(54) Title: THERMAL AND ACOUSTIC INSULATING AND SEALING SYSTEM FOR A SAFING SLOT IN A CURTAIN WALL

Fig. 1

(57) Abstract: Described is a construction and parts of the construction for effectively thermally and acoustically insulating and sealing of a safing slot between a floor of a building and an exterior wall construction wherein the exterior wall construction comprises a curtain wall configuration utilizing an interior panel module design. In particular, the thermal insulating and sealing system comprises a first element comprising a cavity having an interior wall surface and an opening, positioned substantially in the height of the floor, wherein the cavity is located in the spandrel area of the interior wall surface, and a second element comprised of a thermally resistant and/or air tight material for insulating, positioned at least partially in the cavity of the first element, wherein the second element includes an inner end surface positionable in abutment with respect to the outer edge of the floor for sealing there adjacent, outer end surface positionable in abutment with respect the interior wall surface of the cavity, a lower facing surface extending between the inner end surface and the

5 Thermal and acoustic insulating and sealing system for a safing slot in a curtain wall

10 **FIELD OF THE INVENTION**

The present invention relates to the field of constructions and systems designed to thermally and acoustically insulate and seal a safing slot area defined between a curtain wall and the individual floors of a building. In particular, the present invention relates to a thermal as well as acoustic insulating and sealing system for use with curtain wall structures which include an interior panel such as a back pan or other similar construction which can be of metal or other material extending across the interior surface of a curtain wall which is common in modular designs. The interior panels of a curtain wall are generally made from a metal or insulation material which can easily bend, distort or be otherwise deformed when exposed to strong winds or elevated temperatures, such as intensive sunlight or heat, such as in the event of a fire. Bending, distorting or deforming of these interior panels can result in significant problems in attempting to maintain a complete thermal insulation and seal within the safing slots between the outer edges of the floor construction and the exterior curtain wall construction during a storm or fire. In particular, maintaining of a complete thermal insulation and seal at all time during a fire is important to prevent heat, smoke and flames from spreading from one floor to an adjacent floor.

BACKGROUND OF THE INVENTION

30

Curtain walls are general used and applied in modern building constructions and are the outer covering of said constructions in which the outer walls are non-structural, but merely keep the weather out and the occupants in. Curtain walls are usually made of a

- lightweight material, reducing construction costs. The wall transfers horizontal wind loads that are incident upon it to the main building structure through connections at floors or columns of the building. Curtain walls are designed to resist air and water infiltration, sway induced by wind and seismic forces acting on the building, and its own
- 5 dead load weight forces. Curtain walls differ from store-front systems in that they are designed to span multiple floors, and take into consideration design requirements such as thermal expansion and contraction, building sway and movement, water diversion, and thermal efficiency for cost-effective heating, cooling, and lighting in the building.
- 10 A curtain wall structure is defined by an interior wall surface, which includes an interior panel, such as a back pan, extending over the interior surface thereof and at least one floor spatially disposed from the inner wall surface. The gap between the floor and the back pan of a curtain wall defines a safing slot, also referred to as perimeter slab edge, extending between the interior wall surface of the interior panel and the outer edge of
- 15 the floor. This safing slot is essential to slow the passage of fire and combustion gases between floors. Moreover, the safing slot is needed to compensate dimensional tolerances of the concreted floor and to allow movement between the floor and the façade element caused by load, temperature or wind load.
- 20 Therefore, it is of great importance to improve firestopping at the safing slot in order to keep heat, smoke and flames from spreading from one floor to an adjacent floor. It is important to note that the firestop at the perimeter slab edge is considered a continuation of the fire-resistance rating of the floor slab. The curtain wall itself, however, is not ordinarily required to have a rating.
- 25 Various designs have been known for curtain wall constructions and for means for thermally insulating and sealing the safing slot. A typical curtain wall configuration comprises a profiled framework of vertical studs, so called mullions, and horizontal studs, so called transoms. The space between these profiles is either filled with glass
- 30 panels within the window area or spandrel panels within the front of the floors. A common spandrel design comprises a pre-manufactured metal pan filled with insulating material. The remaining gap between spandrel and floor has to be sealed against fire, smoke and sound and withstand certain movement.

US 7,856,775 B2 describes an insulating system including a supplemental insulation belt positioned beneath the safing insulation and attached to the interior panel of a curtain wall construction to maintain sealing of the safing slot during exposure to fire and heat which can cause the interior panel to deform from heat warping to an extent
5 beyond the capability of standard safing insulation for expanding in order to maintain a proper seal extending across the safing slot. Other insulating systems are described in US 2007/0204540 A1 and US 2013/061544 A1.

Current solutions also provide sealing using pre-compressed mineral wool covered by
10 an elastic coating. All these solutions have several drawbacks, such as that the installation of a highly pre-compressed mineral wool is labor intensive and not failure proof. The interface between metal pan and gap insulation is the weak point of the insulating system which is not sufficiently addressed by the current solutions. Further, additional and expensive equipment is needed to install the essential fire-stop spray
15 coating. Often the installation process is weather dependent, the mineral wool can absorb water and the coating needs a certain drying time.

