(54) Title: CONTROL OF HEMIPTERAN PESTS USING RNA MOLECULES

(57) Abstract: Disclosed are double stranded RNA molecules that are toxic to hemipteran insects. In particular, interfering RNA molecules capable of interfering with pest target genes and that are toxic to the target pest are provided. Further, methods of making and using the interfering RNA, for example in transgenic plants or as the active ingredient in a composition, to confer protection from insect damage are disclosed.

## CONTROL OF HEMIPTERAN PESTS USING RNA MOLECULES

### FIELD OF THE INVENTION

**[0001]** The invention relates generally to the control of pests that cause damage to crop plants by their feeding activities, and more particularly to the control of hemipteran pests by compositions comprising interfering RNA molecules. The invention further relates to the compositions and to methods of using such compositions comprising the interfering RNA molecules.

### BACKGROUND

**[0002]** The stink bug complex (family Pentatomidae) represents major agricultural pests of cotton and soybeans in the Americas. Stink bugs are represented by a pest complex that contains more than a dozen species with composition, prevalence, and distribution varying with geography (Koch and Pahn, 2014; Pilkay et al., 2015; Temple et al., 2013). In South America, the stink bug complex is the most destructive pest of soybean crops. In Brazil, a global leader in soybean production, the Neotropical brown stink bug, *Euschistus heros*, is the main target for insecticide applications in soybeans (Sosa-Gomez et al., 2009).

**[0003]** Several native Cry proteins from *Bacillus thuringiensis*, or engineered Cry proteins, have been expressed in transgenic crop plants and exploited commercially to control certain lepidopteran and coleopteran insect pests. For example, starting in 2003, transgenic corn hybrids that control corn rootworm by expressing a Cry3Bb1, Cry34Ab1/Cry35Ab1 or modified Cry3A (mCry3A) or Cry3Ab (eCry3.1Ab) protein have been available commercially in the US. However, these Bt insecticidal proteins only protect plants from a relatively narrow range of pests. Moreover, these modes of insecticidal activity provided varying levels of specificity and, in some cases, caused significant environmental consequences.

**[0004]** Previous control of stink bugs relied on broad spectrum insecticides. With the adoption of transgenic controls for major lepidopteran pests in several crops, these insecticides

are no longer used and stink bugs have become a major secondary pest. No successful use of transgenic control of stink bugs using Bt insecticidal proteins has been described or adopted. This may be due in part to the extra oral digestion employed by stink bugs where digestive enzymes are injected into the host plant prior to feeding. This makes it difficult to find proteins that survive long enough to manifest activity against these insects. Thus, there is an immediate need for alternative methods to control pests.

**[0005]** RNAi offers a potential transgenic approach to control this insect pest complex because it relies on double stranded RNAs, rather than proteins. Successes in inducing RNAi in aphids (Hemiptera: Aphididae) by introducing dsRNA in artificial diet and/or via in planta expression of dsRNA hairpins to control green peach aphid, *Myzus persicae* (Coleman et al., 2015; Pitino et al., 2011), the pea aphid *Acyrtosiphon pisum* (Mao et al., 2013; Mao and Zeng, 2012), and the grain aphid, *Sitobion avenae* (Wang et al., 2015), bolster the potential for achieving RNAi in stink bugs. However, oral RNAi delivery to other hemipteran pests, such as *E. heros*, remained an obstacle that is difficult to overcome. Recent advances in addressing this problem suggest that successful oral delivery of RNAi to stink bugs, including *E. heros*, is possible.

**[0006]** RNA interference (RNAi) occurs when an organism recognizes double-stranded RNA (dsRNA) molecules and hydrolyzes them. The resulting hydrolysis products are small RNA fragments of about 19–24 nucleotides in length, called small interfering RNAs (siRNAs). The siRNAs then diffuse or are carried throughout the organism, including across cellular membranes, where they hybridize to mRNAs (or other RNAs) and cause hydrolysis of the RNA. Interfering RNAs are recognized by the RNA interference silencing complex (RISC) into which an effector strand (or “guide strand”) of the RNA is loaded. This guide strand acts as a template for the recognition and destruction of the duplex sequences. This process is repeated each time the siRNA hybridizes to its complementary-RNA target, effectively preventing those mRNAs from being translated, and thus “silencing” the expression of specific genes from which the mRNAs were transcribed. Most plant microRNAs (miRNAs) show extensive base pairing to, and guide cleavage of, their target mRNAs (Jones-Rhoades et al. (2006) *Annu. Rev. Plant Biol.* 57, 19-53; Llave et al. (2002) *Proc. Natl. Acad. Sci. USA* 97, 13401-13406). In other instances,

interfering RNAs may bind to target RNA molecules having imperfect complementarity, causing translational repression without mRNA degradation. The majority of the animal miRNAs studied so far appear to function in this manner.

**[0007]** RNAi has been found to be useful for insect control of certain insect pests. RNAi strategies typically employ a synthesized, non-naturally occurring “interfering RNA”, or “interfering RNA molecule” which typically comprises at least a RNA fragment against a target gene, a spacer sequence, and a second RNA fragment which is complementary to the first, so that a double-stranded RNA structure can be formed. This non-naturally double-stranded RNA takes advantage of the native RNAi pathways in the insect to trigger down-regulation of target genes that may lead to the cessation of feeding and/or growth and may result in the death of the insect pest.

**[0008]** Although it is known in the literature that RNAi strategies focused on target genes can lead to an insecticidal effect in insect species, it is also known that not every target sequence is successful, and that an insecticidal effect cannot be predicted. For example, the overwhelming majority of sequences complementary to corn rootworm DNAs are not lethal in species of corn rootworm when used as dsRNA or siRNA. Baum et al. ((2007) Nature Biotechnology 25:1322-1326), describe the effects of inhibiting several Western Corn Rootworm (WCR) gene targets by RNAi. These authors reported that the 8 of 26 target genes they tested were not able to provide experimentally significant coleopteran pest mortality, even at a very high iRNA (e.g., dsRNA) concentration of more than 520 ng/cm<sup>2</sup>. Additionally, a target gene against which a dsRNA molecule is known to give a strong RNAi effect in one insect species may not be a good target for a different insect species. Bachman et al ((2013) Transgenic Research 22:1207-1222) teach that a highly efficacious target in WCR had little to no activity in a second insect species, namely *Leptinotarsa decemlineata* (also referred to as Colorado Potato Beetle, or CPB). This is despite the fact that CPB and WCR are both coleopterans and both species of the Chrysomelidae family.

**[0009]** There is an ongoing need for compositions containing insecticidal active ingredients, particularly against stink bugs, and for methods of using such compositions, for instance for use in crop protection or insect-mediated disease control. Ideally such

compositions have a high toxicity and are effective when ingested orally by the target pest. Thus any invention which provided compositions in which any of these properties is enhanced would represent a step forward in the art.

## SUMMARY

**[0010]** The needs outlined above are met by the invention which, in various embodiments, provides new methods of controlling economically important insect pests. The invention in part comprises a method of inhibiting expression of one or more target genes in hemipteran insect pests. Specifically, the invention comprises methods of modulating expression of one or more target genes in stink bug species, such as *Euschistus* spp. (for example *E. servus* (Brown Stink Bug), and *E. heros* (Neotropical Brown Stink Bug)), *Nezara* spp. (for example *N. antennata*, *N. hilare*, and *N. viridula* (Southern Green Stink Bug)), *Piezodorus* spp. (for example *P. guildinii* (Red-banded Stink Bug)), *Halyomorpha* spp. (for example *H. halys* (Brown Marmorated Stink Bug)), *Chinavia* spp. (for example *C. marginatum*, *C. hilare* (Green Stink Bug)), *Dichelops* spp. (for example *D. melacanthus*, *Dichelops furcatus*), *Edessa* spp. (for example *E. meditabunda*), *Thyanta* spp. (for example *T. perditor* (Neotropical Red Shouldered Stink Bug)), *Horcias* spp. (for example *H. nobilellus* (Cotton Bug)), *Taedia* spp. for example *T. stigmosa*), *Dysdercus* spp. (for example *D. peruvianus*), *Neomegalotomus* spp. (for example *N. parvus*), *Leptoglossus* spp. (for example *L. zonatus*), *Niesthrea* spp. (for example *N. sidae*), *Eurygaster* spp. (for example *E. intergriceps*, *E. maura*), *Oebalus* spp. (for example *O. mexicana*, *O. poecilus*, and *O. pugnase*), *Scotinophara* spp. (for example *S. lurida*, *S. coarctata*), and related species, that causes cessation of feeding, growth, development and reproduction, and eventually results in the death of the insect. The method comprises introduction of an interfering RNA molecule comprising a double-stranded RNA (dsRNA) or its modified forms such as small interfering RNA (siRNA) sequences, into cells or into the extracellular environment, such as the midgut, within a pest insect body wherein the dsRNA or siRNA enters the cells and inhibits expression of at least one or more target genes and wherein inhibition of the one or more target genes exerts a deleterious effect upon the pest insect. The interfering RNA molecule is non-naturally occurring. It is specifically contemplated that the methods and

compositions of the invention will be useful in limiting or eliminating pest insect infestation in or on any plant by providing one or more compositions comprising interfering RNA molecules comprising dsRNA or siRNA molecules in the diet of the pest. The invention also provides interfering RNA molecules that when delivered to an insect pest inhibits, through a toxic effect, the ability of the insect pest to survive, grow, feed and/or reproduce, or to limit pest related damage or loss to crop plants. Such delivery may be through production of the interfering RNA in a transgenic plant, for example a soybean plant, or by topically applying a composition comprising the interfering RNA to a plant or plant seed, such as a soybean plant or soybean seed. Delivery may further be through contacting the insect with the interfering RNA, such as when the insect feeds on plant material comprising the interfering RNA, either because the plant material is expressing the interfering RNA through a transgenic approach, or because the plant material is coated with a composition comprising the interfering RNA. The interfering RNA may also be provided in an artificial insect diet which the insect then contacts by feeding. The interfering RNA molecule comprises a nucleotide sequence that is complementary to a nucleotide sequence of a mRNA transcribable from a target gene of the pest insect, or is complementary to a fragment of a nucleotide sequence of a mRNA transcribable from a target gene of the pest insect, and therefore inhibits expression of the target gene, which results in cessation of feeding, growth, development, and/or reproduction and/or eventually results in death of the pest insect. The invention is further drawn to nucleic acid constructs, nucleic acid molecules and recombinant vectors that comprise or encode at least a fragment of one strand of an interfering RNA molecule of the invention. The invention also provides chimeric nucleic acid molecules comprising an antisense strand of a dsRNA of the interfering RNA operably associated with a plant microRNA precursor molecule. The invention also provides artificial plant microRNA precursors comprising an antisense strand of a dsRNA of an interfering RNA of the invention.

**[0011]** The invention further provides an interfering ribonucleic acid (RNA) molecule wherein the RNA comprises at least one dsRNA wherein the dsRNA is a region of double-stranded RNA comprising annealed complementary strands, one strand of which comprises a sequence of at least 19 contiguous nucleotides which is at least partially complementary to a

target nucleotide sequence within a hemipteran or stink bug target gene, and (i) is at least 65% identical to at least a 19 contiguous nucleotide fragment of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, or the complement thereof; or (ii) comprises at least a 19 contiguous nucleotide fragment of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, or the complement thereof ; or (iii) comprises at least a 19 contiguous nucleotide fragment of a nucleotide sequence encoding an amino acid sequence encoded by SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, or the complement thereof , wherein the interfering RNA molecule has insecticidal activity on a hemipteran plant pest. In some embodiments, the interfering molecule may comprise at least two dsRNAs, wherein each dsRNA comprises a sequence of nucleotides which is at least partially complementary to a target nucleotide sequence within the target gene. In further embodiments, each of the dsRNAs may comprise a different sequence of nucleotides which is complementary to a different target nucleotide sequence within the target gene.

**[0012]** The invention further provides compositions comprising one or more interfering RNA molecules comprising two or more of dsRNA molecules, wherein the two or more RNA molecules each comprise a different antisense strand, or comprising two or more nucleic acid constructs or nucleic acid molecules or artificial plant microRNA precursors of the invention.

**[0013]** The invention further provides insecticidal compositions for inhibiting the expression of a hemipteran insect gene that comprises a dsRNA of the invention and an agriculturally acceptable carrier. In one embodiment, inhibition of the expression of a hemipteran or stink bug gene described here leads to cessation of feeding and/or growth and ultimately results in the death of the hemipteran or stink bug.

**[0014]** The invention is further drawn to transgenic plants which produce one or more interfering RNA molecules of the invention that are self-protected from insect feeding damage and to methods of using the plants alone or in combination with other insect control strategies to confer maximal insect control capabilities. Plants and/or plant parts producing one or more interfering RNA molecules of the invention or treated with a composition comprising one or more interfering RNA molecules of the invention are highly resistant to insect pest infestation.

For example, economically important hemipteran pests can be controlled by a plant that produces an interfering RNA molecule of the invention or by a plant or plant seed that is treated with a composition comprising an interfering RNA molecule of the invention.

**[0015]** The invention also provides a method of controlling a hemipteran insect plant pest comprising contacting the hemipteran insect with a nucleic acid molecule that is or is capable of producing an interfering RNA of the invention for inhibiting expression of a gene in the hemipteran insect thereby controlling the hemipteran insect.

**[0016]** In other aspects, the invention provides a method of reducing a hemipteran or stink bug population on a transgenic plant expressing a second insecticidal agent, for example an insecticidal protein, in addition to an interfering RNA of the invention capable of inhibiting expression of an target gene in a hemipteran or stink bug, thereby reducing the hemipteran or stink bug population. The second insecticidal agent may be an insecticidal protein derived from *Bacillus thuringiensis*. A *B. thuringiensis* insecticidal protein can be any of a number of insecticidal proteins including but not limited to a Cry1 protein, a Cry3 protein, a Cry7 protein, a Cry8 protein, a Cry11 protein, a Cry22 protein, a Cry 23 protein, a Cry 36 protein, a Cry37 protein, a Cry34 protein together with a Cry35 protein, a binary insecticidal protein CryET33 and CryET34, a binary insecticidal protein TIC100 and TIC101, a binary insecticidal protein PS149B1, a VIP, a TIC900 or related protein, a TIC901, TIC1201, TIC407, TIC417, a modified Cry3A protein, or hybrid proteins or chimeras made from any of the preceding insecticidal proteins. In other embodiments, the *B. thuringiensis* insecticidal protein is selected from the group consisting of Cry3Bb1, Cry34Ab1 together with Cry35Ab1, mCry3A and eCry3.1Ab.

**[0017]** In other embodiments, the second insecticidal agent may be derived from sources other than *B. thuringiensis*. The second insecticidal agent can be an agent selected from the group comprising a patatin, a protease, a protease inhibitor, a urease, an alpha-amylase inhibitor, a pore-forming protein, a chitinase, a lectin, an engineered antibody or antibody fragment, a *Bacillus cereus* insecticidal protein, a *Xenorhabdus* spp. (such as *X. nematophila* or *X. bovienii*) insecticidal protein, a *Photorhabdus* spp. (such as *P. luminescens* or *P. asymbiotica*) insecticidal protein, a *Brevibacillus laterosporous* insecticidal protein, a *Lysinibacillus sphearicus* insecticidal protein, a *Chromobacterium* spp. insecticidal protein, a

*Yersinia entomophaga* insecticidal protein, a *Paenibacillus popilliae* insecticidal protein, a *Clostridium* spp. (such as *C. bifermentans*) insecticidal protein, a *Alcaligenes* ssp. insecticidal protein, a *Pseudomonas* spp. insecticidal protein, and a lignin. In other embodiments, the second agent may be at least one insecticidal protein derived from an insecticidal toxin complex (Tc) from *Photorhabdus*, *Xenorhabdus*, *Serratia*, or *Yersinia*. In other embodiments, the insecticidal protein may be an ADP-ribosyltransferase derived from an insecticidal bacteria, such as *Photorhabdus* spp. In other embodiments, the insecticidal protein may be a VIP protein, such as VIP1 or VIP2 from *B. cereus*. In still other embodiments, the insecticidal protein may be a binary toxin derived from an insecticidal bacteria, such as ISP1A and ISP2A from *B. laterosporous* or BinA and BinB from *L. sphaericus*. In still other embodiments, the insecticidal protein may be engineered or may be a hybrid or chimera of any of the preceding insecticidal proteins.

**[0018]** In other aspects, the invention provides a method of reducing the level of a target RNA transcribable from a hemipteran or stink bug gene described herein in a hemipteran or stink bug comprising contacting the hemipteran or stink bug with a composition comprising an interfering RNA molecule of the invention, wherein the interfering RNA molecule reduces the level of the target RNA in a cell of the hemipteran or stink bug.

**[0019]** In still other aspects, the invention provides a method of conferring hemipteran or stink bug tolerance or hemipteran plant pest tolerance to a plant, or part thereof, comprising introducing into the plant, or part thereof, an interfering RNA molecule, a dsRNA molecule, a nucleic acid construct, a chimeric nucleic acid molecule, an artificial plant microRNA precursor molecule and/or a composition of the invention, thereby conferring to the plant or part thereof tolerance to the stink bug or hemipteran plant pest.

**[0020]** In further aspects, the invention provides a method of reducing damage to a plant fed upon by a hemipteran insect, comprising introducing into cells of the plant an interfering RNA molecule, a dsRNA, a nucleic acid molecule, a nucleic acid construct, a chimeric nucleic acid molecule, an artificial plant microRNA precursor molecule and/or a composition of the invention, thereby reducing damage to the plant fed upon by a hemipteran insect.

**[0021]** In other aspects, the invention provides a method of producing a transgenic plant cell having toxicity to a hemipteran insect, comprising introducing into a plant cell an interfering RNA molecule, a dsRNA, a nucleic acid molecule, a nucleic acid construct, a chimeric nucleic acid molecule, an artificial plant microRNA precursor molecule and/or a composition of the invention, thereby producing the transgenic plant cell having toxicity to the hemipteran insect compared to a control plant cell which does not comprise a nucleic acid molecule of the invention.

**[0022]** In further aspects, the invention provides a method of producing a transgenic plant having enhanced tolerance to hemipteran insect feeding damage, comprising introducing into a plant an interfering RNA molecule, a dsRNA, a nucleic acid molecule, a nucleic acid construct, a chimeric nucleic acid molecule, an artificial plant microRNA precursor molecule and/or a composition of the invention, thereby producing a transgenic plant having enhanced tolerance to hemipteran insect feeding damage compared to a control plant which does not comprise a nucleic acid molecule of the invention.

**[0023]** In other aspects, the invention provides a method of enhancing control of a hemipteran insect population comprising providing a transgenic plant or transgenic seed of the invention and applying to the transgenic plant or the transgenic seed a chemical pesticide that is insecticidal to a hemipteran insect, thereby enhancing control of the hemipteran insect population.

**[0024]** In other aspects, the invention provides a method of providing a soybean grower with a means of controlling a hemipteran insect pest population below an economic threshold in a soybean crop comprising (a) selling or providing to the grower transgenic soybean seed comprising a dsRNA, a nucleic acid molecule, a nucleic acid construct, a chimeric nucleic acid molecule, an artificial plant microRNA precursor molecule and/or a composition of the invention; and (b) advertising to the grower that the transgenic soybean seed produces transgenic soybean plants capable of controlling a hemipteran insect pest population.

**[0025]** In another aspect, the invention provides a method of identifying an orthologous target gene for using as a RNAi strategy for the control of a plant pest, said method comprising the steps of: a) producing a primer pair that will amplify a target selected from the group

comprising or consisting of SEQ ID NO: 55-162, 700-805; b) amplifying an orthologous target gene from a nucleic acid sample of the plant pest; c) identifying a sequence of an orthologous target gene; d) producing an interfering RNA molecule, wherein the RNA comprises at least one dsRNA, wherein the dsRNA is a region of double-stranded RNA comprising annealed complementary strands, one strand of which comprises a sequence of at least 19 contiguous nucleotides which is at least partially complementary to the orthologous target nucleotide sequence within the target gene; and e) determining if the interfering RNA molecule of step (d) has insecticidal activity on the plant pest. If the interfering RNA has insecticidal activity on the plant pest target gene, an orthologous target gene for using in the control of a plant pest has been identified.

**[0026]** These and other aspects of the invention are set forth in more detail in the description of the invention below.

#### **BRIEF DESCRIPTION OF THE SEQUENCES IN THE SEQUENCE LISTING**

**[0027]** The nucleic acid sequences listed in the accompanying sequence listing are shown using standard letter abbreviations for nucleotide bases, as defined in 37 C.F.R. §1.822. The nucleic acid and amino acid sequences listed define molecules (i.e., polynucleotides and polypeptides, respectively) having the nucleotide and amino acid monomers arranged in the manner described. The nucleic acid and amino acid sequences listed also each define a genus of polynucleotides or polypeptides that comprise the nucleotide and amino acid monomers arranged in the manner described. In view of the redundancy of the genetic code, it will be understood that a nucleotide sequence including a coding sequence also describes the genus of polynucleotides encoding the same polypeptide as a polynucleotide consisting of the reference sequence. It will further be understood that an amino acid sequence describes the genus of polynucleotide ORFs encoding that polypeptide.

**[0028]** Only one strand of each nucleic acid sequence is shown, but the complementary strand is understood as included by any reference to the displayed strand. As the complement and reverse complement of a primary nucleic acid sequence are necessarily disclosed by the primary sequence, the complementary sequence and reverse complementary sequence

reference to the nucleic acid sequence, unless it is explicitly stated to be otherwise (or it is clear to be otherwise from the context in which the sequence appears). Furthermore, as it is understood in the art that the nucleotide sequence of an RNA strand is determined by the sequence of the DNA from which it was transcribed (but for the substitution of uracil (U) nucleobases for thymine (T)), an RNA sequence is included by any reference to the DNA sequence encoding it. In the accompanying sequence listing:

**[0029]** SEQ ID NOs: 1-54 are fragments of *Nezara viridula* DNA coding sequences used to synthesize interfering RNA molecules to test for insecticidal activity.

**[0030]** SEQ ID NOs: 55-162 are nucleic acid sequences of primers used to identify target genes from *N. viridula* for testing for insecticidal activity using a RNAi strategy.

**[0031]** SEQ ID NOs: 163-216 are DNA coding sequences of the 54 *N. viridula* target genes identified in the RNAi-based screen for insecticidal activity.

**[0032]** SEQ ID NOs: 217-270 are the sense RNA sequences of the fragments of the *N. viridula* DNA coding sequences used to synthesize interfering RNA molecules to test for insecticidal activity.

**[0033]** SEQ ID NOs: 271-324 are the sense RNA sequences of the *N. viridula* DNA coding sequences of the 54 target genes identified in the RNAi-based screen for insecticidal activity.

**[0034]** SEQ ID NOs: 325-378 are amino acid sequences encoded by the DNA coding sequences of SEQ ID NOs: 163-216.

**[0035]** SEQ ID NOs: 379-431 are DNA coding sequences of *Piezodorus guildinii* orthologs of SEQ ID NOs: 163-216.

**[0036]** SEQ ID NOs: 432-484 are RNA sequences of the DNA coding sequences of the *P. guildinii* SEQ ID NO: 379-431.

**[0037]** SEQ ID NOs: 485-537 are amino acid sequences encoded by the *P. guildinii* DNA coding sequences of SEQ ID NO: 379-431.

**[0038]** SEQ ID NOs: 538-591 are DNA coding sequences of *Halyomorpha halys* orthologs of SEQ ID NOs: 163-216.

**[0039]** SEQ ID NOs: 592-645 are RNA sequences of the *H. halys* DNA coding sequences of SEQ ID NO: 538-591.

**[0040]** SEQ ID NOs: 646-699 are amino acid sequences encoded by the *H. halys* DNA coding sequences of SEQ ID NO: 538-591.

**[0041]** SEQ ID NOs: 700-805 are nucleic acid sequences of primers used to identify target genes from *P. guidinii* for testing for insecticidal activity using a RNAi strategy.

**[0042]** SEQ ID NOs: 806-858 are the sense RNA sequences of the fragments of the *P. guidinii* DNA coding sequences used to synthesize interfering RNA molecules to test for insecticidal activity.

#### DETAILED DESCRIPTION

**[0043]** The following is a detailed description of the invention provided to aid those skilled in the art in practicing the invention. This description is not intended to be a detailed catalog of all the different ways in which the invention may be implemented, or all the features that may be added to the instant invention. For example, features illustrated with respect to one embodiment may be incorporated into other embodiments, and features illustrated with respect to a particular embodiment may be deleted from that embodiment. In addition, numerous variations and additions to the various embodiments of the invention will be apparent to those skilled in the art in light of the instant disclosure, which do not depart from the invention. Hence, the following descriptions are intended to illustrate some particular embodiments of the invention, and not to exhaustively specify all permutations, combinations and variations thereof. Those of ordinary skill in the art will recognize that modifications and variations in the embodiments described herein may be made without departing from the spirit or scope of the invention.

**[0044]** Unless otherwise defined, all technical and scientific terms used herein have the same meaning as commonly understood by one of ordinary skill in the art to which this invention belongs. The terminology used in the description of the invention herein is for the purpose of describing particular embodiments only and is not intended to be limiting of the

invention. All publications, patent applications, patents, and other references mentioned herein are incorporated by reference in their entirety.

**[0045]** For clarity, certain terms used in the specification are defined and presented as follows:

**[0046]** As used herein, "a," "an" or "the" can mean one or more than one. For example, "a cell" can mean a single cell or a multiplicity of cells.

**[0047]** As used herein, "and/or" refers to and encompasses any and all possible combinations of one or more of the associated listed items, as well as the lack of combinations when interpreted in the alternative (or).

**[0048]** Further, the term "about," as used herein when referring to a measurable value such as an amount of a compound or agent, dose, time, temperature, and the like, is meant to encompass variations of  $\pm 20\%$ ,  $\pm 10\%$ ,  $\pm 5\%$ ,  $\pm 1\%$ ,  $\pm 0.5\%$ , or even  $\pm 0.1\%$  of the specified amount.

**[0049]** As used herein, the transitional phrase "consisting essentially of" means that the scope of a claim is to be interpreted to encompass the specified materials or steps recited in the claim and those that do not materially affect the basic and novel characteristic(s) of the claimed invention. Thus, the term "consisting essentially of" when used in a claim of this invention is not intended to be interpreted to be equivalent to "comprising." A "coding sequence" is a nucleic acid sequence that is transcribed into RNA such as mRNA, rRNA, tRNA, snRNA, sense RNA or antisense RNA. Preferably the RNA is then translated in an organism to produce a protein.

**[0050]** As used herein, "complementary" polynucleotides are those that are capable of base pairing according to the standard Watson-Crick complementarity rules. Specifically, purines will base pair with pyrimidines to form a combination of guanine paired with cytosine (G:C) and adenine paired with either thymine (A:T) in the case of DNA, or adenine paired with uracil (A:U) in the case of RNA. For example, the sequence "A-G-T" binds to the complementary sequence "T-C-A." It is understood that two polynucleotides may hybridize to each other even if they are not completely complementary to each other, provided that each has at least one region that is substantially complementary to the other.

**[0051]** The terms "complementary" or "complementarity," refer to the natural binding of polynucleotides under permissive salt and temperature conditions by base-pairing. Complementarity between two single-stranded molecules may be "partial," in which only some of the nucleotides bind, or it may be complete when total complementarity exists between the single stranded molecules. The degree of complementarity between nucleic acid strands has significant effects on the efficiency and strength of hybridization between nucleic acid strands.

