(54) Title: COMPOUNDS AND COMPOSITIONS AND USES THEREOF

(57) Abstract: Disclosed are compounds of formula (I), and pharmaceutical compositions containing such compounds. Methods of treating neurological or psychiatric disease and disorders in a subject in need are also disclosed.

COMPOUNDS AND COMPOSITIONS AND USES THEREOF**FIELD OF THE INVENTION**

[0001] The invention relates to 1-aminomethylisochroman compounds, and pharmaceutical compositions containing them, for the treatment of central nervous system diseases and disorders. Such diseases and disorders include depression, bipolar disorder, pain, schizophrenia, obsessive compulsive disorder, psychostimulation, addiction, social disorder, attention deficit hyperactivity disorder, an anxiety disorder, autism, a cognitive impairment, or a neuropsychiatric symptom such as apathy, depression, anxiety, cognitive impairment, psychosis, aggression, agitation, impulse control, and sleep disruption in neurological diseases such as Alzheimer's and Parkinson's diseases.

[0002] All publications, patents, patent applications, and other references cited in this application are incorporated herein by reference in their entirety for all purposes and to the same extent as if each individual publication, patent, patent application or other reference was specifically and individually indicated to be incorporated by reference in its entirety for all purposes. Citation of a reference herein shall not be construed as an admission that such is prior art to the present invention.

BACKGROUND OF THE INVENTION

[0003] Central nervous system diseases and disorders affect a wide range of the population with differing severity. Neurological and psychiatric diseases and disorders include major depression, schizophrenia, bipolar disorder, obsessive compulsive disorder (OCD), panic disorder, and posttraumatic stress disorder (PTSD), among others. These diseases and disorders affect a person's thoughts, mood, behavior and social interactions and can significantly impair daily functioning. *See, e.g., Diagnostic and Statistical Manual of Mental Disorders*, 4th Ed., American Psychiatric Association (2000) ("DSM-IV-TR"); *Diagnostic and Statistical Manual of Mental Disorders*, 5th Ed., American Psychiatric Association (2013) ("DSM-5"). Furthermore, neuropsychiatric symptoms such as apathy, depression, anxiety, cognitive impairment, psychosis, aggression, agitation, impulse control and sleep disruption are now recognized as core impairments of neurological diseases and disorders such as Alzheimer's and Parkinson's diseases.

[0004] While medications exist for some aspects of these diseases, there remains a need for effective treatments for various neurological and psychiatric diseases and disorders. For example, while mood stabilizers such as lithium and valproate, antidepressants and antipsychotic drugs are used to treat mood disorders, more effective medications are necessary. And current antipsychotics may be successful in treating the positive symptoms of schizophrenia but fare less well for the negative and cognitive symptoms. Additionally, current antidepressants are typically effective only for a proportion of subjects suffering from depression. Furthermore, despite the fact that the behavioral and psychiatric symptoms of neurological disease such as Parkinson's disease and Alzheimer's disease are major reasons for the institutionalization of subjects, few drugs exist to treat them.

[0051] *Compounds and Compositions and Definitions:*

[0052] Compounds and compositions of this invention include those described generally above, and are further illustrated by the classes, subclasses, and species disclosed herein. As used herein, the following definitions shall apply unless otherwise indicated. A comprehensive list of abbreviations utilized by organic chemists (i.e. persons of ordinary skill in the art) appears in the first issue of each volume of the Journal of Organic Chemistry. The definitions therein, which are typically presented in a table entitled “Standard List of Abbreviations” are the definitions used herein.

[0053] The graphic representations of racemic, ambiscalemic and scalemic or enantiomerically pure compounds used herein are a modified version of the denotations taken from Maehr J. Chem. Ed. 62, 114-120 (1985): simple lines provide no information about stereochemistry and convey only connectivity; solid and broken wedges are used to denote the absolute configuration of a chiral element; solid and broken bold lines are geometric descriptors indicating the relative configuration shown but not necessarily denoting racemic character; and wedge outlines and dotted or broken lines denote enantiomerically pure compounds of the indicated relative stereochemistry of indeterminate absolute configuration. For example, the graphic representation:

indicates a *trans* relationship between the two chiral centers, that is, either or both of the two representations below:

in any ratio, from pure enantiomers to racemates, while the representation:

indicates a single enantiomer with the absolute configuration depicted, e.g., ((*R*)-1-((*R*)-5-fluoroisochroman-1-yl)ethan-1-amine in the illustration above. In the text describing the stereochemistry of the examples, the convention of Chemical Abstracts is used. Thus “(*R*)-1-((*R*)-5-*rel*-...” indicates that the two chiral centers are in that relative relationship, which would be depicted in a structural diagram by solid bold and dashed lines, whereas “(*R*)-1-((*R*)-5-...” without the “*rel*” indicates a single enantiomer of that absolute configuration, which would be depicted in a structural diagram by solid and broken wedges.