Therefore, there is a need for systems that overcome the disadvantages of the prior art systems, in particular, there is a need for systems that can be easily installed within a
20 safing slot, where, for example, access is only needed from one side, implementing a one-sided application. Further, there is a need for systems that are not limited to the width of a joint of a curtain wall structure thereby compensating at the same time dimensional tolerances of the concreted floor and allowing movement between the floor and the façade element caused by load, temperature or wind load. Additionally,
25 maintaining safing insulation between the floors of a residential or commercial building and the exterior curtain wall responsive to various conditions including fire exposure should be guaranteed. Moreover, there is a need for systems that improve fire-resistance as well as sound-resistance and can be easily integrated during installation of the curtain wall structure.

30

In view of the above, it is an object of the present invention to provide a spandrel panel for use in a curtain wall construction, which can be installed on site and hence is part of a modular or prefabricated curtain wall design.

Further, an object of the present invention to provide a thermal insulating and sealing system for thermally insulation and sealing of a safin slot in a building containing a curtain wall structure. In particular, it is an object of the present invention to provide a thermal insulating and sealing system which can be easily installed from one side, which maintains the safin insulation between the floors of a residential or commercial building and the exterior curtain wall responsive to various conditions, including fire exposure, and to maximize safin insulation at a minimal cost. Moreover, it is an object to provide a thermal insulating and sealing system which has no limitation of vertical as well as horizontal movement capacities, limitation to spandrel height as well as the ability to compensate dimensional tolerances of the concreted floor and to allow movement between the floor and the façade element caused by load, temperature or wind load.

Further, it is an object of the present invention to provide a box-insert for use within the spandrel area of a curtain wall construction which can be installed on site and hence is part of a modular or prefabricated curtain wall design.

Still further, it is an object of the present invention to provide a building construction comprising such a spandrel panel or box-insert or such a thermal insulating and sealing system, respectively, for effectively thermally insulating and sealing of the safin slot between a curtain wall structure and the edge of a floor.

Still further, it is an object to provide at the same time an acoustic insulating and sealing system for effectively acoustically insulating and sealing of the safin slot between a curtain wall structure and the edge of a floor.

These and other objectives as they will become apparent from the ensuring description of the invention are solved by the present invention as described in the independent claims. The dependent claims pertain to preferred embodiments.

30

SUMMARY OF THE INVENTION

In one aspect, the present invention provides a spandrel panel for use in a curtain wall construction defined by an interior wall surface including one or more framing members and at least one floor spatially disposed from the interior wall surface of the curtain wall

35

construction, wherein the spandrel panel comprises an exterior wall surface and an interior wall surface, characterized in that the spandrel panel comprises a cavity.

In another aspect, the present invention provides a thermally insulating and sealing
5 system for effectively thermally insulating and sealing of a safin slot within a building construction having a curtain wall construction defined by an interior wall surface, including one or more framing members and a spandrel area, and at least one floor spatially disposed from the interior wall surface of the curtain wall construction defining the safin slot extending between the interior wall surface of the curtain wall
10 construction and an outer edge of the floor, comprising a first element comprising a cavity having an interior wall surface and an opening, positioned substantially in the height of the floor, wherein the cavity is located in the spandrel area of the interior wall surface, and a second element comprised of a thermally resistant and/or air tight material for insulating, positioned at least partially in the cavity of the first element,
15 wherein the second element includes an inner end surface positionable in abutment with respect to the outer edge of the floor for sealing thereadjacent, outer end surface positionable in abutment with respect the interior wall surface of the cavity, a lower facing surface extending between the inner end surface and the outer end surface and facing downwardly therebetween, and an upper facing surface extending between the
20 inner end surface and the outer end surface and facing upwardly therebetween.

In yet another aspect, the present invention provides a box-insert for use within the spandrel area of a curtain wall construction defined by an interior wall surface including one or more framing members and at least one floor spatially disposed from the interior
25 wall surface of the curtain wall construction, wherein the box-insert is preferably a compartment having a base and at least two sides, preferably perpendicular or trapezoidal, to the base with an opening parallel to the base.

In yet another aspect, the present invention provides a building construction comprising
30 said thermal insulating and sealing system.

In yet another aspect, the present invention provides a thermal insulating and sealing system which is suitable for acoustically insulating and sealing of a safin slot of a curtain wall structure.

BRIEF DESCRIPTION OF THE FIGURES

The subject matter of the present invention is further described in more detail by reference to the following figures:

Figure 6 shows a perspective view of an embodiment of a box-insert for installation to a steel back pan.

Figure 7 shows a perspective view of an embodiment of spandrel panel comprising a
30 cavity filled with a thermally resistant and/or air tight material for insulating.

DETAILED DESCRIPTION OF THE INVENTION

The following terms and definitions will be used in the context of the present invention:

35

As used in the context of present invention, the singular forms of “a” and “an” also include the respective plurals unless the context clearly dictates otherwise. Thus, the term “a” or “an” is intended to mean “one or more” or “at least one”, unless indicated otherwise.

5

The term “curtain wall structure” in context with the present invention refers to a wall structure which is defined by an interior wall surface, including an interior panel, such as a back pan, extending over the interior surface thereof and at least one floor spatially disposed from the inner wall surface.

10

The term “safing slot” in context with the present invention refers to the gap between a floor and a back pan of a curtain wall; it is also referred to as “perimeter slab edge”, extending between the interior wall surface of the interior panel, i. e. back pan, and the outer edge of the floor.