**[0052]** As used herein, the terms "substantially complementary" or "partially complementary" mean that two nucleic acid sequences are complementary at least about 50%, 60%, 70%, 80% or 90% of their nucleotides. In some embodiments, the two nucleic acid sequences can be complementary at least at 85%, 90%, 95%, 96%, 97%, 98%, 99% or more of their nucleotides. The terms "substantially complementary" and "partially complementary" can also mean that two nucleic acid sequences can hybridize under high stringency conditions and such conditions are well known in the art.

**[0053]** As used herein, "dsRNA" refers to a polyribonucleotide structure formed either by a single self-complementary RNA strand or at least by two complementary RNA strands. The degree of complementary, in other words the % identity, need not necessarily be 100%. Rather, it must be sufficient to allow the formation of a double-stranded structure under the conditions employed. As used herein, the term "fully complementary" means that all the bases of the nucleotide sequence of the dsRNA are complementary to or 'match' the bases of the target nucleotide sequence. The term "at least partially complementary" means that there is less than a 100% match between the bases of the dsRNA and the bases of the target nucleotide sequence. The skilled person will understand that the dsRNA need only be at least partially complementary to the target nucleotide sequence in order to mediate down-regulation of expression of the target gene. It is known in the art that RNA sequences with insertions, deletions and mismatches relative to the target sequence can still be effective at RNAi. According to the current invention, it is preferred that the dsRNA and the target nucleotide sequence of the target gene share at least 60% or at least 70% sequence identity, preferably at least 80% or 85% sequence identity. Alternatively, the dsRNA may comprise 1, 2 or 3 mismatches as compared with the target nucleotide sequence over every length of 24 partially complementary

nucleotides. It will be appreciated by the person skilled in the art that the degree of complementarity shared between the dsRNA and the target nucleotide sequence may vary depending on the target gene to be down-regulated or depending on the insect pest species in which gene expression is to be controlled.

**[0054]** It will be appreciated that the dsRNA may comprise or consist of a region of double-stranded RNA comprising annealed complementary strands, one strand of which, the sense strand, comprises a sequence of nucleotides at least partially complementary to a target nucleotide sequence within a target gene.

**[0055]** The target nucleotide sequence may be selected from any suitable region or nucleotide sequence of the target gene or RNA transcript thereof. For example, the target nucleotide sequence may be located within the 5'UTR or 3'UTR of the target gene or RNA transcript or within exonic or intronic regions of the gene. The skilled person will be aware of methods of identifying the most suitable target nucleotide sequences within the context of the full-length target gene. For example, multiple dsRNAs targeting different regions of the target gene can be synthesised and tested. Alternatively, digestion of the RNA transcript with enzymes such as RNase H can be used to determine sites on the RNA that are in a conformation susceptible to gene silencing. Target sites may also be identified using *in silico* approaches, for example, the use of computer algorithms designed to predict the efficacy of gene silencing based on targeting different sites within the full-length gene.

**[0056]** Preferably, the % identity of a polyribonucleotide is determined by GAP (Needleman and Wunsch, 1970) analysis (GCG program) using the default settings, wherein the query sequence is at least about 19 to about 23 nucleotides in length, and the GAP analysis aligns the two sequences over a region of at least about 21 nucleotides. In another embodiment, the query sequence is at least 150 nucleotides in length, and the GAP analysis aligns the two sequences over a region of at least 150 nucleotides. In a further embodiment, the query sequence is at least 300 nucleotides in length and the GAP analysis aligns the two sequences over a region of at least 300 nucleotides. In yet another embodiment, the query sequence corresponds to the full length of the target RNA, for example mRNA, and the GAP analysis aligns the two sequences over the full length of the target RNA.

**[0057]** Conveniently, the dsRNA can be produced from a single open reading frame in a recombinant host cell, wherein the sense and anti-sense sequences are flanked by an unrelated sequence which enables the sense and anti-sense sequences to hybridize to form the dsRNA molecule with the unrelated sequence forming a loop structure. Alternatively, the sense strand and antisense strand can be made without an open reading frame to ensure that no protein will be made in the transgenic host cell. The two strands can also be expressed separately as two transcripts, one encoding the sense strand and one encoding the antisense strand.

**[0058]** RNA duplex formation can be initiated either inside or outside the cell. The dsRNA can be partially or fully double-stranded. The RNA can be enzymatically or chemically synthesized, either in vitro or in vivo.

**[0059]** The dsRNA need not be full length relative to either the primary transcription product or fully processed RNA. It is well-known in the art that small dsRNA of about 19-23 bp in length can be used to trigger gene silencing of a target gene. Generally, higher identity can be used to compensate for the use of a shorter sequence. Furthermore, the dsRNA can comprise single stranded regions as well, e.g., the dsRNA can be partially or fully double stranded. The double stranded region of the dsRNA can have a length of at least about 19 to about 23 base pairs, optionally a length of about 19 to about 50 base pairs, optionally a length of about 50 to about 100 base pairs, optionally a length of about 100 to about 200 base pairs, optionally a length of about 200 to about 500, and optionally a length of about 500 to about 1000 or more base pairs, up to a molecule that is double stranded for its full length, corresponding in size to a full length target RNA molecule. Bolognesi et al (2012, *PLOS One*, 7(10): e47534, herein incorporated by reference) teach that dsRNAs greater than or equal to about 60 bp are required for biological activity in artificial diet bioassays with Southern Corn Rootworm (SCR; *Diabrotica undecimpunctata howardii*), although the silencing element or target sequence of the dsRNA molecule may be about 21 base pairs. Therefore, it is known in the art that an RNA molecule which comprises a double-stranded region of at least 19, at least 20, or at least 21 base pairs corresponding to the target RNA molecule is efficacious, when it is known that the target gene responds to RNAi.

**[0060]** Mao *et al* (2007, *Nature Biotechnology*, 35(11): 1307-1313) teach a transgenic plant expressing a dsRNA construct against a target gene (*CYP6AE14*) of an insect pest (cotton bollworm, *Helicoverpa armigera*). Insects feeding on the transgenic plant have small RNAs of about 19-23 bp in size of the target gene in their midgut, with a corresponding reduction in *CYP6AE14* transcripts and protein. This further indicates that it is known in the art that small RNAs are efficacious in reducing expression of the target gene in the insect pest. Therefore, small RNAs of about 19 bp, about 20 bp, about 21 bp, about 22 bp, about 23 bp, about 24 bp, about 25 bp, about 26 bp, about 27 bp, about 28 bp, about 29 bp, or about 30 bp are taught in the art to be efficacious in reducing expression of the target gene in an insect pest.

**[0061]** Further, the dsRNA may comprise a target dsRNA of at least 19 base pairs, and the target dsRNA may be within a dsRNA "carrier" or "filler" sequence. For example, Bolognesi *et al* (2012) show that a 240 bp dsRNA encompassing a target dsRNA, which comprised a 21 bp contiguous sequence with 100% identity to the target sequence, had biological activity in bioassays with Southern Corn Rootworm. The target dsRNA may have a length of at least 19 to about 25 base pairs, optionally a sequence of about 19 to about 50 base pairs, optionally a sequence of about 50 to about 100 base pairs, optionally a sequence of about 100 to about 200 base pairs, optionally a sequence of about 200 to about 500, and optionally a sequence of about 500 to about 1000 or more base pairs. Combined with the carrier dsRNA sequence, the dsRNA of the target sequence and the carrier dsRNA may have a total length of at least about 50 to about 100 base pairs, optionally a sequence of about 100 to about 200 base pairs, optionally a sequence of about 200 to about 500, and optionally a sequence of about 500 to about 1000 or more base pairs.

**[0062]** The dsRNA can contain known nucleotide analogs or modified backbone residues or linkages, which are synthetic, naturally occurring, and non-naturally occurring. Examples of such analogs include, without limitation, phosphorothioates, phosphoramidates, methyl phosphonates, chiral methyl phosphonates and 2-O-methyl ribonucleotides.

**[0063]** As used herein, the term "specifically reduce the level of a target RNA and/or the production of a target protein encoded by the RNA", and variations thereof, refers to the sequence of a portion of one strand of the dsRNA being sufficiently identical to the target RNA

such that the presence of the dsRNA in a cell reduces the steady state level and/or the production of said RNA. In many instances, the target RNA will be mRNA, and the presence of the dsRNA in a cell producing the mRNA will result in a reduction in the production of said protein. Preferably, this accumulation or production is reduced at least 10%, more preferably at least 50%, even more preferably at least 75%, yet even more preferably at least 95% and most preferably 100%, when compared to a wild-type cell which does not comprise the introduced dsRNA.

**[0064]** The consequences of inhibition can be confirmed by examination of the outward properties of the cell or organism or by biochemical techniques such as, but not limited to, Northern hybridization, reverse transcription, gene expression monitoring with a microarray, antibody binding, enzyme linked immunosorbent assay (ELISA), Western blotting, radioimmunoassay (RIA), and other immunoassays.

**[0065]** The interfering RNAs of the current invention may comprise one dsRNA or multiple dsRNAs, wherein each dsRNA comprises or consists of a sequence of nucleotides which is at least partially complementary to a target nucleotide sequence within the target gene and that functions upon uptake by an insect pest species to down-regulate expression of said target gene. Concatemeric RNA constructs of this type are described in WO2006/046148 (incorporated herein by reference). In the context of the present invention, the term 'multiple' means at least two, at least three, at least four, etc and up to at least 10, 15, 20 or at least 30. In one embodiment, the interfering RNA comprises multiple copies of a single dsRNA *i.e.* repeats of a dsRNA that binds to a particular target nucleotide sequence within a specific target gene. In another embodiment, the dsRNAs within the interfering RNA comprise or consist of different sequences of nucleotides complementary to different target nucleotide sequences, which may be to different fragments of the same gene or to different target genes. It should be clear that combinations of multiple copies of the same dsRNA combined with dsRNAs binding to different target nucleotide sequences are within the scope of the current invention.

**[0066]** The dsRNAs may be arranged as one contiguous region of the interfering RNA or may be separated by the presence of linker sequences. The linker sequence may comprise a short random nucleotide sequence that is not complementary to any target nucleotide

sequences or target genes. In one embodiment, the linker is a conditionally self-cleaving RNA sequence, preferably a pH-sensitive linker or a hydrophobic-sensitive linker. In one embodiment, the linker comprises a sequence of nucleotides equivalent to an intronic sequence. Linker sequences of the current invention may range in length from about 1 base pair to about 10000 base pairs, provided that the linker does not impair the ability of the interfering RNA to down-regulate the expression of target gene(s).

**[0067]** In addition to the dsRNA(s) and any linker sequences, the interfering RNA of the invention may comprise at least one additional polynucleotide sequence. In different embodiments of the invention, the additional sequence is chosen from (i) a sequence capable of protecting the interfering RNA against RNA processing, (ii) a sequence affecting the stability of the interfering RNA, (iii) a sequence allowing protein binding, for example to facilitate uptake of the interfering RNA by cells of the insect pest species, (iv) a sequence facilitating large-scale production of the interfering RNA, (v) a sequence which is an aptamer that binds to a receptor or to a molecule on the surface of the insect pest cells to facilitate uptake, or (vi) a sequence that catalyses processing of the interfering RNA within the insect pest cells and thereby enhances the efficacy of the interfering RNA. Structures for enhancing the stability of RNA molecules are well known in the art and are described further in WO2006/046148 as incorporated herein by reference.

**[0068]** The interfering RNA may contain DNA bases, non-natural bases or non-natural backbone linkages or modifications of the sugar-phosphate backbone, for example to enhance stability during storage or enhance resistance to degradation by nucleases. Furthermore, the interfering RNA may be produced chemically or enzymatically by one skilled in the art through manual or automated reactions. Alternatively, the interfering RNA may be transcribed from a polynucleotide encoding the same. Thus, provided herein is an isolated polynucleotide encoding any of the interfering RNAs of the current invention.

**[0069]** MicroRNAs (miRNAs) are non-protein coding RNAs, generally of between about 18 to about 25 nucleotides in length (commonly about 20-24 nucleotides in length in plants). These miRNAs direct cleavage in *trans* of target transcripts, negatively regulating the expression of genes involved in various regulation and development pathways (Bartel, *Cell*, 116:281-297

(2004); Zhang et al. *Dev. Biol.* 289:3-16 (2006)). As such, miRNAs have been shown to be involved in different aspects of plant growth and development as well as in signal transduction and protein degradation. In addition, small endogenous mRNAs including miRNAs may also be involved in biotic stress responses such as pathogen attack. Since the first miRNAs were discovered in plants (Reinhart et al. *Genes Dev.* 16:1616-1626 (2002), Park et al. *Curr. Biol.* 12:1484-1495 (2002)) many hundreds have been identified. Furthermore, many plant miRNAs have been shown to be highly conserved across very divergent taxa. (Floyd et al. *Nature* 428:485-486 (2004); Zhang et al. *Plant J.* 46:243-259 (2006)). Many microRNA genes (MIR genes) have been identified and made publicly available in a database (miRBase, available via the world wide web). miRNAs are also described in U.S. Patent Publications 2005/0120415 and 2005/0144669A1, the entire contents of which are incorporated by reference herein.

**[0070]** Genes encoding miRNAs yield primary miRNAs (termed a "pri-miRNA") of 70 to 300 bp in length that can form imperfect stem-loop structures. A single pri-miRNA may contain from one to several miRNA precursors. In animals, pri-miRNAs are processed in the nucleus into shorter hairpin RNAs of about 65 nt (pre-miRNAs) by the RNaseIII enzyme Drosha and its cofactor DGCR8/Pasha. The pre-miRNA is then exported to the cytoplasm, where it is further processed by another RNaseIII enzyme, Dicer, releasing a miRNA/miRNA\* duplex of about 22 nt in size. In contrast to animals, in plants, the processing of pri-miRNAs into mature miRNAs occurs entirely in the nucleus using a single RNaseIII enzyme, DCL1 (Dicer-like 1). (Zhu. *Proc. Natl. Acad. Sci.* 105:9851-9852 (2008)). Many reviews on microRNA biogenesis and function are available, for example, see, Bartel *Cell* 116:281-297 (2004), Murchison et al. *Curr. Opin. Cell Biol.* 16:223-229 (2004), Dugas et al. *Curr. Opin. Plant Biol.* 7:512-520 (2004) and Kim *Nature Rev. Mol. Cell Biol.* 6:376-385 (2005).

**[0071]** The term "plant microRNA precursor molecule" as used herein describes a small (~70-300 nt) non-coding RNA sequence that is processed by plant enzymes to yield a ~19-24 nucleotide product known as a mature microRNA sequence. The mature sequences have regulatory roles through complementarity to messenger RNA (mRNA). The term "artificial plant microRNA precursor molecule" describes the non-coding miRNA precursor sequence prior to processing that is employed as a backbone sequence for the delivery of a siRNA molecule via

substitution of the endogenous native miRNA/miRNA\* duplex of the miRNA precursor molecule with that of a non-native, heterologous miRNA (amiRNA/amiRNA\*; e.g. siRNA/siRNA\*) that is then processed into the mature miRNA sequence with the siRNA sequence.

**[0072]** In the context of the invention, the term "toxic" used to describe a dsRNA of the invention means that the dsRNA molecules of the invention and combinations of such dsRNA molecules function as orally active insect control agents that have a negative effect on an insect. When a composition of the invention is delivered to the insect, the result is typically death of the insect, or the insect does not feed upon the source that makes the composition available to the insect. Such a composition may be a transgenic plant expressing the dsRNA of the invention.

**[0073]** To "control" or "controlling" insects means to inhibit, through a toxic effect, the ability of one or more insect pests to survive, grow, feed, and/or reproduce, or to limit insect-related damage or loss in crop plants. To "control" insects may or may not mean killing the insects, although it preferably means killing the insects. A composition that controls a target insect has insecticidal activity against the target insect.

**[0074]** To "deliver" or "delivering" a composition or dsRNA means that the composition or dsRNA comes in contact with an insect, resulting in a toxic effect and control of the insect. The composition or dsRNA can be delivered in many recognized ways, e.g., orally by ingestion by the insect via transgenic plant expression, formulated composition(s), sprayable composition(s), a bait matrix, or any other art-recognized toxicant delivery system.

**[0075]** The term "insect" as used herein includes any organism now known or later identified that is classified in the animal kingdom, phylum Arthropoda, class Insecta, including but not limited to insects in the orders Coleoptera (beetles), Lepidoptera (moths, butterflies), Diptera (flies), Protura, Collembola (springtails), Diplura, Microcoryphia (jumping bristletails), Thysanura (bristletails, silverfish), Ephemeroptera (mayflies), Odonata (dragonflies, damselflies), Orthoptera (grasshoppers, crickets, katydids), Phasmatodea (walkingsticks), Grylloblattodea (rock crawlers), Mantophasmatodea, Dermaptera (earwigs), Plecoptera (stoneflies), Embioptera (web spinners), Zoraptera, Isoptera (termites), Mantodea (mantids), Blattodea (cockroaches), Hemiptera (true bugs, cicadas, leafhoppers, aphids, scales),

Thysanoptera (thrips), Psocoptera (book and bark lice), Phthiraptera (lice; including but not limited to suborders Amblycera, Ischnocera and Anoplura), Neuroptera (lacewings, owlflies, mantispids, antlions), Hymenoptera (bees, ants, wasps), Trichoptera (caddisflies), Siphonaptera (fleas), Mecoptera (scorpion flies), Strepsiptera (twisted-winged parasites), and any combination thereof.

**[0076]** As used herein, the terms "hemipteran insect" or "hemipteran pest" refer to insects of the order hemipteran: heteroptera and include but are not limited to the families Pentatomidae, Miridae, Pyrrhocoridae, Coreidae, Alydidae, and Rhopalidae, which feed on a wide range of host plants and have piercing and sucking mouth parts. In particular examples, a hemipteran pest is selected from the list comprising *Euschistus* spp. (for example *E. servus* (Brown Stink Bug), *E. heros* (Neotropical Brown Stink Bug)), *Nezara* spp. (for example *N. antennata*, *N. hilare*, and *N. viridula* (Southern Green Stink Bug)), *Piezodorus* spp. (for example *P. guildinii* (Red-banded Stink Bug)), *Halyomorpha* spp. (for example *H. halys* (Brown Marmorated Stink Bug)), *Chinavia* spp. (for example *C. marginatum*, *C. hilare* (Green Stink Bug)), *Dichelops* spp. (for example *D. melacanthus*, *Dichelops furcatus*), *Edessa* spp. (for example *E. meditabunda*), *Thyanta* spp. (for example *T. perditor* (Neotropical Red Shouldered Stink Bug)), *Horcias* spp. (for example *H. nobilellus* (Cotton Bug)), *Taedia* spp. for example *T. stigmosa*), *Dysdercus* spp. (for example *D. peruvianus*), *Neomegalotomus* spp. (for example *N. parvus*), *Leptoglossus* spp. (for example *L. zonatus*), *Niesthrea* spp. (for example *N. sidae*), *Eurygaster* spp. (for example *E. intergriceps*, *E. maura*), *Oebalus* spp. (for example *O. mexicana*, *O. poecilus*, and *O. pugnase*) *Scotinophara* spp. (for example *S. lurida*, *S. coarctata*), and *Lygus* spp. (for example *L. hesperus* (Western Tarnished Plant Bug), *L. lineolaris*).

**[0077]** As used herein, the term "Pentatomidae plant pest" is used to refer to any member of the Pentatomidae family. Accordingly, the compositions and methods are also useful in protecting plants against any Pentatomidae plant pest including representative genera and species such as, but not limited to, *Acrocorisellus* (*A. serraticollis*), *Acrosternum* (*A. adelpha*, *A. hilare*, *A. herbidum*, *A. scutellatum*), *Agonoscelis* (*A. nubila*), *Alcaeorrhynchus* (*A. grandis*, *A. phymatophorus*), *Amaurochrous* (*A. brevitylus*), *Apateticus* (*A. anataris*, *A. bracteatus*, *A. cynicus*, *A. lineolatus*, *A. marginiventris*), *Apoecilus*, *Arma* (*A. custos*), *Arvelius*, *Bagrada*, *Banasa*

(*B. calva*, *B. dimiata*, *B. grisea*, *B. induta*, *B. sordida*), *Brochymena* (*B. ajjnnis*, *B. cariosa*, *B. haedula*, *B. hoppingi*, *B. sulcata*), *Carbula* (*C. obtusangula*, *C. sinica*), *Chinavia*, *Chlorochroa* (*C. belfragii*, *C. kanej*, *C. norlandi*, *C. senilis*, *C. viridicatá*), *Chlorocoris* (*C. distinctus*, *C. flaviviridis*, *C. hebetatus*, *C. subrugosus*, *C. tau*), *Codophila* (*C. remota*, *C. sulcata*, *C. varius*), *Coenus* (*C. delius*, *C. inermis*, *C. tarsalis*), *Cosmopepla* (*C. bimaculata*, *C. binotata*, *C. carnifex*, *C. decorata*, *C. intergressus*), *Dalpada* (*D. oculata*), *Dendrocoris* (*D. arizonensis*, *D. fruticicola*, *D. humeralis*, *D. parapini*, *D. reticulatus*), *Dolycoris* (*D. baccarum* (sloe bug)), *Dybowskyia* (*D. reticulata*), *Edessa*, *Erthesina* (*E. fullo*), *Eurydema* (*E. dominulus*, *E. gebleri* (shield bug), *E. pulchra*, *E. rugosa*), *Euschistus* (*E. biformis*, *E. integer*, *E. quadrator*, *E. servus*, *E. tristigma*), *Euthyrhynchus* (*E. floridanus*, *E. macronemis*), *Gonopsis* (*G. coccinea*), *Graphosoma* (*G. lineatum* (stink bug), *G. rubrolineatum*), *Elalyomorpha* (*El. halys* (brown marmorated stink bug)), *Elalys* (*El. sindillus*, *H. sulcatus*), *Holcostethus* (*H. abbreviate*, *H. fulvipes*, *H. limbolarius*, *H. piceus*, *H. sphacelatus*), *Homalogonia* (*H. obtusa*), *Hymenarcys* (*H. aequalis*, *H. crassa*, *H. nervosa*, *H. perpuncata*, *H. reticulata*), *Lelia* (*L. decempunctata*), *Lineostethus*, *Loxa* (*L. flavicollis*, *L. viridis*), *Mecidea* (*M. indicia*, *M. major*, *M. minor*), *Megarrhamphus* (*M. hastatus*), *Menecles* (*M. insertus*, *M. portacrus*), *Mormidea* (*M. cubrosa*, *M. lugens*, *M. pama*, *M. pictiventris*, *M. ypsilon*), *Moromorpha* (*M. tetra*), *Murgantia* (*M. angularis*, *M. tessellata*, *M. varicolor*, *M. violascens*), *Neottiglossa* (*N. californica*, *N. cavifrons*, *N. coronaciliata*, *N. sulcifrons*, *N. undata*), *Nezara* (*N. smaragdulus*, *N. viridula* (southern green stink bug)), *Oebalus* (*O. grisescens*, *O. insularis*, *O. mexicanus*, *O. pugnax*, *O. typhoeus*), *Oechalia* (*O. schellenbergii* (spined predatory shield bug)), *Okeanos* (*O. quelpartensis*), *Oplomus* (*O. catena*, *O. dichrous*, *O. tripustulatus*), *Palomena* (*P. prasina* (green shield bug)), *Parabrochymena*, *Pentatoma* (*P. angulata*, *P. illuminata*, *P. japonica*, *P. kunmingensis*, *P. metallifera*, *P. parataibaiensis*, *P. rufipes*, *P. semiannulata*, *P. viridicornuta*), *Perillus* (*P. bioculatus*, *P. confluens*, *P. strigipes*), *Picromerus* (*P. griseus*), *Piezodorus* (*P. degeeri*, *P. guildinii*, *P. lituratus* (gorse shield bug)), *Pinthaeus* (*P. humeralis*), *Plautia* (*P. crossota*, *P. stali* (brown-winged green bug)), *Podisus* (*P. maculiventris*), *Priassus* (*P. testaceus*), *Prionosoma*, *Proxys* (*P. albopunctulatus*, *P. punctulatus*, *P. victor*), *Rhaphigaster* (*R. nebulosa*), *Scotinophara* (*S. horvathi*), *Stiretrus* (*S. anchorage*, *S. fimbriatus*), *Thyanta* (*T. accerra*,

*T. calceata*, *T. casta*, *T. perditor*, *T. pseudocasta*), *Trichopepla* (*T. aurora*, *T. dubia*, *T. pilipes*, *T. semivittata*, *T. vandykei*), *Tylospilus*, and *Zicrona*.

**[0078]** “Effective insect-controlling amount” means that concentration of dsRNA that inhibits, through a toxic effect, the ability of insects to survive, grow, feed and/or reproduce, or to limit insect-related damage or loss in crop plants. “Effective insect-controlling amount” may or may not mean a concentration that kills the insects, although it preferably means that it kills the insects. In some embodiments, application of an insecticidally effective amount of the polynucleotide, such as a dsRNA molecule, to a plant improves the plant's resistance to infestation by the insect. In some embodiments, application of an insecticidally effective amount of the polynucleotide, such as a dsRNA molecule, to a crop plant improves yield (*e.g.*, increased biomass, increased seed or fruit production, or increased oil, starch, sugar, or protein content) of that crop plant, in comparison to a crop plant not treated with the polynucleotide. While there is no upper limit on the concentrations and dosages of a polynucleotide as described herein that can be useful in the methods and compositions provided herein, lower effective concentrations and dosages will generally be sought for efficiency and economy.

**[0079]** Non-limiting embodiments of effective amounts of a polynucleotide include a range from about 10 nano grams per milliliter to about 100 micrograms per milliliter of a polynucleotide in a liquid form sprayed on a plant, or from about 10 milligrams per acre to about 100 grams per acre of polynucleotide applied to a field of plants, or from about 0.001 to about 0.1 microgram per milliliter of polynucleotide in an artificial diet for feeding the insect. Where compositions as described herein are topically applied to a plant, the concentrations can be adjusted in consideration of the volume of spray or treatment applied to plant leaves or other plant part surfaces, such as flower petals, stems, tubers, fruit, anthers, pollen, leaves, roots, or seeds. In one embodiment, a useful treatment for herbaceous plants using 25-mer polynucleotides is about 1 nanomole (nmol) of polynucleotides per plant, for example, from about 0.05 to 1 nmol polynucleotides per plant. Other embodiments for herbaceous plants include useful ranges of about 0.05 to about 100 nmol, or about 0.1 to about 20 nmol, or about 1 nmol to about 10 nmol of polynucleotides per plant. In certain embodiments, about 40 to about 50 nmol of a single-stranded polynucleotide as described herein are applied. In certain

embodiments, about 0.5 nmol to about 2 nmol of a dsRNA as described herein is applied. In certain embodiments, a composition containing about 0.5 to about 2.0 milligrams per milliliter, or about 0.14 milligrams per milliliter of a dsRNA (or a single-stranded 21-mer) as described herein is applied. In certain embodiments, a composition of about 0.5 to about 1.5 milligrams per milliliter of a dsRNA polynucleotide as described herein of about 50 to about 200 or more nucleotides is applied. In certain embodiments, about 1 nmol to about 5 nmol of a dsRNA as described herein is applied to a plant. In certain embodiments, the polynucleotide composition as topically applied to the plant contains at least one polynucleotide as described herein at a concentration of about 0.01 to about 10 milligrams per milliliter, or about 0.05 to about 2 milligrams per milliliter, or about 0.1 to about 2 milligrams per milliliter. Very large plants, trees, or vines can require correspondingly larger amounts of polynucleotides. When using long dsRNA molecules that can be processed into multiple oligonucleotides (*e.g.*, multiple triggers encoded by a single recombinant DNA molecule as disclosed herein) lower concentrations can be used. Non-limiting examples of effective polynucleotide treatment regimes include a treatment of between about 0.1 to about 1 nmol of polynucleotide molecule per plant, or between about 1 nmol to about 10 nmol of polynucleotide molecule per plant, or between about 10 nmol to about 100 nmol of polynucleotide molecule per plant.

