COMBINED BILLFOLD AND HANDKERCHIEF
SIMULATION

Wayne R. Cronn, Topeka, Kans.

Application July 26, 1933, Serial No. 221,366

2 Claims. (Cl. 35-56)

My invention relates to combined billfolds and handkerchief-simulations.

One of the principal objects of my invention is to provide a device of the above described character equipped with means whereby said device can be readily removed from a relatively deep pocket or the like, for instance the upper outside pocket of a coat, the means also presenting an attractive and ornamental appearance and simulating the appearance of a handkerchief or the like.

Another object of my invention is to provide a device of the above described character which is simple in construction, capable of ready replacement, efficient in use, attractive in appearance and economical in manufacture.

Other objects and advantages will be apparent from the following description, appended claims and annexed drawing.

Referring to the drawing wherein like reference characters designate like parts throughout the several views:

Figure 1 is a front elevation of a portion of a coat illustrating my invention as extending from the pocket thereof and simulating the appearance of a handkerchief.

Figure 2 is a front elevation of my invention.

Figure 3 is a sectional view taken on the line 3-3 of Figure 2.

Figure 4 is a plan view of the bill fold in extended position illustrating the interior thereof.

Figure 5 is a top plan view of the bill fold, the means for readily removing the same from a pocket being removed therefrom.

Figure 6 is a front elevation of the means attachable within the billfold whereby the same may be readily removed from a pocket.

As illustrated in the drawing my combined billfold and handkerchief-simulation comprises a holder in the form of a billfold of the foldable type 5 having front and rear sections 6 and 7 respectively connected together by a hinge section 8. The section 6 is fashioned with a pocket 9 provided with a window for viewing an identification card or the like contained in said pocket. The section 7 is provided with a pocket 10 adjacent the free end thereof and said pocket is adapted to contain a note book or the like. The section 7 is also provided with an elongated pocket 11 located between the open end of the pocket 10 and the hinge section 8. Said pocket 11 is provided with an open end located in proximity to said hinge section 8 as clearly illustrated in Figure 4 of the drawing.

The hinge section 8 is fashioned with a slot 12

for accommodating a tab 13 which extends through said slot without the billfold as clearly illustrated in Figures 2 and 3. Within the billfold the tab 13 is secured between a folded strip 14 of substantially rigid material, for instance leather, and said strip is of an elongated configuration and of a length greater than the length of the slot 12. The strip 14 is positioned within the pocket 11 and the tab 13 attached thereto extends outwardly through said slot 12 and when the billfold is in folded position and located within a relative deep pocket of a garment the tab extends beyond the top of said pocket whereby the billfold may be readily extracted therefrom. Due to the strip 14 being of a greater length than the slot 12 the upper faces of said strip engage the end walls of the slot 12 and prevent the strip from being accidentally dislodged from the pocket 11 and withdrawn through the slot 12. When the billfold is inserted within a pocket of a garment, the tab extending above the top of the garment presents a neat and attractive appearance and simulates a handkerchief or the like extending thereabove.

The strip 14 may be inserted into the pocket 11 by inserting said strip endwise through the slot 12 from without the billfold and positioning said strip within said pocket. A sufficient portion of the tab 13 extends through said slot to facilitate the withdrawal of the tab therethrough to adjust to normal position.

From the foregoing it will be apparent that I have provided a combined billfold and handkerchief-simulation equipped with means for facilitating the withdrawal of the device from a pocket and at the same time simulating the appearance of a handkerchief extending from said pocket when the device is positioned therein. Due to the construction of the strip 14, as clearly described and illustrated, said strip may be readily changed for others as desired in order that the tab may conform to a desired harmony in dress.

What I claim is:

1. A device of the character described, comprising, a holder having front and rear sections and a hinged portion connecting said front and rear sections together in folded relation, said hinged portion fashioned with a slot, a holder removing member connected to one of said sections between said sections and of a size greater than said slot whereby to effect engagement with walls defined by said slot to preclude withdrawal through said slot, and a tab connected to said member and extending through said slot for ex-

tension above a pocket of a garment to facilitate removal of said holder from said pocket.

2. A device of the character described, comprising, a holder having front and rear sections and a hinged portion connecting said front and rear sections together, said hinged portion fashioned with a slot, one of said sections provided with a pocket adjacent said slot and between said sections, a holder removing member posi-

tioned within said pocket and of a length greater than said slot whereby to effect engagement with walls defined by said slot to preclude withdrawal through said slot, and a tab simulating a handkerchief connected to said member and extending through said slot for extension above a pocket of a garment to facilitate removal of said holder from said garment pocket.