15

The term “interior panel” in context with the present invention refers, in particular, to a back pan, preferably a steel back pan – also referred to as spandrel panel.

20

The present invention pertains to a thermal insulating and sealing system and parts thereof for effectively thermally insulating and sealing of a safing slot within a building construction having a curtain wall construction defined by an interior wall surface, including one or more framing members and a spandrel area, and at least one floor spatially disposed from the interior wall surface of the curtain wall construction defining the safing slot extending between the interior wall surface of the curtain wall construction and an outer edge of the floor. The curtain wall back pan safing insulation system and parts thereof of the present invention is considered for the purpose of facilitating firestopping and soundstopping of as well as movement within a safing slot present in those buildings utilizing curtain wall structures for the exterior cladding thereof which includes interior panels, such as back pans, which are often made of materials that can deform responsive to exposure to heat.

30

A curtain wall structure is a type of exterior wall system commonly utilized on buildings wherein the curtain wall itself is a non-bearing wall. Such curtain walls generally are of a relatively lightweight material and commonly include metal skins. This type of

construction is normally used in high-rise buildings for providing a relatively lightweight and inexpensive overall construction.

Spandrel panels are included in the curtain wall structure to provide the exterior facing thereof and such panels are commonly made of glass, aluminum, thin sheets of foam material and the like. One particular type of unitized wall structure which is often used in modular constructions includes an interior panel comprising a metallic sheet extending across the internal membrane and this metal sheet is referred to as the back pan. Such curtain wall systems commonly include vertical framing members comprising boxed aluminum channels referred to as mullions and similarly configured horizontally extending pieces as referred to as transoms. Such a transom located or transom configuration at floor level is also known as zero spandrel, i.e., bottom of the transom at the level as top of the concrete floor. The interior panels of curtain wall structures can be made of many materials and many of these materials are susceptible to distorting responsive to high heat conditions. Some of these panels are made from metallic materials but other non-metallic materials can also be used for these interior panels which are also capable of distorting such as insulation and aluminum clad insulation and many other materials. The thermal and acoustic insulating and sealing system and parts thereof according to the present invention are applicable for all types of curtain wall structures. Parts include a spandrel panel and a box-insert, respectively.

The spandrel panel according to the present invention is for use in a curtain wall construction defined by an interior wall surface including one or more framing members and at least one floor spatially disposed from the interior wall surface of the curtain wall construction. The spandrel panel comprises an exterior wall surface and an interior wall surface, and is characterized in that it comprises a cavity. The cavity of the spandrel panel of the present invention comprises at least one wall and an opening. Preferably, the cavity is a compartment having a base and at least two sides, preferably perpendicular or trapezoidal, most preferably perpendicular, to the base with an opening parallel to the base. In particular, the cavity of the spandrel area is in form of a U-shaped, rectangular channel. In a preferred embodiment of the present invention, the cavity of the spandrel area is made from a rigid material, preferably a metal material, concrete material or compressed mineral wool, most preferably a metal material, such as steel. Ideally, the rigid material of the cavity reinforces the steel back pan construction and reduces deformation of the metal back pan caused by heat.

According to the present invention, the cavity is positioned within the spandrel panel so that its opening is parallel and pointing away from the exterior wall surface of the spandrel panel. The cavity is designed to receive a thermally resistant and/or air tight material for insulating. In a particular preferred embodiment of the spandrel panel, the cavity is filled with a thermally resistant and/or air tight material for insulating. Such thermally resistant and/or air tight materials include but are not limited to mineral wool materials, rubber-like materials or foams, such for example an elastomeric interlaced foam based on synthetic rubber (Armaflex), a polyethylene foam, a polyurethane foam, a polypropylene foam or a polyvinyl chloride foam. In particular, the thermally resistant and/or air tight material may be an open-cell or closed-cell foam-based material, for example a polyurethane-based or silicone-based material. In a particular preferred embodiment of the present invention, the thermally resistant and/or air tight material for insulating is a mineral wool material, a polyurethane foam or an elastomeric interlaced foam based on synthetic rubber.

The spandrel panel and the cavity can be made from one material, for example by molding or welding, or from different materials. If the spandrel panel and the cavity are of different materials, the cavity is attached by attachment means to the spandrel panel. Preferred attachment means include at least one adhesive means, pin means, tongue and groove means, screw means or barbed hook means. The at least one pin or screw means preferably extends through one or more fixing points of the cavity and is attached to the interior wall surface of the spandrel panel. However, other attachment devices may be used to attach the cavity according to the present invention. The cavity can also be composed of non-combustible insulation material. To keep it in place a reverse installed metal pan can be used. It is also possible to fix the insulation material directly with hooks or anchors to the adjacent framing material or by welding.

The spandrel panel can be installed on site and hence is part of a modular or prefabricated curtain wall design and forms part of the thermal insulating and sealing system. The spandrel panel of the present invention is also suitable for acoustically insulating and sealing of a safin slot of a curtain wall structure.