**[0080]** The term “agrochemically active ingredient” refers to chemicals and/or biological compositions, such as those described herein, which are effective in killing, preventing, or controlling the growth of undesirable pests, such as, plants, insects, mice, microorganism, algae, fungi, bacteria, and the like (such as pesticidally active ingredients). An interfering RNA molecule of the invention is an agrochemically active ingredient.

**[0081]** An “agriculturally acceptable carrier” includes adjuvants, mixers, enhancers, etc. beneficial for application of an active ingredient, such as an interfering RNA molecule of the invention. Suitable carriers should not be phytotoxic to valuable crops, particularly at the concentrations employed in applying the compositions in the presence of crops, and should not react chemically with the compounds of the active ingredient herein, namely an interfering RNA of the invention, or other composition ingredients. Such mixtures can be designed for application directly to crops, or can be concentrates or formulations which are normally diluted

with additional carriers and adjuvants before application. They may include inert or active components and can be solids, such as, for example, dusts, granules, water dispersible granules, or wettable powders, or liquids, such as, for example, emulsifiable concentrates, solutions, emulsions or suspensions. Suitable agricultural carriers may include liquid carriers, for example water, toluene, xylene, petroleum naphtha, crop oil, acetone, methyl ethyl ketone, cyclohexanone, trichloroethylene, perchloroethylene, ethyl acetate, amyl acetate, butyl acetate, propylene glycol monomethyl ether and diethylene glycol monomethyl ether, methanol, ethanol, isopropanol, amyl alcohol, ethylene glycol, propylene glycol, glycerine, and the like. Water is generally the carrier of choice for the dilution of concentrates. Suitable solid carriers may include talc, pyrophyllite clay, silica, attapulugus clay, kieselguhr, chalk, diatomaceous earth, lime, calcium carbonate, bentonire clay, Fuller's earth, cotton seed hulls, wheat flour, soybean flour, pumice, wood flour, walnut shell flour, lignin, and the like.

**[0082]** It is recognized that the polynucleotides comprising sequences encoding the silencing element can be used to transform organisms to provide for host organism production of these components, and further used for subsequent application of the host organism to the environment of the target pest(s). In this manner, the combination of polynucleotides encoding the silencing element may be introduced via a suitable vector into a microbial host, and said host applied to the environment, or to plants or animals.

**[0083]** For the present invention, the microbial host may be considered an agriculturally acceptable carrier for an interfering RNA molecule of the invention, which is the insect control agent. The microbial host may be non-pathogenic, attenuated, or heat-inactivated strains of microorganisms, or compositions derived therefrom. The microbial host may be microorganisms including bacteria, algae, and fungi. . The microorganisms may be engineered to express a nucleotide sequence of a target gene to produce interfering RNA molecules comprising RNA sequences homologous or complementary to RNA sequences typically found within the cells of an insect. Exposure of the insects to the microorganisms results in ingestion of the microorganisms and down-regulation of expression of target genes mediated directly or indirectly by the interfering RNA molecules or fragments or derivatives thereof.

**[0084]** Further, microbial hosts that are known to occupy the “phytosphere” (phylloplane, phyllosphere, rhizosphere, and/or rhizoplane) of one or more crops of interest may be selected. These microorganisms are selected so as to be capable of successfully competing in the particular environment with the wild-type microorganisms, provide for stable maintenance and expression of the sequences encoding the interfering RNA molecule of the invention, and desirably, provide for improved protection of the components from environmental degradation and inactivation.

**[0085]** Of particular interest are microorganisms such as bacteria, e.g., *Pseudomonas*, *Erwinia*, *Serratia*, *Klebsiella*, *Escherichia*, *Xanthomonas*, *Streptomyces*, *Rhizobium*, *Rhodopseudomonas*, *Methylius*, *Agrobacterium*, *Acetobacter*, *Lactobacillus*, *Arthrobacter*, *Azotobacter*, *Leuconostoc*, and *Alcaligenes*; fungi, particularly yeast, e.g., *Saccharomyces*, *Cryptococcus*, *Kluyveromyces*, *Sporobolomyces*, *Rhodotorula*, and *Aureobasidium*. Of particular interest are such phytosphere bacterial species as *Pseudomonas syringae*, *Pseudomonas fluorescens*, *Serratia marcescens*, *Acetobacter xylinum*, *Agrobacteria spp.*, *Rhodopseudomonas spheroides*, *Xanthomonas campestris*, *Rhizobium melioli*, *Alcaligenes entrophus*, *Clavibacter xyli* and *Azotobacter vinlandir*, and phytosphere yeast species such as *Rhodotorula rubra*, *R. glutinis*, *R. marina*, *R. aurantiaca*, *Cryptococcus albidus*, *C. diffluens*, *C. laurentii*, *Saccharomyces rosei*, *S. pretoriensis*, *S. cerevisiae*, *Sporobolomyces rosues*, *S. odor*, *Kluyveromyces veronae*, and *Aureobasidium pollulans*.

**[0086]** A number of ways are available for introducing the polynucleotide comprising the silencing element into the microbial host under conditions that allow for stable maintenance and expression of such nucleotide encoding sequences. For example, expression cassettes can be constructed which include the nucleotide constructs of interest operably linked with the transcriptional and translational regulatory signals for expression of the nucleotide constructs, and a nucleotide sequence homologous with a sequence in the host organism, whereby integration will occur, and/or a replication system that is functional in the host, whereby integration or stable maintenance will occur.

**[0087]** Transcriptional and translational regulatory signals include, but are not limited to, promoters, transcriptional initiation start sites, operators, activators, enhancers, other

regulatory elements, ribosomal binding sites, an initiation codon, termination signals, and the like. Methods for the production of expression constructs comprising such regulatory signals are well known in the art; see for example Sambrook et al. (2000); Molecular Cloning: A Laboratory Manual (3rd ed.; Cold Spring Harbor Laboratory Press, Plainview, N.Y.); Davis et al. (1980) Advanced Bacterial Genetics (Cold Spring Harbor Laboratory, Cold Spring Harbor, N.Y.); and the references cited therein.

**[0088]** Suitable host cells include the prokaryotes and the lower eukaryotes, such as fungi. Illustrative prokaryotes, both Gram-negative and Gram-positive, include Enterobacteriaceae, such as *Escherichia*, *Erwinia*, *Shigella*, *Salmonella*, and *Proteus*; Bacillaceae; Rhizobiceae, such as *Rhizobium*; Spirillaceae, such as photobacterium, *Zymomonas*, *Serratia*, *Aeromonas*, *Vibrio*, *Desulfovibrio*, *Spirillum*; Lactobacillaceae; Pseudomonadaceae, such as *Pseudomonas* and *Acetobacter*; Azotobacteraceae and Nitrobacteraceae. Among eukaryotes are fungi, such as *Phycomycetes* and *Ascomycetes*, which includes yeast such as *Saccharomyces* and *Schizosaccharomyces*; and *Basidiomycetes* yeast, such as *Rhodotorula*, *Aureobasidium*, *Sporobolomyces*, and the like.

**[0089]** Characteristics of particular interest in selecting a host cell for purposes of the invention include ease of introducing the coding sequence into the host, availability of expression systems, efficiency of expression, RNA stability in the host, and the presence of auxiliary genetic capabilities. Characteristics of interest for use as a pesticide microcapsule include protective qualities, such as thick cell walls, pigmentation, and intracellular packaging or formation of inclusion bodies ; leaf affinity; lack of mammalian toxicity; attractiveness to pests for ingestion; and the like. Other considerations include ease of formulation and handling, economics, storage stability, and the like.

**[0090]** Host organisms of particular interest include yeast, such as *Rhodotorula* spp., *Aureobasidium* spp., *Saccharomyces* spp., and *Sporobolomyces* spp., phylloplane organisms such as *Pseudomonas* spp., *Erwinia* spp., and *Flavobacterium* spp., and other such organisms, including *Pseudomonas aeruginosa*, *Pseudomonas fluorescens*, *Saccharomyces cerevisiae*, *Bacillus thuringiensis*, *Escherichia coli*, *Bacillus subtilis*, and the like.

**[0091]** The sequences encoding the interfering RNA molecules encompassed by the invention can be introduced into microorganisms that multiply on plants (epiphytes) to deliver these components to potential target pests. Epiphytes, for example, can be gram-positive or gram-negative bacteria.

**[0092]** An interfering RNA molecule of the invention can be fermented in a bacterial host and the resulting bacteria processed, and used as a microbial spray in the same manner that *Bacillus thuringiensis* strains have been used as insecticidal sprays. Any suitable microorganism can be used for this purpose. *Pseudomonas* spp. have been used to express *Bacillus thuringiensis* endotoxins as encapsulated proteins and the resulting cells processed and sprayed as an insecticide (Gaertner et al. 1993. *Advanced Engineered Pesticides*, ed. L. Kim (Marcel Decker, Inc.). *E. coli* is also well-known in the art for expressing molecules of interest as part during a fermentation process. In some embodiments, the resulting bacteria is processed by heat inactivation. In some embodiments, heat inactivation kills the bacteria but does not degrade the produced RNA molecules. The resulting compositions may then be formulated in accordance with conventional techniques for application to the environment hosting a target pest, e.g., soil, water, and foliage of plants.

**[0093]** The transformed microorganisms carrying an interfering RNA molecule of the invention may also be referred to as insect control agents. The microorganisms may be engineered to express a nucleotide sequence of a target gene to produce interfering RNA molecules comprising RNA sequences homologous or complementary to RNA sequences typically found within the cells of an insect. Exposure of the insects to the microorganisms result in ingestion of the microorganisms and down-regulation of expression of target genes mediated directly or indirectly by the interfering RNA molecules or fragments or derivatives thereof.

**[0094]** In the present invention, a transformed microorganism can be formulated with an agriculturally acceptable carrier into separate or combined compositions that are, for example, a suspension, a solution, an emulsion, a dusting powder, a dispersible granule, a wettable powder, and an emulsifiable concentrate, an aerosol, an impregnated granule, an adjuvant, a coatable paste, and also encapsulations in, for example, polymer substances.

**[0095]** Such compositions disclosed above may be obtained by the addition of a surface-active agent, an inert carrier, a preservative, a humectant, a feeding stimulant, an attractant, an encapsulating agent, a binder, an emulsifier, a dye, a UV protectant, a buffer, a flow agent or fertilizers, micronutrient donors, or other preparations that influence plant growth. One or more agrochemicals including, but not limited to, herbicides, insecticides, fungicides, bactericides, nematocides, molluscicides, acaricides, plant growth regulators, harvest aids, and fertilizers, can be combined with carriers, surfactants or adjuvants customarily employed in the art of formulation or other components to facilitate product handling and application for particular target pests. Suitable carriers and adjuvants can be solid or liquid and correspond to the substances ordinarily employed in formulation technology, e.g., natural or regenerated mineral substances, solvents, dispersants, wetting agents, tackifiers, binders, or fertilizers. The active ingredients of the present invention (i.e., at least one interfering RNA molecule) are normally applied in the form of compositions and can be applied to the crop area, plant, or seed to be treated. For example, the compositions may be applied to grain in preparation for or during storage in a grain bin or silo, etc. The compositions may be applied simultaneously or in succession with other compounds. Methods of applying an active ingredient or a composition that contains at least one interfering RNA molecule include, but are not limited to, foliar application, seed coating, and soil application. The number of applications and the rate of application depend on the intensity of infestation by the corresponding pest.

**[0096]** To apply a compound of the invention as an insecticide, acaricide, nematocide or molluscicide to a pest, a locus of pest, or to a plant susceptible to attack by a pest, compounds of the invention are usually formulated into a composition which includes, in addition to the compound of the invention, a suitable inert diluent or carrier and, optionally, a surface active agent (SFA). SFAs are chemicals which are able to modify the properties of an interface (for example, liquid/solid, liquid/air or liquid/liquid interfaces) by lowering the interfacial tension and thereby leading to changes in other properties (for example dispersion, emulsification and wetting). It is preferred that all compositions (both solid and liquid formulations) comprise, by weight, 0.0001 to 95%, more preferably 1 to 85%, for example 5 to 60%, of a compound of the invention. The composition is generally used for the control of pests such that a compound of

the invention is applied at a rate of from 0.1g to 10kg per hectare, preferably from 1g to 6kg per hectare, more preferably from 1g to 1kg per hectare.

**[0097]** Suitable surface-active agents include, but are not limited to, anionic compounds such as a carboxylate of, for example, a metal; carboxylate of a long chain fatty acid; an N-acylsarcosinate; mono- or di-esters of phosphoric acid with fatty alcohol ethoxylates or salts of such esters; fatty alcohol sulfates such as sodium dodecyl sulfate, sodium octadecyl sulfate, or sodium cetyl sulfate; ethoxylated fatty alcohol sulfates; ethoxylated alkylphenol sulfates; lignin sulfonates; petroleum sulfonates; alkyl aryl sulfonates such as alkylbenzene sulfonates or lower alkyl naphthalene sulfonates, e.g., butyl-naphthalene sulfonate; salts of sulfonated naphthaleneformaldehyde condensates; salts of sulfonated phenol-formaldehyde condensates; more complex sulfonates such as the amide sulfonates, e.g., the sulfonated condensation product of oleic acid and N-methyl taurine; or the dialkyl sulfosuccinates, e.g., the sodium sulfonate or dioctyl succinate. Nonionic agents include condensation products of fatty acid esters, fatty alcohols, fatty acid amides or fatty-alkyl- or alkenyl-substituted phenols with ethylene oxide, fatty esters of polyhydric alcohol ethers, e.g., sorbitan fatty acid esters, condensation products of such esters with ethylene oxide, e.g., polyoxyethylene sorbitan fatty acid esters, block copolymers of ethylene oxide and propylene oxide, acetylenic glycols such as 2,4,7,9-tetraethyl-5-decyn-4,7-diol, or ethoxylated acetylenic glycols. Examples of a cationic surface-active agent include, for instance, an aliphatic mono-, di-, or polyamine such as an acetate, naphthenate or oleate; or oxygen-containing amine such as an amine oxide of polyoxyethylene alkylamine; an amide-linked amine prepared by the condensation of a carboxylic acid with a di- or polyamine; or a quaternary ammonium salt.

**[0098]** Examples of inert materials include, but are not limited to inorganic minerals such as kaolin, phyllosilicates, carbonates, sulfates, phosphates, or botanical materials such as cork, powdered corncobs, peanut hulls, rice hulls, and walnut shells.

**[0099]** The compositions comprising an interfering RNA molecule of the invention can be in a suitable form for direct application or as a concentrate of primary composition that requires dilution with a suitable quantity of water or other dilutant before application. The compositions (including the transformed microorganisms) can be applied to the environment of

an insect pest (such as a hemipteran insect) by, for example, spraying, atomizing, dusting, scattering, coating or pouring, introducing into or on the soil, introducing into irrigation water, by seed treatment or general application or dusting at the time when the pest has begun to appear or before the appearance of pests as a protective measure. For example, the composition(s) and/or transformed microorganism(s) may be mixed with grain to protect the grain during storage. It is generally important to obtain good control of pests in the early stages of plant growth, as this is the time when the plant can be most severely damaged.

**[0100]** Application of the compounds of the invention is preferably to a crop of soybean plants, the locus thereof (for example, a field where the soybean plants are or will be planted or where soybean seeds are or will be planted), or propagation material thereof. Preferably application is to a crop of soybean plants or the locus thereof, more preferably to a crop of soybean plants. Application may be before infestation or when the pest is present. Application of the compounds of the invention can be performed according to any of the usual modes of application, e.g. foliar, drench, soil, in furrow etc. However, control of stinkbugs is usually achieved by foliar application, which is the preferred mode of application according to the invention.

**[0101]** The compounds of the invention may be applied in combination with an attractant. An attractant is a chemical that causes the insect to migrate towards the location of application. For control of stinkbugs it can be advantageous to apply the compounds of the invention with an attractant, particularly when the application is foliar. Stinkbugs are often located near to the ground, and application of an attractant may encourage migration up the plant towards the active ingredient. Suitable attractants include glucose, sacchrose, salt, glutamate (e.g. Aji-no-moto™), citric acid (e.g. Orobor™), soybean oil, peanut oil and soybean milk. Glutamate and citric acid are of particular interest, with citric acid being preferred.

**[0102]** An attractant may be premixed with the compound of the invention prior to application, e.g. as a readymix or tankmix, or by simultaneous application or sequential application to the plant. Suitable rates of attractants are for example 0.02kg/ha-3kg/ha.

**[0103]** The compositions can conveniently contain another insecticide if this is thought necessary. In an embodiment of the invention, the composition(s) is applied directly to the soil,

at a time of planting, in granular form of a composition of a carrier and dead cells of a *Bacillus* strain or transformed microorganism of the invention. Another embodiment is a granular form of a composition comprising an agrochemical such as, for example, a herbicide, an insecticide, a fertilizer, in an inert carrier, and dead cells of a *Bacillus* strain or live or dead cells of transformed microorganisms of the invention.

**[0104]** In another embodiment, the interfering RNA molecules may be encapsulated in a synthetic matrix such as a polymer and applied to the surface of a host such as a plant. Ingestion of the host cells by an insect permits delivery of the insect control agents to the insect and results in down-regulation of a target gene in the host.

**[0105]** A composition of the invention, for example a composition comprising an interfering RNA molecule of the invention and an agriculturally acceptable carrier, may be used in conventional agricultural methods. For example, the compositions of the invention may be mixed with water and/or fertilizers and may be applied preemergence and/or postemergence to a desired locus by any means, such as airplane spray tanks, irrigation equipment, direct injection spray equipment, knapsack spray tanks, cattle dipping vats, farm equipment used in ground spraying (e.g., boom sprayers, hand sprayers), and the like. The desired locus may be soil, plants, and the like.

**[0106]** A composition of the invention may be applied to a seed or plant propagule in any physiological state, at any time between harvest of the seed and sowing of the seed; during or after sowing; and/or after sprouting. It is preferred that the seed or plant propagule be in a sufficiently durable state that it incurs no or minimal damage, including physical damage or biological damage, during the treatment process. A formulation may be applied to the seeds or plant propagules using conventional coating techniques and machines, such as fluidized bed techniques, the roller mill method, rotostatic seed treaters, and drum coaters.

**[0107]** When used in a seed dressing, a compound of the invention is used at a rate of 0.0001g to 10g (for example 0.001g or 0.05g), preferably 0.005g to 10g, more preferably 0.005g to 4g, per kilogram of seed.

**[0108]** Compositions comprising a compound of the invention can be chosen from a number of formulation types, including dustable powders (DP), soluble powders (SP), water

soluble granules (SG), water dispersible granules (WG), wettable powders (WP), granules (GR) (slow or fast release), soluble concentrates (SL), oil miscible liquids (OL), ultra low volume liquids (UL), emulsifiable concentrates (EC), dispersible concentrates (DC), emulsions (both oil in water (EW) and water in oil (EO)), micro-emulsions (ME), suspension concentrates (SC), aerosols, fogging/smoke formulations, capsule suspensions (CS) and seed treatment formulations. The formulation type chosen in any instance will depend upon the particular purpose envisaged and the physical, chemical and biological properties of the compound of the invention.

**[0109]** Dustable powders (DP) may be prepared by mixing a compound of the invention with one or more solid diluents (for example natural clays, kaolin, pyrophyllite, bentonite, alumina, montmorillonite, kieselguhr, chalk, diatomaceous earths, calcium phosphates, calcium and magnesium carbonates, sulfur, lime, flours, talc and other organic and inorganic solid carriers) and mechanically grinding the mixture to a fine powder.

**[0110]** Soluble powders (SP) may be prepared by mixing a compound of the invention with one or more water-soluble inorganic salts (such as sodium bicarbonate, sodium carbonate or magnesium sulfate) or one or more water-soluble organic solids (such as a polysaccharide) and, optionally, one or more wetting agents, one or more dispersing agents or a mixture of said agents to improve water dispersibility/solubility. The mixture is then ground to a fine powder. Similar compositions may also be granulated to form water soluble granules (SG).

**[0111]** Wettable powders (WP) may be prepared by mixing a compound of the invention with one or more solid diluents or carriers, one or more wetting agents and, preferably, one or more dispersing agents and, optionally, one or more suspending agents to facilitate the dispersion in liquids. The mixture is then ground to a fine powder. Similar compositions may also be granulated to form water dispersible granules (WG).

**[0112]** Granules (GR) may be formed either by granulating a mixture of a compound of the invention and one or more powdered solid diluents or carriers, or from pre-formed blank granules by absorbing a compound of the invention (or a solution thereof, in a suitable agent) in a porous granular material (such as pumice, attapulgite clays, fuller's earth, kieselguhr, diatomaceous earths or ground corn cobs) or by adsorbing a compound of the invention (or a

solution thereof, in a suitable agent) on to a hard core material (such as sands, silicates, mineral carbonates, sulfates or phosphates) and drying if necessary. Agents which are commonly used to aid absorption or adsorption include solvents (such as aliphatic and aromatic petroleum solvents, alcohols, ethers, ketones and esters) and sticking agents (such as polyvinyl acetates, polyvinyl alcohols, dextrans, sugars and vegetable oils). One or more other additives may also be included in granules (for example an emulsifying agent, wetting agent or dispersing agent).

**[0113]** Dispersible Concentrates (DC) may be prepared by dissolving a compound of the invention in water or an organic solvent, such as a ketone, alcohol or glycol ether. These solutions may contain a surface active agent (for example to improve water dilution or prevent crystallization in a spray tank).

**[0114]** Emulsifiable concentrates (EC) or oil-in-water emulsions (EW) may be prepared by dissolving a compound of the invention in an organic solvent (optionally containing one or more wetting agents, one or more emulsifying agents or a mixture of said agents). Suitable organic solvents for use in ECs include aromatic hydrocarbons (such as alkylbenzenes or alkylnaphthalenes, exemplified by SOLVESSO 100, SOLVESSO 150 and SOLVESSO 200; SOLVESSO is a Registered Trade Mark), ketones (such as cyclohexanone or methylcyclohexanone) and alcohols (such as benzyl alcohol, furfuryl alcohol or butanol), *N*-alkylpyrrolidones (such as *N*-methylpyrrolidone or *N*-octylpyrrolidone), dimethyl amides of fatty acids (such as C<sub>8</sub>-C<sub>10</sub> fatty acid dimethylamide) and chlorinated hydrocarbons. An EC product may spontaneously emulsify on addition to water, to produce an emulsion with sufficient stability to allow spray application through appropriate equipment. Preparation of an EW involves obtaining a compound of the invention either as a liquid (if it is not a liquid at room temperature, it may be melted at a reasonable temperature, typically below 70°C) or in solution (by dissolving it in an appropriate solvent) and then emulsifying the resultant liquid or solution into water containing one or more SFAs, under high shear, to produce an emulsion. Suitable solvents for use in EWs include vegetable oils, chlorinated hydrocarbons (such as chlorobenzenes), aromatic solvents (such as alkylbenzenes or alkylnaphthalenes) and other appropriate organic solvents which have a low solubility in water.

**[0115]** Microemulsions (ME) may be prepared by mixing water with a blend of one or more solvents with one or more SFAs, to produce spontaneously a thermodynamically stable isotropic liquid formulation. A compound of the invention is present initially in either the water or the solvent/SFA blend. Suitable solvents for use in MEs include those hereinbefore described for use in ECs or in EWs. An ME may be either an oil-in-water or a water-in-oil system (which system is present may be determined by conductivity measurements) and may be suitable for mixing water-soluble and oil-soluble pesticides in the same formulation. An ME is suitable for dilution into water, either remaining as a microemulsion or forming a conventional oil-in-water emulsion.

**[0116]** Suspension concentrates (SC) may comprise aqueous or non-aqueous suspensions of finely divided insoluble solid particles of a compound of the invention. SCs may be prepared by ball or bead milling the solid compound of the invention in a suitable medium, optionally with one or more dispersing agents, to produce a fine particle suspension of the compound. One or more wetting agents may be included in the composition and a suspending agent may be included to reduce the rate at which the particles settle. Alternatively, a compound of the invention may be dry milled and added to water, containing agents hereinbefore described, to produce the desired end product.

**[0117]** Aerosol formulations comprise a compound of the invention and a suitable propellant (for example *n*-butane). A compound of the invention may also be dissolved or dispersed in a suitable medium (for example water or a water miscible liquid, such as *n*-propanol) to provide compositions for use in non-pressurized, hand-actuated spray pumps.

**[0118]** A compound of the invention may be mixed in the dry state with a pyrotechnic mixture to form a composition suitable for generating, in an enclosed space, a smoke containing the compound.

**[0119]** Capsule suspensions (CS) may be prepared in a manner similar to the preparation of EW formulations but with an additional polymerization stage such that an aqueous dispersion of oil droplets is obtained, in which each oil droplet is encapsulated by a polymeric shell and contains a compound of the invention and, optionally, a carrier or diluent therefor. The polymeric shell may be produced by either an interfacial polycondensation

reaction or by a coacervation procedure. The compositions may provide for controlled release of the compound of the invention and they may be used for seed treatment. A compound of the invention may also be formulated in a biodegradable polymeric matrix to provide a slow, controlled release of the compound.

**[0120]** A composition may include one or more additives to improve the biological performance of the composition (for example by improving wetting, retention or distribution on surfaces; resistance to rain on treated surfaces; or uptake or mobility of a compound of the invention). Such additives include surface active agents, spray additives based on oils, for example certain mineral oils or natural plant oils (such as soy bean and rape seed oil), and blends of these with other bio-enhancing adjuvants (ingredients which may aid or modify the action of a compound of the invention).

**[0121]** A compound of the invention may also be formulated for use as a seed treatment, for example as a powder composition, including a powder for dry seed treatment (DS), a water soluble powder (SS) or a water dispersible powder for slurry treatment (WS), or as a liquid composition, including a flowable concentrate (FS), a solution (LS) or a capsule suspension (CS). The preparations of DS, SS, WS, FS and LS compositions are very similar to those of, respectively, DP, SP, WP, SC and DC compositions described above. Compositions for treating seed may include an agent for assisting the adhesion of the composition to the seed (for example a mineral oil or a film-forming barrier).

**[0122]** Wetting agents, dispersing agents and emulsifying agents may be surface SFAs of the cationic, anionic, amphoteric or non-ionic type.

**[0123]** Suitable SFAs of the cationic type include quaternary ammonium compounds (for example cetyltrimethyl ammonium bromide), imidazolines and amine salts.

**[0124]** Suitable anionic SFAs include alkali metals salts of fatty acids, salts of aliphatic monoesters of sulfuric acid (for example sodium lauryl sulfate), salts of sulfonated aromatic compounds (for example sodium dodecylbenzenesulfonate, calcium dodecylbenzenesulfonate, butylnaphthalene sulfonate and mixtures of sodium di-*isopropyl*- and tri-*isopropyl*-naphthalene sulfonates), ether sulfates, alcohol ether sulfates (for example sodium laureth-3-sulfate), ether carboxylates (for example sodium laureth-3-carboxylate), phosphate esters (products from the

reaction between one or more fatty alcohols and phosphoric acid (predominately mono-esters) or phosphorus pentoxide (predominately di-esters), for example the reaction between lauryl alcohol and tetraphosphoric acid; additionally these products may be ethoxylated), sulfosuccinamates, paraffin or olefine sulfonates, taurates and lignosulfonates.

