DIAZEPINONE DERIVATIVES USEFUL FOR THE TREATMENT OF FRAGILE X SYNDROME, PARKINSONS OR REFLUX DISEASE

The invention relates to diazepinone derivatives, to their preparation, to their use as medicaments and to medicaments comprising them.

Some mGluR5 antagonists are described e.g. in WO2003047581.

US3853851 describes 5-(oxo, thio or imino)-7,8-dihydro[1,4]diazepino[7.1a]isoquinolines and their use as neuroleptic agents.

mGluR5 antagonists are considered to be useful in the treatment of a wide range of disorders, in particular fragile X syndrome (FXS), L-dopa induced dyskinesias in Parkinsons Disease (PD-LID) and Gastro-Esophageal Reflux Disease (GERD).

There is a need to provide new mGluR5 antagonists that are good drug candidates. In particular, preferred compounds should bind potently to mGluR5 whilst showing little affinity for other mGluRs. They should exhibit a low binding to plasma proteins. They should be well absorbed from the gastrointestinal tract, be sufficiently metabolically stable and possess favorable pharmacokinetic properties. They should be non-toxic and demonstrate few side-effects. Furthermore, the ideal drug candidate will be able to exist in a physical form that is stable, non-hygroscopic and easily formulated.

The compounds of the invention are mGluR5 antagonists and are therefore potentially useful in the treatment of a wide range of disorders, particularly FXS, PD-LID and GERD.

In a first aspect, the invention relates to a compound of the formula I

or a salt thereof, wherein

Case 55201A

- 8 -

In the context of the invention, the definitions of B₂ and R₇ as a "three- to seven-membered monocyclic ring system which may be aromatic, saturated or unsaturated non-aromatic and which may contain from 1 to 4 hetero atoms" encompasses three- to seven-membered monocyclic aromatic or non-aromatic hydrocarbon groups and aromatic or non-aromatic heterocyclic ring systems of the same sizes.

In the context of the invention, the definition of B₁ as a "five- to six-membered aromatic ring system which may contain from 1 to 4 hetero atoms" encompasses phenyl or a five- to six-membered monocyclic heterocyclic aromatic ring system.

In the context of the invention, the definition of two R₇ as a "fused five- to seven-membered monocyclic unsaturated non-aromatic ring system which may contain from 1 to 4 hetero atoms" encompasses a five- to seven-membered monocyclic unsaturated non-aromatic hydrocarbon group or a five- to seven-membered monocyclic heterocyclic unsaturated non-aromatic ring system. Compounds of formula I may exist in optically active form or in form of mixtures of optical isomers, e.g. in form of racemic mixtures or diastereomeric mixtures. In particular, asymmetrical carbon atom(s) may be present in the compounds of formula I and their salts. Unless otherwise provided herein, all optical isomers and their mixtures, including the racemic mixtures, are embraced by the invention.

As used herein, the term "isomers" refers to different compounds that have the same molecular formula but differ in arrangement and configuration of the atoms. Also as used herein, the term "an optical isomer" or "a stereoisomer" refers to any of the various stereo-

Case 55201A

- 9 -

isomeric configurations which may exist for a given compound of the invention and includes geometric isomers. It is understood that a substituent may be attached at a chiral center of a carbon atom. The term "chiral" refers to molecules which have the property of non-superimposability on their mirror image partner, while the term "achiral" refers to molecules which are superimposable on their mirror image partner. Therefore, the invention includes enantiomers, diastereomers or racemates of the compound. "Enantiomers" are a pair of stereoisomers that are non-superimposable mirror images of each other. A 1:1 mixture of a pair of enantiomers is a "racemic" mixture. The term is used to designate a racemic mixture where appropriate. "Diastereoisomers" are stereoisomers that have at least two asymmetric atoms, but which are not mirror-images of each other. The absolute stereochemistry is specified according to the Cahn-Ingold-Prelog R-S system. When a compound is a pure enantiomer the stereochemistry at each chiral carbon may be specified by either *R* or *S*. Resolved compounds whose absolute configuration is unknown can be designated (+) or (-) depending on the direction (dextro- or levorotatory) which they rotate plane polarized light at the wavelength of the sodium D line. The compounds described herein may contain one or more asymmetric centers and may thus give rise to enantiomers, diastereomers, and other stereoisomeric forms that may be defined, in terms of absolute stereochemistry, as (*R*)- or (*S*)-. Unless otherwise provided herein, the invention is meant to include all such possible isomers, including racemic mixtures, optically pure forms and intermediate mixtures. Optically active (*R*)- and (*S*)- isomers may be prepared using chiral synthons or chiral reagents, or resolved using conventional techniques.