[0054] The "enantiomeric excess" or "% enantiomeric excess" of a composition can be calculated using the equation shown below. In the example shown below, a composition contains 90% of one enantiomer, e.g., the S enantiomer, and 10% of the other enantiomer, e.g., the R enantiomer. $ee = (90 - 10) / 100 = 80\%$.

[0055] Thus, a composition containing 90% of one enantiomer and 10% of the other enantiomer is said to have an enantiomeric excess of 80%. Some compositions described herein contain an enantiomeric excess of at least about 50%, 75%, 90%, 95%, or 99% of the S enantiomer. In other words, the compositions contain an enantiomeric excess of the S enantiomer over the R enantiomer. In other embodiments, some compositions described herein contain an enantiomeric excess of at least about 50%, 75%, 90%, 95%, or 99% of the R enantiomer. In other words, the compositions contain an enantiomeric excess of the R enantiomer over the S enantiomer.

[0056] For instance, an isomer/enantiomer can, in some embodiments, be provided substantially free of the corresponding enantiomer, and can also be referred to as "optically enriched," "enantiomerically enriched," "enantiomerically pure" and "non-racemic," as used interchangeably herein. These terms refer to compositions in which the percent by weight of one enantiomer is greater than the amount of that one enantiomer in a control mixture of the racemic composition (e.g., greater than 1:1 by weight). For example, an enantiomerically enriched preparation of the S enantiomer, means a preparation of the compound having greater than about 50% by weight of the S enantiomer relative to the R enantiomer, such as at least about 75% by weight, further such as at least about 80% by weight. In some embodiments, the enrichment can be much greater than about 80% by weight, providing a "substantially enantiomerically enriched," "substantially enantiomerically pure" or a "substantially non-racemic" preparation, which refers to preparations of compositions which have at least about 85% by weight of one enantiomer relative to other enantiomer, such as at least about 90% by weight, and further such as at least 95% by weight. In certain embodiments, the compound provided herein is made up of at least about 90% by weight of one enantiomer. In other embodiments, the compound is made up of at least about 95%, 98%, or 99% by weight of one enantiomer.

[0057] In some embodiments, the compound is a racemic mixture of (S)- and (R)-isomers. [0061] Hydrocarbonyl refers to any substituent comprised of hydrogen and carbon as the only elemental constituents. C₁ to C₂₀ hydrocarbon includes, for example, alkyl, cycloalkyl, polycycloalkyl, alkenyl, alkynyl, aryl and combinations thereof. Examples include benzyl, phenethyl, cyclohexylmethyl, adamantyl, camphoryl and naphthylethyl. Aromatic hydrocarbons include benzene (phenyl), naphthalene (naphthyl), anthracene, etc. Aliphatic hydrocarbons are hydrocarbons that are not aromatic; they may be saturated or unsaturated, cyclic, linear or branched, or combinations thereof. Non-limiting examples of aliphatic hydrocarbons include isopropyl, 2-butenyl, 2-butenyl, cyclopentyl, cyclopropylmethyl, norbornyl, and the like.

[0062] Unless otherwise specified, alkyl (or alkylene) is intended to include linear or branched saturated hydrocarbon structures and combinations thereof. Alkyl refers to alkyl groups from 1 to 20 carbon atoms, preferably 1 to 10 carbon atoms, more preferably 1 to 6 carbon atoms. Examples of alkyl groups include methyl, ethyl, propyl, isopropyl, *n*-butyl, *s*-butyl, *t*-butyl and the like.

[0063] Cycloalkyl is a subset of hydrocarbon and includes cyclic hydrocarbon groups of from 3 to 8 carbon atoms. Examples of cycloalkyl groups include cyclopropyl, cyclobutyl, cyclopentyl, norbornyl and the like.

[0064] Unless otherwise specified, the term “carbocycle” is intended to include ring systems in which the ring atoms are all carbon but of any oxidation state. Thus (C₃-C₁₀) carbocycle refers to both non-aromatic and aromatic systems, including such systems as cyclopropane, benzene and cyclohexene; (C₈-C₁₂) carbopolycycle refers to such systems as norbornane, decalin, indane and naphthalene. Carbocycle, if not otherwise limited, refers to monocycles, bicycles and polycycles, including bridged structures.

[0065] Heterocycle means an aliphatic or aromatic carbocycle residue in which from one to four carbons is replaced by a heteroatom selected from the group consisting of N, O, and S. The nitrogen and sulfur heteroatoms may optionally be oxidized, and the nitrogen heteroatom may optionally be quaternized. Unless otherwise specified, a heterocycle may be non-aromatic (heteroaliphatic) or aromatic (heteroaryl). Heterocycle, if not otherwise limited, refers to monocycles, bicycles and polycycles, including bridged structures. Examples of heterocycles include, but are not limited to, pyrrolidine, pyrazole, pyrrole, indole, quinoline, isoquinoline, tetrahydroisoquinoline, benzofuran, benzodioxan, benzodioxole (commonly referred to as methylenedioxyphenyl, when occurring as a substituent), tetrazole, morpholine, thiazole, pyridine, pyridazine, pyrimidine, thiophene, furan, oxazole, oxazoline, isoxazole, atrophine, dioxane, tetrahydrofuran and the like. [0066] Hydrocarbyloxy refers to groups of from 1 to 20 carbon atoms, preferably 1 to 10 carbon atoms, more preferably 1 to 6 carbon atoms attached to the parent structure through an oxygen. Alkoxy is a subset of hydrocarbyloxy and includes groups of a straight or branched configuration. Examples include methoxy, ethoxy, propoxy, isopropoxy and the like. Lower-alkoxy refers to groups containing one to four carbons. The term "halogen" means fluorine, chlorine, bromine or iodine atoms.

