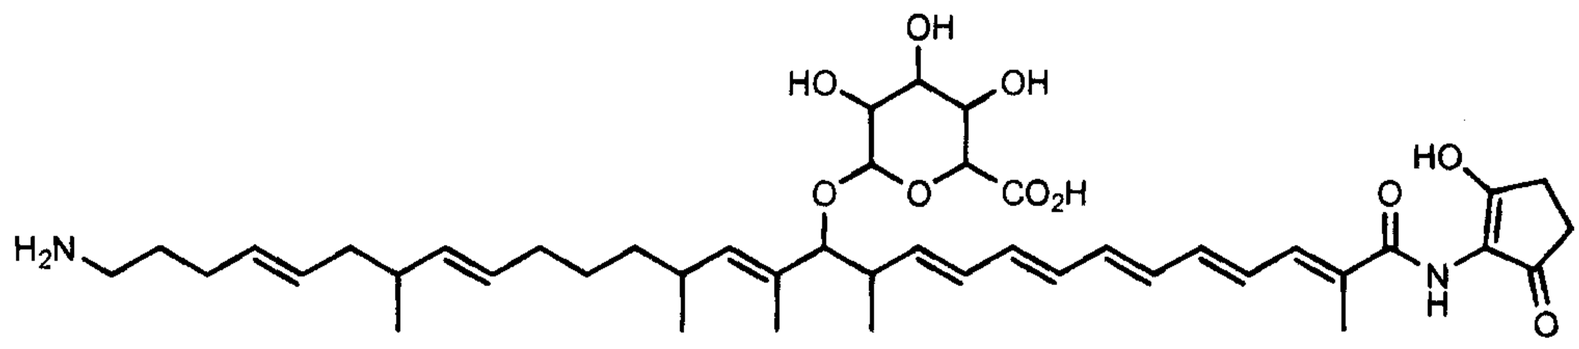
Compound 6;



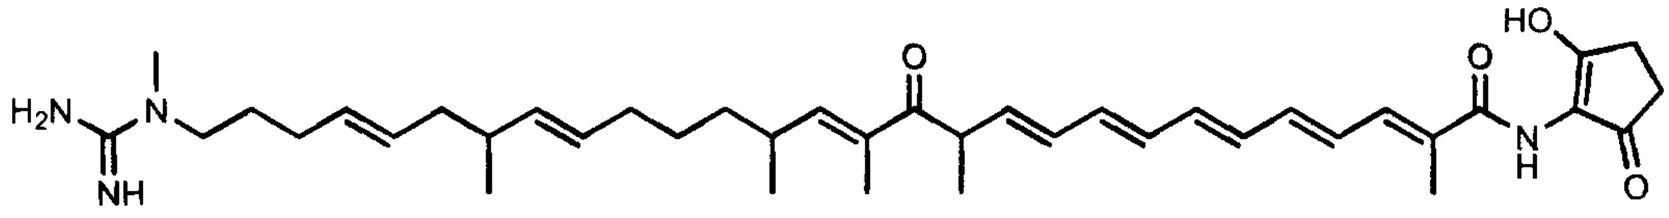
Compound 7;



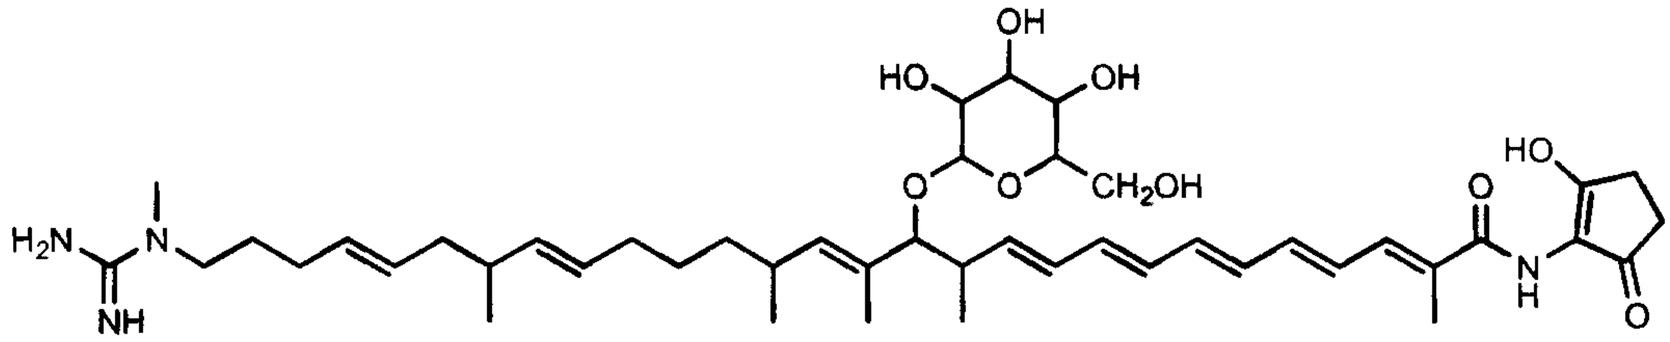
Compound 8;



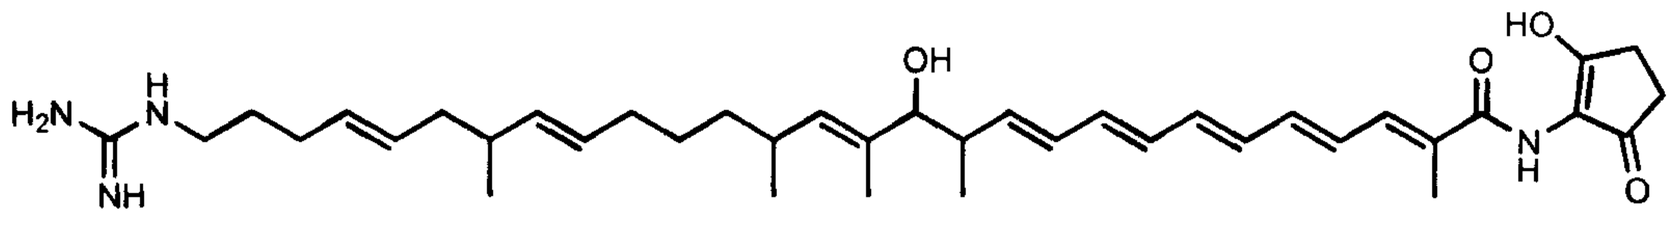
Compound 9;



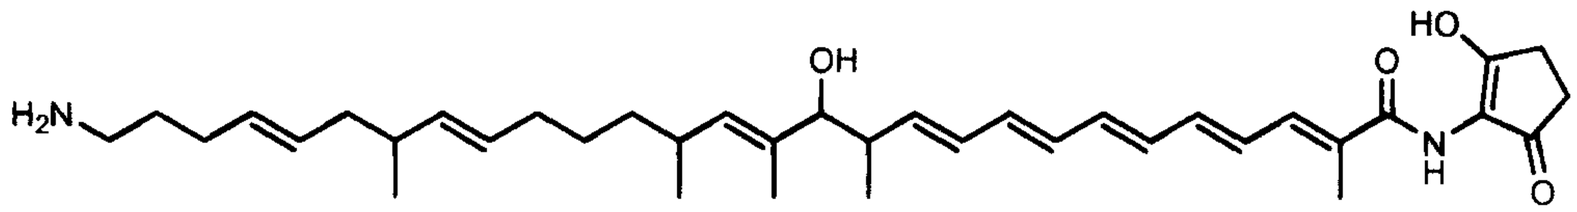
Compound 10;