If the compound contains a double bond, the substituent may be *E* or *Z* configuration.

If the compound contains a disubstituted cycloalkyl, the cycloalkyl substituent may have a *cis*- or *trans*-configuration.

Any asymmetric atom (e.g. carbon or the like) of the compound(s) of the invention can be present in racemic or enantiomerically enriched, for example the (*R*)-, (*S*)- or (*R,S*)- configuration. In certain embodiments, each asymmetric atom has at least 50 % enantiomeric excess, at least 60 % enantiomeric excess, at least 70 % enantiomeric excess, at least 80 % enantiomeric excess, at least 90 % enantiomeric excess, at least 95 % enantiomeric excess, or at least 99 % enantiomeric excess in the (*R*)- or (*S*)- configuration. Substituents at atoms with unsaturated bonds may, if possible, be present in *cis*- (*Z*)- or *trans*- (*E*)- form.

Case 55201A

- 10 -

Accordingly, as used herein, a compound of the invention can be in the form of one of the possible isomers, rotamers, atropisomers, tautomers or mixtures thereof, for example, as substantially pure geometric (*cis* or *trans*) isomers, diastereomers, optical isomers
5 (antipodes), racemates or mixtures thereof.

Any resulting mixtures of isomers can be separated on the basis of the physicochemical differences of the constituents, into the pure or substantially pure geometric or optical isomers, diastereomers, racemates, for example, by chromatography and/or fractional
10 crystallization.

Any resulting racemates of final products or intermediates can be resolved into the optical antipodes by known methods, e.g., by separation of the diastereomeric salts thereof, obtained with an optically active acid or base, and liberating the optically active acidic or
15 basic compound. In particular, a basic moiety may thus be employed to resolve the compounds of the invention into their optical antipodes, e.g., by fractional crystallization of a salt formed with an optically active acid, e.g., tartaric acid, dibenzoyl tartaric acid, diacetyl tartaric acid, di-O, O'-*p*-toluoyl tartaric acid, mandelic acid, malic acid or camphor-10-sulfonic acid. Racemic products can also be resolved by chiral chromatography, e.g., high pressure
20 liquid chromatography (HPLC) using a chiral adsorbent.

Depending on substituent definition, compounds of formula I may occur in various tautomeric forms. All tautomeric forms of the compounds of formula I are embraced by the invention.

25 As used herein, the terms "salt" or "salts" refers to an acid addition or base addition salt of a compound of the invention. "Salts" include in particular "pharmaceutically acceptable salts". The term "pharmaceutically acceptable salts" refers to salts that retain the biological effectiveness and properties of the compounds of this invention and, which typically are not biologically or otherwise undesirable. The compounds of the invention may be capable of
30 forming acid and/or base salts by virtue of the presence of amino and/or carboxyl groups or groups similar thereto.

 20 magnesium salts.

Organic bases from which salts can be derived include, for example, primary, secondary, and tertiary amines, substituted amines including naturally occurring substituted amines, cyclic amines, basic ion exchange resins, and the like. Certain organic amines include
 25 isopropylamine, benzathine, choline, diethanolamine, diethylamine, lysine, meglumine, piperazine and tromethamine.

The pharmaceutically acceptable salts of the invention can be synthesized from a basic or acidic moiety, by conventional chemical methods. Generally, such salts can be prepared by
 30 reacting free acid forms of these compounds with a stoichiometric amount of the appropriate base (such as Na, Ca, Mg, or K hydroxide, carbonate, bicarbonate or the like), or by reacting free base forms of these compounds with a stoichiometric amount of the appropriate acid. Such reactions are typically carried out in water or in an organic solvent, or in a mixture of the two. Generally, use of non-aqueous media like ether, ethyl acetate, ethanol, isopropanol,
 35 or acetonitrile is desirable, where practicable. Lists of additional suitable salts can be found,

- 5 When both a basic group and an acid group are present in the same molecule, the compounds of the invention may also form internal salts, e.g., zwitterionic molecules.