[0067] The term "halogen" means fluorine, chlorine, bromine or iodine. In one embodiment, halogen may be fluorine or chlorine. In a further embodiment, the halogen is fluorine.

[0068] Unless otherwise specified, acyl refers to formyl and to groups of 1, 2, 3, 4, 5, 6, 7 and 8 carbon atoms of a straight, branched, cyclic configuration, saturated, unsaturated and aromatic and combinations thereof, attached to the parent structure through a carbonyl functionality. Examples include acetyl, benzoyl, propionyl, isobutyryl and the like. Lower-acyl refers to groups containing one to four carbons. The double bonded oxygen, when referred to as a substituent itself is called "oxo".

[0069] As used herein, the term “optionally substituted” may be used interchangeably with “unsubstituted or substituted”. The term “substituted” refers to the replacement of one or more hydrogen atoms in a specified group with a specified radical. For example, substituted alkyl, aryl, cycloalkyl, heterocyclyl etc. refer to alkyl, aryl, cycloalkyl, or heterocyclyl wherein one or more H atoms in each residue are replaced with halogen, haloalkyl, hydrocarbyl, acyl, alkoxyalkyl, hydroxy lower alkyl, carbonyl, phenyl, heteroaryl, benzenesulfonyl, hydroxy, hydrocarbyloxy, haloalkoxy, oxaalkyl, carboxy, alkoxycarbonyl [-C(=O)O-alkyl], alkoxycarbonylamino [HNC(=O)O-alkyl], aminocarbonyl (also known as carboxamido) [-C(=O)NH₂], alkylaminocarbonyl [-C(=O)NH-alkyl], dialkylaminocarbonyl [-C(=O)N(alkyl)₂], cyano, acetoxyl, nitro, amino, alkylamino, dialkylamino, (alkyl)(aryl)aminoalkyl, alkylaminoalkyl (including cycloalkylaminoalkyl), dialkylaminoalkyl, dialkylaminoalkoxy, heterocyclylalkoxy, mercapto, alkylthio, sulfoxide, sulfone, sulfonylamino, alkylsulfinyl, alkylsulfonyl, acylaminoalkyl, acylaminoalkoxy, acylamino, amidino, aryl, benzyl, heterocyclyl, heterocyclylalkyl, phenoxy, benzyloxy, heteroaryloxy, hydroxyimino, alkoxyimino, oxaalkyl, aminosulfonyl, trityl, amidino, guanidino, ureido, benzyloxyphenyl, and benzyloxy. “Oxo” is also included among the substituents referred to in “optionally substituted”; it will be appreciated by persons of skill in the art that, because oxo is a divalent radical, there are circumstances in which it will not be appropriate as a substituent (e.g. on phenyl). In one embodiment, 1, 2, or 3 hydrogen atoms are replaced with a specified radical. In the case of alkyl and cycloalkyl, more than three hydrogen atoms can be replaced by fluorine; indeed, all available hydrogen atoms could be replaced by fluorine. [0070] Substituents Rⁿ are generally defined when introduced and retain that definition throughout the specification and claims.

[0071] As used herein, and as would be understood by the person of skill in the art, the recitation of “a compound” - unless expressly further limited - is intended to include salts of that compound. Thus, for example, the recitation “a compound of formula I” as depicted

above, which contains a basic amine residue $\text{-NR}^3\text{R}^4$, would include salts $\text{-NHR}^3\text{R}^4 + \text{X}^-$ wherein X^- is any counterion. In a particular embodiment, the term "compound of formula I" refers to the compound or a pharmaceutically acceptable salt thereof; this term refers to a pharmaceutically acceptable salt of the compound, even if not explicitly stated. Unless otherwise stated or depicted, structures depicted herein are also meant to include all stereoisomeric (e.g., enantiomeric, diastereomeric, and cis-trans isomeric) forms of the structure; for example, the R and S configurations for each asymmetric center, (Z) and (E) double bond isomers, and (Z) and (E) conformational isomers. Therefore, single stereochemical isomers as well as enantiomeric, diastereomeric, and cis-trans isomeric (or conformational) mixtures of the present compounds are within the scope of the invention. Unless otherwise stated, all tautomeric forms of the compounds of the invention are within the scope of the invention. Additionally, unless otherwise stated, structures depicted herein are also meant to include compounds that differ only in the presence of one or more isotopically enriched atoms. For example, compounds having the present structures except for the replacement of hydrogen by deuterium or tritium, or the replacement of a carbon by a ^{13}C - or ^{14}C -enriched carbon are within the scope of this invention. In addition to therapeutic uses, such compounds are useful, for example, as analytical tools or probes in biological assays.

