REENFORCED BUCKET

Otto F. Becker, Corona, N. Y.

Application March 11, 1936, Serial No. 68,253

1 Claim. (Cl. 150—49)

This invention relates to implements used in paper hanging, and more particularly to such as are readily portable, together with the necessary accessories.

The object of the invention is to produce a novel form of paste container and brush supports, attachable to the table when extended in operative position.

These and other objects are accomplished by the novel construction and combination of parts hereinafter described and illustrated in the accompanying drawing, forming a material component of this disclosure, and in which:

Figure 1 is a partial side elevational, partial sectional view of a paste container.

Figure 2 is a similar view of an expanding member for the container.

Figure 3 is a bottom plan view of the same.

Figure 4 is a side view of the container with the bottom turned at an angle.

The paste container consists of a pair of spaced bands 80—81 respectively upper and lower, each being provided with means for diametral adjustment, as the loops 82 and clips 83, the band being made in two semi-circular sections.

These elements are held in spaced relation by uprights 84 to which they are engaged by winged clamp nuts 85 passing through spacers 86—87, the latter extending to constitute ears to receive the bail 88.

This skeleton frame is adapted to distend the paste bucket 90, preferably made of flexible leather and having reenforcing bands 91—92 at the top and bottom respectively, the bottom 93 is flat and reenforced as seen in Figure 1.

From the foregoing, it will be seen that a convenient container for paperhanger's use has been disclosed in the preferred form of its embodiment, but it is to be understood that changes coming within the scope of the appended claim may be made without invention.

Having thus described the invention what is claimed as new and sought to secure by Letters Patent, is:

A paste bucket comprising a flexible substantially cylindrical body, a reenforcing band at the upper edge of said body, a bottom having a raised band secured circumjacent the lower edge of said body, a circumferentially adjustable frame to distend said body, said frame consisting of upper and lower arcuate members, said frame being removably engageable in said body, rigid unitary bars connecting said members, clips carried by said frame and a bail attached to said clips.

OTTO F. BECKER.