Any formula given herein is also intended to represent unlabeled forms as well as isotopically labeled forms of the compounds. Isotopically labeled compounds have structures depicted by
10 the formulas given herein except that one or more atoms are replaced by an atom having a selected atomic mass or mass number. Examples of isotopes that can be incorporated into compounds of the invention include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorous, fluorine, and chlorine, such as ^2H , ^3H , ^{11}C , ^{13}C , ^{14}C , ^{15}N , ^{18}F , ^{31}P , ^{32}P , ^{35}S , ^{36}Cl , ^{125}I respectively. The invention includes various isotopically labeled compounds as defined
15 herein, for example those into which radioactive isotopes, such as ^3H and ^{14}C , or those into which non-radioactive isotopes, such as ^2H and ^{13}C are present. Such isotopically labelled compounds are useful in metabolic studies (with ^{14}C), reaction kinetic studies (with, for example ^2H or ^3H), detection or imaging techniques, such as positron emission tomography (PET) or single-photon emission computed tomography (SPECT) including drug or substrate
20 tissue distribution assays, or in radioactive treatment of patients. In particular, an ^{18}F or labeled compound may be particularly desirable for PET or SPECT studies. Isotopically-labeled compounds of formula (I) can generally be prepared by conventional techniques known to those skilled in the art or by processes analogous to those described in the accompanying Examples and Preparations using an appropriate isotopically-labeled
25 reagents in place of the non-labeled reagent previously employed.

Further, substitution with heavier isotopes, particularly deuterium (i.e., ^2H or D) may afford certain therapeutic advantages resulting from greater metabolic stability, for example increased in vivo half-life or reduced dosage requirements or an improvement in therapeutic
30 index. It is understood that deuterium in this context is regarded as a substituent of a compound of the formula (I). The concentration of such a heavier isotope, specifically deuterium, may be defined by the isotopic enrichment factor. The term "isotopic enrichment factor" as used herein means the ratio between the isotopic abundance and the natural abundance of a specified isotope. If a substituent in a compound of this invention is denoted
35 deuterium, such compound has an isotopic enrichment factor for each designated deuterium

Case 55201A

atom of at least 3500 (52.5% deuterium incorporation at each designated deuterium atom), at least 4000 (60% deuterium incorporation), at least 4500 (67.5% deuterium incorporation), at least 5000 (75% deuterium incorporation), at least 5500 (82.5% deuterium incorporation), at least 6000 (90% deuterium incorporation), at least 6333.3 (95% deuterium incorporation),
5 at least 6466.7 (97% deuterium incorporation), at least 6600 (99% deuterium incorporation), or at least 6633.3 (99.5% deuterium incorporation).

Pharmaceutically acceptable solvates in accordance with the invention include those wherein the solvent of crystallization may be isotopically substituted, e.g. D₂O, d₆-acetone, d₆-DMSO.

10

Compounds of the invention that contain groups capable of acting as donors and/or acceptors for hydrogen bonds may be capable of forming co-crystals with suitable co-crystal formers. These co-crystals may be prepared from compounds of formula (I) by known co-crystal forming procedures. Such procedures include grinding, heating, co-subliming, co-melting, or contacting in solution compounds of formula I with the co-crystal former under
15 crystallization conditions and isolating co-crystals thereby formed. Suitable co-crystal formers include those described in WO 2004/078163. Hence the invention further provides co-crystals comprising a compound of formula (I).

20

The invention also envisages the use of pro-drugs of the compounds of the invention that convert in vivo to the compounds of the invention. A pro-drug is an active or inactive compound that is modified chemically through in vivo physiological action, such as hydrolysis, metabolism and the like, into a compound of the invention following administration of the prodrug to a subject. The suitability and techniques involved in making and using pro-drugs are well known by those skilled in the art. Prodrugs can be conceptually divided into
25 two non-exclusive categories, bioprecursor prodrugs and carrier prodrugs. See *The Practice of Medicinal Chemistry*, Ch. 31-32 (Ed. Wermuth, Academic Press, San Diego, Calif., 2001).