[0072] As used herein, the term "pharmaceutically acceptable salt" refers to those salts which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of humans and lower animals without undue toxicity, irritation, allergic response and the like, and are commensurate with a reasonable benefit/risk ratio. Pharmaceutically acceptable salts are well known in the art. For example, S. M. Berge et al., describe pharmaceutically acceptable salts in detail in *J. Pharmaceutical Sciences*, 1977, 66, 1–19. Pharmaceutically acceptable salts of the compounds of this invention include those derived from suitable inorganic and organic acids and bases. Examples of pharmaceutically acceptable, nontoxic acid addition salts are salts of an amino group formed with inorganic acids such as hydrochloric acid, hydrobromic acid, phosphoric acid, sulfuric acid and perchloric acid or with organic acids such as acetic acid, oxalic acid, maleic acid, tartaric acid, citric acid, succinic acid or malonic acid or by using other methods used in the art such as ion exchange. Other pharmaceutically acceptable salts include adipate, alginate, ascorbate, aspartate, benzenesulfonate, benzoate, bisulfate, borate, butyrate, camphorate, camphorsulfonate, citrate, cyclopentanepropionate, digluconate, dodecylsulfate,

ethanesulfonate, formate, fumarate, glucoheptonate, glycerophosphate, gluconate, hemisulfate, heptanoate, hexanoate, hydroiodide, 2-hydroxy-ethanesulfonate, lactobionate, lactate, laurate, lauryl sulfate, malate, maleate, malonate, methanesulfonate, 2-naphthalenesulfonate, nicotinate, nitrate, oleate, oxalate, palmitate, pamoate, pectinate, persulfate, 3-phenylpropionate, phosphate, pivalate, propionate, stearate, succinate, sulfate, tartrate, thiocyanate, p-toluenesulfonate, undecanoate, valerate salts, and the like. Although pharmaceutically acceptable counter ions will be preferred for preparing pharmaceutical formulations, other anions are quite acceptable as synthetic intermediates. Thus X may be pharmaceutically undesirable anions, such as iodide, oxalate, trifluoromethanesulfonate and the like, when such salts are chemical intermediates.

[0073] Unless otherwise specified, the word "includes" (or any variation thereon, e.g., "include", "including", etc.) is intended to be open-ended. For example, "A includes 1, 2 and 3" means that A includes but is not limited to 1, 2 and 3.

[0074] Unless otherwise specified, the phrase "such as" is intended to be open-ended. For example, "A can be a halogen, such as chlorine or bromine" means that A can be, but is not limited to, chlorine or bromine.

[0075] According to another embodiment, the invention provides a composition comprising a compound of this invention (or its pharmaceutically acceptable salt) and a pharmaceutically acceptable carrier, adjuvant, or vehicle. In some embodiments, the amount of compound in compositions of this invention is such that is effective to treat, prevent, and/or manage various neurological and/or psychiatric diseases, disorders and/or symptoms in a subject. In some embodiments, a composition of this invention is formulated for administration to a subject in need of such composition. In some embodiments, a composition of this invention is formulated for oral administration to a subject.

[0076] As used herein, the term "subject" to which administration is contemplated includes, but is not limited to, humans (i.e., a male or female of any age group, e.g., a pediatric subject (e.g., infant, child, adolescent) or adult subject (e.g., young adult, middle-aged adult or senior adult)) and/or other primates (e.g., cynomolgus monkeys, rhesus monkeys); mammals, including commercially relevant mammals such as cattle, pigs, horses, sheep, goats, cats, and/or dogs; and/or birds, including commercially relevant birds such as chickens, ducks, geese, quail, and/or turkeys.

Examples of carriers and excipients are well known to those skilled in the art and are described in detail in, e.g., Ansel, Howard C., et al., *Ansel's Pharmaceutical Dosage Forms and Drug Delivery Systems*. Philadelphia: Lippincott, Williams & Wilkins, 2004; Gennaro, Alfonso R., et al. *Remington: The Science and Practice of Pharmacy*. Philadelphia: Lippincott, Williams & Wilkins, 2000; and Rowe, Raymond C. *Handbook of Pharmaceutical Excipients*. Chicago, Pharmaceutical Press, 2005. The formulations may also include one or more buffers, stabilizing agents, surfactants, wetting agents, lubricating agents, emulsifiers, suspending agents, preservatives, antioxidants, opaquing agents, glidants, processing aids, colorants, sweeteners, perfuming agents, flavoring agents, diluents and other known additives to provide an elegant presentation of the drug (i.e., a compound of the present invention or pharmaceutical composition thereof) or aid in the manufacturing of the pharmaceutical product (i.e., medicament).