**[0125]** Suitable SFAs of the amphoteric type include betaines, propionates and glycines.

**[0126]** Suitable SFAs of the non-ionic type include condensation products of alkylene oxides, such as ethylene oxide, propylene oxide, butylene oxide or mixtures thereof, with fatty alcohols (such as oleyl alcohol or cetyl alcohol) or with alkylphenols (such as octylphenol, nonylphenol or octylcresol); partial esters derived from long chain fatty acids or hexitol anhydrides; condensation products of said partial esters with ethylene oxide; block polymers (comprising ethylene oxide and propylene oxide); alkanolamides; simple esters (for example fatty acid polyethylene glycol esters); amine oxides (for example lauryl dimethyl amine oxide); and lecithins.

**[0127]** Suitable suspending agents include hydrophilic colloids (such as polysaccharides, polyvinylpyrrolidone or sodium carboxymethylcellulose) and swelling clays (such as bentonite or attapulgite).

**[0128]** A compound of the invention may be applied by any of the known means of applying pesticidal compounds. For example, it may be applied, formulated or unformulated, to the pests or to a locus of the pests (such as a habitat of the pests, or a growing plant liable to infestation by the pests) or to any part of the plant, including the foliage, stems, branches or roots, to the seed before it is planted or to other media in which plants are growing or are to be planted (such as soil surrounding the roots, the soil generally, paddy water or hydroponic culture systems), directly or it may be sprayed on, dusted on, applied by dipping, applied as a cream or paste formulation, applied as a vapor or applied through distribution or incorporation of a composition (such as a granular composition or a composition packed in a water-soluble bag) in soil or an aqueous environment.

**[0129]** A compound of the invention may also be injected into plants or sprayed onto vegetation using electrodynamic spraying techniques or other low volume methods, or applied by land or aerial irrigation systems.

**[0130]** Compositions for use as aqueous preparations (aqueous solutions or dispersions) are generally supplied in the form of a concentrate containing a high proportion of the active ingredient, the concentrate being added to water before use. These concentrates, which may include DCs, SCs, ECs, EWs, MEs, SGs, SPs, WPs, WGs and CSs, are often required to withstand storage for prolonged periods and, after such storage, to be capable of addition to water to form aqueous preparations which remain homogeneous for a sufficient time to enable them to be applied by conventional spray equipment. Such aqueous preparations may contain varying amounts of a compound of the invention (for example 0.0001 to 10%, by weight) depending upon the purpose for which they are to be used.

**[0131]** A compound of the invention may be used in mixtures with fertilizers (for example nitrogen-, potassium- or phosphorus-containing fertilizers). Suitable formulation types include granules of fertilizer. The mixtures preferably contain up to 25% by weight of the compound of the invention.

**[0132]** The invention therefore also provides a fertilizer composition comprising a fertilizer and a compound of the invention.

**[0133]** The compositions of this invention may contain other compounds having biological activity, for example micronutrients or compounds having fungicidal activity or which possess plant growth regulating, herbicidal, insecticidal, nematocidal or acaricidal activity.

**[0134]** The compound of the invention may be the sole active ingredient of the composition or it may be admixed with one or more additional active ingredients such as a pesticide, fungicide, synergist, herbicide or plant growth regulator where appropriate. An additional active ingredient may: provide a composition having a broader spectrum of activity or increased persistence at a locus; synergize the activity or complement the activity (for example by increasing the speed of effect or overcoming repellency) of the compound of the invention; or help to overcome or prevent the development of resistance to individual

components. The particular additional active ingredient will depend upon the intended utility of the composition. Examples of suitable pesticides include the following:

**[0135]** a) Pyrethroids, such as permethrin, cypermethrin, fenvalerate, esfenvalerate, deltamethrin, cyhalothrin (in particular lambda-cyhalothrin and gamma cyhalothrin), bifenthrin, fenpropathrin, cyfluthrin, tefluthrin, fish safe pyrethroids (for example ethofenprox), natural pyrethrin, tetramethrin, S-bioallethrin, fenfluthrin, prallethrin, acrinathrin, etofenprox or 5-benzyl-3-furylmethyl-(E)-(1R,3S)-2,2-dimethyl- 3-(2-oxothiolan-3-ylidenemethyl)cyclopropane carboxylate;

**[0136]** b) Organophosphates, such as profenofos, sulprofos, acephate, methyl parathion, azinphos-methyl, demeton-s-methyl, heptenophos, thiometon, fenamiphos, monocrotophos, profenofos, triazophos, methamidophos, dimethoate, phosphamidon, malathion, chlorpyrifos, phosalone, terbufos, fensulfothion, fonofos, phorate, phoxim, pirimiphos-methyl, pirimiphos-ethyl, fenitrothion, fosthiazate or diazinon;

**[0137]** c) Carbamates (including aryl carbamates), such as pirimicarb, triazamate, cloethocarb, carbofuran, furathiocarb, ethiofencarb, aldicarb, thiofurox, carbosulfan, bendiocarb, fenobucarb, propoxur, methomyl or oxamyl;

**[0138]** d) Benzoyl ureas, such as diflubenzuron, triflumuron, hexaflumuron, flufenoxuron, diafenthiuron, lufenuron, novaluron, noviflumuron or chlorfluazuron;

**[0139]** e) Organic tin compounds, such as cyhexatin, fenbutatin oxide or azocyclotin;

**[0140]** f) Pyrazoles, such as tebufenpyrad, tolfenpyrad, ethiprole, pyriprole, fipronil, and fenpyroximate;

**[0141]** g) Macrolides, such as avermectins or milbemycins, for example abamectin, emamectin benzoate, ivermectin, milbemycin, spinosad, azadirachtin, milbemectin, lepimectin or spinetoram;

**[0142]** h) Hormones or pheromones;

**[0143]** i) Organochlorine compounds, such as endosulfan (in particular alpha-endosulfan), benzene hexachloride, DDT, chlordane or dieldrin;

**[0144]** j) Amidines, such as chlordimeform or amitraz;

**[0145]** k) Fumigant agents, such as chloropicrin, dichloropropane, methyl bromide or metam;

**[0146]** l) Neonicotinoid compounds, such as imidacloprid, thiacloprid, acetamiprid, nitenpyram, dinotefuran, thiamethoxam, clothianidin, or nithiazine;

**[0147]** m) Diacylhydrazines, such as tebufenozide, chromafenozide or methoxyfenozide;

**[0148]** n) Diphenyl ethers, such as diofenolan or pyriproxifen;

**[0149]** o) Ureas such as Indoxacarb or metaflumizone;

**[0150]** p) Ketoenols, such as Spirotetramat, spiroticlofen or spiromesifen;

**[0151]** q) Diamides, such as flubendiamide, chlorantraniliprole (Rynaxypyr®) or cyantraniliprole;

**[0152]** r) Essential oils such as Bugoil® - (PlantImpact); or

**[0153]** s) a compound selected from buprofezine, flonicamid, acequinocyl, bifenazate, cyenopyrafen, cyflumetofen, etoxazole, flometoquin, fluacrypyrim, fluensulfone, flufenerim, flupyradifuone, harpin, iodomethane, dodecadienol, pyridaben, pyridalyl, pyrimidifen, flupyradifurone, 4-[(6-Chloro-pyridin-3-ylmethyl)-(2,2-difluoro-ethyl)-amino]-5H-furan-2-one (DE 102006015467), CAS: 915972-17-7 (WO 2006129714; WO 2011/147953; WO 2011/147952), CAS: 26914-55-8 (WO 2007/020986), chlorfenapyr, pymetrozine, sulfoxaflor and pyrifluquinazon.

**[0154]** In addition to the major chemical classes of pesticide listed above, other pesticides having particular targets may be employed in the composition, if appropriate for the intended utility of the composition. For instance, selective insecticides for particular crops, for example stemborer specific insecticides (such as cartap) or hopper specific insecticides (such as buprofezin) for use in rice may be employed. Alternatively insecticides or acaricides specific for particular insect species/stages may also be included in the compositions (for example acaricidal ovo-larvicides, such as clofentezine, flubenzimine, hexythiazox or tetradifon; acaricidal motilicides, such as dicofol or propargite; acaricides, such as bromopropylate or chlorobenzilate; or growth regulators, such as hydramethylnon, cyromazine, methoprene, chlorfluazuron or diflubenzuron).

**[0155]** Examples of fungicidal compounds which may be included in the composition of the invention are (E)-*N*-methyl-2-[2-(2,5-dimethylphenoxy)methyl]phenyl]-2-methoxy-iminoacetamide (SSF-129), 4-bromo-2-cyano-*N,N*-dimethyl-6-trifluoromethylbenzimidazole-1-sulfonamide,  $\alpha$ -[*N*-(3-chloro-2,6-xylyl)-2-methoxyacetamido]- $\gamma$ -butyrolactone, 4-chloro-2-cyano-*N,N*-dimethyl-5-*p*-tolylimidazole-1-sulfonamide (IKF-916, cyamidazosulfamid), 3-5-dichloro-*N*-(3-chloro-1-ethyl-1-methyl-2-oxopropyl)-4-methylbenzamide (RH-7281, zoxamide), *N*-allyl-4,5,-dimethyl-2-trimethylsilylthiophene-3-carboxamide (MON65500), *N*-(1-cyano-1,2-dimethylpropyl)-2-(2,4-dichlorophenoxy)propionamide (AC382042), *N*-(2-methoxy-5-pyridyl)-cyclopropane carboxamide, acibenzolar (CGA245704), alanycarb, aldimorph, anilazine, azaconazole, azoxystrobin, benalaxyl, benomyl, biloxazol, bitertanol, blasticidin S, bromuconazole, bupirimate, captafol, captan, carbendazim, carbendazim chlorhydrate, carboxin, carpropamid, carvone, CGA41396, CGA41397, chinomethionate, chlorothalonil, chlorozolate, clozylacon, copper containing compounds such as copper oxychloride, copper oxyquinolate, copper sulfate, copper tallate and Bordeaux mixture, cymoxanil, cyproconazole, cyprodinil, debacarb, di-2-pyridyl disulfide 1,1'-dioxide, dichlofluanid, diclomezine, dicloran, diethofencarb, difenoconazole, difenzoquat, diflumetorim, *O,O*-di-*iso*-propyl-*S*-benzyl thiophosphate, dimefluazole, dimetconazole, dimethomorph, dimethirimol, diniconazole, dinocap, dithianon, dodecyl dimethyl ammonium chloride, dodemorph, dodine, doguadine, edifenphos, epoxiconazole, ethirimol, ethyl-(Z)-*N*-benzyl-*N*--([methyl(methyl-thioethylideneaminooxycarbonyl)amino]thio)- $\beta$ -alaninate, etridiazole, famoxadone, fenamidone (RPA407213), fenarimol, fenbuconazole, fenfuram, fenhexamid (KBR2738), fempiclonil, fenpropidin, fenpropimorph, fentin acetate, fentin hydroxide, ferbam, ferimzone, fluazinam, fludioxonil, flumetover, fluoroimide, fluquinconazole, flusilazole, flutolanil, flutriafol, folpet, fuberidazole, furalaxyl, furametpyr, guazatine, hexaconazole, hydroxyisoxazole, hymexazole, imazalil, imibenconazole, iminoctadine, iminoctadine triacetate, ipconazole, iprobenfos, iprodione, iprovalicarb (SZX0722), isopropanyl butyl carbamate, isoprothiolane, kasugamycin, kresoxim-methyl, LY186054, LY211795, LY248908, mancozeb, maneb, mefenoxam, mepanipyrim, mepronil, metalaxyl, metconazole, metiram, metiram-zinc,

metominostrobin, myclobutanil, neoasozin, nickel dimethyldithiocarbamate, nitrothal-iso-propyl, nuarimol, ofurace, organomercury compounds, oxadixyl, oxasulfuron, oxolinic acid, oxpoconazole, oxycarboxin, pefurazate, penconazole, pencycuron, phenazin oxide, phosetyl-Al, phosphorus acids, phthalide, picoxystrobin (ZA1963), polyoxin D, polyram, probenazole, prochloraz, procymidone, propamocarb, propiconazole, propineb, propionic acid, pyrazophos, pyrifenox, pyrimethanil, pyroquilon, pyroxyfur, pyrrolnitrin, quaternary ammonium compounds, quinomethionate, quinoxifen, quintozone, sipconazole (F-155), sodium pentachlorophenate, spiroxamine, streptomycin, sulfur, tebuconazole, tecloftalam, tecnazene, tetraconazole, thiabendazole, thifluzamid, 2-(thiocyanomethylthio)benzothiazole, thiophanate-methyl, thiram, timibenconazole, tolclofos-methyl, tolylfluanid, triadimefon, triadimenol, triaz-butyl, triazoxide, tricyclazole, tridemorph, trifloxystrobin (CGA279202), triforine, triflumizole, triticonazole, validamycin A, vapam, vinclozolin, zineb, ziram; N-[9-(dichloromethylene)-1,2,3,4-tetrahydro-1,4-methanonaphthalen-5-yl]-3-(difluoromethyl)-1-methyl-1H-pyrazole-4-carboxamide [1072957-71-1], 1-methyl-3-difluoromethyl-1H-pyrazole-4-carboxylic acid (2-dichloromethylene-3-ethyl-1-methyl-indan-4-yl)-amide, and 1-methyl-3-difluoromethyl-4H-pyrazole-4-carboxylic acid [2-(2,4-dichloro-phenyl)-2-methoxy-1-methyl-ethyl]-amide.

**[0156]** Preferred additional pesticidally active ingredients are those selected from neonicotinoids, pyrethroids, strobilurins, triazoles and carboxamides (SDHI inhibitors). Pyrethroids are of interest of which lambda-cyhalothrin is of particular interest. Combinations of compounds of the invention and pyrethroids, in particular lambda-cyhalothrin, exhibit synergistic control of stinkbugs (according to the Colby formula), in particular *Euschistus*, e.g. *Euschistus heros*.

**[0157]** In a further aspect of the invention there is provided a method comprising applying to a crop of soybean plants, the locus thereof, or propagation material thereof, a combination of a compound a compound of the invention and lambda cyhalothrin in a synergistically effective amount, wherein the method is for control and/or prevention of stinkbugs, preferably *Euschistus*, e.g. *Euschistus heros*.

**[0158]** The compounds of the invention may be mixed with soil, peat or other rooting media for the protection of plants against seed-borne, soil-borne or foliar fungal diseases.

**[0159]** Examples of suitable synergists for use in the compositions include piperonyl butoxide, sesamex, safroxan and dodecyl imidazole.

**[0160]** Suitable herbicides and plant-growth regulators for inclusion in the compositions will depend upon the intended target and the effect required.

**[0161]** An example of a rice selective herbicide which may be included is propanil. An example of a plant growth regulator for use in cotton is PIX™.

**[0162]** Some mixtures may comprise active ingredients which have significantly different physical, chemical or biological properties such that they do not easily lend themselves to the same conventional formulation type. In these circumstances other formulation types may be prepared. For example, where one active ingredient is a water insoluble solid and the other a water insoluble liquid, it may nevertheless be possible to disperse each active ingredient in the same continuous aqueous phase by dispersing the solid active ingredient as a suspension (using a preparation analogous to that of an SC) but dispersing the liquid active ingredient as an emulsion (using a preparation analogous to that of an EW). The resultant composition is a suspoemulsion (SE) formulation.

**[0163]** Unless otherwise stated the weight ratio of the compound of I with an additional active ingredient may generally be between 1000 : 1 and 1 : 1000. In other embodiments that weight ratio of A to B may be between 500 : 1 to 1 : 500, for example between 100 : 1 to 1 : 100, for example between 1 : 50 to 50 : 1, for example 1 : 20 to 20 : 1, for example 1:10 to 10:1, for example 1:5 to 5:1, for example 1:1.

**[0164]** Compositions of the invention include those prepared by premixing prior to application, e.g. as a readymix or tankmix, or by simultaneous application or sequential application to the plant.

**[0165]** "Expression cassette" as used herein means a nucleic acid sequence capable of directing expression of a particular nucleic acid sequence in an appropriate host cell, comprising a promoter operably linked to the nucleic acid sequence of interest which is operably linked to termination signal sequences. It also typically comprises sequences required for proper translation of the nucleic acid sequence. The expression cassette comprising the nucleic acid sequence of interest may be chimeric, meaning that at least one of its components is

heterologous with respect to at least one of its other components. The expression cassette may also be one that is naturally occurring but has been obtained in a recombinant form useful for heterologous expression. Typically, however, the expression cassette is heterologous with respect to the host, i.e., the particular nucleic acid sequence of the expression cassette does not occur naturally in the host cell and must have been introduced into the host cell or an ancestor of the host cell by a transformation event. The expression of the nucleic acid sequence in the expression cassette may be under the control of, for example, a constitutive promoter or of an inducible promoter that initiates transcription only when the host cell is exposed to some particular external stimulus. In the case of a multicellular organism, such as a plant, the promoter can also be specific to a particular tissue, or organ, or stage of development.

**[0166]** A "gene" is a defined region that is located within a genome and that, besides the aforementioned coding sequence, comprises other, primarily regulatory nucleic acid sequences responsible for the control of the expression, that is to say the transcription and translation, of the coding portion. A gene may also comprise other 5' and 3' untranslated sequences and termination sequences. Further elements that may be present are, for example, introns.

**[0167]** As used herein, the term "grower" means a person or entity that is engaged in agriculture, raising living organisms, such as crop plants, for example soybean, for food, feed or raw materials.

**[0168]** A "heterologous" nucleic acid sequence is a nucleic acid sequence not naturally associated with a host cell into which it is introduced, including non- naturally occurring multiple copies of a naturally occurring nucleic acid sequence.

**[0169]** A "homologous" nucleic acid sequence is a nucleic acid sequence naturally associated with a host cell into which it is introduced.

**[0170]** "Insecticidal" is defined as a toxic biological activity capable of controlling insects, preferably by killing them.

**[0171]** An "isolated" nucleic acid molecule or nucleotide sequence or nucleic acid construct or dsRNA molecule or protein of the invention is generally exists apart from its native environment and is therefore not a product of nature. An isolated nucleic acid molecule or

nucleotide sequence or nucleic acid construct or dsRNA molecule or protein may exist in a purified form or may exist in a non-native environment such as, for example, a recombinant host or host cell such as a transgenic plant or transgenic plant cell.

**[0172]** In the context of the invention, a number in front of the suffix “mer” indicates a specified number of subunits. When applied to RNA or DNA, this specifies the number of bases in the molecule. For example, a 19 nucleotide subsequence of an mRNA having the sequence UGAAAUGGCUGUUGGUCUU is a “19-mer” of SEQ ID NO: 217.

**[0173]** A “plant” is any plant at any stage of development, particularly a seed plant.

**[0174]** A “plant cell” is a structural and physiological unit of a plant, comprising a protoplast and a cell wall. The plant cell may be in the form of an isolated single cell or a cultured cell, or as a part of a higher organized unit such as, for example, plant tissue, a plant organ, or a whole plant.

**[0175]** “Plant cell culture” means cultures of plant units such as, for example, protoplasts, cell culture cells, cells in plant tissues, pollen, pollen tubes, ovules, embryo sacs, zygotes and embryos at various stages of development.

**[0176]** “Plant material” refers to leaves, stems, roots, flowers or flower parts, fruits, pollen, egg cells, zygotes, seeds, cuttings, cell or tissue cultures, or any other part or product of a plant.

**[0177]** A “plant organ” is a distinct and visibly structured and differentiated part of a plant such as a root, stem, leaf, flower bud, or embryo.

**[0178]** “Plant tissue” as used herein means a group of plant cells organized into a structural and functional unit. Any tissue of a plant *in planta* or in culture is included. This term includes, but is not limited to, whole plants, plant organs, plant seeds, tissue culture and any groups of plant cells organized into structural and/or functional units. The use of this term in conjunction with, or in the absence of, any specific type of plant tissue as listed above or otherwise embraced by this definition is not intended to be exclusive of any other type of plant tissue.

**[0179]** A “transcriptome” is a collection of all or nearly all the ribonucleic acid (RNA) transcripts in a cell or group of cells, such as a tissue or cell culture.

**[0180]** "Transformation" is a process for introducing heterologous nucleic acid into a host cell or organism. In particular, "transformation" means the stable integration of a DNA molecule into the genome of an organism of interest.

**[0181]** "Transformed / transgenic / recombinant" refer to a host organism such as a bacterium or a plant into which a heterologous nucleic acid molecule has been introduced. The nucleic acid molecule can be stably integrated into the genome of the host or the nucleic acid molecule can also be present as an extrachromosomal molecule. Such an extrachromosomal molecule can be auto-replicating. The nucleic acid molecule can also be introduced into the genome of the chloroplast or the mitochondria of a plant cell or eukaryotic cell. Transformed cells, tissues, or plants are understood to encompass not only the end product of a transformation process, but also transgenic progeny thereof. A "non-transformed", "non-transgenic", or "non-recombinant" host refers to a wild-type organism, e.g., a bacterium or plant, which does not contain the heterologous nucleic acid molecule.

**[0182]** The nomenclature used herein for DNA or RNA bases and amino acids is as set forth in 37 C.F.R. § 1.822.

**[0183]** The invention is based on the unexpected discovery that double stranded RNA (dsRNA) or small interfering RNAs (siRNA) designed to target a mRNA transcribable from the stink bug genes described herein are toxic to the stink bug pest and can be used to control stink bug or hemipteran infestation of a plant and impart to a transgenic plant tolerance to a stink bug or hemipteran infestation. Thus, in one embodiment, the invention provides a double stranded RNA (dsRNA) molecule comprising a sense strand and an antisense strand, wherein a nucleotide sequence of the antisense strand is complementary to a portion of a mRNA polynucleotide transcribable from a stink bug gene described in the present disclosure, wherein the dsRNA molecule is toxic to a stink bug or hemipteran plant pest.

**[0184]** It is known in the art that dsRNA molecules that are not perfectly complementary to a target sequence (for example, having only 95% identity to the target gene) are effective to control insect pests (see, for example, Narva *et al.*, U.S. Patent No. 9,012,722). The invention provides an interfering RNA molecule comprising at least one dsRNA, where the dsRNA is a region of double-stranded RNA comprising annealed at least partially

complementary strands. One strand of the dsRNA comprises a sequence of at least 19, at least 20, at least 21, at least 22, at least 23, at least 24, at least 25, at least 26, at least 27, at least 28, at least 29, at least 30, at least 35, at least 40, at least 45, at least 50, at least 55, at least 60, at least 65, at least 70, at least 75, at least 80, at least 85, at least 90, at least 95, at least 100, at least 110, at least 120, at least 130, at least 140, at least 150, at least 160, at least 170, at least 180, at least 190, at least 200, at least 210, at least 220, at least 230, at least 240, at least 250, at least 260, at least 270, at least 280, at least 290, or at least 300 contiguous nucleotides which is at least partially complementary to a target nucleotide sequence within a stink bug spp target gene. The interfering RNA molecule (i) has at least 60% identity, at least 65% identity, at least 70% identity, at least 75% identity, at least 80% identity, at least 85% identity, at least 86% identity, at least 87% identity, at least 88% identity, at least 89% identity, at least 90% identity, at least 91% identity, at least 92% identity, at least 93% identity, at least 94% identity, at least 95% identity, at least 96% identity, at least 97% identity, at least 98% identity, at least 99% identity, or 100% identity, to at least a 19, at least a 20, at least a 21, at least a 22, at least a 23, at least a 24, at least a 25, at least a 26, at least a 27, at least a 28, at least a 29, at least a 30, at least a 35, at least a 40, at least a 45, at least a 50, at least a 55, at least a 60, at least a 65, at least a 70, at least a 75, at least a 80, at least a 85, at least a 90, at least a 95, at least a 100, at least a 110, at least a 120, at least a 130, at least a 140, at least a 150, at least a 160, at least a 170, at least a 180, at least a 190, at least a 200, at least a 210, at least a 220, at least a 230, at least a 240, at least a 250, at least a 260, at least a 270, at least a 280, at least a 290, or at least a 300 contiguous nucleotide fragment of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, or the complement thereof; or (ii) comprises at least a 19, at least a 20, at least a 21, at least a 22, at least a 23, at least a 24, at least a 25, at least a 26, at least a 27, at least a 28, at least a 29, at least a 30, at least a 35, at least a 40, at least a 45, at least a 50, at least a 55, at least a 60, at least a 65, at least a 70, at least a 75, at least a 80, at least a 85, at least a 90, at least a 95, at least a 100, at least a 110, at least a 120, at least a 130, at least a 140, at least a 150, at least a 160, at least a 170, at least a 180, at least a 190, at least a 200, at least a 210, at least a 220, at least a 230, at least a 240, at least a 250, at least a 260, at least a 270, at least a 280, at least a 290, or at least a 300 contiguous nucleotide fragment of

SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, or the complement thereof ; or (iii) comprises at least a 19, at least a 20, at least a 21, at least a 22, at least a 23, at least a 24, at least a 25, at least a 26, at least a 27, at least a 28, at least a 29, at least a 30, at least a 35, at least a 40, at least a 45, at least a 50, at least a 55, at least a 60, at least a 65, at least a 70, at least a 75, at least a 80, at least a 85, at least a 90, at least a 95, at least a 100, at least a 110, at least a 120, at least a 130, at least a 140, at least a 150, at least a 160, at least a 170, at least a 180, at least a 190, at least a 200, at least a 210, at least a 220, at least a 230, at least a 240, at least a 250, at least a 260, at least a 270, at least a 280, at least a 290, or at least a 300 contiguous nucleotide fragment of a nucleotide sequence encoding an amino acid sequence encoded by SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858 or the complement thereof , wherein the interfering RNA molecule has insecticidal activity on a hemipteran plant pest.

**[0185]** In some embodiments, the interfering RNA molecule comprises at least two dsRNAs, wherein each dsRNA comprises a sequence of nucleotides which is at least partially complementary to a target nucleotide sequence within the target gene. In some embodiments, each of the dsRNAs comprise a different sequence of nucleotides which is complementary to a different target nucleotide sequence within the target gene. In other embodiments, each of the dsRNAs comprise a different sequence of nucleotides which is complementary to a target nucleotide sequence within two different target genes.

**[0186]** In some embodiments, the interfering RNA molecule comprises a dsRNA that can comprise, consist essentially of or consist of from at least 19 to about 25 consecutive nucleotides (e.g. 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, or 29) to at least about 300 consecutive nucleotides. Additional nucleotides can be added at the 3' end, the 5' end or both the 3' and 5' ends to facilitate manipulation of the dsRNA molecule but that do not materially affect the basic characteristics or function of the dsRNA molecule in RNA interference (RNAi).

**[0187]** In some embodiments, the interfering RNA molecule comprises a dsRNA which comprises an antisense strand that is complementary to at least 19, at least 20, at least 21, at least 22, at least 23, at least 24, at least 25, at least 26, at least 27, at least 28, at least 29, at least 30, at least 35, at least 40, at least 45, at least 50, at least 55, at least 60, at least 65, at

least 70, at least 75, at least 80, at least 85, at least 90, at least 95, at least 100, at least 110, at least 120, at least 130, at least 140, at least 150, at least 160, at least 170, at least 180, at least 190, at least 200, at least 210, at least 220, at least 230, at least 240, at least 250, at least 260, at least 270, at least 280, at least 290, or at least 300 consecutive nucleotides of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858. In other embodiments, the portion of dsRNA comprises, consists essentially of or consists of at least from 19, 20 or 21 consecutive nucleotides to at least 19, at least 20, at least 21, at least 22, at least 23, at least 24, at least 25, at least 26, at least 27, at least 28, at least 29, at least 30, at least 35, at least 40, at least 45, at least 50, at least 55, at least 60, at least 65, at least 70, at least 75, at least 80, at least 85, at least 90, at least 95, at least 100, at least 110, at least 120, at least 130, at least 140, at least 150, at least 160, at least 170, at least 180, at least 190, at least 200, at least 210, at least 220, at least 230, at least 240, at least 250, at least 260, at least 270, at least 280, at least 290, or at least 300 consecutive nucleotides of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, or the complement thereof.