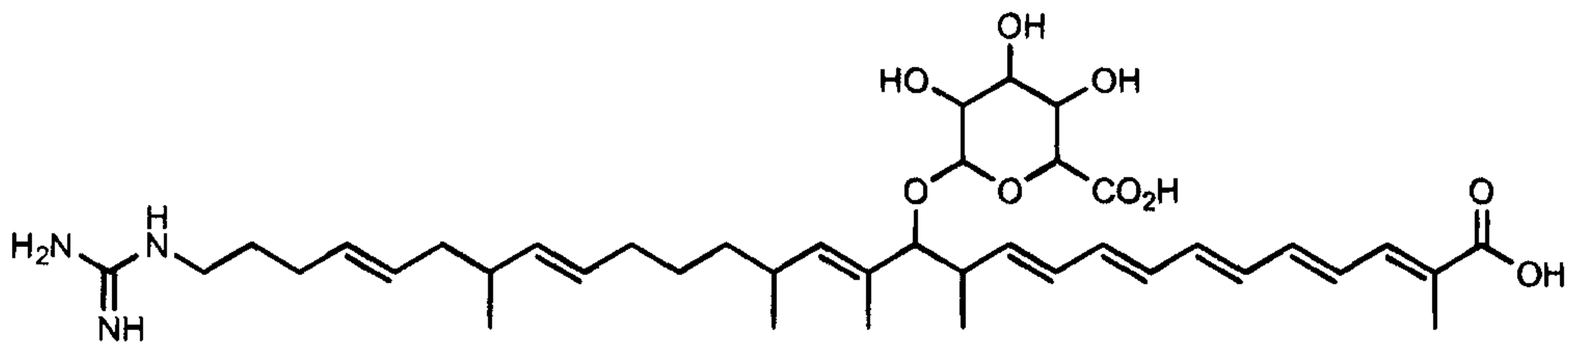
Compound 11;



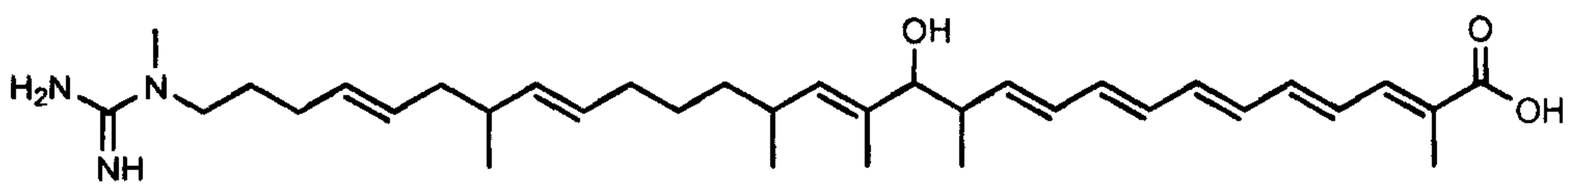
Compound 12;



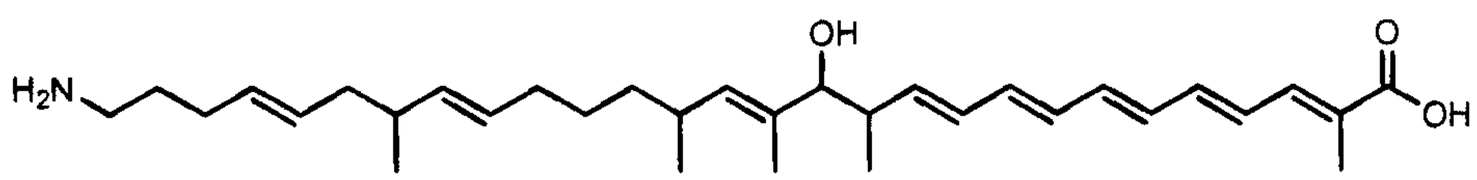
Compound 13;



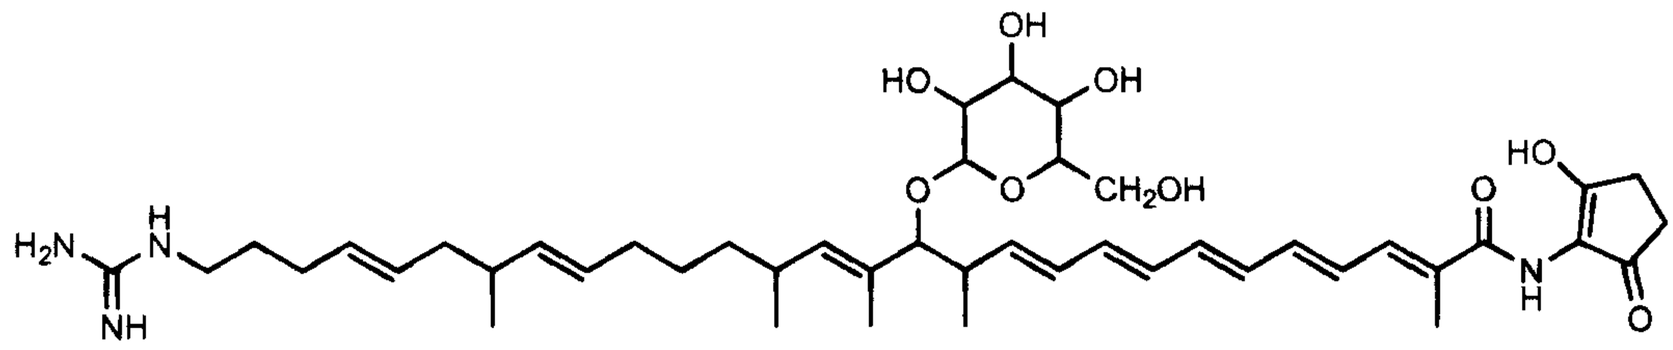
Compound 14;