[0078]

The term "parenteral" as used herein includes subcutaneous, intravenous, intramuscular, intra-articular, intra-synovial, intrasternal, intrathecal, intrahepatic, intralesional and intracranial injection or infusion techniques. Preferably, the compositions are administered orally, intraperitoneally or intravenously. Sterile injectable forms of the compositions of this invention may be aqueous or oleaginous suspension. These suspensions may be formulated according to techniques known in the art using suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally acceptable diluent or solvent, for example as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. Pharmaceutically acceptable compositions of this invention may be orally administered in

any orally acceptable dosage form including capsules, tablets, aqueous suspensions or solutions.

[0080] The amount of compounds of the present invention that may be combined with the carrier materials to produce a composition in a single dosage form will vary depending upon a variety of factors, including the host treated and the particular mode of administration. It should also be understood that a specific dosage and treatment regimen for any particular subject will depend upon a variety of factors, including the activity of the specific compound employed, the age, body weight, general health, sex, diet, time of administration, rate of excretion, drug combination, and the judgment of the treating physician and the severity of the particular disease being treated. The amount of a compound of the present invention in the composition will also depend upon the particular compound in the composition.

[0081] As used herein, the terms "treatment," "treat," and "treating" refer to reversing, alleviating, delaying the onset of, or inhibiting the progress of a disease or disorder, or one or more symptoms thereof, as described herein. In some embodiments, treatment may be administered after one or more symptoms have developed. In other embodiments, treatment may be administered in the absence of symptoms. For example, treatment may be administered to a susceptible individual prior to the onset of symptoms (e.g., in light of a history of symptoms and/or in light of genetic or other susceptibility factors). Treatment may also be continued after symptoms have resolved, for example to prevent or delay their recurrence.

[0082] In some embodiments, the invention provides a method for treating a neurological or psychiatric disease or disorder in a subject, comprising administering to the subject an effective amount of a compound of this invention (or its pharmaceutically acceptable salt), or composition comprising a compound of this invention (or its pharmaceutically acceptable salt). Neurological and/or psychiatric diseases and disorders can exhibit a variety of psychiatric and behavioral symptoms, including apathy, depression, anxiety, cognitive impairment, psychosis, aggression, agitation, poor impulse control and sleep disruptions.

[0083] In one embodiment, the neurological or psychiatric disease or disorder is bipolar disorder, anxiety, depression, Alzheimer's Disease with agitation, Alzheimer's Disease with aggression or Alzheimer's Disease with agitation aggression.

[0084] In one embodiment, the neurological or psychiatric disease or disorder is bipolar disorder, anxiety, depression, dementia, Alzheimer's Disease, Alzheimer's Disease with agitation, Alzheimer's Disease with aggression or Alzheimer's Disease with agitation aggression, a neurocognitive disorder, a neurocognitive disorder with behavioral and psychological symptoms.

[0085] In one embodiment, the neurological or psychiatric disease or disorder are behavioral and psychological symptoms of a neurocognitive disorder including dementia and Alzheimer's disease. The behavioral and psychological symptoms include disturbances in perception, thought content, mood, or behaviors including delusions (distressing beliefs), hallucinations, agitation (easily upset, repeating questions, arguing or complaining, hoarding, pacing, inappropriate screaming, crying out, disruptive sounds, rejection of care leaving home), aggression (physical or verbal), depression or dysphoria, anxiety (worrying, shadowing), apathy or indifference, disinhibition (socially inappropriate behavior, sexually inappropriate behavior, irritability or lability, motor disturbance (repetitive activities without purpose, wandering, rummaging, night-time behaviors (waking and getting up at night) impulsivity, attentional deficits, executive dysfunction.

[0086] Assays were used herein to identify representative candidate treatments. Examples of candidate treatments include, without limitation, treatment of Alzheimer's Disease with agitation, Alzheimer's Disease with aggression and Alzheimer's Disease with agitation aggression. Aggression and agitation are common symptoms in neurological and psychiatric diseases and disorders. Aggression and agitation have been associated with hyperactivity in subcortical brain regions, which can be modelled in animals using psychostimulants (eg PCP, Amphetamine). For example, psychostimulants induce hyperlocomotor activity (HLA) in animals. Antipsychotics (eg. haloperidol, clozapine and risperidone) have been shown to reduce psychostimulant-induced HLA and are efficacious against agitation in Alzheimer's disease. Other drugs used off-label, or are currently under study in clinical trials, for agitation in Alzheimer's disease are mood stabilizers, such as lithium (which also decreases Amphetamine-induced HLA), and antidepressants (eg. citalopram). Antidepressants demonstrate activity in assays such as the forced swim and tail suspension tests. Therefore, the aforementioned assays were helpful in identifying candidate treatments for agitation in Alzheimer's disease and agitation/aggression in other neurological and psychiatric diseases and disorders.

In some embodiments, the neurological or psychiatric disorder is Down syndrome. In some embodiments, the neurological or psychiatric disorder is Fetal Alcohol Syndrome.