The thermally insulating and sealing system of the present invention, for effectively thermally insulating and sealing of a safin slot within a building construction having a curtain wall construction defined by an interior wall surface, including one or more framing members and a spandrel area, and at least one floor spatially disposed from the interior wall surface of the curtain wall construction defining the safin slot extending between the interior wall surface of the curtain wall construction and an outer edge of the floor, comprises:

- i) a first element comprising a cavity having an interior wall surface and an opening, positioned substantially in the height of the floor, wherein the cavity is located in the spandrel area of the interior wall surface, and
- ii) a second element comprised of a thermally resistant and/or air tight material for insulating, positioned at least partially in the cavity of the first element, wherein the second element includes:
 - a) an inner end surface positionable in abutment with respect to the outer edge of the floor for sealing thereadjacent,
 - b) an outer end surface positionable in abutment with respect the interior wall surface of the cavity,
 - c) a lower facing surface extending between the inner end surface and the outer end surface and facing downwardly therebetween, and
 - d) an upper facing surface extending between the inner end surface and the outer end surface and facing upwardly therebetween.

In particular, the cavity of the first element of the thermally insulating and sealing system according to the present invention is preferably a compartment having a base and at least two sides, preferably perpendicular or trapezoidal, to the base with an opening parallel to the base. Preferably, the cavity of the spandrel area is in form of a U-shaped, rectangular channel. The cavity is positioned within the spandrel area of the interior wall surface so that its opening is parallel and pointing away from the exterior wall surface of the spandrel area. The cavity of the first element of the thermally insulating and sealing system according to the present invention is made from a rigid material, preferably a metal material, concrete material or compressed mineral wool, most preferably a metal material, such as steel. Ideally, a rigid material of the cavity reinforces the steel back pan construction and reduces deformation of the metal back pan caused by heat.

The second element of the thermally insulating and sealing system according to the present invention is comprised of a thermally resistant and/or air tight material. Preferably, the second element of the thermally insulating and sealing system for insulating is positioned at least partially in the cavity of the first element, and includes an inner end surface positionable in abutment with respect to the outer edge of the floor for sealing thereadjacent, an outer end surface positionable in abutment with respect the interior wall surface of the cavity, a lower facing surface extending between the inner end surface and the outer end surface and facing downwardly therebetween, and an upper facing surface extending between the inner end surface and the outer end surface and facing upwardly therebetween. The thermally resistant and/or air tight material of the second element comprises a thermally resistant and/or air tight flexible mineral wool material, rubber-like material or a foam, such for example an elastomeric interlaced foam based on synthetic rubber (Armaflex), a polyethylene foam, a polyurethane foam, a polypropylene foam or a polyvinyl chloride foam, to facilitate placement thereof into the safing slot. In particular, the thermally resistant and/or air tight material may be an open-cell or closed-cell foam-based material, for example a polyurethane-based or silicone-based material. In a particular preferred embodiment of the present invention, the thermally resistant and/or air tight material is a thermally resistant flexible mineral wool material, a polyurethane foam or an elastomeric interlaced foam based on synthetic rubber. It is preferred that the thermally resistant flexible mineral wool material is installed with fibers running parallel to the outer edge of the floor and the base of the first element.

By positioning the second element in a cavity located within the spandrel area the construction strength is enhanced during a fire due to the additional stabilization of the panel and by avoiding a persistent joint. By using a cavity in a spandrel panel, the second element can be designed as a drawer with a sealing area on top and/or bottom allowing using a more rigid material for the second element.

There is no specific means of attachment between the surfaces of the second element and the at least one wall of the cavity. These surfaces can laterally slide along one another while maintaining abutting contact therebetween. This sliding relative movement would occur responsive to deforming of the interior panel; however additional sealing can enhance maintaining sealing of the safing slot. It should be

appreciated that the dimension of the first element can be varied significantly to accommodate various configurations of different interior panels and safing slots in order to accommodate and effectively thermally insulate and seal any such safing slot.

5 According to the present invention, the thermal insulating and sealing system further comprises a connecting third element comprised of a thermally resistant and/or air tight material for insulating, positioned in front of the vertical framing member and in abutment with respect to the second element. The thermally resistant and/or air tight material comprises a thermally resistant and/or air tight flexible mineral wool material,
10 rubber-like material or a foam, such for example an elastomeric interlaced foam based on synthetic rubber (Armaflex), a polyethylene foam, a polyurethane foam, a polypropylene foam or a polyvinyl chloride foam, to facilitate placement thereof into the safing slot. In a preferred embodiment of the present invention, the connecting third element and the second element are made from the same material. Preferably, the
15 connecting third element is of a T-shaped form. In order to secure fitting of the T-shaped connecting third element, the second element may comprise additional recesses for receiving parts of the connecting third element, like a key-lock principle. In general, it is preferred that the connecting third element has a step design to allow the tight placement of a middle section in the mullion areas. In the mullion area - due
20 higher stability of the frame construction - only less movement is to be expected and hence a straight joint or connecting third element can be sufficient to maintain complete seal of the safing slot.

Preferably, the connecting third element is installed in a last step, after the first and
25 second element have been positioned and secured within the safing slot of a curtain wall structure.

In order to further maintain a complete seal extending within the safing slot, in particular with regard to a seal against smoke and/or when using mineral wool as an
30 insulation material, the thermal insulating and sealing system may further comprise an outer fire retardant coating positioned across the second element and the adjacent portions of the interior wall surface of the interior panel and the floor located thereadjacent. The sealing characteristics of the construction shown in the present invention can be significantly enhanced by the application of such fire retardant
35 coating.