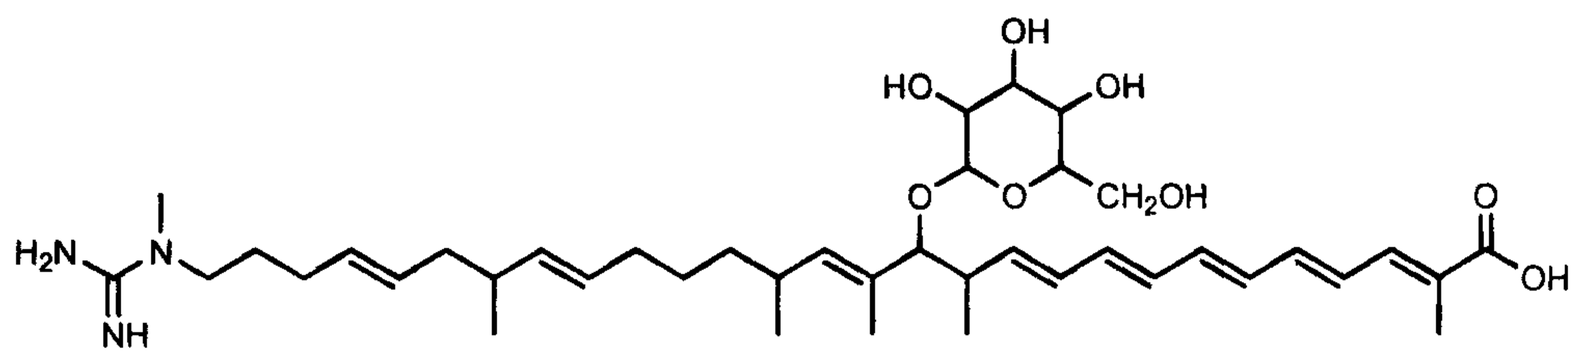
Compound 15;



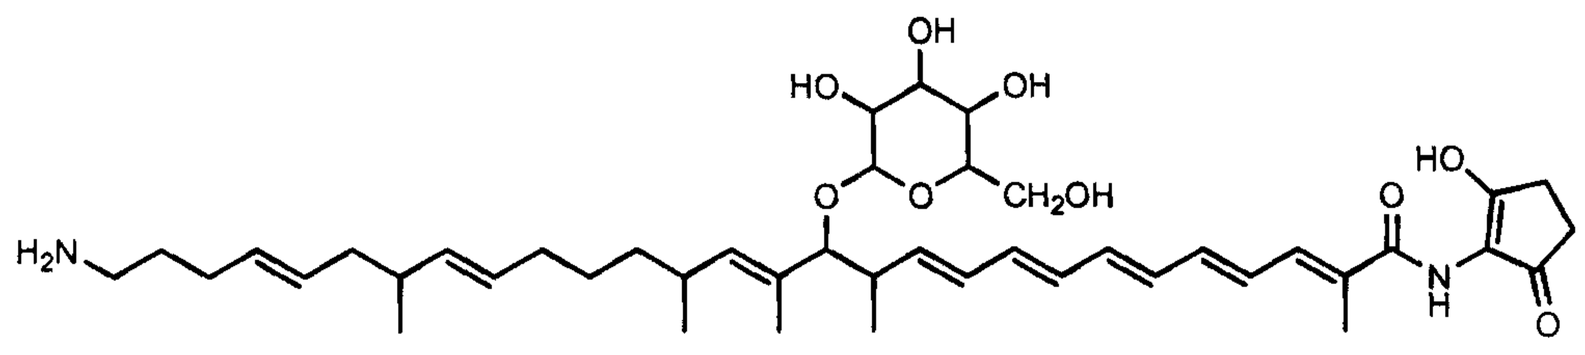
Compound 16;



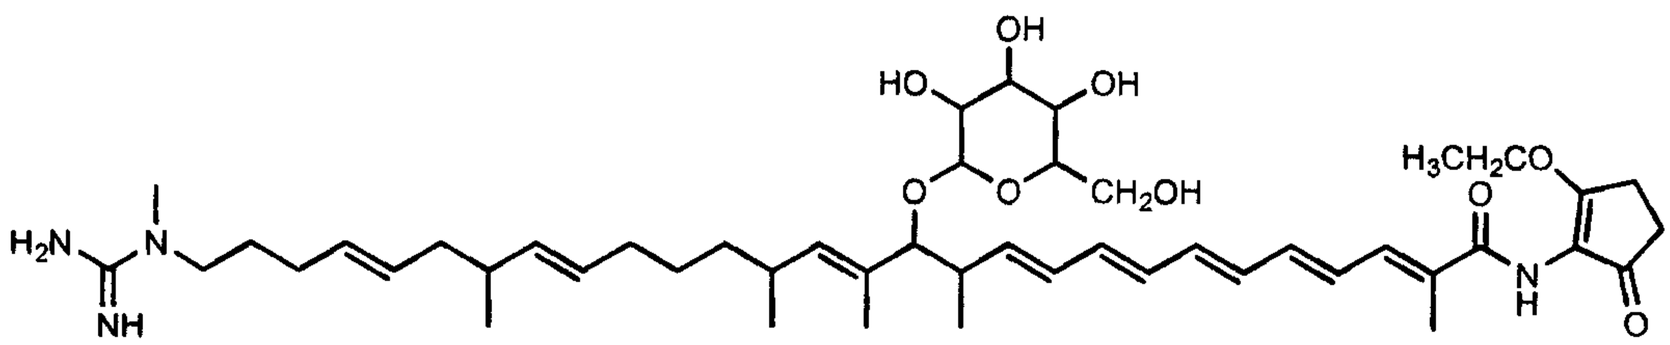
Compound 17;



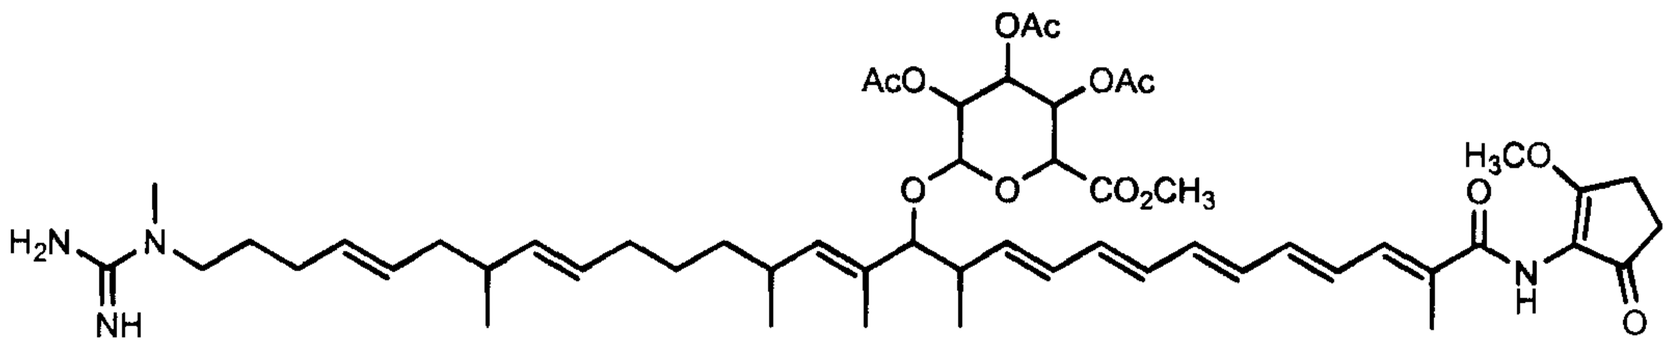
Compound 18;