[0098] In some embodiments, the neurological or psychiatric disease or disorder is bipolar disorder. Bipolar disorders (including both bipolar I and bipolar II) are serious psychiatric disorders that have a prevalence of approximately 2% of the population, and affects both genders alike. It is a relapsing-remitting condition characterized by cycling between elevated (*i.e.*, manic) and depressed moods, which distinguishes it from other disorders such as major depressive disorder and schizophrenia. Bipolar I is defined by the occurrence of a full manic episode, although most individuals experience significant depression. Symptoms of mania include elevated or irritable mood, hyperactivity, grandiosity, decreased need for sleep, racing thoughts and in some cases, psychosis. The depressive episodes are characterized by anhedonia, sad mood, hopelessness, poor self-esteem, diminished concentration and lethargy. Bipolar II is defined as the occurrence of a major depressive episode and hypomanic (less severe mania) episode although subjects spend considerable more time in the depressive state. Other related conditions include cyclothymic disorder.

[0099] In some embodiments, the neurological or psychiatric disease or disorder is schizophrenia. Schizophrenia is a disorder of unknown origin, which usually appears for the first time in early adulthood and is marked by characteristics such as psychotic symptoms, phasic progression and development, and/or deterioration in social behavior and professional capability. Characteristic psychotic symptoms are disorders of thought content (*e.g.*, multiple, fragmentary, incoherent, implausible or simply delusional contents, or ideas of persecution) and of mentality (*e.g.*, loss of association, flight of imagination, incoherence up to incomprehensibility), as well as disorders of perceptibility (*e.g.*, hallucinations), emotions (*e.g.*, superficial or inadequate emotions), self-perceptions, intentions, impulses, and/or inter-human relationships, and psychomotoric disorders (*e.g.*, catatonia). Other symptoms are also

associated with this disorder. Schizophrenia is classified into subgroups: the paranoid type, characterized by delusions and hallucinations and absence of thought disorder, disorganized behavior, and affective flattening; the disorganized type, also named "hebephrenic schizophrenia," in which thought disorder and flat affect are present together; the catatonic type, in which prominent psychomotor disturbances are evident, and symptoms may include catatonic stupor and waxy flexibility; and the undifferentiated type, in which psychotic symptoms are present but the criteria for paranoid, disorganized, or catatonic types have not been met. The symptoms of schizophrenia normally manifest themselves in three broad categories: positive, negative and cognitive symptoms. Positive symptoms are those which represent an "excess" of normal experiences, such as hallucinations and delusions. Negative symptoms are those where the subject suffers from a lack of normal experiences, such as anhedonia and lack of social interaction. The cognitive symptoms relate to cognitive impairment in schizophrenics, such as lack of sustained attention and deficits in decision making.

[0100] In some embodiments, the neurological or psychiatric disease or disorder is anxiety disorder. Anxiety disorders are characterized by fear, worry, and uneasiness, usually generalized and unfocused as an overreaction to a situation. Anxiety disorders differ in the situations or types of objects that induce fear, anxiety, or avoidance behavior, and the associated cognitive ideation. Anxiety differs from fear in that anxiety is an emotional response to a perceived future threat while fear is associated with a perceived or real immediate threat. They also differ in the content of the associated thoughts or beliefs. Examples of anxiety disorders include separation anxiety disorder, selective mutism, specific phobia, social anxiety disorder (social phobia), panic disorder, panic attack specifier, agoraphobia, generalized anxiety disorder, substance/medication-induced anxiety disorder, anxiety disorder due to another medical condition, illness anxiety disorder, social (pragmatic) communication disorder, other specified anxiety disorder, and unspecified anxiety disorder; stressor-related disorders, including reactive attachment disorder, disinhibited social engagement disorder, posttraumatic stress disorder (PTSD), acute stress disorder, and adjustment disorders.

[0101] Cognitive impairment includes a decline in cognitive functions or cognitive domains, *e.g.*, working memory, attention and vigilance, verbal learning and memory, visual learning and memory, reasoning and problem solving (*e.g.*, executive function, speed of processing

and/or social cognition). In particular, cognitive impairment may indicate deficits in attention, disorganized thinking, slow thinking, difficulty in understanding, poor concentration, impairment of problem solving, poor memory, difficulties in expressing thoughts, and/or difficulties in integrating thoughts, feelings and behavior, or difficulties in extinction of irrelevant thoughts.

[0102] In some embodiments, the neurological or psychiatric disease or disorder involves a deficit in cognition (cognitive domains as defined by the DSM-5 are: complex attention, executive function, learning and memory, language, perceptual-motor, social cognition). In some embodiments, the neurological or psychiatric disorder is associated with a deficit in dopamine signaling. In some embodiments, the neurological or psychiatric disorder is associated with basal ganglia dysfunction. In some embodiments, the neurological or psychiatric disorder is associated with dysregulated locomotor activity. In some embodiments, the neurological or psychiatric disorder is associated with impairment of prefrontal cortex functioning.