Generally, such outer fire retardant coatings are applied by spraying or other similar means of application. Such outer fire retardant coatings are for example firestop joint sprays, preferably based on water, and self-leveling silicon sealants. Preferably, the
5 outer fire retardant coating has a wet film thickness of at least 1/8 in. Additionally, it is preferable that the outer fire retardant coating overs the top of the second element overlapping the outer edge of the floor and the interior face of interior wall surface of the interior panel by a min of 1/2 in.

10 One aspect of the present invention provides for a box-insert for use within the spandrel area of a curtain wall construction defined by an interior wall surface including one or more framing members and at least one floor spatially disposed from the interior wall surface of the curtain wall construction, wherein the box-insert is a compartment
15 having a base and at least two sides, preferably perpendicular or trapezoidal, to the base with an opening parallel to the base. Preferably, the box-insert is in form of a U-shaped, rectangular channel. In an alternative embodiment the box-insert is a compartment constructed from four sides perpendicular or trapezoidal to the base with an opening parallel to the base. The box-insert of the present invention can be installed on site and hence is part of a modular or prefabricated curtain wall design and forms
20 part of the thermal insulating and sealing system. A box-insert having a base and at least two sides, preferably perpendicular or trapezoidal, to the base with an opening parallel to the base, has the advantage that the insulation material can be oversized at the sides thereby improving the sealing between adjacent elements and allows for a simple manufacturing of the box-insert filled with an insulation material ready for
25 installation on site.

The box-insert according to the present invention, for use in a curtain wall construction, may comprise additional ledges for fixing the box-insert to the interior panel, preferably
a metal steel back pan.

30

Additionally, the box-insert may comprise a pre-compressed flexible sealing element, such as a thermally resistant and/or air tight material, such as a thermally resistant and/or air tight flexible mineral wool material, rubber-like material or a foam, such for
example an elastomeric interlaced foam based on synthetic rubber (Armaflex), a
35 polyethylene foam, a polyurethane foam, a polypropylene foam or a polyvinyl chloride

foam, to facilitate placement thereof into the safig slot. In particular, the thermally resistant and/or air tight material may be an open-cell or closed-cell foam-based material, for example a polyurethane-based or silicone-based material. In a particular preferred embodiment of the present invention, the thermally resistant and/or air tight material is thermally resistant flexible mineral wool material, a polyurethane foam or an elastomeric interlaced foam based on synthetic rubber.

In order to hold the pre-compressed flexible sealing element in place, the box-insert comprises a cover foil or cover lid. This cover foil or lid may be made from a plastic material, such as for example polyethylene-material. It can also be a net or a grid made from materials known to a person skilled in the art. Preferably, the box-insert comprises a polyethylene foil. This foil of the box-insert preferably has a perforation. The foil is used to cover the flexible sealing element and protects it from water and other environmental influence which may have an impact on the material. Due to the pre-compression, the sealing element will expand upon tearing or cutting off the perforation and extends the cavity to close the safig slot between the interior wall surface and the adjacent floor. The sealing element can compensate different joint widths caused by tolerances and movement. The sealing element can either be pre-installed in the façade element or installed on job site.

20

The thermal insulating and sealing system according to the present invention is preferably for use with a building construction having a curtain wall construction defined by an interior wall surface including one or more framing members and at least one floor spatially disposed from the interior wall surface of the curtain wall construction defining the safig slot extending between the interior wall surface of the curtain wall construction and an outer edge of the floor.

In particular, the building construction comprises a thermally insulating and sealing system for effectively thermally insulating and sealing of the safig slot, wherein the thermal insulating and sealing system comprises:

30

- i) a first element comprising a cavity, which is a compartment having a base and at least two sides, preferably perpendicular or trapezoidal to the base with an opening parallel to the base, positioned substantially in the height of the floor, within the spandrel area of the interior wall surface so that its opening is

parallel and pointing away from the exterior wall surface of the spandrel area, and

- ii) a second element comprised of a thermally resistant and/or air tight material for insulating, positioned at least partially in the cavity of the first element, wherein the second element includes:

- 5 a) an inner end surface positionable in abutment with respect to the outer edge of the floor for sealing thereadjacent,
- b) an outer end surface positionable in abutment with respect the interior wall surface of the cavity,
- 10 c) a lower facing surface extending between the inner end surface and the outer end surface and facing downwardly therebetween, and
- d) an upper facing surface extending between the inner end surface and the outer end surface and facing upwardly therebetween, and
- iii) a connecting third element comprised of a thermally resistant and/or air tight material for insulating, positioned in front of the vertical framing member and in abutment with respect to the second element,
- 15

wherein the cavity is made from rigid material, preferably steel, and

wherein the thermally resistant and/or air tight material comprises a thermally resistant and/or air tight flexible mineral wool material, rubber-like material or a foam.

20

The thermal insulating and sealing system as well as the spandrel panel and the box-insert according to the present invention is also for acoustically insulating and sealing of a safing slot of a curtain wall structure. The material used for insulating may be of a sound resistant and/or air tight material, such as a mineral wool material, rubber-like material or a foam, such for example an elastomeric interlaced foam based on synthetic rubber (Armaflex), a polyethylene foam, a polyurethane foam, a polypropylene foam or a polyvinyl chloride foam.

25

While the invention is particularly pointed out and distinctly described herein, a preferred embodiment is set forth in the following detailed description which may be best understood when read in connection with the accompanying drawings.