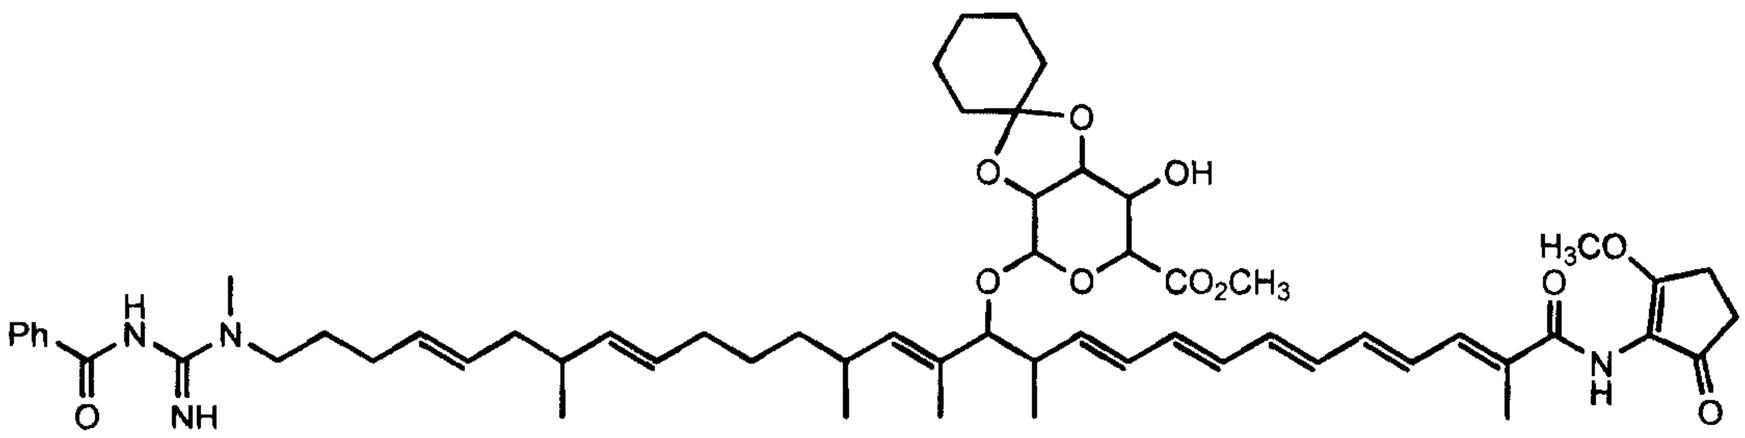
Compound 19;



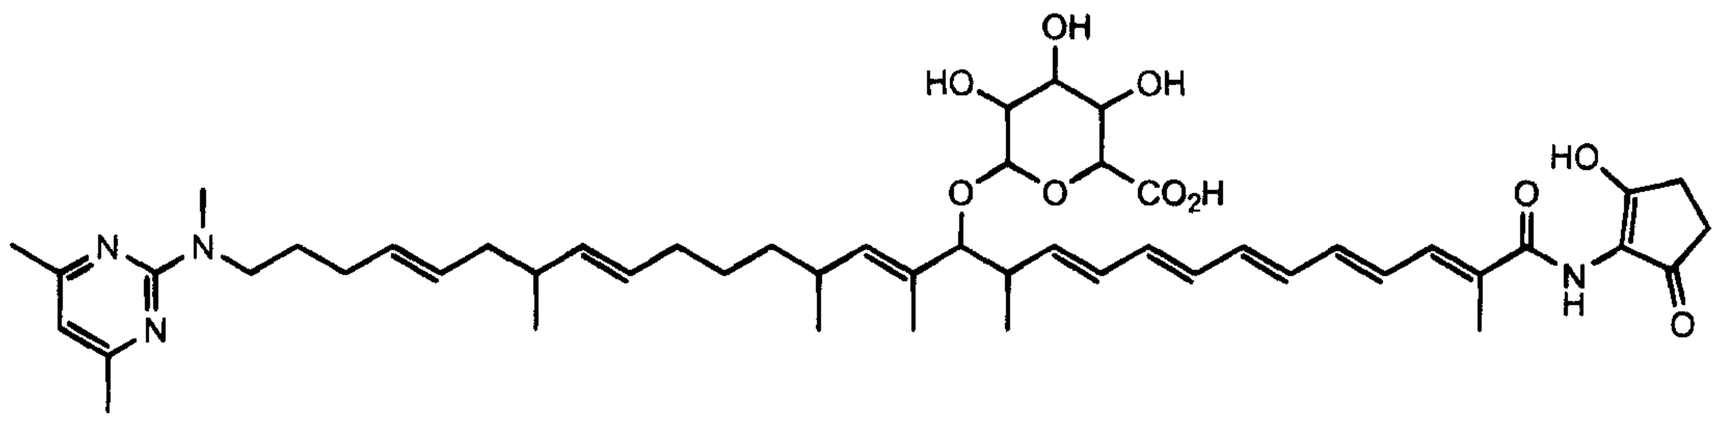
Compound 20;



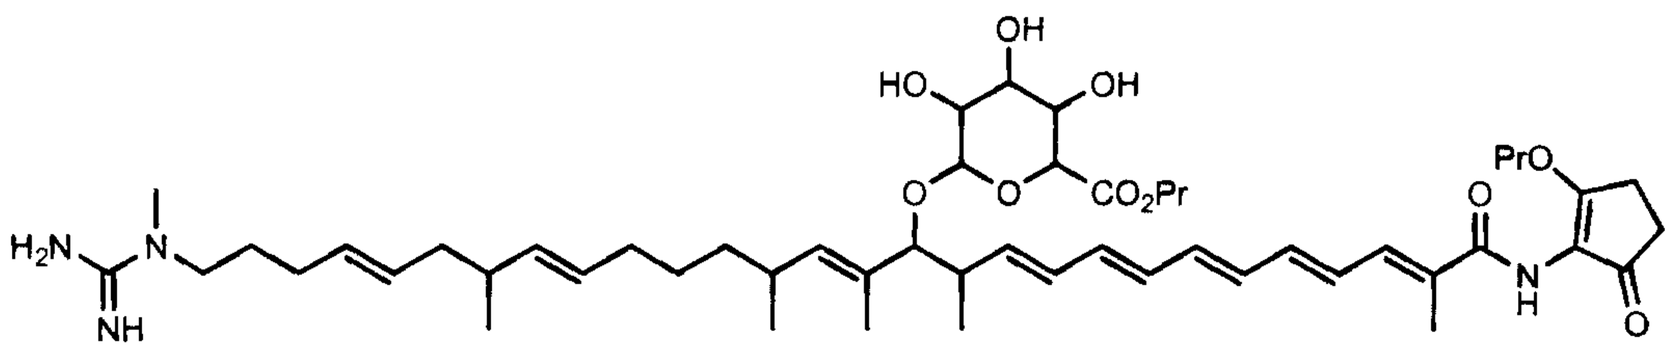
Compound 21;