In such compositions a dosage of between 0.01 - 100 mg/kg body weight/day of the additional therapeutic agent can be administered.

[0141] The amount of additional therapeutic agent present in the compositions of this invention will be no more than the amount that would normally be administered in a composition comprising that therapeutic agent as the only active agent. Preferably the amount of additional therapeutic agent in the presently disclosed compositions will range from about 50% to 100% of the amount normally present in a composition comprising that agent as the only therapeutically active agent.

[0143] In some embodiments, the present invention provides the use of a compound of formula I, or a pharmaceutically acceptable salt thereof, in the manufacture of a medicament for the treatment of a neurological and/or psychiatric disease or disorder.

[0147] In one embodiment, a suitable hydroxyalkyl substituted benzene (**1-1**) is reacted with a suitable 2,2-dialkoxy-ethanamine or *N*-protected 2,2-dialkoxy-ethanamine (**1-2**) in the presence of an acid or a Lewis acid such as trifluoromethanesulfonic acid or trimethylsilyl trifluoromethanesulfonate to render the cyclized product (**I**) (Scheme 1), which may be separated using chiral HPLC to provide single enantiomers of formula (**I**). In some cases, to facilitate the purification of **I**, crude **I** was *N*-protected with a BOC-protecting group by reacting **I** with di-*tert*-butyl dicarbonate. After purification, the BOC-group was removed under acidic conditions to afford compound of formula (**I**). The stereoisomers of **I** are separated using HPLC/chiral HPLC to provide single enantiomers (**I**).

The reaction was stirred at ambient temperature for 3 h, then quenched with the addition of water. A solution of sodium hydroxide in water was added followed by the addition of H₂O₂. The mixture was exothermic and then stirred at room temperature for 2 hours. The mixture was extracted with EtOAc, and the separated organic layer was washed with 1N FeSO₄ solution and brine, dried over sodium sulfate, filtered and concentrated, then purified by chromatography to give 2-(2,3-dihydrobenzofuran-6-yl)ethan-1-ol as a white solid. The reaction was stirred at ambient temperature until complete (~2 h). Upon the completion, the mixture was washed with Na₂SO₃ solution, brine and then dried. The residue was purified via silica chromatography,

eluting with petroleum ether: EtOAc=5:1 to afford 2-(5-bromo-2,3-dihydrobenzofuran-6-yl)ethan-1-ol as white solid, 2.8 g, yield=87%. MS (ESI): m/z 225, 227 [M-18]⁺.

[0348] In order to demonstrate the utility of the provided compounds to treat neurological and psychiatric diseases and disorders, exemplary compounds were evaluated using the neuropharmacological screen described in S.L. Roberds *et al.*, *Front. Neurosci.* 2011 Sep 9;5:103 (doi: 10.3389/fnins.2011.00103) ("*Roberds*"). As reported in *Roberds*, because psychiatric diseases generally result from disorders of cell-cell communication, circuitry, intact systems are useful in detecting improvement in disease-relevant endpoints. These endpoints are typically behavioral in nature, often requiring human observation and interpretation. To facilitate testing of multiple compounds for behavioral effects relevant to psychiatric disease, PsychoGenics, Inc. (Tarrytown, NY, "PGI") developed SmartCube™, an automated system in which behaviors of compound-treated mice are captured by digital video and analyzed with computer algorithms. (D. Brunner *et al.*, *Drug Discov. Today* 2002, 7:S107-S112). PGI Analytical Systems uses data from SmartCube™ to compare the behavioral signature of a test compound to a database of behavioral signatures obtained using a large set of diverse reference compounds. (The composition of the database as well as validation of the method is further described in *Roberds*). In this way, the neuropharmacological effects of a test compound can be predicted by similarity to major classes of compounds, such as antipsychotics, anxiolytics and antidepressants.

[0349] The SmartCube™ system produces an activity signature indicating the probability that the activity of the test compound at the administered dose matches a given class of neuropharmacological agents. (See, e.g., *Roberds*, Figures 2 and 3). The test compound is simultaneously compared against multiple classes of agents; thus, a separate probability is generated for each behavioral effect measured (e.g., anxiolytic activity, analgesic activity, etc.). In the table below, these probabilities are reported for each behavioral effect measured as follows:

LOQ ≤	+	< 5%
5% ≤	++	< 25 %
25% ≤	+++	< 50 %
50% ≤	++++	

where LOQ is the limit of quantification.

[0350] Provided compounds were dissolved in a mixture of Pharmasolve™ (*N*-methyl-2-pyrrolidone), polyethylene glycol and propylene glycol, and were injected i.p. 15 min. before the behavioral test. For each compound, injections were administered at 3 different doses. For each behavioral effect measured, results for the most efficacious dose(s) are presented. In the table below, DP: anti-depressant; AX: anxiolytic; SD: sedative hypnotic; PS: anti-psychotic; MS: mood stabilizer; AD: ADHD; CE: cognitive enhancer; AG: analgesic; UN: uncharacterized CNS activity.