30

In Figure 1 is shown a side cross-sectional view of an embodiment of the thermal insulating and sealing system between the outer edge of a floor and the interior wall surface of the interior panel having a cavity. In particular, the thermally insulating and

35

sealing system for effectively thermally insulating and sealing of a safing slot 1 within a building construction having a curtain wall construction 2 defined by an interior wall surface 3, including one or more framing members 4 and a spandrel area 5, and at least one floor 6 spatially disposed from the interior wall surface 3 of the curtain wall construction 2. The thermal insulating and sealing system comprises a first element 7, such as a spandrel panel, comprising a cavity 8 having an interior wall surface and an opening, positioned substantially in the height of the floor, wherein the cavity is located in the spandrel area 5 of the interior wall surface 3, and a second element 9 comprised of a thermally resistant and/or air tight material for insulating, such as a thermally resistant flexible mineral wool material, a polyurethane foam or an elastomeric interlaced foam based on synthetic rubber, positioned in the cavity 8 of the first element 7, wherein the second element 9 includes an inner end surface 10 positionable in abutment with respect to the outer edge 11 of the floor for sealing thereadjacent, an outer end surface 12 positionable in abutment with respect the interior wall surface 13 of the cavity 8, a lower facing surface 14 extending between the inner end surface 10 and the outer end surface 12 and facing downwardly therebetween, and an upper facing surface 15 extending between the inner end surface 10 and the outer end surface 12 and facing upwardly therebetween. The cavity 8 is a compartment having a base and at least two sides, preferably perpendicular or trapezoidal, most preferably perpendicular, to the base with an opening parallel to the base. As shown in Fig. 1, the cavity of the spandrel area is in form of a U-shaped, rectangular channel. The cavity 8 is positioned within the spandrel area 5 of the interior wall surface 3 so that its opening is parallel and pointing away from the exterior wall surface of the spandrel area 5. The cavity 8 is made from steel. Not shown in Fig. 1 is that an outer fire retardant coating may be positioned across the second element 9 and the adjacent portions of the interior framing member 4 of the curtain wall construction and the floor 5 located thereadjacent.

In Figure 2 is shown a side cross-sectional view of an embodiment of the thermal insulating and sealing system between the outer edge of a floor and the interior wall surface of the interior panel having a cavity similar to the embodiment shown in Fig. 1, just the cavity 8 has an interior wall surface and an opening and is of a round shape. The other remaining elements of the thermal insulating and sealing system are the same as described for Fig. 1.

In Figure 3 is shown a side cross-sectional view of an embodiment of the thermal insulating and sealing system between the outer edge of a floor and the interior wall surface of the interior panel having a cavity similar to the embodiment shown in Fig. 1, just the spandrel area 5 comprises a reversed metal pan filled with mineral wool, a polyurethane foam or an elastomeric interlaced foam based on synthetic rubber, thereby forming the cavity 8. The other remaining elements of the thermal insulating and sealing system are the same as described for Fig. 1.

In Figure 4 is shown a side cross-sectional view of an embodiment of the thermal insulating and sealing system between the outer edge of a floor and the interior wall surface of the interior panel having a cavity similar to the embodiment shown in Fig. 1, just the spandrel area 5 including the cavity 8 is made of the same material, such as concrete or compressed mineral wool. The other remaining elements of the thermal insulating and sealing system are the same as described for Fig. 1. The cavity can also be composed of non-combustible insulation material. To keep it in place a reverse installed metal pan can be used. It is also possible to fix the insulation material directly with hooks or anchors to the adjacent framing material or by welding.

In Figure 5 is shown a perspective view of an embodiment of the connecting third element 16 to be positioned in front of the vertical framing member 4 and in abutment with respect to the second element 9. The thermally resistant and/or air tight material of connecting third element 16 is made of a thermally resistant and/or air tight flexible mineral wool material, a polyurethane foam or an elastomeric interlaced foam based on synthetic rubber. The connecting third element 16 is of a T-shaped form, in order to secure fitting of the T-shaped connecting third element 16, the second element 9 may comprise additional recesses for receiving parts of the connecting third element 16, like a key-lock principle. The connecting third element 16 is installed in a last step, after the first 7 and second element 9 have been positioned and secured within the safing slot 1 of a curtain wall structure 2.

In Figure 6 is shown a perspective view of an embodiment of a box-insert 17 for installation to a steel back pan. The box-insert is for use within the spandrel area 5 of a curtain wall construction and is a compartment having a base and at least two sides, preferably perpendicular or trapezoidal, most preferably perpendicular, to the base with an opening parallel to the base. The box-insert as shown is in form of a U-shaped,

rectangular channel. The box-insert 17 comprises additional ledges 18 for fixing the box-insert to an interior panel, preferably a metal steel back pan.