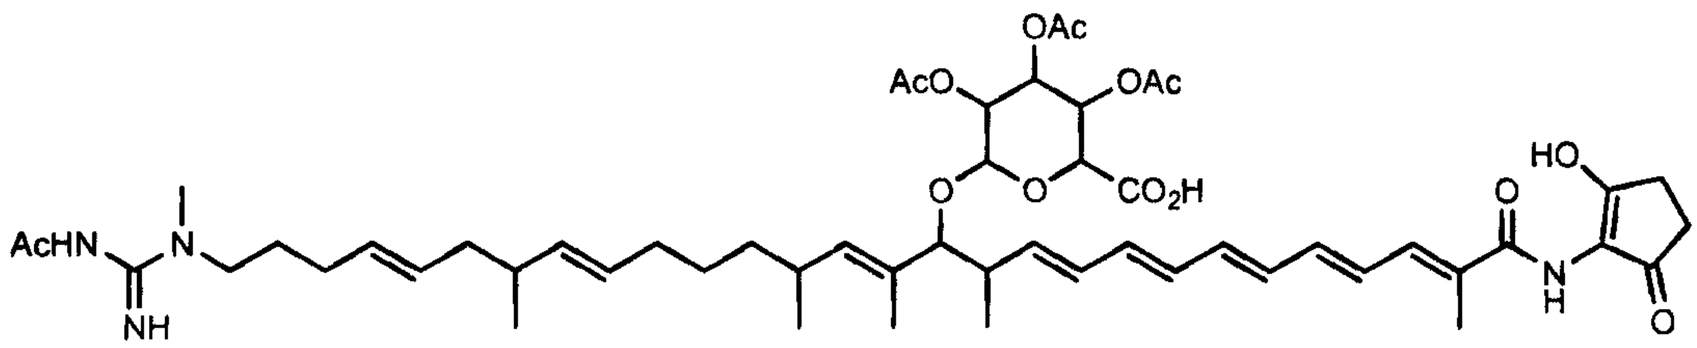
Compound 22;



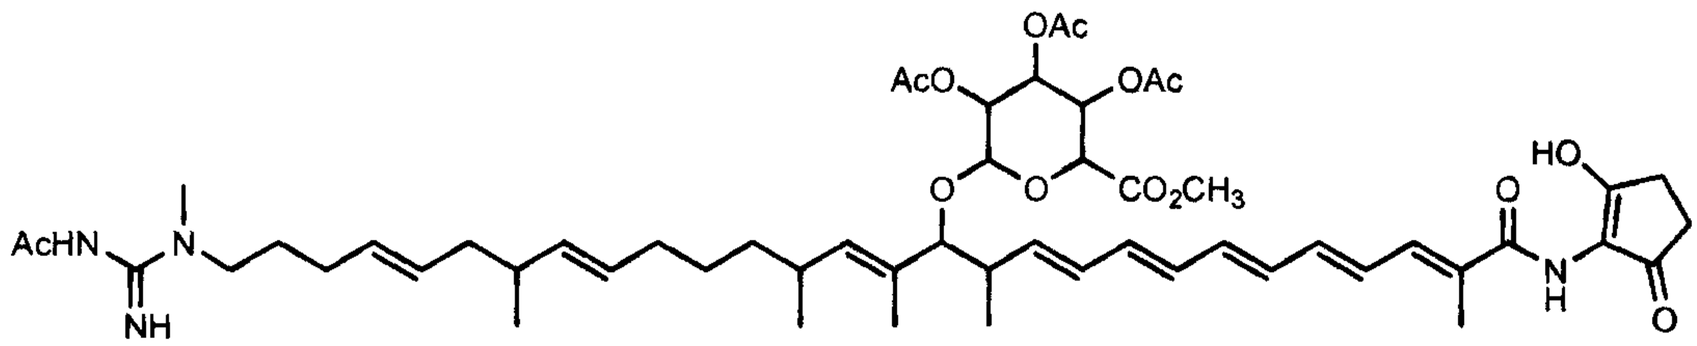
Compound 23;



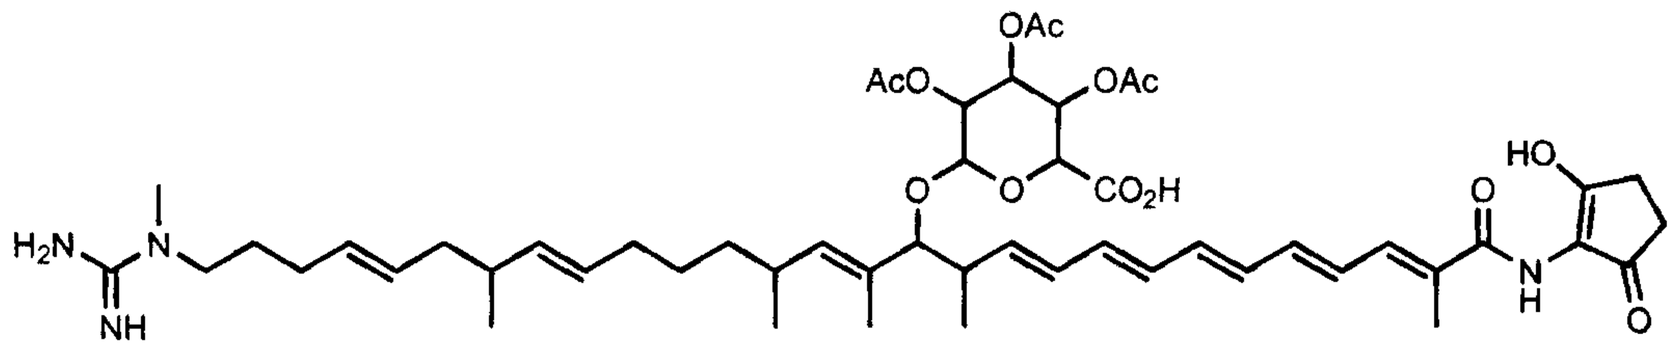
Compound 24;



Compound 25;

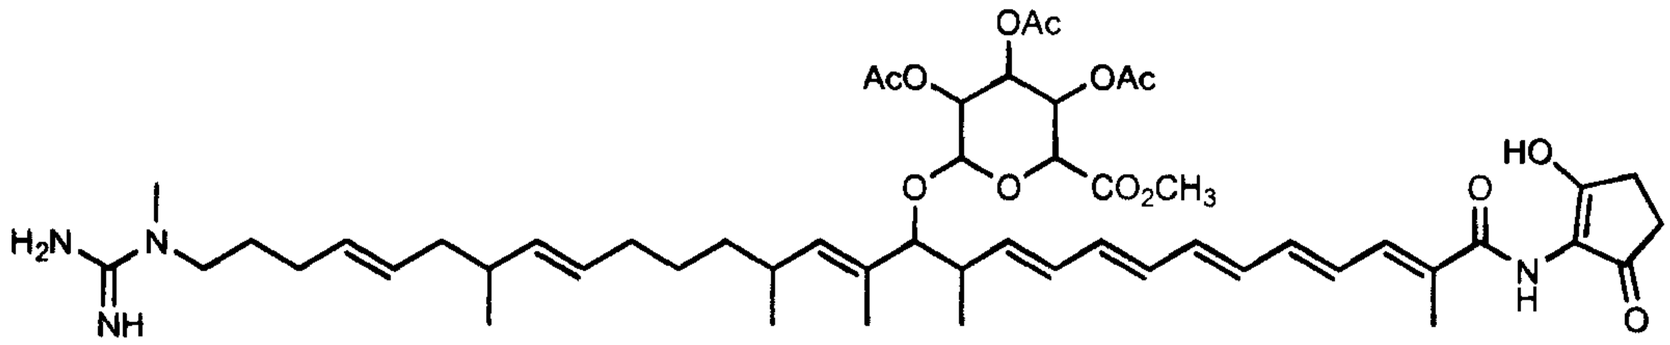


Compound 26;