**[0188]** In other embodiments, an interfering RNA molecule of the invention comprises a dsRNA which comprises, consists essentially of or consists of any 19-mer subsequence of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858 consisting of N to N+18 nucleotides, or any complement thereof. For example, an interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 271, wherein N is nucleotide 1 to nucleotide 336 of SEQ ID NO: 271, or any complement thereof. In other words, the portion of the mRNA that is targeted comprises any of the 336 19-mers (a 19-mer refers to 19 consecutive nucleotides) subsequences of SEQ ID NO: 271, or any of their complementing sequences. It will be recognized that these 336 19-mer subsequences include all possible 19-mer subsequences from SEQ ID NO: 271 and from SEQ ID NO: 217, and their complements, as SEQ ID NOs 217 and 271 are to the same target, namely Nv\_CG7622. It will similarly be recognized that all 19-mer subsequences of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, and all complement subsequences thereof, include all possible 19-mer subsequences

of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, and the complement subsequences thereof.

**[0189]** Similarly, an interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 272, wherein N is nucleotide 1 to nucleotide 663 of SEQ ID NO: 272, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 273, wherein N is nucleotide 1 to nucleotide 357 of SEQ ID NO: 273, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 274, wherein N is nucleotide 1 to nucleotide 1275 of SEQ ID NO: 274, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 275, wherein N is nucleotide 1 to nucleotide 369 of SEQ ID NO: 275, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 276, wherein N is nucleotide 1 to nucleotide 1170 of SEQ ID NO: 276, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 277, wherein N is nucleotide 1 to nucleotide 1233 of SEQ ID NO: 277, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 278, wherein N is nucleotide 1 to nucleotide 462 of SEQ ID NO: 278, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 279, wherein N is nucleotide 1 to nucleotide 639 of SEQ ID NO: 279, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 280, wherein N is nucleotide 1 to nucleotide 672 of SEQ ID NO: 280, or any complement thereof. Another

interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 281, wherein N is nucleotide 1 to nucleotide 1113 of SEQ ID NO: 281, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 282, wherein N is nucleotide 1 to nucleotide 1113 of SEQ ID NO: 282, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 283, wherein N is nucleotide 1 to nucleotide 1500 of SEQ ID NO: 283, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 284, wherein N is nucleotide 1 to nucleotide 1251 of SEQ ID NO: 284, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 285, wherein N is nucleotide 1 to nucleotide 774 of SEQ ID NO: 285, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 286, wherein N is nucleotide 1 to nucleotide 2391 of SEQ ID NO: 286, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 287, wherein N is nucleotide 1 to nucleotide 2974 of SEQ ID NO: 287, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 288, wherein N is nucleotide 1 to nucleotide 432 of SEQ ID NO: 288, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 289, wherein N is nucleotide 1 to nucleotide 4587 of SEQ ID NO: 289, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 290, wherein N is

nucleotide 1 to nucleotide 1089 of SEQ ID NO: 290, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 291, wherein N is nucleotide 1 to nucleotide 834 of SEQ ID NO: 291, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 292, wherein N is nucleotide 1 to nucleotide 771 of SEQ ID NO: 292, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 293, wherein N is nucleotide 1 to nucleotide 645 of SEQ ID NO: 293, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 294, wherein N is nucleotide 1 to nucleotide 696 of SEQ ID NO: 294, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 295, wherein N is nucleotide 1 to nucleotide 336 of SEQ ID NO: 295, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 296, wherein N is nucleotide 1 to nucleotide 639 of SEQ ID NO: 296, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 297, wherein N is nucleotide 1 to nucleotide 438 of SEQ ID NO: 297, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 298, wherein N is nucleotide 1 to nucleotide 1266 of SEQ ID NO: 298, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 299, wherein N is nucleotide 1 to nucleotide 597 of SEQ ID NO: 299, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist

essentially of or consists of any 19-mer subsequence of SEQ ID NO: 300, wherein N is nucleotide 1 to nucleotide 3525 of SEQ ID NO: 300, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 301, wherein N is nucleotide 1 to nucleotide 393 of SEQ ID NO: 301, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 302, wherein N is nucleotide 1 to nucleotide 492 of SEQ ID NO: 302, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 303, wherein N is nucleotide 1 to nucleotide 5856 of SEQ ID NO: 303, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 304, wherein N is nucleotide 1 to nucleotide 750 of SEQ ID NO: 304, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 305, wherein N is nucleotide 1 to nucleotide 786 of SEQ ID NO: 305, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 306, wherein N is nucleotide 1 to nucleotide 714 of SEQ ID NO: 306, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 307, wherein N is nucleotide 1 to nucleotide 648 of SEQ ID NO: 307, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 308, wherein N is nucleotide 1 to nucleotide 519 of SEQ ID NO: 308, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 309, wherein N is nucleotide 1 to nucleotide 531 of SEQ ID NO: 309, or any complement thereof. Another

interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 310, wherein N is nucleotide 1 to nucleotide 366 of SEQ ID NO: 310, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 311, wherein N is nucleotide 1 to nucleotide 1284 of SEQ ID NO: 311, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 312, wherein N is nucleotide 1 to nucleotide 426 of SEQ ID NO: 312, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 313, wherein N is nucleotide 1 to nucleotide 1680 of SEQ ID NO: 313, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 314, wherein N is nucleotide 1 to nucleotide 474 of SEQ ID NO: 314, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 315, wherein N is nucleotide 1 to nucleotide 5025 of SEQ ID NO: 315, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 316, wherein N is nucleotide 1 to nucleotide 453 of SEQ ID NO: 316, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 317, wherein N is nucleotide 1 to nucleotide 564 of SEQ ID NO: 317, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 318, wherein N is nucleotide 1 to nucleotide 816 of SEQ ID NO: 318, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 319, wherein N is

nucleotide 1 to nucleotide 687 of SEQ ID NO: 319, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 320, wherein N is nucleotide 1 to nucleotide 846 of SEQ ID NO: 320, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 321, wherein N is nucleotide 1 to nucleotide 333 of SEQ ID NO: 321, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 322, wherein N is nucleotide 1 to nucleotide 882 of SEQ ID NO: 322, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 323, wherein N is nucleotide 1 to nucleotide 1299 of SEQ ID NO: 323, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 324, wherein N is nucleotide 1 to nucleotide 576 of SEQ ID NO: 324, or any complement thereof.

**[0190]** In still other embodiments, the interfering RNA molecule of the invention comprises a dsRNA which comprises, consists essentially of or consists of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, or the complement thereof.

**[0191]** In other embodiments of the interfering RNA molecule of the invention, the nucleotide sequence of the antisense strand of a dsRNA of the invention comprises, consists essentially of or consists of the complementary ribonucleic acid sequence of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858. The nucleotide sequence of the antisense strand of a dsRNA of the invention can have one nucleotide at either the 3' or 5' end deleted or can have up to six nucleotides added at the 3' end, the 5' end or both, in any combination to achieve an antisense strand consisting essentially of any 19-mer, any 20-mer, or any 19-mer nucleotide sequence of the complementary ribonucleic acid sequence of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, as it would be understood that the deletion of the one nucleotide or the addition of up to the six nucleotides

do not materially affect the basic characteristics or function of the double stranded RNA molecule of the invention. Such additional nucleotides can be nucleotides that extend the complementarity of the antisense strand along the target sequence and/or such nucleotides can be nucleotides that facilitate manipulation of the RNA molecule or a nucleic acid molecule encoding the RNA molecule, as would be known to one of ordinary skill in the art. For example, a TT overhang at the 3' end may be present, which is used to stabilize the siRNA duplex and does not affect the specificity of the siRNA.

**[0192]** In some embodiments of this invention, the antisense strand of the double stranded RNA of the interfering RNA molecule can be fully complementary to the target RNA polynucleotide or the antisense strand can be substantially complementary or partially complementary to the target RNA polynucleotide. The dsRNA of the interfering RNA molecule may comprise a dsRNA which is a region of double-stranded RNA comprising substantially complementary annealed strands, or which is a region of double-stranded RNA comprising fully complementary annealed strands. By substantially or partially complementary is meant that the antisense strand and the target RNA polynucleotide can be mismatched at about 1, 2, 3, 4, 5, 6, 7, 8, 9, or 10 nucleotide pairings. Such mismatches can be introduced into the antisense strand sequence, e.g., near the 3' end, to enhance processing of the double stranded RNA molecule by Dicer, to duplicate a pattern of mismatches in a siRNA molecule inserted into a chimeric nucleic acid molecule or artificial microRNA precursor molecule of this invention, and the like, as would be known to one of skill in the art. Such modification will weaken the base pairing at one end of the duplex and generate strand asymmetry, therefore enhancing the chance of the antisense strand, instead of the sense strand, being processed and silencing the intended gene (Geng and Ding "Double-mismatched siRNAs enhance selective gene silencing of a mutant ALS-causing Allele1" *Acta Pharmacol. Sin.* 29:211-216 (2008); Schwarz et al. "Asymmetry in the assembly of the RNAi enzyme complex" *Cell* 115:199-208 (2003)).

**[0193]** In some embodiments of this invention, the interfering RNA comprises a dsRNA which comprises a short hairpin RNA (shRNA) molecule. Expression of shRNA in cells is typically accomplished by delivery of plasmids or recombinant vectors, for example in transgenic plants such as transgenic soybean.

**[0194]** The invention encompasses a nucleic acid construct comprising an interfering RNA of the invention. The invention further encompasses a nucleic acid molecule encoding at least one interfering molecule of the invention. The invention further encompasses a nucleic acid construct comprising at least one interfering molecule of the invention or comprising a nucleic acid molecule encoding the at least one interfering molecule of the invention. The invention further encompasses a nucleic acid construct wherein the nucleic acid construct is an expression vector. The invention further encompasses a recombinant vector comprising a regulatory sequence operably linked to a nucleotide sequence that encodes an interfering RNA molecule of the invention. A regulatory sequence may refer to a promoter, enhancer, transcription factor binding site, insulator, silencer, or any other DNA element involved in the expression of a gene.

**[0195]** The invention further encompasses chimeric nucleic acid molecules comprising an interfering RNA molecule with an antisense strand of a dsRNA operably linked with a plant microRNA precursor molecule. In some embodiments, the chimeric nucleic acid molecule comprises an antisense strand having the nucleotide sequence of any of the 19-mer subsequences of SEQ ID NOs: 181-210, or any complement thereof, operably linked with a plant microRNA precursor molecule. In some embodiments, the plant microRNA precursor molecule is a maize microRNA precursor.

**[0196]** In some embodiments, the invention encompasses an artificial plant microRNA precursor molecule comprising an antisense strand of a dsRNA of an interfering RNA molecule of the invention. In other embodiments, the artificial plant microRNA precursor molecule comprises an antisense strand having the nucleotide sequence of any of the 19-mer, 20-mer, or 19-mer subsequences of the complementary ribonucleic acid sequence of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858. The use of artificial plant microRNAs to deliver a nucleotide sequence of interest (e.g. an artificial miRNA; siRNA/siRNA\*) into a plant is known in the art (see, e.g., Schwab et al. 2006. The Plant Cell 18:1121-1133 and Examples section herein). In the invention, the artificial microRNAs are chimeric or hybrid molecules, having a plant microRNA precursor backbone and an insect siRNA sequence inserted therein. As would be understood by one of ordinary skill in the art, it is typically desirable to

maintain mismatches that normally occur in the plant microRNA precursor sequence in any nucleotide sequence that is substituted into the plant microRNA precursor backbone. In still other embodiments, the artificial plant microRNA precursor comprises portions of a soybean microRNA precursor molecule. Any soybean microRNA (miRNA) precursor is suitable for the compositions and methods of the invention. Non-limiting examples of families of soybean microRNAs include miR159, miR169, miR395, miR156, miR159, miR160, miR171, miR398, miR408, miR828, miR4996, and miR5770 (Turner et al., 2012. *BMC Genomics* 13: 169; Tian et al., 2017. *BMC Genomics* 18: 572). Further non-limiting examples of soybean microRNAs can be found on the world wide web at the Soybean miRNA Functional Network website, also referred to as SoymiRNet, or at the Soybean Functional Network, also referred to as SoyFN.

**[0197]** In some embodiments, the invention encompasses interfering RNA molecules, nucleic acid constructs, nucleic acid molecules or recombinant vectors comprising at least one strand of a dsRNA of an interfering RNA molecule of the invention, or comprising a chimeric nucleic acid molecule of the invention, or comprising an artificial plant microRNA of the invention. In some embodiments the nucleic acid construct comprises a nucleic acid molecule of the invention. In other embodiments, the nucleic acid construct is a recombinant expression vector.

**[0198]** In some embodiments, the interfering RNA molecules of the invention have insecticidal activity on a stink bug. In some embodiments the stink bug is a member of the group comprising *Euschistus* spp. (for example *E. servus* (Brown Stink Bug), and *E. heros* (Neotropical Brown Stink Bug)), *Nezara* spp. (for example *N. antennata*, *N. hilare*, and *N. viridula* (Southern Green Stink Bug)), *Piezodorus* spp. (for example *P. guildinii* (Red-banded Stink Bug)), *Halyomorpha* spp. (for example *H. halys* (Brown Marmorated Stink Bug)), *Chinavia* spp. (for example *C. marginatum*, *C. hilare* (Green Stink Bug)), *Dichelops* spp. (for example *D. melacanthus*, *Dichelops furcatus*), *Edessa* spp. (for example *E. meditabunda*), *Thyanta* spp. (for example *T. perditor* (Neotropical Red Shouldered Stink Bug)), *Horcias* spp. (for example *H. nobilellus* (Cotton Bug)), *Taedia* spp. for example *T. stigmosa*), *Dysdercus* spp. (for example *D. peruvianus*), *Neomegalotomus* spp. (for example *N. parvus*), *Leptoglossus* spp. (for example *L. zonatus*), *Niesthrea* spp. (for example *N. sidae*), *Eurygaster* spp. (for example *E. intergriceps*, *E.*

*maura*), *Oebalus* spp. (for example *O. mexicana*, *O. poecilus*, and *O. pugnase*) and *Scotinophara* spp. (for example *S. lurida*, *S. coarctata*). In some embodiments, the coding sequence of the target gene comprises a sequence selected from the group comprising SEQ ID NO: 1-54, SEQ ID NO: 163-216, SEQ ID NO: 379-431, SEQ ID NO: 538-591, and the complements thereof.

**[0199]** In some embodiments, the invention encompasses a composition comprising one or more or two or more of the interfering RNA molecules of the invention. In some embodiments, the interfering RNA molecules are present on the same nucleic acid construct, on different nucleic acid constructs, or any combination thereof. For example, one interfering RNA molecule of the invention may be present on a nucleic acid construct, and a second interfering RNA molecule of the invention may be present on the same nucleic acid construct or on a separate, second nucleic acid construct. The second interfering RNA molecule of the invention may be to the same target gene or to a different target gene. The second interfering RNA molecule may have the same sequences as the first interfering RNA molecule or may have a different sequence compared to the first interfering RNA molecule.

**[0200]** In some embodiments, the invention encompasses a composition comprising an interfering RNA molecule which comprises at least one dsRNA wherein the dsRNA is a region of double-stranded RNA comprising annealed complementary strands. One strand of the dsRNA comprises a sequence of at least 19, at least 20, at least 21, at least 22, at least 23, at least 24, at least 25, at least 26, at least 27, at least 28, at least 29, at least 30, at least 35, at least 40, at least 45, at least 50, at least 55, at least 60, at least 65, at least 70, at least 75, at least 80, at least 85, at least 90, at least 95, at least 100, at least 110, at least 120, at least 130, at least 140, at least 150, at least 160, at least 170, at least 180, at least 190, at least 200, at least 210, at least 220, at least 230, at least 240, at least 250, at least 260, at least 270, at least 280, at least 290, or at least 300 contiguous nucleotides which is at least partially complementary to a target nucleotide sequence within a stink bug spp target gene. The interfering RNA molecule (i) has at least 60% identity, at least 65% identity, at least 70% identity, at least 75% identity, at least 80% identity, at least 85% identity, at least 86% identity, at least 87% identity, at least 88% identity,

at least 89% identity, at least 90% identity, at least 91% identity, at least 92% identity, at least 93% identity, at least 94% identity, at least 95% identity, at least 96% identity, at least 97% identity, at least 98% identity, at least 99% identity, or 100% identity, to at least a 19, at least a 20, at least a 21, at least a 22, at least a 23, at least a 24, at least a 25, at least a 26, at least a 27, at least a 28, at least a 29, at least a 30, at least a 35, at least a 40, at least a 45, at least a 50, at least a 55, at least a 60, at least a 65, at least a 70, at least a 75, at least a 80, at least a 85, at least a 90, at least a 95, at least a 100, at least a 110, at least a 120, at least a 130, at least a 140, at least a 150, at least a 160, at least a 170, at least a 180, at least a 190, at least a 200, at least a 210, at least a 220, at least a 230, at least a 240, at least a 250, at least a 260, at least a 270, at least a 280, at least a 290, or at least a 300 contiguous nucleotide fragment of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, or the complement thereof; or (ii) comprises at least a 19, at least a 20, at least a 21, at least a 22, at least a 23, at least a 24, at least a 25, at least a 26, at least a 27, at least a 28, at least a 29, at least a 30, at least a 35, at least a 40, at least a 45, at least a 50, at least a 55, at least a 60, at least a 65, at least a 70, at least a 75, at least a 80, at least a 85, at least a 90, at least a 95, at least a 100, at least a 110, at least a 120, at least a 130, at least a 140, at least a 150, at least a 160, at least a 170, at least a 180, at least a 190, at least a 200, at least a 210, at least a 220, at least a 230, at least a 240, at least a 250, at least a 260, at least a 270, at least a 280, at least a 290, or at least a 300 contiguous nucleotide fragment of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, or the complement thereof ; or (iii) comprises at least a 19, at least a 20, at least a 21, at least a 22, at least a 23, at least a 24, at least a 25, at least a 26, at least a 27, at least a 28, at least a 29, at least a 30, at least a 35, at least a 40, at least a 45, at least a 50, at least a 55, at least a 60, at least a 65, at least a 70, at least a 75, at least a 80, at least a 85, at least a 90, at least a 95, at least a 100, at least a 110, at least a 120, at least a 130, at least a 140, at least a 150, at least a 160, at least a 170, at least a 180, at least a 190, at least a 200, at least a 210, at least a 220, at least a 230, at least a 240, at least a 250, at least a 260, at least a 270, at least a 280, at least a 290, or at least a 300 contiguous nucleotide fragment of a nucleotide sequence encoding an amino acid sequence encoded by SEQ ID NO:

217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, or the complement thereof.

**[0201]** In some embodiments, the invention encompasses compositions comprising an interfering RNA molecule comprising two or more dsRNAs, wherein the two or more dsRNAs each comprise a different antisense strand. In some embodiments the invention encompasses compositions comprising at least two more interfering RNA molecules, wherein the two or more interfering RNA molecules each comprise a dsRNA comprising a different antisense strand. The two or more interfering RNAs may be present on the same nucleic acid construct, on different nucleic acid constructs or any combination thereof. In other embodiments, the composition comprises a RNA molecule comprising an antisense strand consisting essentially of a nucleotide sequence comprising at least a 19 contiguous nucleotide fragment of the complementary ribonucleic acid sequence of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, and in some embodiments may further comprise an RNA molecule comprising an antisense strand consisting essentially of a second nucleotide sequence comprising at least a 19 contiguous nucleotide fragment of the complementary ribonucleic acid sequence of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858; and in some embodiments may further comprise an RNA molecule comprising an antisense strand consisting essentially of a third nucleotide sequence comprising at least a 19 contiguous nucleotide fragment of the complementary ribonucleic acid sequence of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, and in some embodiments may further comprise an RNA molecule comprising an antisense strand consisting essentially of a fourth nucleotide sequence comprising at least a 19 contiguous nucleotide fragment of the complementary ribonucleic acid sequence of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, and in some embodiments may further comprise an RNA molecule comprising an antisense strand consisting essentially of a fifth nucleotide sequence comprising at least a 19 contiguous nucleotide fragment of the complementary ribonucleic acid sequence of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, and in some embodiments may further comprise an RNA molecule comprising an antisense strand consisting essentially of a sixth nucleotide sequence

comprising at least a 19 contiguous nucleotide fragment of the complementary ribonucleic acid sequence of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, and in some embodiments may further comprise an RNA molecule comprising an antisense strand consisting essentially of a seventh nucleotide sequence comprising at least a 19 contiguous nucleotide fragment of the complementary ribonucleic acid sequence of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858. In other embodiments, the composition may comprise two or more of the nucleic acid molecules, wherein the two or more nucleic acid molecules each encode a different interfering RNA molecule. In other embodiments, the composition may comprise two or more of the nucleic acid constructs, wherein the two or more nucleic acid constructs each comprise a nucleic acid molecule encoding a different interfering RNA.

**[0202]** In other embodiments, the composition comprises two or more nucleic acid constructs, two or more nucleic acid molecules, two or more chimeric nucleic acid molecules, two or more artificial plant microRNA precursors of the invention, wherein the two or more nucleic acid constructs, two or more nucleic acid molecules, two or more chimeric nucleic acid molecules, or two or more artificial plant microRNA precursors, each comprise a different antisense strand.

**[0203]** In some embodiments, the invention encompasses an insecticidal composition for inhibiting the expression of a stink bug gene described herein, comprising an interfering RNA of the invention and an agriculturally acceptable carrier. In some embodiments, the acceptable agricultural carrier is a transgenic organism expressing an interfering RNA of the invention. In some embodiments the transgenic organism may be a transgenic plant expressing the interfering RNA of the invention that when fed upon by a target hemipteran plant pest causes the target hemipteran plant pest to stop feeding, growing or reproducing or causing death of the target hemipteran plant pest. In other embodiments, the transgenic plant is a transgenic soybean plant and the target pest is a hemipteran or stink bug pest. In still other embodiments, the stink bug pest is selected from the group comprising *Euschistus* spp. (for example *E. servus* (Brown Stink Bug), and *E. heros* (Neotropical Brown Stink Bug)), *Nezara* spp. (for example *N. antennata*, *N. hilare*, and *N. viridula* (Southern Green Stink Bug)), *Piezodorus*

spp. (for example *P. guildinii* (Red-banded Stink Bug)), *Halyomorpha* spp. (for example *H. halys* (Brown Marmorated Stink Bug)), *Chinavia* spp. (for example *C. marginatum*, *C. hilare* (Green Stink Bug)), *Dichelops* spp. (for example *D. melacanthus*, *Dichelops furcatus*), *Edessa* spp. (for example *E. meditabunda*), *Thyanta* spp. (for example *T. perditor* (Neotropical Red Shouldered Stink Bug)), *Horcias* spp. (for example *H. nobilellus* (Cotton Bug)), *Taedia* spp. for example *T. stigmosa*), *Dysdercus* spp. (for example *D. peruvianus*), *Neomegalotomus* spp. (for example *N. parvus*), *Leptoglossus* spp. (for example *L. zonatus*), *Niesthrea* spp. (for example *N. sidae*), *Eurygaster* spp. (for example *E. intergriceps*, *E. maura*), *Oebalus* spp. (for example *O. mexicana*, *O. poecilus*, and *O. pugnase*) and *Scotinophara* spp. (for example *S. lurida*, *S. coarctata*).

**[0204]** In other embodiments, the transgenic organism is selected from, but not limited to, the group consisting of: yeast, fungi, algae, bacteria, virus or an arthropod expressing the interfering RNA molecule of the invention. In some embodiments, the transgenic organism is a virus, for example an insect baculovirus that expresses an interfering RNA molecule of the invention upon infection of an insect host. Such a baculovirus is likely more virulent against the target insect than the wild-type untransformed baculovirus. In other embodiments the transgenic organism is a transgenic bacterium that is applied to an environment where a target pest occurs or is known to have occurred. In some embodiments, the transgenic bacterium is *Escherichia coli*. In some embodiments, non-pathogenic symbiotic bacteria, which are able to live and replicate within plant tissues, so-called endophytes, or non-pathogenic symbiotic bacteria, which are capable of colonizing the phyllosphere or the rhizosphere, so-called epiphytes, are used. Such bacteria include bacteria of the genera *Agrobacterium*, *Alcaligenes*, *Azospirillum*, *Azotobacter*, *Bacillus*, *Clavibacter*, *Enterobacter*, *Erwinia*, *Flavobacter*, *Klebsiella*, *Pseudomonas*, *Rhizobium*, *Serratia*, *Streptomyces* and *Xanthomonas*. Symbiotic fungi, such as *Trichoderma* and *Gliocladium* are also possible hosts for expression of the inventive interfering RNA molecule for the same purpose.

**[0205]** In some embodiments, an acceptable agricultural carrier is a formulation useful for applying the composition comprising the interfering RNA molecule to a plant or seed. In some embodiments, the interfering RNA molecules are stabilized against degradation because of their double stranded nature and the introduction of Dnase/Rnase inhibitors. For example,

dsRNA or siRNA can be stabilized by including thymidine or uridine nucleotide 3' overhangs. The dsRNA or siRNA contained in the compositions of the invention can be chemically synthesized at industrial scale in large amounts. Methods available would be through chemical synthesis or through the use of a biological agent.

**[0206]** In other embodiments the formulation comprises a transfection promoting agent. In other embodiments, the transfection promoting agent is a lipid-containing compound. In further embodiments, the lipid-containing compound is selected from the group consisting of; Lipofectamine, Cellfectin, DMRIE-C, DOTAP and Lipofectin. In another embodiment, the lipid-containing compound is a Tris cationic lipid.

**[0207]** In some embodiments, the formulation further comprises a nucleic acid condensing agent. The nucleic acid condensing agent can be any such compound known in the art. Examples of nucleic acid condensing agents include, but are not limited to, spermidine (N-[3-aminopropyl]-1,4-butanediamine), protamine sulphate, poly-lysine as well as other positively charged peptides. In some embodiments, the nucleic acid condensing agent is spermidine or protamine sulfate.

**[0208]** In still further embodiments, the formulation further comprises buffered sucrose or phosphate buffered saline.

**[0209]** In some embodiments, the invention encompasses transgenic plants, or parts thereof, comprising an interfering RNA molecule, a nucleic acid construct, a chimeric nucleic acid molecule, an artificial plant microRNA precursor molecule and/or a composition of the invention, wherein the transgenic plant has enhanced resistance to a hemipteran insect or stink bug as compared to a control plant which does not comprise the molecule and/or composition of the invention. In other embodiments, the transgenic plant, or part thereof, is a transgenic soybean plant, or part thereof. The invention further encompasses transgenic seed of the transgenic plants of the invention, wherein the transgenic seed comprises an interfering RNA molecule, a nucleic acid construct, a chimeric nucleic acid molecule, an artificial plant microRNA precursor molecule and/or a composition of the invention. In some embodiments the transgenic seed is a transgenic soybean seed.

**[0210]** Transgenic plants expressing an interfering RNA of the invention are tolerant or resistant to attack by target insect pests. When the insect starts feeding on such a transgenic plant, it also ingests the expressed dsRNA or siRNA. This may deter the insect from further biting into the plant tissue or may even harm or kill the insect. A nucleic acid sequence encoding a dsRNA or siRNA of the invention is inserted into an expression cassette, which is then preferably stably integrated in the genome of the plant. The nucleic acid sequences of the expression cassette introduced into the genome of the plant are heterologous to the plant and non-naturally occurring. Plants transformed in accordance with the present invention may be monocots or dicots and include, but are not limited to, corn, soy, wheat, barley, rye, sweet potato, bean, pea, chicory, lettuce, cabbage, cauliflower, broccoli, turnip, radish, spinach, asparagus, onion, garlic, pepper, celery, squash, pumpkin, hemp, zucchini, apple, pear, quince, melon, plum, cherry, peach, nectarine, apricot, strawberry, grape, raspberry, blackberry, pineapple, avocado, papaya, mango, banana, soybean, tomato, sorghum, sugarcane, sugar beet, sunflower, rapeseed, clover, tobacco, carrot, cotton, alfalfa, rice, potato, eggplant, cucumber, Arabidopsis, and woody plants such as coniferous and deciduous trees. In further embodiments, the transgenic plant is a transgenic soybean plant.