Figure 7 shows a perspective view of an embodiment of spandrel panel comprising a
5 cavity filled with a thermally resistant and/or air tight material for insulating. The cavity is a box-insert 17 as depicted in Figure 6. The rectangular compartment of the box-insert 17 comprises additional ledges 18 for fixing the box-insert 17 to the interior panel, preferably a metal steel back pan 19. The box-insert 17 comprises a pre-compressed elastic sealing element 20, preferably a thermally resistant and/or air tight
10 flexible mineral wool material, rubber-like material or a foam, and a cover foil 21. The pre-compressed elastic sealing element 20 is held in place by a cover foil 21 or lid. This cover foil or lid is made from a plastic material, such as for example polyethylene-material. It can also be a net or a gird made from materials known to a person skilled in the art. In the embodiment shown in Figure 7, the cover foil 21 is a polyethylene foil.
15 This foil 21 of the box-insert 17 has a perforation 22, which can be torn or cut off. Due to the pre-compression, the sealing element will expand upon tearing of the perforation and extends the cavity to close the safin slot between the interior wall surface and the adjacent floor.

20 It should be appreciate that these embodiments of the present invention will work with many different types of insulating materials used for the insulation means of thermally resistant and/or air tight material, with many different types and shapes of the cavity, and with many different types and shapes of the box-insert as long as the material is suitable for maintaining the seal of the safin slot.

25

It has been shown, that the thermal insulating and sealing system for sealing between the edge of a floor and an interior panel of the present invention maintains sealing of the safin slots surrounding the floor of each level in a building despite deforming of the interior panels especially those back pans made of various materials such as metal or
30 the like which are positioned extending across the interior expanse of the curtain walls.

Furthermore, the thermal insulating and sealing system effectively creates a continuous fireproofing seal extending from the outermost edge of the floor to the curtain wall structure and, in particular, to abutment with or even within a cavity in the interior panel
35 extending across the curtain wall surface.

It has been shown that a cavity positioned within the spandrel area of a curtain wall structure enhances sealing within a safing slot by penetration of the thermally resistant and/or air tight material for insulating deep into it and in consequence the former linear
5 gap between joint insulation and metal pan surface is transformed to a labyrinth seal, which – due its increased sealing surface - has higher tolerance against movement and leads to an increased fire-resistance.

It has been further shown that the thermal insulation and sealing system according to
10 the present invention is easily installable from the top, i.e. a one-sided application.

Further, the thermal insulating and sealing system is not limited to a specific joint width or spandrel height; on face installation on the transom is possible and there is no limitation of vertical as well as horizontal movement capacities of the joint system. The
15 thermal insulating and sealing system provides a clear separation of movement and tolerance compensation as well as reduction of the final movement joint width to a minimum which leads to improved fire-resistance. It has been shown that the thermal insulating and sealing system is able to compensate dimensional tolerances of the concreted floor and to allow movement between the floor and the façade element
20 caused by load, temperature or wind load.

Moreover, the spandrel panel including the cavity can be installed on site and hence is part of a modular or prefabricated curtain wall design. It can be integrated in the façade assembly providing an increase of installation efficiency, thereby reduce installation
25 failures. It has been shown that a box-insert having a base and at least two sides, preferably perpendicular or trapezoidal, to the base with an opening parallel to the base, has the advantage that the insulation material can be oversized at the sides thereby improving the sealing between adjacent elements and allows for a simple manufacturing of the box-insert filled with an insulation material ready for installation on
30 site.

As such, the thermal insulating and sealing system of the present invention provides a system for effectively maintaining a complete seal in a safing slot when utilizing modular curtain wall constructions which include interior panels extending across the

interior surface thereof as is commonly utilized currently for modular or prefabricated designs.

Finally, it has been shown that the thermal insulating and sealing system as well as the
5 spandrel panel and the box-insert according to the present invention is also for
acoustically insulating and sealing of a safin slot of a curtain wall structure.

While particular embodiments of this invention have been shown in the drawings and
described above, it will be apparent that many changes may be made in the form,
10 arrangement and positioning of the various elements of the combination. In
consideration thereof, it should be understood that preferred embodiments of this
invention disclosed herein are intended to be illustrative only and not intended to limit
the scope of the invention.

CLAIMS

1. A spandrel panel for use in a curtain wall construction defined by an interior wall surface including one or more framing members and at least one floor spatially disposed from the interior wall surface of the curtain wall construction, wherein the spandrel panel comprises an exterior wall surface and an interior wall surface, characterized in that the spandrel panel comprises a cavity.
2. Spandrel panel for use according to claim 1, wherein the cavity comprises at least one wall and an opening.
3. Spandrel panel for use according to claim 1 or 2, wherein the cavity is a compartment having a base and at least two sides, preferably perpendicular or trapezoidal, to the base with an opening parallel to the base.
4. Spandrel panel for use according to any one of claims 1 to 3, wherein the cavity of the spandrel area is in form of a U-shaped, rectangular channel.
5. Spandrel panel for use according to any one of claims 1 to 4, wherein the cavity is positioned within the spandrel panel so that its opening is parallel and pointing away from the exterior wall surface of the spandrel panel.
6. Spandrel panel for use according to any one of claims 1 to 5, wherein the cavity is made from a rigid material, preferably a metal material, concrete material or compressed mineral wool.
7. Spandrel panel for use according to any one of claims 1 to 6, wherein the cavity is filled with a thermally resistant and/or air tight material for insulating.
8. A thermally insulating and sealing system for effectively thermally insulating and sealing of a safig slot within a building construction having a curtain wall construction defined by an interior wall surface, including one or more framing members and a spandrel area, and at least one floor spatially disposed from the interior wall surface of the curtain wall construction defining the safig slot

extending between the interior wall surface of the curtain wall construction and an outer edge of the floor, comprising:

- 5 i) a first element comprising a cavity having an interior wall surface and an opening, positioned substantially in the height of the floor, wherein the cavity is located in the spandrel area of the interior wall surface, and
- ii) a second element comprised of a thermally resistant and/or air tight material for insulating, positioned at least partially in the cavity of the first element, wherein the second element includes:
- 10 a) an inner end surface positionable in abutment with respect to the outer edge of the floor for sealing thereadjacent,
- b) an outer end surface positionable in abutment with respect the interior wall surface of the cavity,
- c) a lower facing surface extending between the inner end surface and the outer end surface and facing downwardly therebetween,
- 15 and
- d) an upper facing surface extending between the inner end surface and the outer end surface and facing upwardly therebetween.
9. Thermally insulating and sealing system according to claim 8, wherein the cavity of the first element is a compartment having a base and at least two sides, preferably perpendicular or trapezoidal, to the base with an opening parallel to the base.
- 20 10. Thermally insulating and sealing system according to claim 8 or 9, wherein the cavity is positioned within the spandrel area of the interior wall surface so that its opening is parallel and pointing away from the exterior wall surface of the spandrel area.
- 25 11. Thermally insulating and sealing system according to any one of claims 8 to 10, wherein the cavity is made from rigid material, preferably a metal material, concrete material or compressed mineral wool, a polyurethane foam or an elastomeric interlaced foam based on synthetic rubber.
- 30 12. Thermally insulating and sealing system according to claim 11, wherein the metal material is steel.
- 35

13. Thermally insulating and sealing system according to any one of claims 8 to 12,
wherein the thermally resistant and/or air tight material comprises a thermally
resistant and/or air tight flexible mineral wool material, rubber-like material or a
foam to facilitate placement thereof into the safin slot.
14. Thermally insulating and sealing system according to claim 13, wherein the
thermally resistant and/or air tight material is thermally resistant flexible mineral
wool material, a polyurethane foam or an elastomeric interlaced foam based on
synthetic rubber.
15. Thermally insulating and sealing system according to any one of claims 8 to 14,
further comprising a connecting third element comprised of a thermally resistant
and/or air tight material for insulating, positioned in front of the vertical framing
member and in abutment with respect to the second element.
16. Thermally insulating and sealing system according to claim 15, wherein the
thermally resistant and/or air tight material comprises a thermally resistant and/or
air tight flexible mineral wool material, rubber-like material or a foam to facilitate
placement thereof into the safin slot.
17. Thermally insulating and sealing system according to any one of claims 8 to 16,
further comprising an outer fire retardant coating positioned across the second
element and the adjacent portions of the interior framing member of the curtain
wall construction and the floor located thereadjacent.
18. A box-insert for use within the spandrel area of a curtain wall construction defined
by an interior wall surface including one or more framing members and at least
one floor spatially disposed from the interior wall surface of the curtain wall
construction, wherein the box-insert is a compartment having a base and at least
two sides, preferably perpendicular or trapezoidal, to the base with an opening
parallel to the base.
19. Box-insert for use according to claim 18, wherein the box-insert is in form of a U-
shaped, rectangular channel.

20. Box-insert for use according to claim 18 or 19, wherein the box-insert comprises additional ledges for fixing the box-insert to an interior panel, preferably a metal steel back pan.
- 5
21. Box-insert for use according to any one of claims 18 to 20, comprising a pre-compressed elastic sealing element and a cover foil.
- 10
22. A building construction having a curtain wall construction defined by an interior wall surface including one or more framing members and at least one floor spatially disposed from the interior wall surface of the curtain wall construction defining the safing slot extending between the interior wall surface of the curtain wall construction and an outer edge of the floor, comprising a thermally insulating and sealing system for effectively thermally insulating and sealing of the safing slot, wherein the thermal insulating and sealing system comprises:
- 15
- i) a first element comprising a cavity, which is a compartment having a base and at least two sides, preferably perpendicular or trapezoidal, to the base with an opening parallel to the base, positioned substantially in the height of the floor, within the spandrel area of the interior wall surface so that its opening is parallel and pointing away from the exterior wall surface of the spandrel area, and

20

 - ii) a second element comprised of a thermally resistant and/or air tight material for insulating, positioned at least partially in the cavity of the first element, wherein the second element includes:
 - 25 a) an inner end surface positionable in abutment with respect to the outer edge of the floor for sealing thereadjacent,
 - b) an outer end surface positionable in abutment with respect the interior wall surface of the cavity,
 - c) a lower facing surface extending between the inner end surface and the outer end surface and facing downwardly therebetween, and

30

 - d) an upper facing surface extending between the inner end surface and the outer end surface and facing upwardly therebetween, and
 - iii) a connecting third element comprised of a thermally resistant and/or air tight material for insulating, positioned in front of the vertical framing member and in

35

 - abutment with respect to the second element,

wherein the cavity is made from rigid material, preferably steel, and
wherein the thermally resistant and/or air tight material comprises a thermally resistant
and/or air tight flexible mineral wool material, rubber-like material or a foam.

- 5 23. Spandrel panel according to any one of claims 1 to 7, thermal insulating and
 sealing system according to any one of claims 8 to 17 and/or a box-insert
 according to any one of claims 18 to 21, for acoustically insulating and sealing of
 a safig slot of a curtain wall structure.