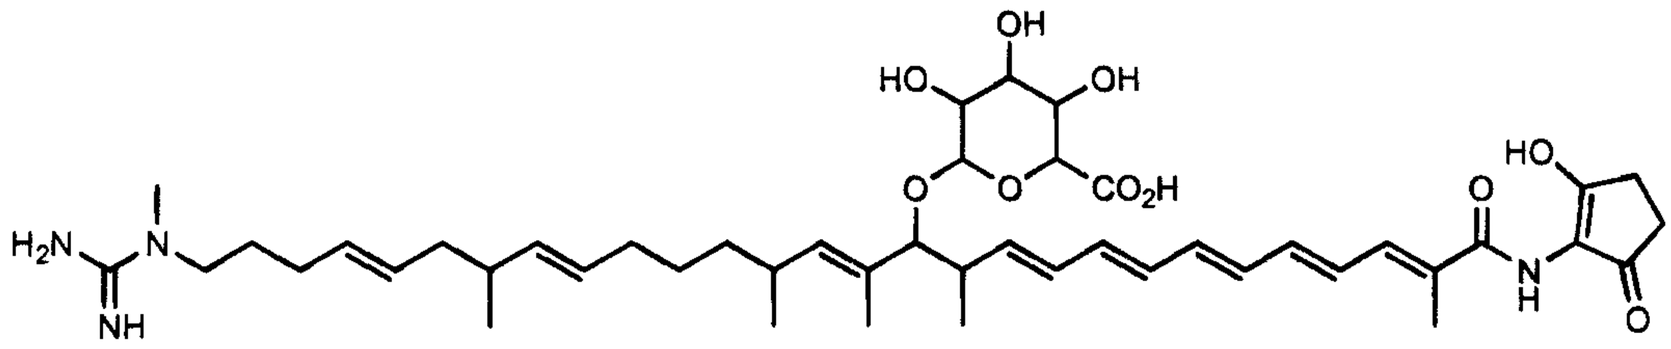
Compound 27; and

10

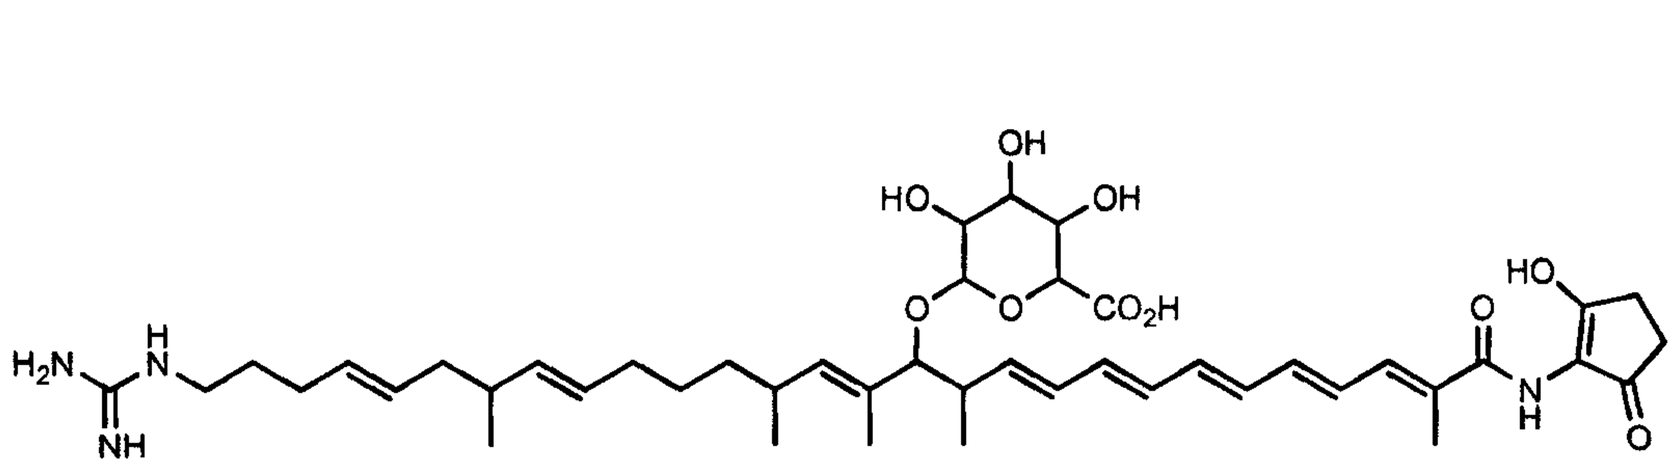


Compound 28.

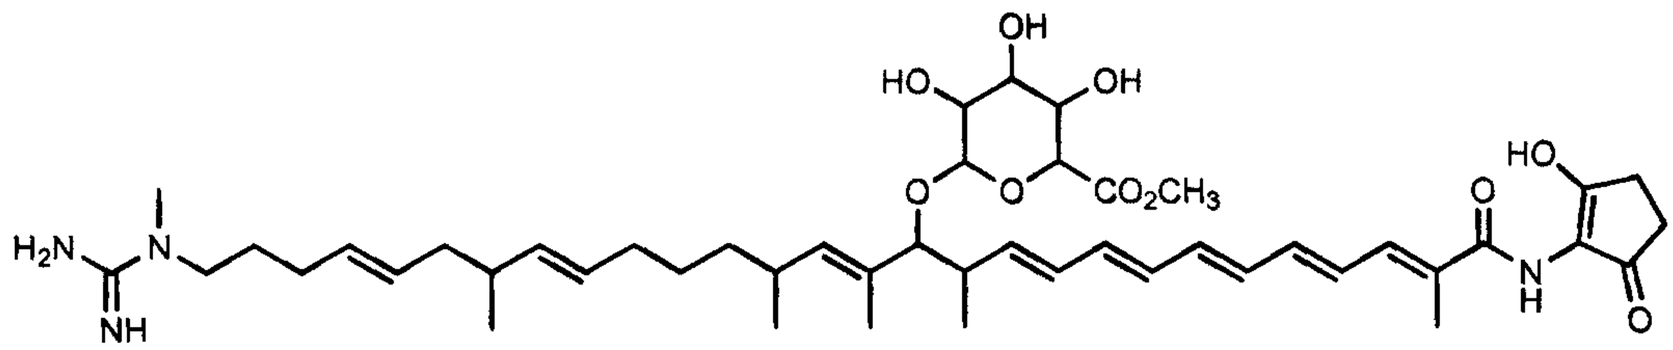
11. A compound of claim 2, or a pharmaceutically acceptable salt or prodrug thereof, selected from the group consisting of:



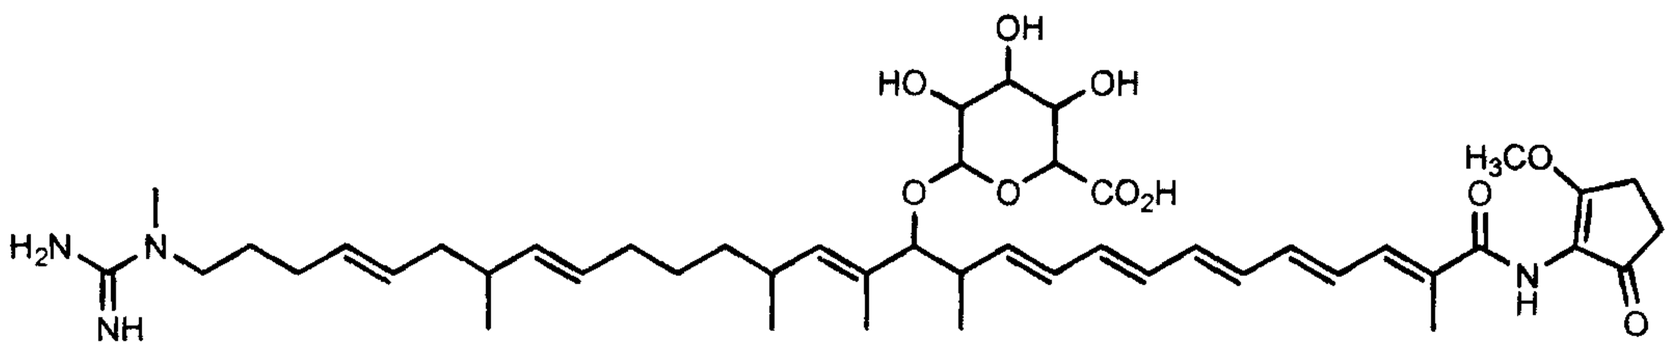
Compound 1;



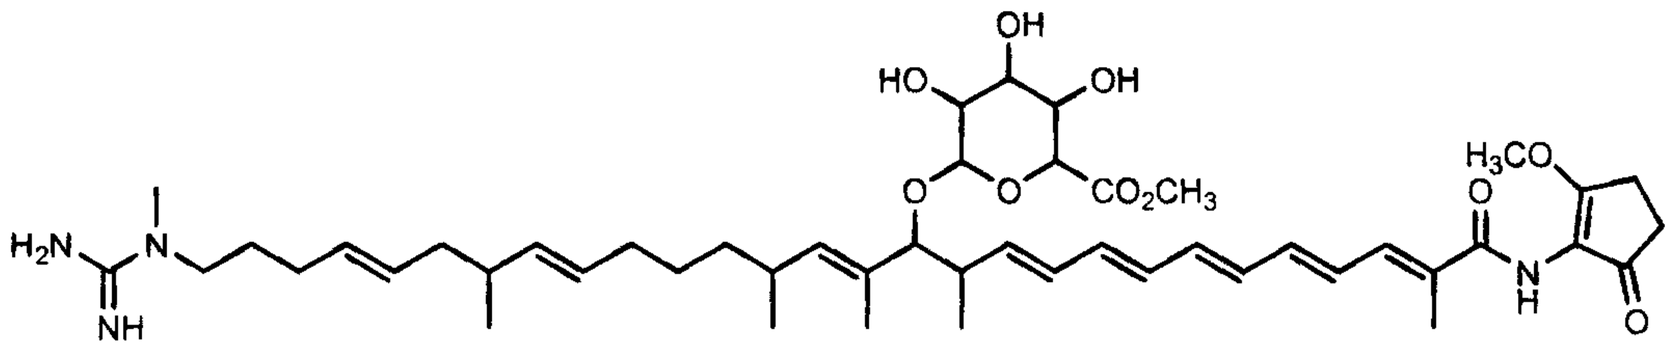
Compound 2;



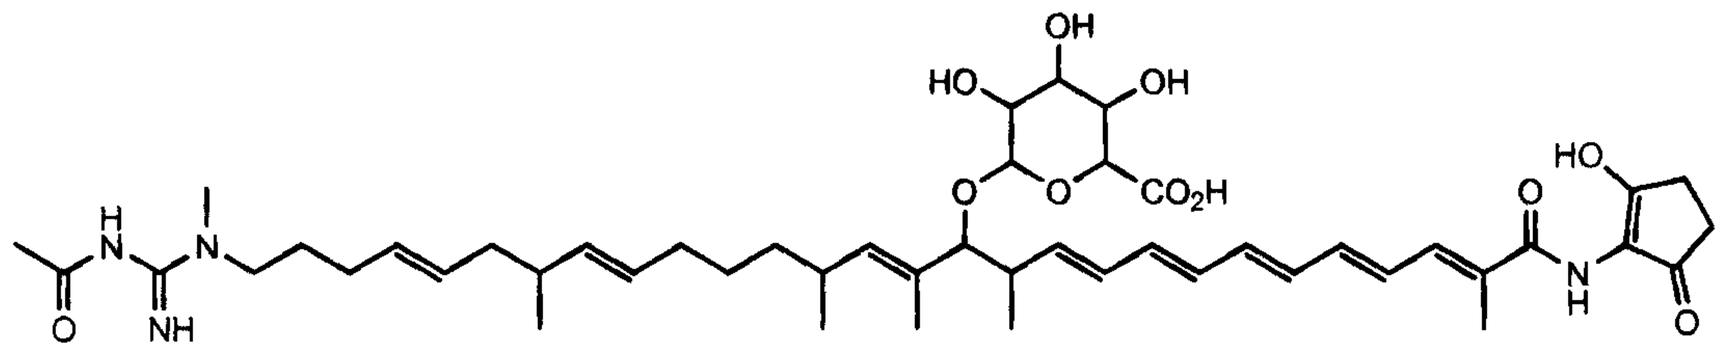
Compound 3;