**[0211]** Expression of the interfering RNA molecule in transgenic plants is driven by regulatory sequences comprising promoters that function in plants. The choice of promoter will vary depending on the temporal and spatial requirements for expression, and also depending on the insect target species. Thus, expression of the interfering RNAs of this invention in leaves, in stalks or stems, in inflorescences (e.g. flowers, pistil, stamen, and other flower parts), in seed pods, in seeds, in roots, and/or seedlings is contemplated. In many cases, however, protection against more than one type of insect pest is sought, and thus expression in multiple tissues is desirable. Although many promoters from dicotyledons have been shown to be operational in monocotyledons and vice versa, ideally dicotyledonous promoters are selected for expression in dicotyledons, and monocotyledonous promoters for expression in monocotyledons. However, there is no restriction to the provenance of selected promoters; it is sufficient that they are operational in driving the expression of the dsRNA or siRNA in the desired cell.

**[0212]** Promoters useful with the invention include, but are not limited to, those that drive expression of a nucleotide sequence constitutively, those that drive expression when induced, and those that drive expression in a tissue- or developmentally-specific manner. These various types of promoters are known in the art.

**[0213]** Examples of constitutive promoters include, but are not limited to, cestrum virus promoter (cmp) (U.S. Patent No. 7,166,770), CaMV 35S promoter (Odell *et al.* (1985) *Nature* 313:810-812), CaMV 19S promoter (Lawton *et al.* (1987) *Plant Mol. Biol.* 9:315-324), nos promoter (Ebert *et al.* (1987) *Proc. Natl. Acad. Sci USA* 84:5745-5749), Adh promoter (Walker *et al.* (1987) *Proc. Natl. Acad. Sci. USA* 84:6624-6629), figwort mosaic virus (FMV) promoter (Govindarajulu *et al.* 2008. *Mol Plant Microbe Interact* 21:1027-35) and the ubiquitin promoter. The constitutive promoter derived from ubiquitin accumulates in many cell types. Ubiquitin promoters have been cloned from several plant species for use in transgenic plants, for example, sunflower (Binet *et al.*, 1991. *Plant Science* 79: 87-94), maize (Christensen *et al.*, 1989. *Plant Molec. Biol.* 12: 619-632), and Arabidopsis (Norris *et al.* 1993. *Plant Molec. Biol.* 21:895-906).

**[0214]** In some embodiments, tissue-specific/tissue-preferred promoters can be used. Tissue-specific or tissue-preferred expression patterns include, but are not limited to, green tissue specific or preferred, root specific or preferred, stem specific or preferred, and flower specific or preferred. Tissue-specific or tissue-preferential promoters useful for the expression of the nucleotide sequences of the invention in plants include but are not limited to those that direct expression in roots or particular cells in roots, pith, leaf or pollen. Such promoters are disclosed, for example without limitation, in WO 93/07278, herein incorporated by reference in its entirety. Other non-limiting examples of tissue specific or tissue preferred promoters useful with the invention include the stem specific promoter described in U.S. Patent 5,625,136 (to Ciba-Geigy) and which drives expression of the maize *trpA* gene; and the cestrum yellow leaf curling virus promoter disclosed in WO 01/73087, all incorporated herein by reference.

**[0215]** In addition, promoters functional in plastids can be used. Non-limiting examples of such promoters include the bacteriophage T3 gene 9 5' UTR and other promoters disclosed in U.S. Patent No. 7,579,516. Other promoters useful with the invention include but are not

limited to the S-E9 small subunit RuBP carboxylase promoter and the Kunitz trypsin inhibitor gene promoter (Kti3).

**[0216]** In some embodiments of the invention, inducible promoters can be used. Thus, for example, chemical-regulated promoters can be used to modulate the expression of nucleotide sequences of the invention in a plant through the application of an exogenous chemical regulator. In further aspects, the nucleotide sequences of the invention can be operably associated with a promoter that is wound inducible or inducible by pest or pathogen infection (e.g., an insect or nematode plant pest).

**[0217]** In some embodiments of the present invention, a “minimal promoter” or “basal promoter” is used. A minimal promoter is capable of recruiting and binding RNA polymerase II complex and its accessory proteins to permit transcriptional initiation and elongation. In some embodiments, a minimal promoter is constructed to comprise only the nucleotides/nucleotide sequences from a selected promoter that are required for binding of the transcription factors and transcription of a nucleotide sequence of interest that is operably associated with the minimal promoter including but not limited to TATA box sequences. In other embodiments, the minimal promoter lacks cis sequences that recruit and bind transcription factors that modulate (e.g., enhance, repress, confer tissue specificity, confer inducibility or repressibility) transcription. A minimal promoter is generally placed upstream (i.e., 5′) of a nucleotide sequence to be expressed. Thus, nucleotides/nucleotide sequences from any promoter useable with the present invention can be selected for use as a minimal promoter.

**[0218]** In some embodiments, a recombinant nucleic acid molecule of the invention can be an “expression cassette.” As used herein, “expression cassette” means a recombinant nucleic acid molecule comprising a nucleotide sequence of interest (e.g., the nucleotide sequences of the invention), wherein the nucleotide sequence is operably associated with at least a control sequence (e.g., a promoter). Thus, some embodiments of the invention provide expression cassettes designed to express nucleotide sequences encoding the dsRNAs or siRNAs of the invention. In this manner, for example, one or more plant promoters operably associated with one or more nucleotide sequences of the invention are provided in expression cassettes for expression in a soybean plant, plant part and/or plant cell.

**[0219]** An expression cassette comprising a nucleotide sequence of interest may be chimeric, meaning that at least one of its components is heterologous with respect to at least one of its other components. An expression cassette may also be one that comprises a native promoter driving its native gene, however it has been obtained in a recombinant form useful for heterologous expression. Such usage of an expression cassette makes it so it is not naturally occurring in the cell into which it has been introduced.

**[0220]** An expression cassette also can optionally include a transcriptional and/or translational termination region (*i.e.*, termination region) that is functional in plants. A variety of transcriptional terminators are available for use in expression cassettes and are responsible for the termination of transcription beyond the heterologous nucleotide sequence of interest and correct mRNA polyadenylation. The termination region may be native to the transcriptional initiation region, may be native to the operably linked nucleotide sequence of interest, may be native to the plant host, or may be derived from another source (*i.e.*, foreign or heterologous to the promoter, the nucleotide sequence of interest, the plant host, or any combination thereof). Appropriate transcriptional terminators include, but are not limited to, the CAMV 35S terminator, the tml terminator, the nopaline synthase terminator and/or the pea rbcS E9 terminator. These can be used in both monocotyledons and dicotyledons. In addition, a coding sequence's native transcription terminator can be used.

**[0221]** An expression cassette of the invention also can include a nucleotide sequence for a selectable marker, which can be used to select a transformed plant, plant part and/or plant cell. As used herein, "selectable marker" means a nucleotide sequence that when expressed imparts a distinct phenotype to the plant, plant part and/or plant cell expressing the marker and thus allows such transformed plants, plant parts and/or plant cells to be distinguished from those that do not have the marker. Such a nucleotide sequence may encode either a selectable or screenable marker, depending on whether the marker confers a trait that can be selected for by chemical means, such as by using a selective agent (*e.g.*, an antibiotic, herbicide, or the like), or on whether the marker is simply a trait that one can identify through observation or testing, such as by screening (*e.g.*, the R-locus trait). Of course, many examples

of suitable selectable markers are known in the art and can be used in the expression cassettes described herein.

**[0222]** Examples of selectable markers include, but are not limited to, a nucleotide sequence encoding *neo* or *nptII*, which confers resistance to kanamycin, G418, and the like (Potrykus *et al.* (1985) *Mol. Gen. Genet.* 199:183-188); a nucleotide sequence encoding *bar*, which confers resistance to phosphinothricin; a nucleotide sequence encoding an altered 5-enolpyruvylshikimate-3-phosphate (EPSP) synthase, which confers resistance to glyphosate (Hinchee *et al.* (1988) *Biotech.* 6:915-922); a nucleotide sequence encoding a nitrilase such as *bxn* from *Klebsiella ozaenae* that confers resistance to bromoxynil (Stalker *et al.* (1988) *Science* 242:419-423); a nucleotide sequence encoding an altered acetolactate synthase (ALS) that confers resistance to imidazolinone, sulfonylurea or other ALS-inhibiting chemicals (EP Patent Application No. 154204); a nucleotide sequence encoding a methotrexate-resistant dihydrofolate reductase (DHFR) (Thillet *et al.* (1988) *J. Biol. Chem.* 263:12500-12508); a nucleotide sequence encoding a dalapon dehalogenase that confers resistance to dalapon; a nucleotide sequence encoding a mannose-6-phosphate isomerase (also referred to as phosphomannose isomerase (PMI)) that confers an ability to metabolize mannose (US Patent Nos. 5,767,378 and 5,994,629); a nucleotide sequence encoding an altered anthranilate synthase that confers resistance to 5-methyl tryptophan; and/or a nucleotide sequence encoding *hph* that confers resistance to hygromycin. One of skill in the art is capable of choosing a suitable selectable marker for use in an expression cassette of the invention.

**[0223]** An expression cassette of the invention also can include polynucleotides that encode other desired traits. Such desired traits can be other polynucleotides which confer insect resistance, or which confer nematode resistance, or other agriculturally desirable traits. Such polynucleotides can be stacked with any combination of nucleotide sequences to create plants, plant parts or plant cells having the desired phenotype. Stacked combinations can be created by any method including, but not limited to, cross breeding plants by any conventional methodology, or by genetic transformation. If stacked by genetically transforming the plants, nucleotide sequences encoding additional desired traits can be combined at any time and in any order. For example, a single transgene can comprise multiple expression cassettes, such

that multiple expression cassettes are introduced into the genome of a transformed cell at a single genomic location. Alternatively, a transgenic plant comprising one or more desired traits can be used as the target to introduce further traits by subsequent transformation. The additional nucleotide sequences can be introduced simultaneously in a co-transformation protocol with a nucleotide sequence, nucleic acid molecule, nucleic acid construct, and/or other composition of the invention, provided by any combination of expression cassettes. For example, if two nucleotide sequences will be introduced, they can be incorporated in separate cassettes (*trans*) or can be incorporated on the same cassette (*cis*). Expression of the nucleotide sequences can be driven by the same promoter or by different promoters. It is further recognized that nucleotide sequences can be stacked at a desired genomic location using a site-specific recombination system. *See, e.g.*, Int'l Patent Application Publication Nos. WO 99/25821; WO 99/25854; WO 99/25840; WO 99/25855 and WO 99/25853.

**[0224]** Thus, an expression cassette can include a coding sequence for one or more polypeptides for agronomic traits that primarily are of benefit to a seed company, grower or grain processor. A polypeptide of interest can be any polypeptide encoded by a polynucleotide sequence of interest. Non-limiting examples of polypeptides of interest that are suitable for production in plants include those resulting in agronomically important traits such as herbicide resistance (also sometimes referred to as “herbicide tolerance”), virus resistance, bacterial pathogen resistance, insect resistance, nematode resistance, and/or fungal resistance. *See, e.g.*, U.S. Patent Nos. 5,569,823; 5,304,730; 5,495,071; 6,329,504; and 6,337,431.

**[0225]** Vectors suitable for plant transformation are well known in the art. For *Agrobacterium*-mediated transformation, binary vectors or vectors carrying at least one T-DNA border sequence are suitable, whereas for direct gene transfer any vector is suitable and linear DNA containing only the construct of interest may be preferred. In the case of direct gene transfer, transformation with a single DNA species or co-transformation can be used (Schocher *et al.* *Biotechnology* 4:1093- 1096 (1986)). For both direct gene transfer and *Agrobacterium*-mediated transfer, transformation is usually (but not necessarily) undertaken with a selectable marker that may provide resistance to an antibiotic (kanamycin, hygromycin or methotrexate) or a herbicide (basta). Plant transformation vectors of the invention may also comprise other

selectable marker genes, for example, phosphomannose isomerase (PMI), which provides for positive selection of the transgenic plants as disclosed in U.S. Patents 5,767,378 and 5,994,629, herein incorporated by reference, or phosphinotricin acetyltransferase (PAT), which provides tolerance to the herbicide phosphinotricin (glufosinate). The choice of selectable marker is not, however, critical to the invention.

**[0226]** In other embodiments, a nucleic acid sequence of the invention is directly transformed into the plastid genome. Plastid transformation technology is extensively described in U.S. Patent Nos. 5,451,513, 5,545,817, and 5,545,818, in PCT application no. WO 95/16783, and in McBride *et al.* (1994) *Proc. Natl. Acad. Sci. USA* 91, 7301-7305. The basic technique for chloroplast transformation involves introducing regions of cloned plastid DNA flanking a selectable marker together with the gene of interest into a suitable target tissue, e.g., using biolistics or protoplast transformation (e.g., calcium chloride or PEG mediated transformation). The 1 to 1.5 kb flanking regions, termed targeting sequences, facilitate homologous recombination with the plastid genome and thus allow the replacement or modification of specific regions of the plastome. Initially, point mutations in the chloroplast 16S rRNA and rps12 genes conferring resistance to spectinomycin and/or streptomycin are utilized as selectable markers for transformation (Svab, Z., Hajdukiewicz, P., and Maliga, P. (1990) *Proc. Natl. Acad. Sci. USA* 87, 8526-8530; Staub, J. M., and Maliga, P. (1992) *Plant Cell* 4, 39-45). This resulted in stable homoplasmic transformants at a frequency of approximately one per 100 bombardments of target leaves. The presence of cloning sites between these markers allowed creation of a plastid targeting vector for introduction of foreign genes (Staub, J.M., and Maliga, P. (1993) *EMBO J.* 12, 601-606). Substantial increases in transformation frequency are obtained by replacement of the recessive rRNA or r-protein antibiotic resistance genes with a dominant selectable marker, the bacterial aadA gene encoding the spectinomycin-cletoxyfying enzyme aminoglycoside- 3'- adenylyltransf erase (Svab, Z., and Maliga, P. (1993) *Proc. Natl. Acad. Sci. USA* 90, 913-917). Previously, this marker had been used successfully for high-frequency transformation of the plastid genome of the green alga *Chlamydomonas reinhardtii* (Goldschmidt- Clermont, M. (1991) *Nucl. Acids Res.* 19:4083-4089). Other selectable markers useful for plastid transformation are known in the art and encompassed within the scope of the

invention. Typically, approximately 15-20 cell division cycles following transformation are required to reach a homoplastidic state. Plastid expression, in which genes are inserted by homologous recombination into all of the several thousand copies of the circular plastid genome present in each plant cell, takes advantage of the enormous copy number advantage over nuclear- expressed genes to permit expression levels that can readily exceed 10% of the total soluble plant protein. In a preferred embodiment, a nucleic acid sequence of the present invention is inserted into a plastid-targeting vector and transformed into the plastid genome of a desired plant host. Plants homoplastic for plastid genomes containing a nucleic acid sequence of the present invention are obtained, and are preferentially capable of high expression of the nucleic acid sequence.

**[0227]** Transgenic plants or seed comprising an interfering RNA of the invention can also be treated with an insecticide or insecticidal seed coating, for example as described in U. S. Patent No. 5,849,320 and 5,876,739 and in U.S. Patent Application Publication US 2015/0164078A1, all of which are herein incorporated by reference. Where both the insecticide or insecticidal seed coating and the transgenic plant or seed of the invention are active against the same target insect, for example a hemipteran pest or a stink bug target pest, the combination is useful (i) in a method for further enhancing activity of the composition of the invention against the target insect, and (ii) in a method for preventing development of resistance to the composition of the invention by providing yet another mechanism of action against the target insect. Thus, the invention provides a method of enhancing control of a hemipteran or stink bug population comprising providing a transgenic plant or seed of the invention and applying to the plant or the seed an insecticide or insecticidal seed coating to a transgenic plant or seed of the invention. Examples of such insecticides and/or insecticidal seed coatings include, without limitation, a carbamate, a pyrethroid, an organophosphate, a fiprole, a neonicotinoid, an organochloride, a nereistoxin, or a combination thereof. In another embodiment, the insecticide or insecticidal seed coating are selected from the group consisting of carbofuran, carbaryl, methomyl, bifenthrin, tefluthrin, permethrin, cyfluthrin, lambda-cyhalothrin, cypermethrin, deltamethrin, chlorpyrifos, chlorethoxyfos, dimethoate, ethoprophos, malathion, methyl-parathion, phorate, terbufos, tebupirimiphos, fipronil,

acetamiprid, imidacloprid, thiacloprid, thiamethoxam, endosulfan, bensultap, and a combination thereof. Commercial products containing such insecticides and insecticidal seed coatings include, without limitation, Furadan® (carbofuran), Lanate® (methomyl, metomil, mesomile), Sevin® (carbaryl), Talstar® (bifenthrin), Force® (tefluthrin), Ammo® (cypermethrin), Cymbush® (cypermethrin), Delta Gold® (deltamethrin), Karate® (lambda-cyhalothrin), Ambush® (permethrin), Pounce® (permethrin), Brigade® (bifenthrin), Capture® (bifenthrin), ProShield® (tefluthrin), Warrior® (lambda-cyhalothrin), Dursban® (chlorpyrifos), Fortress® (chlorethoxyfos), Mocap® (ethoprop), Thimet® (phorate), AStar® (phorate, flucythinate), Rampart® (phorate), Counter® (terbufos), Cygon® (dimethoate), Dicapthon, Regent® (fipronil), Cruiser® (thiamethoxam), Gaucho® (imidacloprid), Prescribe® (imidacloprid), Poncho® (clothianidin) and Aztec® (cyfluthrin, tebupirimphos).

**[0228]** The compositions of the invention can also be combined with other biological control agents to enhance control of a hemipteran insect or a stink bug populations, or to provide control against other insect pests. Thus, the invention provides a method of enhancing control of a hemipteran insect population or a stink bug population by providing a transgenic plant that produces an interfering RNA of the invention and further comprises a polynucleotide that encodes a second insecticidal agent. The second insecticidal agent may be an insecticidal protein derived from *Bacillus thuringiensis*. A *B. thuringiensis* insecticidal protein can be any of a number of insecticidal proteins including but not limited to a Cry1 protein, a Cry3 protein, a Cry7 protein, a Cry8 protein, a Cry11 protein, a Cry22 protein, a Cry23 protein, a Cry36 protein, a Cry37 protein, a Cry34 protein together with a Cry35 protein, a binary insecticidal protein CryET33 and CryET34, a binary insecticidal protein TIC100 and TIC101 (for example U.S. Patent No. 7,655,838), a binary insecticidal protein PS149B1, a VIP (for example U.S. Patent No. 5,877,012), a TIC900 or related protein, a TIC901, TIC1201, TIC407, TIC417, a modified Cry1 protein, or hybrid proteins or chimeras made from any of the preceding insecticidal proteins. In other embodiments, the *B. thuringiensis* insecticidal protein is selected from the group consisting of Cry1Ac, Cry1A.105, Cry1F, and Cry2Ab2.

**[0229]** In other embodiments, the transgenic plant may produce an interfering RNA of the invention and a second insecticidal agent which is derived from sources other than *B.*

*thuringiensis*. The second insecticidal agent can be an agent selected from the group comprising a patatin, a protease, a protease inhibitor, a chitinase, a urease, an alpha-amylase inhibitor, a pore-forming protein, a lectin, an engineered antibody or antibody fragment, a *Bacillus cereus* insecticidal protein, a *Xenorhabdus* spp. (such as *X. nematophila* or *X. bovienii*) insecticidal protein, a *Photorhabdus* spp. (such as *P. luminescens* or *P. asymobiotica*) insecticidal protein, a *Brevibacillus laterosporus* insecticidal protein, a *Lysinibacillus sphaericus* insecticidal protein, a *Chromobacterium* spp. insecticidal protein, a *Yersinia entomophaga* insecticidal protein, a *Paenibacillus popilliae* insecticidal protein, a *Clostridium* spp. (such as *C. bifermentans*) insecticidal protein, and a lignin. In other embodiments, the second agent may be at least one insecticidal protein derived from an insecticidal toxin complex (Tc) from *Photorhabdus*, *Xenorhabdus*, *Serratia*, or *Yersinia*. In other embodiments the insecticidal protein may be an ADP-ribosyltransferase derived from an insecticidal bacteria, such as *Photorhabdus* spp. In other embodiments, the insecticidal protein may be a VIP protein, such as VIP1 or VIP2 from *B. cereus*. In still other embodiments, the insecticidal protein may be a binary toxin derived from an insecticidal bacteria, such as ISP1A and ISP2A from *B. laterosporus* or BinA and BinB from *L. sphaericus*. In still other embodiments, the insecticidal protein may be engineered or may be a hybrid or chimera of any of the preceding insecticidal proteins.

**[0230]** In another embodiment, the transgenic plant and transgenic seed is a soybean plant or soybean seed. In another embodiment, the transgenic soybean plant is provided by crossing a first transgenic soybean plant comprising a dsRNA of the invention with a transgenic soybean plant comprising a transgenic event, such as for example a YIELD GARD® soybean plant, a Roundup Ready® soybean plant, a Roundup Ready2 Xtend® soybean plant, a Liberty Link™ soybean plant, an Enlist™ soybean plant, a Treus™ soybean plant, a Plenish™ soybean plant, or a SYHT0H2 soybean plant.

**[0231]** Even where the insecticide or insecticidal seed coating is active against a different insect, the insecticide or insecticidal seed coating is useful to expand the range of insect control, for example by adding an insecticide or insecticidal seed coating that has activity against lepidopteran insects to the transgenic plant or seed of the invention, which has activity

against hemipteran insects, the treated plant or coated transgenic seed controls both lepidopteran and hemipteran insect pests.

**[0232]** In further embodiments, the invention encompasses a biological sample from a transgenic plant, seed, or parts thereof, of the invention, wherein the sample comprises a nucleic acid that is or encodes at least one strand of a dsRNA of the invention. In other embodiments, the invention encompasses a commodity product derived from a transgenic plant, seed, or parts thereof, of the invention. In some embodiments, the commodity product is selected from the group consisting of whole or processed seeds, beans, grains, kernels, hulls, meals, grits, flours, sugars, starches, protein concentrates, protein isolates, waxes, oils, extracts, juices, concentrates, liquids, syrups, feed, silage, fiber, paper or other food or product produced from plants. In some embodiments, the commodity product consists of whole seeds and comprises a nucleic acid that is or encodes at least one strand of a dsRNA of the invention. In some embodiments, the biological sample or commodity product is toxic to insects. In some embodiments, the transgenic plant is a transgenic soybean plant.

**[0233]** The invention further encompasses a method of controlling a hemipteran insect or a stink bug comprising contacting the insect with a nucleic acid molecule that is or is capable of producing an interfering RNA molecule of the invention for inhibiting expression of a target gene in the insect thereby controlling the hemipteran insect or the stink bug. In some embodiments, the target gene comprises a coding sequence (i) having at least 60% identity, at least 65% identity, at least 70% identity, at least 75% identity, at least 80% identity, at least 85% identity, at least 86% identity, at least 87% identity, at least 88% identity, at least 89% identity, at least 90% identity, at least 91% identity, at least 92% identity, at least 93% identity, at least 94% identity, at least 95% identity, at least 96% identity, at least 97% identity, at least 98% identity, at least 99% identity, or 100% identity, to at least a 19, at least a 20, at least a 21, at least a 22, at least a 23, at least a 24, at least a 25, at least a 26, at least a 27, at least a 28, at least a 29, at least a 30, at least a 35, at least a 40, at least a 45, at least a 50, at least a 55, at least a 60, at least a 65, at least a 70, at least a 75, at least a 80, at least a 85, at least a 90, at least a 95, at least a 100, at least a 110, at least a 120, at least a 130, at least a 140, at least a 150, at least a 160, at least a 170, at least a 180, at least a 190, at least a 200, at least a 210, at

least a 220, at least a 230, at least a 240, at least a 250, at least a 260, at least a 270, at least a 280, at least a 290, or at least a 300 contiguous nucleotide fragment of SEQ ID NO: 1-54, SEQ ID NO: 163-216, SEQ ID NO: 379-431, SEQ ID NO: 538-591, or the complement thereof; or (ii) comprising at least a 19, at least a 20, at least a 21, at least a 22, at least a 23, at least a 24, at least a 25, at least a 26, at least a 27, at least a 28, at least a 29, at least a 30, at least a 35, at least a 40, at least a 45, at least a 50, at least a 55, at least a 60, at least a 65, at least a 70, at least a 75, at least a 80, at least a 85, at least a 90, at least a 95, at least a 100, at least a 110, at least a 120, at least a 130, at least a 140, at least a 150, at least a 160, at least a 170, at least a 180, at least a 190, at least a 200, at least a 210, at least a 220, at least a 230, at least a 240, at least a 250, at least a 260, at least a 270, at least a 280, at least a 290, or at least a 300 contiguous nucleotide fragment of SEQ ID NO: 1-54, SEQ ID NO: 163-216, SEQ ID NO: 379-431, SEQ ID NO: 538-591, or the complement thereof; or (iii) comprising at least a 19, at least a 20, at least a 21, at least a 22, at least a 23, at least a 24, at least a 25, at least a 26, at least a 27, at least a 28, at least a 29, at least a 30, at least a 35, at least a 40, at least a 45, at least a 50, at least a 55, at least a 60, at least a 65, at least a 70, at least a 75, at least a 80, at least a 85, at least a 90, at least a 95, at least a 100, at least a 110, at least a 120, at least a 130, at least a 140, at least a 150, at least a 160, at least a 170, at least a 180, at least a 190, at least a 200, at least a 210, at least a 220, at least a 230, at least a 240, at least a 250, at least a 260, at least a 270, at least a 280, at least a 290, or at least a 300 contiguous nucleotide fragment of a nucleotide sequence encoding an amino acid sequence encoded by SEQ ID NO: 1-54, SEQ ID NO: 163-216, SEQ ID NO: 379-431, SEQ ID NO: 538-591, or the complement thereof.. In some embodiments the target gene coding sequence comprises SEQ ID NO: 1-54, SEQ ID NO: 163-216, SEQ ID NO: 379-431, SEQ ID NO: 538-591, or the complement thereof. In other embodiments, the interfering RNA molecule of the invention is complementary to a portion of a mRNA polynucleotide transcribable from the stink bug target genes described herein.

