(54) Title: SYSTEM AND METHOD FOR DETECTING NEUROMOTOR DISORDER

FIGURE 3

(57) Abstract: The present invention provides a system and a method for detecting a neuromotor disorder or condition in a subject using an electronic device that comprises an input device. The method generally involves determining input device usage characteristics of the subject and comparing the result to a reference input device usage characteristic.

* Special categories of cited documents:	"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
"A" document defining the general state of the art which is not considered to be of particular relevance	"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
"E" earlier application or patent but published on or after the international filing date	"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)	"&" document member of the same patent family
"O" document referring to an oral disclosure, use, exhibition or other means	
"P" document published prior to the international filing date but later than the priority date claimed