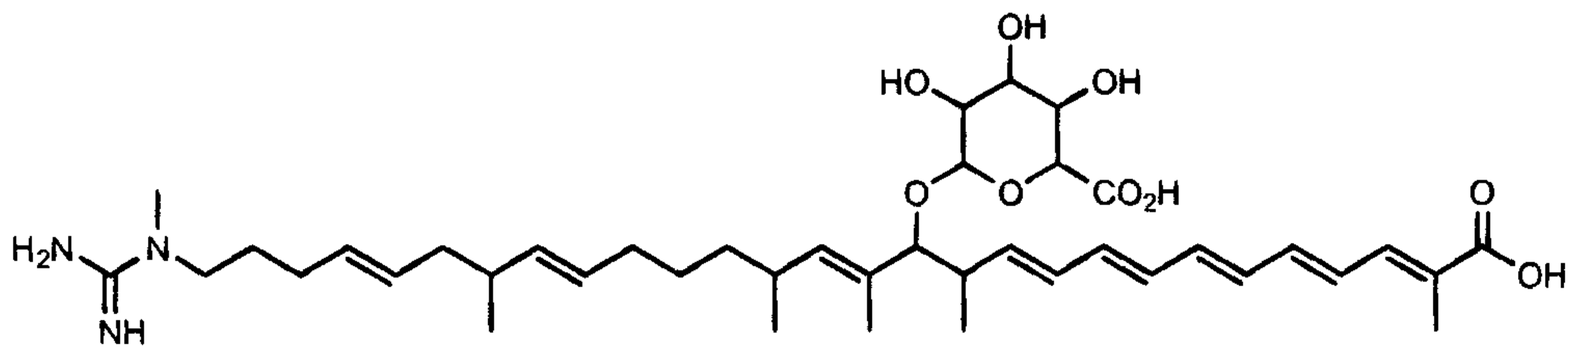
Compound 4;



Compound 5;



Compound 6; and



Compound 7.

12. A pharmaceutical composition comprising a compound of claim 1 or a pharmaceutically acceptable salt thereof, together with a pharmaceutically acceptable carrier.

13. A pharmaceutical composition comprising a compound of claim 2 or a pharmaceutically acceptable salt thereof, together with a pharmaceutically acceptable carrier.

14. A pharmaceutical composition comprising a compound of claim 10 or a pharmaceutically acceptable salt thereof, together with a pharmaceutically acceptable carrier.

15. A pharmaceutical composition comprising a compound of claim 11 or a pharmaceutically acceptable salt thereof, together with a pharmaceutically acceptable carrier.

16. A polyene polyketide obtained by a method comprising

a) cultivating a *Amycolatopsis orientalis* strain, wherein said cultivation is performed under aerobic conditions in a nutrient medium comprising at least one source of carbon atoms and at least one source of nitrogen atoms; and
b) isolating a polyene polyketide from the bacteria cultivated in step (a).

17. A polyene polyketide obtained by a method comprising

a) cultivating a *Amycolatopsis orientalis* strain, wherein said cultivation is performed under aerobic conditions in a nutrient medium comprising at least one source of carbon atoms and at least one source of nitrogen atoms; and
b) isolating a polyene polyketide from the bacteria cultivated in step (a); and
c) chemically modifying the polyene polyketide isolated in step (b).

18. The polyene polyketide of claim 16 that generates NMR spectra essentially as shown in Figure 4.

19. The polyene polyketide of claim 16 that generates NMR spectra essentially as shown in Figure 5.

20. The polyene polyketide of claim 16 that generates NMR spectra essentially as shown in Figure 10.

21. The polyene polyketide of claim 17 that generates NMR spectra essentially as shown in Figure 6.

22. The polyene polyketide of claim 17 that generates NMR spectra essentially as shown in Figure 7.

23. The polyene polyketide of claim 17 that generates NMR spectra essentially as shown in Figure 8.

24. The polyene polyketide of claim 17 that generates NMR spectra essentially as shown in Figure 9.

25. A process for making a compound of claim 1, comprising the steps of: a) cultivating a *Amycolatopsis orientalis* strain, in a nutrient medium comprising at least one source of carbon atoms and at least one source of nitrogen atoms; and b) isolating said compound.

26. The process of claim 25 further comprising chemically modifying the compound obtained at the end of step b).

27. The process of claim 25, wherein the *Amycolatopsis orientalis* strain is *Amycolatopsis orientalis* ATCC 43491 or a mutant or variant thereof.

28. The process of claim 25, wherein the *Amycolatopsis orientalis* strain is *Amycolatopsis orientalis* having accession number IDAC 220604-01, or a mutant or variant thereof.

29. The process of claim 25, wherein the cultivating step occurs under aerobic conditions.

30. The process of claim 25, wherein said carbon atom and said nitrogen atom sources are chosen from the components shown in Table 1.

31. The process of claim 25, wherein said cultivation is carried out at a temperature ranging from 18°C to 40°C.

32. The process of claim 25, wherein said cultivation is carried out at a pH ranging from 6 to 9.

33. *Amycolatopsis orientalis sp.* having IDAC Accession No. 220604-01.

34. Use of a compound of any one of claims 1-11 and 16-25 as an antibacterial agent.

35. Use of a compound of any one of claims 1-11 and 16-25 to inhibit bacterial growth.

36. Use of a compound of any one of claims 2-11 in the treatment of bacterial infection.

37. Use of a compound of any one of claims 2-11 in the treatment of bacterial infection in a subject.

38. Use of a compound of claim 11 in the treatment of bacterial infection in a mammal.

39. Use of a compound of any one of claims 1-11 and 16-25 in the preparation of a medicament to treat bacterial infection.

40. Use of a compound of claim 11 in the preparation of a medicament for the treatment of bacterial infection.

41. Use according to any one of claims 35-40 wherein the bacterial growth or bacterial infection involves a bacterial strain selected from the group consisting of *Streptococcus pneumoniae, Streptococcus pyogenes, Enterococcus faecalis, Enterococcus faecium, Klebsiella pneumoniae, Enterobacter spp., Proteus spp.,*

Pseudomonas aeruginosa, E. coli, Serratia marcesens, Staphylococcus aureus, Coagulase negative *Staphylococcus, Haemophilus infuenzae, Bacillus anthracis, Mycoplasma pneumoniae*, and *Staphylococcus epidermidis*.

42. Use according to any one of claims 35-40 wherein the bacterial growth or bacterial infection involves a strain selected from the group consisting of *Staphylococcus aureus, Stahylococcus epidermidis, Bacillus subtilis, Bacillus megaterium, Enterococcus faecalis and Micrococcus luteus.*

43. Use of any one of claims 41 or 42 wherein the bacterial strain is *Staphylococcus aureus*.

44. Use of a pharmaceutical composition according to any one of claims 12-15 in the treatment of bacterial infection.

45. Use of a pharmaceutical comosition according to any one of claims 12-15 in the preparation of a medicament for the treatment of bacterial infection.

46. Use according to claim 44 or 45 wherein the bacterial infection involves a strain selected from the group consisting *Streptococcus pneumoniae, Streptococcus pyogenes, Enterococcus faecalis*, *Enterococcus faecium, Klebsiella pneumoniae, Enterobacter spp., Proteus spp., Pseudomonas aeruginosa, E. coli, Serratia marcesens, Staphylococcus aureus,* Coagulase negative *Staphylococcus, Haemophilus infuenzae, Bacillus anthracis, Mycoplasma pneumoniae*, and *Staphylococcus epidermidis*.

47. Use according to claim 44 or 45 wherein the bacterial infection involves a strain selected from *Staphylococcus aureus, Stahylococcus epidermidis, Bacillus subtilis, Bacillus megaterium, Enterococcus faecalis and Micrococcus luteus.*