25

Furthermore, the compounds of the invention, including their salts, can also be obtained in the form of their hydrates, or include other solvents used for their crystallization. The
30 compounds of the invention may inherently or by design form solvates with pharmaceutically acceptable solvents (including water); therefore, it is intended that the invention embrace both solvated and unsolvated forms. The term "solvate" refers to a molecular complex of a compound of the invention (including pharmaceutically acceptable salts thereof) with one or
35 more solvent molecules. Such solvent molecules are those commonly used in the

30

35

Case 55201A

- 14 -

pharmaceutical art, which are known to be innocuous to the recipient, e.g., water, ethanol, and the like. The term "hydrate" refers to the complex where the solvent molecule is water. The compounds of the invention, including salts, hydrates and solvates thereof, may inherently or by design form polymorphs.

An anhydrous pharmaceutical composition may be prepared and stored such that its anhydrous nature is maintained. Accordingly, anhydrous compositions are preferably packaged using materials known to prevent exposure to water such that they can be included in suitable formulary kits. Examples of suitable packaging include, but are not
15 limited to, hermetically sealed foils, plastics, unit dose containers (e. g., vials), blister packs, and strip packs.

- The invention further provides pharmaceutical compositions and dosage forms that comprise one or more agents that reduce the rate by which the compound of the invention as an active
20 ingredient will decompose. Such agents, which are referred to herein as "stabilizers," include, but are not limited to, antioxidants such as ascorbic acid, pH buffers, or salt buffers, etc.

- As used herein, the term "pharmaceutically acceptable carrier" includes any and all solvents, dispersion media, coatings, surfactants, antioxidants, preservatives (e.g., antibacterial
25 agents, antifungal agents), isotonic agents, absorption delaying agents, salts, preservatives, drugs, drug stabilizers, binders, excipients, disintegration agents, lubricants, sweetening agents, flavoring agents, dyes, such like materials and combinations thereof, as would be known to one of ordinary skill in the art (see, for example, Remington's Pharmaceutical Sciences, 18th Ed. Mack Printing Company, 1990, pp. 1289- 1329). Except insofar as any
30 conventional carrier is incompatible with the active ingredient, its use in the therapeutic or pharmaceutical compositions is contemplated.

The compounds of formula I or pharmaceutical acceptable salts thereof exhibit valuable pharmacological properties and are therefore useful as pharmaceuticals.

Case 55201A

- 54 -

Furthermore, compounds of formula I may be useful for research on mGluR5, e.g. as tool compounds.

- In particular, compounds of formula I exhibit an antagonistic action at human metabotropic glutamate receptor 5 (human mGluR5). This can be determined in vitro, for example, at recombinant human mGluR5, using different procedures like, for example, measurement of the inhibition of the agonist induced elevation of intracellular Ca^{2+} concentration in accordance with L. P. Daggett et al., Neuropharm. Vol. 34, pages 871-886 (1995), P. J. Flor et al., J. Neurochem. Vol. 67, pages 58-63 (1996) or by determination to what extent the agonist induced elevation of the inositol phosphate turnover is inhibited as described by T. Knoepfel et al., Eur. J. Pharmacol. Vol. 288, pages 389-392 (1994), L. P. Daggett et al., Neuropharm. Vol. 67, pages 58-63 (1996) and references cited therein. Isolation and expression of human mGluR subtypes are described in US-Patent No. 5,521,297.
- Selected compounds of formula (I) show IC_{50} values for the inhibition of the agonist (e.g. glutamate or quisqualate) induced elevation of intracellular Ca^{2+} concentration or the agonist (e.g. glutamate or quisqualate) induced inositol phosphate turnover, measured in recombinant cells expressing hmGluR5a of about 1 nM to about 10 μM .
- Preferred compounds of formula (I) show an inhibition of said inositol phosphate turnover in recombinant cells expressing hmGluR5a of at least 1 μM .
Further preferred compounds of formula (I) show an IC_{50} value of said inositol phosphate turnover in recombinant cells expressing hmGluR5a of at least 500 nM.
Further preferred compounds of formula (I) show an IC_{50} value of said inositol phosphate turnover in recombinant cells expressing hmGluR5a of at least 250 nM.
Further preferred compounds of formula (I) show an IC_{50} value of said inositol phosphate turnover in recombinant cells expressing hmGluR5a of at least 100 nM.
- The compounds of the invention may be therefore useful in the prevention, treatment or delay of progression of disorders associated with irregularities of the glutamatergic signal transmission, of the gastro-intestinal and urinary tract and of nervous system disorders mediated full or in part by mGluR5.
- Disorders associated with irregularities of the glutamatergic signal transmission are for example epileptogenesis including neuronal protection after status epilepticus, cerebral

Case 55201A

- 55 -

ischemias, especially acute ischemias, ischemic diseases of the eye, muscle spasms such as local or general spasticity, skin disorders, obesity disorders and, in particular, convulsions or pain.