**[0234]** In some embodiments of the method of controlling a hemipteran insect pest or a stink bug pest, the interfering RNA molecule of the invention comprises at least one dsRNA, wherein the dsRNA is a region of double-stranded RNA comprising annealed complementary strands, one strand of which comprises a sequence of at least 19 contiguous nucleotides which

(i) has at least 60% identity, at least 65% identity, at least 70% identity, at least 75% identity, at least 80% identity, at least 85% identity, at least 86% identity, at least 87% identity, at least 88% identity, at least 89% identity, at least 90% identity, at least 91% identity, at least 92% identity, at least 93% identity, at least 94% identity, at least 95% identity, at least 96% identity, at least 97% identity, at least 98% identity, at least 99% identity, or 100% identity, to at least a 19, at least a 20, at least a 21, at least a 22, at least a 23, at least a 24, at least a 25, at least a 26, at least a 27, at least a 28, at least a 29, at least a 30, at least a 35, at least a 40, at least a 45, at least a 50, at least a 55, at least a 60, at least a 65, at least a 70, at least a 75, at least a 80, at least a 85, at least a 90, at least a 95, at least a 100, at least a 110, at least a 120, at least a 130, at least a 140, at least a 150, at least a 160, at least a 170, at least a 180, at least a 190, at least a 200, at least a 210, at least a 220, at least a 230, at least a 240, at least a 250, at least a 260, at least a 270, at least a 280, at least a 290, or at least a 300 contiguous nucleotide fragment of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, or the complement thereof; or (ii) comprises at least a 19, at least a 20, at least a 21, at least a 22, at least a 23, at least a 24, at least a 25, at least a 26, at least a 27, at least a 28, at least a 29, at least a 30, at least a 35, at least a 40, at least a 45, at least a 50, at least a 55, at least a 60, at least a 65, at least a 70, at least a 75, at least a 80, at least a 85, at least a 90, at least a 95, at least a 100, at least a 110, at least a 120, at least a 130, at least a 140, at least a 150, at least a 160, at least a 170, at least a 180, at least a 190, at least a 200, at least a 210, at least a 220, at least a 230, at least a 240, at least a 250, at least a 260, at least a 270, at least a 280, at least a 290, or at least a 300 contiguous nucleotide fragment of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, or the complement thereof; or (iii) comprises at least a 19, at least a 20, at least a 21, at least a 22, at least a 23, at least a 24, at least a 25, at least a 26, at least a 27, at least a 28, at least a 29, at least a 30, at least a 35, at least a 40, at least a 45, at least a 50, at least a 55, at least a 60, at least a 65, at least a 70, at least a 75, at least a 80, at least a 85, at least a 90, at least a 95, at least a 100, at least a 110, at least a 120, at least a 130, at least a 140, at least a 150, at least a 160, at least a 170, at least a 180, at least a 190, at least a 200, at least a 210, at least a 220, at least a 230, at least a 240, at least a 250, at least a 260, at least a 270, at least a 280, at least a 290, or at least a 300 contiguous nucleotide

fragment of a nucleotide sequence encoding an amino acid sequence encoded by SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, or the complement thereof.

**[0235]** In some embodiments of the method of controlling a hemipteran insect pest or a stink bug pest, the interfering RNA molecule comprises, consists essentially of or consists of from 18, 19, 20 or 21 consecutive nucleotides to at least about 300 consecutive of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, or a complement thereof. In other embodiments of the method, the interfering RNA of the invention comprises, consists essentially of or consists of any 19-mer subsequence of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858 consisting of N to N+18 nucleotides, or any complement thereof. For example, an interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 271, wherein N is nucleotide 1 to nucleotide 336 of SEQ ID NO: 271, or any complement thereof. In other words, the portion of the mRNA that is targeted comprises any of the 336 19-mers (a 19-mer refers to 19 consecutive nucleotides) subsequences of SEQ ID NO: 271, or any of their complementing sequences. It will be recognized that these 336 19-mer subsequences include all possible 19-mer subsequences from SEQ ID NO: 271 and from SEQ ID NO: 217, and their complements, as SEQ ID NOs 217 and 271 are to the same target, namely Nv\_CG7622. It will similarly be recognized that all 19-mer subsequences of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, and all complement subsequences thereof, include all possible 19-mer subsequences of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, and the complement subsequences thereof.

**[0236]** Similarly, in some embodiments of the method of controlling a hemipteran pest or stink bug pest, the interfering RNA molecule comprises a dsRNA which comprises, consists essentially of or consists of any 19-mer subsequence of SEQ ID NO: 272, wherein N is nucleotide 1 to nucleotide 663 of SEQ ID NO: 272, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 273, wherein N is

nucleotide 1 to nucleotide 357 of SEQ ID NO: 273, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 274, wherein N is nucleotide 1 to nucleotide 1275 of SEQ ID NO: 274, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 275, wherein N is nucleotide 1 to nucleotide 369 of SEQ ID NO: 275, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 276, wherein N is nucleotide 1 to nucleotide 1170 of SEQ ID NO: 276, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 277, wherein N is nucleotide 1 to nucleotide 1233 of SEQ ID NO: 277, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 278, wherein N is nucleotide 1 to nucleotide 462 of SEQ ID NO: 278, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 279, wherein N is nucleotide 1 to nucleotide 639 of SEQ ID NO: 279, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 280, wherein N is nucleotide 1 to nucleotide 672 of SEQ ID NO: 280, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 281, wherein N is nucleotide 1 to nucleotide 1113 of SEQ ID NO: 281, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 282, wherein N is nucleotide 1 to nucleotide 1113 of SEQ ID NO: 282, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist

essentially of or consists of any 19-mer subsequence of SEQ ID NO: 283, wherein N is nucleotide 1 to nucleotide 1500 of SEQ ID NO: 283, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 284, wherein N is nucleotide 1 to nucleotide 1251 of SEQ ID NO: 284, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 285, wherein N is nucleotide 1 to nucleotide 774 of SEQ ID NO: 285, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 286, wherein N is nucleotide 1 to nucleotide 2391 of SEQ ID NO: 286, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 287, wherein N is nucleotide 1 to nucleotide 2974 of SEQ ID NO: 287, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 288, wherein N is nucleotide 1 to nucleotide 432 of SEQ ID NO: 288, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 289, wherein N is nucleotide 1 to nucleotide 4587 of SEQ ID NO: 289, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 290, wherein N is nucleotide 1 to nucleotide 1089 of SEQ ID NO: 290, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 291, wherein N is nucleotide 1 to nucleotide 834 of SEQ ID NO: 291, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 292, wherein N is nucleotide 1 to nucleotide 771 of SEQ ID NO: 292, or any complement thereof. Another

interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 293, wherein N is nucleotide 1 to nucleotide 645 of SEQ ID NO: 293, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 294, wherein N is nucleotide 1 to nucleotide 696 of SEQ ID NO: 294, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 295, wherein N is nucleotide 1 to nucleotide 336 of SEQ ID NO: 295, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 296, wherein N is nucleotide 1 to nucleotide 639 of SEQ ID NO: 296, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 297, wherein N is nucleotide 1 to nucleotide 438 of SEQ ID NO: 297, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 298, wherein N is nucleotide 1 to nucleotide 1266 of SEQ ID NO: 298, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 299, wherein N is nucleotide 1 to nucleotide 597 of SEQ ID NO: 299, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 300, wherein N is nucleotide 1 to nucleotide 3525 of SEQ ID NO: 300, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 301, wherein N is nucleotide 1 to nucleotide 393 of SEQ ID NO: 301, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 302, wherein N is

nucleotide 1 to nucleotide 492 of SEQ ID NO: 302, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 303, wherein N is nucleotide 1 to nucleotide 5856 of SEQ ID NO: 303, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 304, wherein N is nucleotide 1 to nucleotide 750 of SEQ ID NO: 304, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 305, wherein N is nucleotide 1 to nucleotide 786 of SEQ ID NO: 305, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 306, wherein N is nucleotide 1 to nucleotide 714 of SEQ ID NO: 306, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 307, wherein N is nucleotide 1 to nucleotide 648 of SEQ ID NO: 307, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 308, wherein N is nucleotide 1 to nucleotide 519 of SEQ ID NO: 308, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 309, wherein N is nucleotide 1 to nucleotide 531 of SEQ ID NO: 309, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 310, wherein N is nucleotide 1 to nucleotide 366 of SEQ ID NO: 310, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 311, wherein N is nucleotide 1 to nucleotide 1284 of SEQ ID NO: 311, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist

essentially of or consists of any 19-mer subsequence of SEQ ID NO: 312, wherein N is nucleotide 1 to nucleotide 426 of SEQ ID NO: 312, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 313, wherein N is nucleotide 1 to nucleotide 1680 of SEQ ID NO: 313, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 314, wherein N is nucleotide 1 to nucleotide 474 of SEQ ID NO: 314, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 315, wherein N is nucleotide 1 to nucleotide 5025 of SEQ ID NO: 315, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 316, wherein N is nucleotide 1 to nucleotide 453 of SEQ ID NO: 316, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 317, wherein N is nucleotide 1 to nucleotide 564 of SEQ ID NO: 317, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 318, wherein N is nucleotide 1 to nucleotide 816 of SEQ ID NO: 318, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 319, wherein N is nucleotide 1 to nucleotide 687 of SEQ ID NO: 319, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 320, wherein N is nucleotide 1 to nucleotide 846 of SEQ ID NO: 320, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 321, wherein N is nucleotide 1 to nucleotide 333 of SEQ ID NO: 321, or any complement thereof. Another

interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 322, wherein N is nucleotide 1 to nucleotide 882 of SEQ ID NO: 322, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 323, wherein N is nucleotide 1 to nucleotide 1299 of SEQ ID NO: 323, or any complement thereof. Another interfering RNA molecule of the invention comprises a dsRNA which comprises, consist essentially of or consists of any 19-mer subsequence of SEQ ID NO: 324, wherein N is nucleotide 1 to nucleotide 576 of SEQ ID NO: 324, or any complement thereof.

**[0237]** In some embodiments of the method of controlling a stink bug pest, the stink bug is a member of the group comprising *Euschistus spp.* (for example *E. servus*, *E. heros* (Fabr.) (Neotropical Brown Stink Bug)), *Nezara spp.* (for example *N. antennata*, *N. hilare*, *N. viridula* (L.) (Southern Green Stink Bug)), *Piezodorus guildinii* (Westwood) (Red-banded Stink Bug), *Halyomorpha halys* (Stal) (Brown Marmorated Stink Bug), *Chinavia hilare* (Say) (Green Stink Bug), *Euschistus servus* (Say) (Brown Stink Bug), *Dichelops melacanthus* (Dallas), *Dichelops furcatus* (F.), *Edessa meditabunda* (F.), *Thyanta perditor* (F.) (Neotropical Red Shouldered Stink Bug), *Chinavia marginatum* (Palisot de Beauvois), *Horcias nobilellus* (Berg) (Cotton Bug), *Taedia stigmosa* (Berg), *Dysdercus peruvianus* (Guerin-Meneville), *Neomegalotomus parvus* (Westwood), *Leptoglossus zonatus* (Dallas), *Niesthrea sidae* (F.), *Eurygaster spp.* (e.g. *Eurygaster intergriceps*, *Eurygaster maura*), *Oebalus spp.* (e.g. *Oebalus mexicana*, *Oebalus poecilus*, *Oebalus pugnase*, and *Scotinophara spp.* (e.g. *Scotinophara lurida*, *Scotinophara coarctata*).

**[0238]** In other embodiments of the method of controlling a hemipteran insect pest or a stink bug pest, the contacting comprises (a) planting a transgenic seed capable of producing a transgenic plant that expresses the nucleic acid molecule, wherein the insect feeds on the transgenic plant, or part thereof; or (b) applying a composition comprising the nucleic acid molecule to a seed or plant, or part thereof, wherein the insect feeds on the seed, the plant, or a part thereof. In some embodiments, the transgenic seed and the transgenic plant is a soybean seed or a soybean plant. In other embodiments the seed or plant is a soybean seed or a soybean plant.

**[0239]** The invention also encompasses a method of controlling a hemipteran or stink bug comprising contacting the hemipteran or stink bug with a nucleic acid molecule that is or is capable of producing the interfering RNA molecule of the invention for inhibiting expression of a target gene in the hemipteran or stink bug, and also contacting the hemipteran or stink bug with at least a second insecticidal agent for controlling hemipteran or stink bug, wherein said second insecticidal agent comprises a *B. thuringiensis* insecticidal protein, thereby controlling the hemipteran or stink bug. The invention also encompasses a method for controlling hemipteran or stink bug pests on a plant, comprising topically applying to said plant a pesticide composition comprising an interfering RNA of the invention and at least a second insecticidal agent for controlling a hemipteran or stink bug, wherein said second insecticidal agent does not comprise a *B. thuringiensis* insecticidal protein, and providing said plant in the diet of said hemipteran or stink bug. The invention also encompasses a method wherein the second insecticidal agent comprises a patatin, a protease, a protease inhibitor, a urease, an alpha-amylase inhibitor, a pore-forming protein, a lectin, an engineered antibody or antibody fragment, or a chitinase. The second insecticidal agent may also be a *Bacillus cereus* insecticidal protein, a *Xenorhabdus* spp. insecticidal protein, a *Photorhabdus* spp. insecticidal protein, a *Brevibacillus laterosporous* insecticidal protein, a *Lysinibacillus sphearicus* insecticidal protein, a *Chromobacterium* ssp. insecticidal protein, a *Yersinia entomophaga* insecticidal protein, a *Paenibacillus popilliae* insecticidal protein, or a *Clostridium* spp. insecticidal protein.

**[0240]** The invention also encompasses a method of reducing an hemipteran insect population or an stink bug population on a transgenic plant expressing a Cry protein, a hybrid Cry protein or modified Cry protein comprising expressing in the transgenic plant a nucleic acid molecule that is or is capable of producing an interfering RNA molecule of the invention capable of inhibiting expression of a target gene as described herein in an insect, thereby reducing the hemipteran insect population or stink bug population.

**[0241]** In some embodiments, the invention encompasses a method of reducing the level of a target mRNA transcribable from a target gene as described herein in a hemipteran insect or a stink bug comprising contacting the insect with a composition comprising the interfering RNA molecule of the invention, wherein the interfering RNA molecule reduces the

level of the target mRNA in a cell of the insect. In some embodiments, the interfering RNA of the method comprises at least one dsRNA, wherein the dsRNA is a region of double-stranded RNA comprising annealed complementary strands, one strand of which comprises a sequence of at least 19 contiguous nucleotides which (i) has at least 60% identity, at least 65% identity, at least 70% identity, at least 75% identity, at least 80% identity, at least 85% identity, at least 86% identity, at least 87% identity, at least 88% identity, at least 89% identity, at least 90% identity, at least 91% identity, at least 92% identity, at least 93% identity, at least 94% identity, at least 95% identity, at least 96% identity, at least 97% identity, at least 98% identity, at least 99% identity, or 100% identity, to at least a 19, at least a 20, at least a 21, at least a 22, at least a 23, at least a 24, at least a 25, at least a 26, at least a 27, at least a 28, at least a 29, at least a 30, at least a 35, at least a 40, at least a 45, at least a 50, at least a 55, at least a 60, at least a 65, at least a 70, at least a 75, at least a 80, at least a 85, at least a 90, at least a 95, at least a 100, at least a 110, at least a 120, at least a 130, at least a 140, at least a 150, at least a 160, at least a 170, at least a 180, at least a 190, at least a 200, at least a 210, at least a 220, at least a 230, at least a 240, at least a 250, at least a 260, at least a 270, at least a 280, at least a 290, or at least a 300 contiguous nucleotide fragment of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, or the complement thereof; or (ii) comprises at least a 19, at least a 20, at least a 21, at least a 22, at least a 23, at least a 24, at least a 25, at least a 26, at least a 27, at least a 28, at least a 29, at least a 30, at least a 35, at least a 40, at least a 45, at least a 50, at least a 55, at least a 60, at least a 65, at least a 70, at least a 75, at least a 80, at least a 85, at least a 90, at least a 95, at least a 100, at least a 110, at least a 120, at least a 130, at least a 140, at least a 150, at least a 160, at least a 170, at least a 180, at least a 190, at least a 200, at least a 210, at least a 220, at least a 230, at least a 240, at least a 250, at least a 260, at least a 270, at least a 280, at least a 290, or at least a 300 contiguous nucleotide fragment of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, or the complement thereof; or (iii) comprises at least a 19, at least a 20, at least a 21, at least a 22, at least a 23, at least a 24, at least a 25, at least a 26, at least a 27, at least a 28, at least a 29, at least a 30, at least a 35, at least a 40, at least a 45, at least a 50, at least a 55, at least a 60, at least a 65, at least a 70, at least a 75, at least a 80, at least a 85, at least a 90, at least a 95, at

least a 100, at least a 110, at least a 120, at least a 130, at least a 140, at least a 150, at least a 160, at least a 170, at least a 180, at least a 190, at least a 200, at least a 210, at least a 220, at least a 230, at least a 240, at least a 250, at least a 260, at least a 270, at least a 280, at least a 290, or at least a 300 contiguous nucleotide fragment of a nucleotide sequence encoding an amino acid sequence encoded by SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, or the complement thereof, wherein the interfering RNA molecule has insecticidal activity against the target hemipteran insect or a stink bug. In another embodiment, the contacting is achieved by the target insect feeding on the composition. In other embodiments, production of the protein encoded by the target mRNA is reduced. In other embodiments, the target protein comprises an amino acid having at least about 80%, at least about 85%, at least about 90%, at least about 91%, at least about 92%, at least about 93%, at least about 94%, at least about 95%, at least about 96%, at least about 97%, at least about 98% or at least about 99% identity to SEQ ID NO: 325-378, SEQ ID NO: 485-537, or SEQ ID NO: 646-699. In other embodiments the target protein comprises SEQ ID NO: 241-270. In other embodiments, the interfering RNA is contacted with a hemipteran insect or a stink bug through a transgenic organism expressing the interfering RNA. In other embodiments, the transgenic organism is a transgenic plant, a transgenic microorganism, a transgenic bacterium or a transgenic endophyte. In other embodiments, the interfering RNA is contacted with a hemipteran insect or a stink bug by topically applying an interfering RNA in an acceptable agricultural carrier to a plant or plant part on which the insect feeds. In some embodiments, the interfering RNA that reduces the level of a target mRNA transcribable from a target gene described herein is lethal to the hemipteran insect or stink bug. In some embodiments, the stink bug is a member of the group comprising *Euschistus spp.* (for example *E. servus*, *E. heros* (Fabr.) (Neotropical Brown Stink Bug)), *Nezara spp.* (for example *N. antennata*, *N. hilare*, *N. viridula* (L.) (Southern Green Stink Bug)), *Piezodorus guildinii* (Westwood) (Red-banded Stink Bug), *Halyomorpha halys* (Stal) (Brown Marmorated Stink Bug), *Chinavia hilare* (Say) (Green Stink Bug), *Euschistus servus* (Say) (Brown Stink Bug), *Dichelops melacanthus* (Dallas), *Dichelops furcatus* (F.), *Edessa mediatubunda* (F.), *Thyanta perditor* (F.) (Neotropical Red Shouldered Stink Bug), *Chinavia marginatum* (Palisot de Beauvois), *Horcias nobilellus* (Berg) (Cotton Bug), *Taedia*

*stigmosa* (Berg), *Dysdercus peruvianus* (Guerin-Meneville), *Neomegalotomus parvus* (Westwood), *Leptoglossus zonatus* (Dallas), *Niesthrea sidae* (F.), *Eurygaster* spp. (e.g. *Eurygaster intergriceps*, *Eurygaster maura*), *Oebalus* spp. (e.g. *Oebalus mexicana*, *Oebalus poecilus*, *Oebalus pugnase*, and *Scotinophara* spp. (e.g. *Scotinophara lurida*, *Scotinophara coarctata*).

**[0242]** In some embodiments, the invention encompasses a method of conferring hemipteran insect tolerance or stink bug tolerance to a plant, or part thereof, comprising introducing into the plant, or part thereof, an interfering RNA molecule, a dsRNA molecule, a nucleic acid construct, a chimeric nucleic acid molecule, an artificial plant microRNA precursor molecule and/or a composition of the invention, wherein the dsRNA molecule, nucleic acid construct, chimeric nucleic acid molecule, artificial plant microRNA precursor molecule and/or composition of the invention are toxic to the insect, thereby conferring tolerance of the plant or part thereof to the hemipteran insect or stink bug. In other embodiments, the introducing step is performed by transforming a plant cell and producing the transgenic plant from the transformed plant cell. In still other embodiments, the introducing step is performed by breeding two plants together.

**[0243]** In other embodiments, the invention encompasses a method of reducing plant damage to a plant fed upon by a hemipteran or stink bug, comprising introducing into cells of the plant an interfering RNA molecule, a dsRNA, a nucleic acid molecule, a nucleic acid construct, a chimeric nucleic acid molecule, an artificial plant microRNA precursor molecule and/or a composition of the invention, wherein the dsRNA, nucleic acid molecule, nucleic acid construct, chimeric nucleic acid molecule, artificial plant microRNA precursor molecule and/or composition of the invention are toxic to the hemipteran or stink bug, thereby reducing plant damage to the plant. In other embodiments, the introducing step is performed by transforming a plant cell and producing the transgenic plant from the transformed plant cell. In still other embodiments, the introducing step is performed by breeding two plants together.

**[0244]** In still other embodiments, the invention encompasses a method of producing a transgenic plant cell having toxicity to a hemipteran insect or stink bug, comprising introducing into a plant cell an interfering RNA molecule, a dsRNA, a nucleic acid molecule, a nucleic acid construct, a chimeric nucleic acid molecule, an artificial plant microRNA precursor molecule

and/or a composition of the invention, thereby producing the transgenic plant cell having toxicity to the insect compared to a control plant cell. In some embodiments, the invention encompasses a plurality of transgenic plant cells produced by this method. In other embodiments, the plurality of transgenic plant cells is grown under conditions which include natural sunlight. In other embodiments, the introducing step is performed by transforming a plant cell and producing the transgenic plant from the transformed plant cell. In still other embodiments, the introducing step is performed by breeding two plants together.

**[0245]** In some embodiments, the invention encompasses a method of producing a transgenic plant having enhanced tolerance to hemipteran or stink bug feeding damage, comprising introducing into a plant an interfering RNA molecule, a dsRNA, a nucleic acid molecule, a nucleic acid construct, a chimeric nucleic acid molecule, an artificial plant microRNA precursor molecule and/or a composition of the invention, thereby producing a transgenic plant having enhanced tolerance to hemipteran or stink bug feeding damage compared to a control plant. In other embodiments, the introducing step is performed by transforming a plant cell and producing the transgenic plant from the transformed plant cell. In still other embodiments, the introducing step is performed by breeding two plants together.

**[0246]** In some embodiments, the invention encompasses a method of providing a soybean grower with a means of controlling a hemipteran insect pest population or a stink bug pest population in a soybean crop comprising (a) selling or providing to the grower transgenic soybean seed that comprises an interfering RNA, a nucleic acid molecule, a nucleic acid construct, a chimeric nucleic acid molecule, an artificial plant microRNA precursor molecule and/or a composition of the invention; and (b) advertising to the grower that the transgenic soybean seed produce transgenic soybean plants that control a hemipteran or stink bug pest population.

**[0247]** In some embodiments, the invention encompasses a method of identifying a target gene for using as a RNAi strategy for the control of a plant pest for RNAi in a hemipteran plant pest, said method comprising the steps of a) producing a primer pair with sequences selected from the group comprising or consisting of SEQ ID NO: 55-162, 700-805; b) amplifying an orthologous target from a nucleic acid sample of the plant pest; c) identifying a sequence of

an orthologous target gene; d) producing an interfering RNA molecule, wherein the RNA comprises at least one dsRNA, wherein the dsRNA is a region of double-stranded RNA comprising annealed complementary strands, one strand of which comprises a sequence of at least 19 contiguous nucleotides which is at least partially complementary to a target nucleotide sequence within a hemipteran target gene, is obtained; and e) determining if the interfering RNA molecule has insecticidal activity on the plant pest. If the interfering RNA has insecticidal activity on the hemipteran pest, a target gene for using in the control of the plant pest has been identified. In some embodiments, the plant pest is a hemipteran plant pest.

## EXAMPLES

**[0248]** The invention will be further described by reference to the following detailed examples. These examples are provided for the purposes of illustration only, and are not intended to be limiting unless otherwise specified.

### Example 1: Stink bug putative target identification

**[0249]** Total RNA was isolated from mixed instars of southern green stink bugs that were field collected from the United States and kept in colony. Messenger RNA was isolated and a 100 bp paired-end library was prepared and sequenced according to the manufacturer's protocols on an Illumina HiSeq2000. Reads were assembled using Trinity with default settings. Open reading frames (ORFs) were predicted using Transdecoder using default parameters. The resulting ORFs were used in downstream analyses and lethal gene prediction.

**[0250]** Lethal genes from *Drosophila melanogaster* such as genes linked to cell viability (Boutros et al. 2004), lethal alleles, lethal insertions and *Caenorhabditis elegans* RNAi-lethal genes were compared by tblastn to the southern green stink bug ORFs to identify the best matching transcript for each entry in the lethal gene set. The ORF with the best blast match (lowest e-value, then highest bitscore) was kept as the putative ortholog, resulting in 2924 unique sequences. Of that list 144 southern green stink bug ORFs had matches to a *Drosophila*

ortholog that was a lethal allele, lethal insertion, and linked to cell viability in the cell-based screen. Next, 30 previously qualified western corn rootworm, *Diabrotica virgifera virgifera*, target genes were compared by tblastx to the southern green stink bug ORFs, and 29 orthologs were identified. A separate list of 231 lethal target genes from multiple species was compared via tblastn to the southern green stink bug ORFs and 109 sequences were chosen. A final list of 249 southern green stink bug ORFs were selected for primer design and dsRNA synthesis.

**[0251]** Double-stranded RNAs of the 249 targets were produced in a 96 well plate format, one target per well, with appropriate positive and negative controls. Primers were designed with Primer3 software to amplify a 700-800 bp fragment; for sequences less than this length, primers were designed to amplify a region as large as possible. T7 promoters were added to the 5' end of each primer so that resulting DNA templates could be immediately used in in vitro transcription reactions. The mean dsRNA length was 649 bp long and ranged from 183 to 799 bp. Templates were synthesized by PCR on cDNA prepared from *N. viridula* at different life stages. The quality of the template material was analyzed by gel electrophoresis and spectrophotometry. Following dsRNA synthesis by in vitro T7 transcription, the dsRNA was purified, the amounts of dsRNA per target were normalized, and a final quality check of the dsRNA was performed by gel electrophoresis and spectrophotometry.

## **Example 2: Identification of dsRNAs that are insecticidal on stink bugs**

### **Identification of dsRNAs from *N. viridula* that are insecticidal in *E. heros***

**[0252]** A variety of native sequences in hemipteran pests may be used as target sequences for the design of nucleic acid molecules of the invention, such as dsRNAs, interfering RNAs, and DNA molecules encoding interfering RNAs. Selection of native sequences is not, however, a straight-forward process. Only a small number of native sequences in the hemipteran pest will be effective targets. For example, it cannot be predicted with certainty whether a particular native sequence can be effectively down-regulated by nucleic acid molecules of the invention, or whether down-regulation of a particular native sequence will have a detrimental effect on the growth, viability, proliferation, and/or reproduction of the

hemipteran pest. It is known in the art that the vast majority of native insect plant pest sequences, such as ESTs isolated therefrom (for example, as listed in U.S. Pat. No. 7,612,194 and U.S. Pat. No. 7,943,819), do not have a detrimental effect on the growth, viability, proliferation, and/or reproduction of the insect pest (See Baum et al., 2007; also see Narva et al, U.S. Patent Publication US2012/0174260A1). Therefore, the dsRNA molecules described above were tested for their potential to elicit a lethal RNAi response against second instar nymphs of *Euschistus heros* and *Nezara viridula* in laboratory bioassays.

**[0253]** In vitro assays on stink bug nymphs were performed in 96-well nylon mesh filter plates. Each well of a 96-well filter plate housed a second instar nymph exposed to a parafilm sachet containing a mixture of 15% sucrose and 1 µg/µl dsRNA. Plates were stored in plastic boxes in a rearing chamber at 26°C, 65% RH, and 16:8 hours light:dark. Survival was recorded from 3 to 10 days post exposure to dsRNA. dsRNA of non target GFP was used as a negative control. A positive control dsRNA target known to be lethal was also included in the assays. dsRNA molecules to the 249 targets described above were tested. Surprisingly, despite extensive pre-selection, only 54 of these targets induced a significantly high level of mortality (>30% mortality above the negative control) 6-10 days post infestation compared to the negative control. Results are shown in Table 1. Percent mortality above the negative control (Abbot corrected; Abbott, 1925, J. Econ. Entomology 18: 265-267) at 10 days post-exposure are shown. The Flybase ID (found at the flybase.org website), which is based on the putative orthologous *D. melanogaster* gene, is also shown with the corresponding putative gene name or function.