[0351] The potency of many of the compounds in the table was also determined in the SmartCube™ system. Test compounds were routinely examined at dose levels of 0.3, 1, 3 10 and 30 mg per kg (mpk), although the dose range was increased or decreased if necessary to obtain a full dose response curve. A compound's minimal effective dose (MED) is a measure of the compounds potency. The MED was defined as the dose (in mpk) having 50% or more total activity in SmartCube. The potencies of the compounds are shown in the table below, with potency values in mpk binned in the following manner:

MED mpk range	BIN
≤3 mpk	A
>3 to 10 mpk	B
>10 to ≤30 mpk	C
>30 mpk	D

Example 116 Additional Rodent Tests

Forced Swim Test Procedures

[0352] The Forced Swim test (FST) is an indicator of the antidepressant-like activity of a test compound. Male Balb/cJ mice (26-31g) were given a 30 minute pretreatment with vehicle (sterile water), sertraline control or test compound. The FST consists of one 6 minute session of forced swimming in individual opaque cylinders containing water at a temperature of 23 ± 2 °C. The mouse will swim before “giving up” and becoming immobile, the time spent immobile was recorded over the 6 minute trial. A compound with antidepressant-like activity will decrease the time the mouse is immobile over the 6 minute trial. Data were analyzed by analysis of variance (ANOVA) followed by post-hoc comparisons with Fisher Tests when appropriate. Data is shown in Figures 1a and 1b.

Phencyclidine (PCP)-Induced Hyperlocomotion

[0353] The PCP-induced hyperlocomotion assay is an indicator of antipsychotic-like activity. Male C57Bl/6J mice (20-26g) were administered vehicle or test compound and placed in holding cages for 30 minutes, after which they were placed in the locomotor activity chambers for 30 minutes of baseline capture. The test chambers are Plexiglas rectangular chambers (24 x 45 cm) that fit inside two steel frames (9.5 x 18 inches) and are fitted with two-dimensional 4 x 8 beam grids to monitor horizontal and vertical locomotor activity. Total distance traveled was measured from horizontal beam breaks as the animal traveled. Following the 30 minute baseline period, all rats were injected with saline or PCP (2.5 mg/kg, s.c.) and returned to the locomotor activity chambers for a 60 minute test session. A compound with antipsychotic-like activity will decrease the distance traveled following administration of PCP. Data were analyzed by analysis of variance (ANOVA) followed by post-hoc comparisons with Fisher Tests when appropriate. Data is shown in Figures 2a and 2b.

Amphetamine-Induced Hyperlocomotion Assay

[0354] Amphetamine (AMPH) is frequently used to induce or mimic a manic-like state. The antimanic-like effects of test compounds were evaluated in male C57Bl/6J mice. Mice were acclimatized to the experimental room for at least 1 hour prior to testing. The mice (n=10 per group) were administered vehicle or test compound and placed in the open field (OF) chambers for 30 minutes of baseline activity measurement. The mice were then injected with either water or AMPH (4 mg/kg, ip) and placed back in the OF chambers for a 60-minute testing session during which, the effects of test compounds on stimulant-induced hyperactivity behaviors (total distance traveled, rearing and stereotypy) were measured. Data were analyzed by analysis of variance (ANOVA) followed by post-hoc comparisons with Fisher Tests when appropriate. Data is shown in Figures 3a to 3d.

Tail Suspension Test

[0355] The tail suspension test (TST) is a rodent screening test for potential (human) antidepressant drugs. It is based on the assumption that an animal will actively try to escape an aversive (stressful) stimulus. If escape is impossible, the animal will eventually stop trying ("give up"). In the TST, a mouse is suspended by the tail so that its body dangles in the air, head downward. Mice initially struggle to face upward and climb to a solid surface. When the animal stops struggling and hangs immobile it is considered to have "given up". Shorter periods of immobility are characteristic of antidepressant-like activity. Accordingly, longer periods of immobility are considered indicative of a depressive-like state. It has been shown that treatment with an antidepressant drug will decrease the time the animal spends immobile. *See generally* L. Steru *et al.*, *Psychopharmacology (Berl)*. 1985;85(3):367-70; B. Thierry *et al.*, *Psychopharmacology* 1986;90:284-85.

[0356] *Procedure.* Adult male AJ mice from Jackson Laboratories received vehicle (sterile water) or test compound orally by gavage, or the positive control desipramine (20 mg/kg, i.p.), in 10 mL/kg injection volumes, 30 min before being subjected to the Tail Suspension Test. In this test, mice are placed in the Tail Suspension chambers (white polyvinylchloride cubicles measuring 33 x 33 x 31.75 cm *Med Associates, Inc.* St. Albans, VT) by a piece of transparent (Scotch[®]) tape attached to the tail, from about the mid-tail, with approximately 2 cm of tape past the end of the tail for 10 min during which the time spent immobile is

measured. A reduction in total time immobile relative to the vehicle condition indicates an antidepressant drug-like response. Data is shown in Figures 4a to 4c.