- 5 Disorders of the gastro-intestinal tract include Gastro-Esophageal Reflux Disease (GERD), Functional Gastro-intestinal Disorders and Post-operative Ileus.
Functional Gastro-intestinal Disorders (FGIDs) are defined as chronic or recurrent conditions associated with abdominal symptoms without organic cause using conventional diagnostic measures. A cardinal symptom present in many FGIDs is visceral pain and/or discomfort.
- 10 FGIDs include functional dyspepsia (FD), functional heartburn (a subset of GERD), irritable bowel syndrome (IBS), functional bloating, functional diarrhea, chronic constipation, functional disturbances of the biliary tract as well as other conditions according to Gut 1999; Vol. 45 Suppl. II. A disorder of particular interest is GERD.
- 15 Post-operative Ileus is defined as failure of aboral passage of intestinal contents due to transient impairment of GI motility following abdominal surgery.

- Disorders of the Urinary Tract comprise conditions associated with functional disturbances and/or discomfort/pain of the urinary tract. Examples of disorders of the urinary tract include
- 20 but are not limited to incontinence, benign prostatic hyperplasia, prostatitis, detrusor hyperreflexia, outlet obstruction, urinary frequency, nocturia, urinary urgency, overactive bladder (OAB), pelvic hypersensitivity, urge incontinence, urethritis, prostatodynia, cystitis, idiopathic bladder hypersensitivity and the like. OAB is a syndrome characterized by urgency, with or without urinary incontinence, and usually with increased voiding frequency
- 25 and nocturia.

- Nervous system disorders mediated full or in part by mGluR5 are for example acute, traumatic and chronic degenerative processes of the nervous system, such as Parkinson's disease, Parkinson's dyskinesia (e.g. L-dopa induced dyskinesia), dyskinesias induced by
- 30 neuroleptics (e.g. tardive dyskinesia), Tic disorders, Tourette Syndrome, Restless Leg Syndrome, Periodic Limb Movement Syndromes, senile dementia, Alzheimer's disease, Huntington's chorea, amyotrophic lateral sclerosis, multiple sclerosis and fragile X syndrome, substance-related disorders, psychiatric diseases such as schizophrenia, affective and anxiety disorders, attention deficit disorders and cognitive dysfunction associated with these
- 35 and other CNS disorders. Substance-related disorders include substance abuse, substance

Case 55201A

- 56 -

Affective disorders include depressive (major depression, dysthymia, depressive disorders

- 5 NOS) and bipolar disorders (bipolar I and II disorders). Cognitive dysfunction associated with these and other CNS disorders include deficits and abnormalities in attention and vigilance, executive functions and memory (for instance working memory and episodic memory). Other disorders which are mediated fully or in part by mGluR5 are pain and itch.

- 10 A disorder of particular interest is L-dopa induced dyskinesia in Parkinsons Disease.

The compounds of the invention, especially the compounds as defined in group P under Embodiment 8, are useful in the treatment, prevention or delay of progression of dyskinesias in Parkinsons Disease, especially L-dopa induced dyskinesia in Parkinsons Disease.

- 15 Dyskinesia in Parkinsons Disease often, although not exclusively, occurs as a side-effect of treatment of Parkinson's Disease with levodopa (L-dopa), a precursor of dopamine. Characteristics of such dyskinesia include motor impairment, e.g. the appearance of slow and uncoordinated involuntary movements, shaking, stiffness and problems walking. Patients treated with L-dopa often have reduced symptoms of Parkinson's Disease but they
- 20 experience increasing difficulties to remain standing or even sitting. After prolonged use of L-dopa, a majority of patients develop dyskinesia.

Dyskinesia can occur at any time during the cycle of treatment with L-dopa. In one embodiment, the compounds of the invention are for the treatment of dyskinesia which

25 occurs at the time of peak L-dopa plasma concentrations in the patient. In one embodiment, the compounds of the invention are for the treatment of dyskinesia which occurs when the L-dopa plasma concentrations in a patient rise or fall (diphasic dyskinesia).

- 30 Dyskinesia can also develop in Parkinson's disease sufferers who do not take L-dopa. In one embodiment, the compounds of the invention are for the treatment of non-L-dopa induced Parkinson's dyskinesia.

- Treatment with a compound of the invention, especially with a compound as defined in group P, may comprise a reduction in the characteristics associated with Parkinson's dyskinesia,
- 35 including for example, although not limited to, a reduction in the scale of involuntary

Case 55201A

- 57 -

movements, a reduction in the number of involuntary movements, an improvement in the ability to carry out normal tasks, an improved ability to walk, increased period of time between episodes of dyskinesia.

- 5 In the case of prophylactic treatment, the compounds of the invention, especially the compounds as defined in group P may be used to delay or prevent the onset of Parkinson's dyskinesia.

For the above-mentioned indications (the conditions and disorders) the appropriate dosage
10 will vary depending upon, for example, the compound employed, the host, the mode of administration and the nature and severity of the condition being treated. However, in general, satisfactory results in animals are indicated to be obtained at a daily dosage of from about 0.01 to about 100 mg/kg body weight, preferably from about 0.1 to about 10 mg/kg body weight, e.g. 1 mg/kg. In larger mammals, for example humans, an indicated daily
15 dosage is in the range from about 0.1 to about 1000 mg, preferably from about 1 to about 400 mg, most preferably from about 10 to about 100 mg of the compound of the invention conveniently administered, for example, in divided doses up to four times a day.

For use according to the invention, a compound of the invention, especially a compound as
20 defined in group P, may be administered as single active agent or in combination with other active agents, in any usual manner, e.g. orally, for example in the form of tablets or capsules, or parenterally, for example in the form of injection solutions or suspensions. A combination comprising a compound of the invention and another active agent will be referred to as
"combination of the invention".

25 in the case of Parkinson's dyskinesia induced by L-dopa, the compound of the invention, especially being a compound as defined in group P, will be combined with L-dopa and optionally with at least one active agent selected from the group consisting of a dopa decarboxylase inhibitor, a catechol-O-methyl transferase inhibitor, a dopamine agonist, a

Step 1: 9-iodo-2-(4-(methoxymethyl)-1H-imidazol-1-yl)-7,8-dihydro-[1,4]diazepino[7,1-a]isoquinolin-5(4H)-one, 71-1. To a stirred solution of 9-iodo-3,4,7,8-tetrahydro-

[1,4]diazepino[7,1-a]isoquinoline-2,5-dione (1.78 g, 5.03 mmol) in 1,2-dichloroethane (50 mL) was added POCl_3 (0.94 mL, 10.1 mmol) and the resulting suspension was stirred at 100°C for 1h. The reaction mixture was cooled to rt and concentrated under reduced pressure to dryness. For complete removal of POCl_3 the residue was taken up in toluene and evaporated twice again and dried under high vacuo.

The resulting crude chloro compound was dissolved in 1,2-dichloroethane (50 mL), 4-(methoxymethyl)-1H-imidazole (2.24 g, 20.0 mmol) was added and the mixture was stirred at 100°C for 2h. The reaction mixture was allowed to warm to rt and diluted with DCM.

Saturated aqueous NaHCO_3 solution was added and the mixture was extracted twice with DCM. The combined organic layers were dried with sodium sulfate, filtered and the solvent

Biological Testing

1.1 In-vitro Testing

Activity of compounds of the present invention was examined by determination to what extent the glutamate-induced elevation of the intracellular calcium concentration in L(tk-) cells expressing human mGluR5a receptors (see L. P. Daggett et al., Neuropharm. Vol. 34, pages 871-886, 1995) is inhibited by utilizing methods as described e.g. by L. P. Daggett et al., Neuropharm. Vol. 34, pages 871-886 (1995) and P. J. Flor et al., J. Neurochem. Vol. 67, pages 58-63 (1996).

Activity of compounds of the present invention with respect to mGluR1 antagonism was examined by an assay based on measurements of L-glutamate induced intracellular calcium increases using a 96 well plate-based Fluorometric Imaging Plate Reader (FLIPR), and CHO cells stably expressing human mGluR1. L-glutamate induced robust calcium responses via human mGluR1 in a concentration-dependent manner and in the low micromolar range. The table below represents IC₅₀ values of the inhibition of the glutamate-induced elevation of the intracellular calcium concentration.