**[0254]** Table 1 also shows the percent identity of the *N. viridula* target gene to the orthologous gene from other stink bug species, namely *E. heros*, *Piezodorus guildinii*, *Dichelops melacanthus*, and *Halyomorpha halys*. The nucleic acid sequences for the *E. heros*, *D. melacanthus*, and *H. halys* orthologs were identified using sequences deposited in publicly available NCBI databases. (Farias et al., 2015. *PLOS One*, DOI: 10.1371/journal.pone.0132286; Fishilevich et al., 2016. *Insect Biochemistry and Molecular Biology*, 71: 58-71; Sparks et al., 2014. *PLOS One*, 9(11): e111646; SRA Database, ID No. SRR5651513). The nucleic acids

sequences for the *P. guildinii* orthologs were determined using a transcriptome generated from a mixture of each instar and adult *P. guildinii* stink bugs.

**Table 1. dsRNAs derived from *N. viridula* targets insecticidal against *E. heros***

| SEQ ID NO | Target ID  | flybase ID | flybase symbol | % mortality | % Identity compared to: |       |       |       |

**[0255]** The data in Table 1 indicate that dsRNA molecules against a target gene in one genus of stink bug (*Nezara viridula*) have insecticidal activity against a different genus of stink bug (*Euschistus heros*). This is true despite the percent identity between the target gene from *N. viridula* and *E. heros* being as low as 63.9%. Therefore, this example illustrates that a percent identity as low as 63.9% between the target gene and the dsRNA molecule is sufficient for an insecticidal effect in a stink bug species. The best performing 33 targets were selected for further study.

#### **Targets insecticidal to more than one genus of stink bug**

**[0256]** Of the 33 targets confirmed to be significantly insecticidal, 16 were subsequently assayed for insecticidal activity on *N. viridula*. Positive and negative controls were also assayed using bioassay methods similar to Example 2, except *N. viridula* nymphs were used. Percent

mortality was determined on day 14 and was Abbot corrected compared to the negative control. Results are shown in Table 2.

**Table 2: Targets with insecticidal activity on *N. viridula***

| Target ID  | % mortality |
|------------|-------------|
| Nv_CG3948  | 94.5%       |
| Nv_CG32744 | 61.5%       |
| Nv_CG6213  | 84.7%       |

| Nv_CG10305 | 52.9%       |
| Nv_CG4759  | 47.4%       |
| Nv_CG10305 | 37.6%       |
| Nv_CG1475  | 33.2%       |

**[0257]** Results shown in Table 2 indicate the insecticidal activity of the dsRNA molecules derived from *N. viridula* coding sequences on *N. viridula*. Based on the high insecticidal activity in both stink bug species, targets were selected for bacterial production of dsRNA and soybean transformation.

### **Example 3. Producing targeted dsRNA molecules by bacterial expression**

**[0258]** This example describes producing dsRNA molecules engineered against identified stink bug targets using a bacterial expression system.

**[0259]** Hairpin cassettes were engineered for four selected stink bug targets. The hairpin cassette comprises a T7 promoter operably linked to an antisense sequence of the target, further linked at the 3' end to a nucleic acid sequence which is capable of forming a loop structure, further linked at the 3' end to the corresponding sense sequence of the target,

operably linked at the 3' end to a T7 terminator sequence. The hairpin cassette was introduced into bacterial expression vector pGCP295 via *Bam*HI and *Not*I restriction sites. The vector was then introduced into *Escherichia coli* strain HT115(DE3)GA01 via electroporation using standard methods, and transformants were selected for using kanamycin selection.

**[0260]** The bacteria containing the targeted dsRNA expression vector plasmid were grown in defined medium to a specific optical density unit (OD units; U) and induced by addition of IPTG for a specific time period following standard methods and routine optimization. After induction, the bacteria were subjected to heat treatment and centrifugation, and the produced dsRNA molecules were collected.

#### **Example 4. Activity of dsRNA molecules in a spray application assay**

**[0261]** This example describes testing of a sub-set of the identified target dsRNAs of the invention for biological activity against stink bugs when applied as a spray.

**[0262]** Three 3 week old soy bean plants (*Glycine max* (L.) Jack) were sprayed with a 15% sucrose solution containing 75U/ml bacterial lysate expressing non targeting GFP dsRNA and target dsRNA molecules from the expression vectors described above. 25 second instar nymphs were then placed on each sprayed plant. Plants were placed in a box coated with fluon PTFE to prevent stink bug escape and stored in a rearing chamber (26°C, 65% RH, with 16:8 hours l:d). Photographs were taken on a daily basis to record plant health. The nymphal survival rate was recorded 3 to 14 days post exposure to the sprayed plant. These experiments were performed using either *E. heros* or *N. viridula* nymphs. dsRNA of non target GFP was used as a negative control and dsRNA designed against a known *N. viridula* target gene was used as positive control. Percent mortality of the nymphs by day 14 are shown in Table 3.

**[0263]** Results in Table 3 indicate that the dsRNA molecule retain insecticidal activity when applied onto the surface of plants on which the stink bug feeds.

**Example 5. Activity of dsRNA molecules against *Piezodorus guildinii***

**[0264]** This example describes testing dsRNAs derived from the orthologous *P. guildinii* target genes for biological activity against the stink bug *P. guildinii*.

**[0265]** Templates for dsRNA production were synthesized by PCR on cDNA prepared from *P.guildinii* at different life stages using methods similar to that of Example 1. The dsRNA

molecules were produced using methods similar to that of Example 2. The dsRNA molecules were tested for toxicity against 12 second instar nymphs of *P.guildinii* in laboratory bioassays using methods similar to that of Example 2. Results are shown in Table 4. Percent mortality above the negative control (Abbot corrected; Abbott, 1925, J. Econ. Entomology 18: 265-267) at 7 days post-exposure are shown. The Flybase ID (found at the flybase.org website), which is based on the putative orthologous *D. melanogaster* gene, is also shown with the corresponding putative gene name or function.

**Table 4: Targets with insecticidal activity on *P.guildinii***

|           | negative con. |            |                | 0           |                         |           |           |       |

**[0266]** Results in Table 4 indicate the insecticidal activity of dsRNAs derived from *P. guildinii* targets Pg\_CG5271, Pg\_CG3948, and Pg\_CG2960 on *P. guildinii*. These result further support that targets which are found to be insecticidal for one stink bug species can be insecticidal in a second stink bug species.

#### **Example 6. Activity of dsRNA molecules against other stink bugs**

**[0267]** This example further describes testing dsRNAs derived from *N. viridula* target genes for biological activity against the stink bug *Piezodorus guildinii* (Small Green Stink Bug, SGSB), *Halomorpha halys* (Brown Marmorated Stink Bug, BMSB), and *Dichelops melacanthus*

**[0268]** The dsRNA molecules described above in Example 2 are tested for toxicity against second instar nymphs of *P. guildinii*, *H. halys*, and/or *D. melacanthus*, in laboratory bioassays. In vitro assays on each stink bug are performed in 96-well nylon mesh filter plates.

Each well of a 96-well filter plate houses a second instar nymph which is exposed to a parafilm sachet containing a mixture of 15% sucrose and 1 µg/µl dsRNA. Plates are stored in plastic boxes in the rearing chamber at 26°C, 65% RH, and 16:8 hours light: dark. Three days post infestation, nymphs may be transferred to a petridish containing a filter paper and a runner bean (*Phaseolus coccineus*) or another suitable feeding source. Mortality is recorded from 3 to 14 days post exposure to dsRNA. dsRNA of non target GFP is used as a negative control.

#### **Example 7. Activity of orthologous dsRNA molecules on multiple stink bug species**

**[0269]** This example describes testing dsRNAs derived from orthologs of the *N. viridula* target genes identified in Example 2 for biological activity on each of the stink bug species *N. viridula*, *E. heros*, *P. guildinii*, *H. halys*, and *D. melacanthus*.

**[0270]** Table 5 shows the *N. viridula* target ID and SEQ ID NO of the coding sequence of the gene target; the gene target is the same as that of Table 1. Table 5 also provides the SEQ ID NO of the orthologous target of *P. guildinii* (Pg SEQ ID NO) and *H. halys* (Hh SEQ ID NO). Table 5 also provides references to the publicly available sequences of the orthologous targets of *D. melacanthus* (Dm ref) and *E. heros* (Eh ref) at the NCBI databases. The sequences for these stink bugs are the same as were analyzed for Example 2 and Table 1. The *D. melacanthus* sequences are identified by reference to Accession Numbers for databases publicly available at the NCBI website (prefix GBES-), are predicted based on analysis of publicly available transcriptome data (prefix DN-), or no *D. melacanthus* ortholog is currently known (not available; NA). The *E. heros* sequences are identified by reference to Accession Numbers for databases publicly available at the NCBI website (prefix GBER- or KT-), or no *E. heros* ortholog is currently known (not available, NA).

**[0271]** dsRNA molecules of the *E. heros*, *P. guildinii*, *H. halys*, and *D. melacanthus* orthologous genes identified and described in Example 2 and Table 5 are produced following methods similar to those described in Example 1. Laboratory bioassays for each stink bug species described (*N. viridula*, *E. heros*, *P. guildinii*, *H. halys*, and *D. melacanthus*) with each of the dsRNA molecules produced based on the sequences described in Table 5 are performed following methods similar to those described in Example 2 and Example 4. Results are expected

to indicate that dsRNA molecules produced against the orthologous targets are insecticidal on all stink bug species described.

**Table 5: Expected insecticidal targets orthologous to *N. viridula* insecticidal targets**

#### **Example 8. Expression of an interfering RNA molecule comprising target dsRNA in soybean plants**

**[0272]** This example describes introducing a construct that expresses an interfering RNA molecule into plant cells.

##### **Vector construction**

**[0273]** A binary vector comprising at least one expression cassette designed to produce a hairpin RNA (hpRNA) comprising a promoter operably linked to a sense strand of a target nucleic acid sequence, an intron functioning as a loop sequence, a corresponding an antisense strand, and a terminator. The binary vector may also comprise a second cassette between the left and right T-DNA borders, designed to express a selectable marker for use in selection of transformed plant cells. The binary vector may also contain selectable markers for selection of

transformed bacteria, for example transformed *Agrobacterium tumefaciens* bacterial cells which contain the binary vector.

### **Soybean Transformation**

**[0274]** Soybean plant material can be suitably transformed and fertile plants regenerated by many methods which are well known to one of skill in the art. For example, fertile morphologically normal transgenic soybean plants may be obtained by: 1) production of somatic embryogenic tissue from, e.g., immature cotyledon, hypocotyl or other suitable tissue; 2) transformation by particle bombardment or infection with *Agrobacterium*; and 3) regeneration of plants. In one example, as described in U.S. Patent No. 5,024,944, cotyledon tissue is excised from immature embryos of soybean, optionally with the embryonic axis removed, and cultured on hormone-containing medium so as to form somatic embryogenic plant material. This material is transformed using, for example, direct DNA methods, DNA coated microprojectile bombardment or infection with *Agrobacterium*, cultured on a suitable selection medium and regenerated, optionally also in the continued presence of selecting agent, into fertile transgenic soybean plants. Selection agents may be antibiotics such as kanamycin, hygromycin, or herbicides such as an HPPD inhibitor, phosphinothricin, or glyphosate or, alternatively, selection may be based upon expression of a visualisable marker gene such as GUS. Target tissues for transformation include meristematic tissue, somaclonal embryogenic tissue, and flower or flower-forming tissue. Other examples of soybean transformation include physical DNA delivery methods, such as particle bombardment (see e.g., Finer & McMullen, *In Vitro Cell Dev. Biol.*, 1991, 27P:175-182; McCabe et al., *Bio/technology*, 1998, 6:923-926), whisker (Khalafalla et al., *African J. of Biotechnology*, 2006, 5:1594-1599), aerosol bean injection (U.S. Patent No. 7,001,754), or by *Agrobacterium*-mediated delivery methods (Hinchee et al., *Bio/Technology*, 1988, 6:915-922; U.S. Patent No. 7,002,058; U.S. Patent Application Publication Nos. 20040034889 and 20080229447; Paz et al., *Plant Cell Report*, 2006, 25:206-213).

**[0275]** Soybean transgenic plants can be generated with the above described binary vector containing an expression cassette capable of producing an interfering RNA molecule

using any available transformation method. Optionally, an interfering RNA molecule expression cassette can be present in the T-DNA alongside other sequences which provide additional means of selection/ identification of transformed tissue including, for example, the known genes which provide resistance to kanamycin, hygromycin, phosphinothricin, butafenacil, or glyphosate. For example, different binary vectors containing PAT or EPSPS selectable marker genes are known in the art (see e.g., U.S. Patent Application Publication No. 20080229447). Alternatively, selectable marker sequences may be present on separate polynucleotides and a process of, for example, co-transformation and co-selection is used. A scorable marker gene such as GUS may also be used to identify transformed tissue.

**[0276]** T0 plants are taken from tissue culture to the greenhouse where they are transplanted into water-saturated soil (REDI-EARTH® Plug and Seedling Mix, Sun Gro Horticulture, Bellevue, WA, or Fafard Germinating Mix) mixed with 1% granular MARATHON® (Olympic Horticultural Products, Co., Mainland, PA) at 5-10 g/gal soil in 2" square pots. The plants are covered with humidity domes and placed in a Conviron chamber (Pembina, ND) with the following environmental conditions: 24°C day; 20°C night; 16-23 hours light-1-8 hours dark photoperiod; 80% relative humidity.

**[0277]** After plants became established in the soil and new growth appeared (~1-2 weeks), plants are sampled and tested for the presence of desired transgene by TAQMAN® analysis using appropriate probes for the interfering RNA expression cassette, including for example for promoters (for example prCMP). Positive plants are transplanted into 4" square pots containing Fafard #3 soil. Sierra 17-6-12 slow release fertilizer may be incorporated into the soil at the recommended rate. The plants are then relocated into a standard greenhouse to acclimatize (~1 week). The environmental conditions are: 27°C day; 21°C night; 14 hour photoperiod (with supplemental light); ambient humidity. After acclimatizing (~1 week), the plants are sampled and tested in detail for the presence and copy number of inserted transgenes. Transgenic soybean plants may then be assayed for resistance to stink bug species by a feeding assay, and/or they may be grown to maturity for T1 seed production. T1 plants may be grown and may also be assayed for resistance to stink bug species by a feeding assay.

**Example 10. Interfering RNA molecules with a Second Insecticidal Agent Bioassays**

**[0278]** Double stranded RNA molecules are produced against an insecticidal target selected from the targets shown in Table 1. Additionally, a second insecticidal agent is prepared. Both the RNA and the second insecticidal agent are tested in combination for toxicity against stink bug species in laboratory bioassays similar to those described in Example 2.

**[0279]** It should be understood that the examples and embodiments described herein are for illustrative purposes only and that various modifications or changes in light thereof of the description will be suggested to persons skilled in the art and are to be included within the spirit and purview of this application and the scope of the appended claims.

**[0280]** All publications and patent applications mentioned in this specification are indicative of the level of skill of those skilled in the art that this invention pertains. All publications and, patent applications are herein incorporated by reference to the same extent as if each individual publication or patent application was specifically and individually indicated to be incorporated by reference.

**Example 11. Activity of dsRNA molecules in a spray application assay against *Piezodorus guildinii***

**[0001]** This example describes testing of a sub-set of the identified target dsRNAs of the invention for biological activity against *P. guildinii* stink bugs when applied as a spray, following the same setup as example 4.

**[0002]** Three 3 week old soy bean plants (*Glycine max* (L.) Jack) were sprayed with a 15% sucrose solution containing 75U/ml bacterial lysate expressing non targeting GFP dsRNA and target dsRNA molecules from the expression vectors described above. 25 second instar *P. guildinii* nymphs were then placed on each sprayed plant. Plants were placed in a box coated with fluon PTFE to prevent stink bug escape and stored in a rearing chamber (26°C, 65% RH, with 16:8 hours l:d). The nymphal survival rate was recorded 3 to 14 days post exposure to the sprayed plant dsRNA of non target GFP was used as a negative control and dsRNA designed

against a known *N. viridula* target gene was used as positive control. Percent mortality of the nymphs by day 14 are shown in Table 6.

**Table 6: Spray Application Assay with *P. guildinii* nymphs**

| SEQ ID | Target ID     | <i>P. guildinii</i><br>(% mortality) |

**[0003]** Results in Table 6 indicate that the *N. viridula* dsRNA molecule retain insecticidal activity when applied onto the surface of plants on which the *P. guildinii* stink bug feeds.

**Example 12. Activity of dsRNA molecules against *Piezodorus guildinii***

This example describes testing dsRNAs derived from the orthologous *P. guildinii* target genes for biological activity against the redbanded soy stink bug *P. guildinii*.

Templates for dsRNA production were synthesized by PCR on cDNA prepared from *P.guildinii* at different life stages using methods similar to that of Example 1. The dsRNA molecules were produced using methods similar to that of Example 2. The dsRNA molecules were tested for toxicity against 24 second instar nymphs of *P.guildinii* in laboratory bioassays using a liquid diet based assay in 6-well plates. dsRNA molecules were diluted to 1µg/µl in 15% sucrose solution. 100 µl of the dsRNA solution was pipetted in 6 wells of a 96-well plate. The 96-well plate was sealed, pierced and placed upside down on a 6-well plate containing the insects. Eight second instar nymphs were placed in each well and 24 nymphs were tested per treatment. The dsRNA solution was provided to the nymphs for 5 days. On day 5 the diet was refreshed with 200 µl sucrose solution (15%). Mortality was recorded 3, 4, 5, 6, 7, 10, 11 and 12 days post-infestation. dsRNA of non-target GFP was used as a negative control and dsRNA designed to target an ubiquitin gene of *P. guildinii* was used as a positive control. Plates were stored at 26°C and 70% RH, with a 16 hour: 8 hour light:dark photoperiod. Results are shown in Table 7. Percent mortality above the negative control (Abbot corrected; Abbott, 1925, J. Econ. Entomology 18: 265-267) at 14 days post-exposure are shown. The Flybase ID (found at the flybase.org website), which is based on the putative orthologous *D. melanogaster* gene, is also shown with the corresponding putative gene name or function.

[0004]

**What is claimed is:**

1. An interfering ribonucleic acid (RNA) molecule wherein the RNA comprises at least one dsRNA wherein the dsRNA is a region of double-stranded RNA comprising annealed complementary strands, one strand of which comprises a sequence of at least 19 contiguous nucleotides which is at least partially complementary to a target nucleotide sequence within a stink bug target gene, and (i) is at least 80% identical to at least a 19 contiguous nucleotide fragment of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, or the complement thereof; or (ii) comprises at least a 19 contiguous nucleotide fragment of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, or the complement thereof; or (iii) comprises at least a 19 contiguous nucleotide fragment of a nucleotide sequence encoding an amino acid sequence encoded by SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, or the complement thereof, wherein the interfering RNA molecule has insecticidal activity on a hemipteran plant pest.
2. An interfering RNA molecule of claim 1, wherein said hemipteran plant pest is a stink bug.
3. An interfering RNA molecule of claim 1 wherein the RNA comprises at least two dsRNAs, wherein each dsRNA comprises a sequence of nucleotides which is at least partially complementary to a target nucleotide sequence within the target gene.
4. An interfering RNA molecule of claim 3 wherein each of the dsRNAs comprise a different sequence of nucleotides which is at least partially complementary to a different target nucleotide sequence within the target gene.
5. The interfering RNA molecule of claim 1, wherein the interfering RNA molecule comprises SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, or the complement thereof.

6. An interfering RNA molecule of claim 1, wherein the dsRNA is a region of double-stranded RNA comprising substantially complementary annealed strands.
7. An interfering RNA molecule of claim 1, wherein the dsRNA is a region of double-stranded RNA comprising fully complementary annealed strands.
8. An interfering RNA molecule of any one of claims 1 to 7, wherein the stink bug is selected from the group consisting of *Euschistus heros*, *Nezara viridula*, *Piezodorus guildinii*, *Halyomorpha halys*, *Chinavia hilare*, *Euschistus servus*, *Dichelops melacanthus*, *Dichelops furcatus*, *Edessa meditabunda*, *Thyanta perditor*, *Chinavia marginatum*, *Horcias nobilellus*, *Taedia stigmosa*, *Dysdercus peruvianus*, *Neomegalotomus parvus*, *Leptoglossus zonatus*, and *Niesthrea sidea*.
9. A nucleic acid construct comprising the interfering RNA molecule of any of claims 1 to 8.
10. A nucleic acid molecule encoding the interfering RNA molecule of any of claims 1 to 8.
11. A nucleic acid construct comprising a nucleotide sequence that encodes the nucleic acid molecule of claim 10.
12. The nucleic acid construct of any of claims 9 or 11 wherein the nucleic acid construct is an expression vector.
13. A recombinant vector comprising a regulatory sequence operably linked to a nucleotide sequence that encodes the interfering RNA molecule of any one of claims 1 to 8.
14. A composition comprising two or more of the interfering RNA molecules of any of claims 1 to 8.

15. A composition of claim 14 wherein the two or more interfering RNA molecules are present on the same nucleic acid construct, on different nucleic acid constructs, or any combination thereof.
16. A composition of any of claims 14 or 15, comprising an interfering RNA molecule which comprises at least one dsRNA wherein the dsRNA is a region of double-stranded RNA comprising annealed complementary strands, one strand of which comprises a sequence of at least 19 contiguous nucleotides which (i) is at least 80% identical to at least a 19 contiguous nucleotide fragment of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, or complement thereof; or (ii) comprises at least a 19 contiguous nucleotide fragment of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, or complement thereof.
17. A composition comprising two or more of the nucleic acid constructs of any of claims 9, 11, or 12, wherein the two or more nucleic acid constructs each comprise a different interfering RNA.
18. A composition comprising two or more of the nucleic acid molecules of claim 10, wherein the two or more nucleic acid molecules each encode a different interfering RNA molecule.
19. An insecticidal composition for inhibiting the expression of a stink bug target gene, comprising the interfering RNA of any one of claims 1 to 8 and an agriculturally acceptable carrier.
20. An insecticidal composition of claim 19 comprising at least a second insecticidal agent for controlling a stink bug.
21. An insecticidal composition of claim 20 wherein the second insecticidal agent is a *Bacillus thuringiensis* insecticidal protein.

22. An insecticidal composition of claim 20 wherein the second insecticidal agent is not a *Bacillus thuringiensis* insecticidal protein.

23. An insecticidal composition of claim 20 wherein the second insecticidal agent is a patatin, a protease, a protease inhibitor, a urease, an alpha-amylase inhibitor, a pore-forming protein, a lectin, an engineered antibody or antibody fragment, or a chitinase.

24. An insecticidal composition of claim 22 wherein the second insecticidal agent is or is derived from a *Bacillus cereus* insecticidal protein, a *Xenorhabdus* spp. insecticidal protein, a *Photorhabdus* spp. insecticidal protein, a *Brevibacillus laterosporous* insecticidal protein, a *Lysinibacillus sphearicus* insecticidal protein, a *Chromobacterium* spp. insecticidal protein, a *Yersinia entomophaga* insecticidal protein, a *Paenibacillus popilliae* insecticidal protein, or a *Clostridium* spp. insecticidal protein.

25. A transgenic plant, or part thereof, comprising the interfering RNA molecule, the nucleic acid molecule, the nucleic acid construct, and/or the composition of any of the respective preceding claims, wherein the transgenic plant has enhanced resistance to a stink bug as compared to a control plant.

26. A transgenic plant, or part thereof, of claim 25, wherein the transgenic plant comprises at least a second insecticidal agent for controlling stink bugs.

27. A transgenic plant, or part thereof, of claim 26, wherein the second insecticidal agent is a *Bacillus thuringiensis* insecticidal protein.

28. A transgenic plant, or part thereof, of claim 26, wherein the second insecticidal agent is not a *Bacillus thuringiensis* insecticidal protein.

29. A transgenic plant, or part thereof, of claim 26, wherein the second insecticidal agent is a patatin, a protease, a protease inhibitor, a urease, an alpha-amylase inhibitor, a pore-forming protein, a lectin, an engineered antibody or antibody fragment, or a chitinase.

30. The transgenic plant, or part thereof, of claim 28, wherein the second insecticidal agent is or is derived from a *Bacillus cereus* insecticidal protein, a *Xenorhabdus* spp. insecticidal protein, a *Photorhabdus* spp. insecticidal protein, a *Brevibacillus laterosporous* insecticidal protein, a *Lysinibacillus sphearicus* insecticidal protein, a *Chromobacterium* spp. insecticidal protein, a *Yersinia entomophaga* insecticidal protein, a *Paenibacillus popilliae* insecticidal protein, or a *Clostridium* spp. insecticidal protein.

31. A transgenic plant, or part thereof, of any one of claims 25 to 30, wherein the transgenic plant, or part thereof, is a maize plant or part thereof.

32. Transgenic seed of a transgenic plant of any one of claims 25 to 31.

33. A biological sample from the transgenic plant, or part thereof, of any one of claims 25 to 31.

34. A commodity product derived from the transgenic plant, or part thereof, of any one of claims 25 to 31.

35. A commodity product of claim 34, wherein the commodity product is selected from the group consisting of whole or processed seeds, beans, grains, kernels, hulls, meals, grits, flours, sugars, starches, protein concentrates, protein isolates, waxes, oils, extracts, juices, concentrates, liquids, syrups, feed, silage, fiber, paper or other food or product produced from plants.

36. A method of controlling a stink bug comprising contacting the stink bug with a nucleic acid molecule that is or is capable of producing an interfering RNA molecule of claims 1-8 for inhibiting expression of a target gene in the stink bug thereby controlling the stink bug.

37. The method of claim 36, wherein the target gene comprises a coding sequence which:

- a) is at least 80% identical to at least a 19 nucleotide contiguous fragment of SEQ ID NO: 1-54, SEQ ID NO: 163-216, SEQ ID NO: 379-431, SEQ ID NO: 538-591, or the complement thereof;
- b) comprises at least a 19 nucleotide contiguous fragment of SEQ ID NO: 1-54, SEQ ID NO: 163-216, SEQ ID NO: 379-431, SEQ ID NO: 538-591, or the complement thereof; or
- c) comprises at least a 19 nucleotide contiguous fragment of a nucleotide sequence encoding an amino acid sequence encoded by SEQ ID NO: 1-54, SEQ ID NO: 163-216, SEQ ID NO: 379-431, SEQ ID NO: 538-591, or the complement thereof.

38. The method of claim 36 wherein the interfering RNA molecule comprises at least one dsRNA, wherein the dsRNA is a region of double-stranded RNA comprising annealed complementary strands, one strand of which comprises a sequence of at least 19 contiguous nucleotides which (i) is at least 80% identical to at least a 19 contiguous nucleotide fragment of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, or the complement thereof; or (ii) comprises at least a 19 contiguous nucleotide fragment of SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, or the complement thereof; or (iii) comprises at least a 19 contiguous nucleotide fragment of a nucleotide sequence encoding an amino acid sequence encoded by SEQ ID NO: 217-324, SEQ ID NO: 432-484, SEQ ID NO: 592-645, SEQ ID NO: 806-858, or the complement thereof.

39. The method of any one of claims 36 to 38, wherein the stink bug is selected from the group consisting of *Euschistus heros*, *Nezara viridula*, *Piezodorus guildinii*, *Halyomorpha halys*, *Chinavia hilare*, *Euschistus servus*, *Dichelops melacanthus*, *Dichelops furcatus*, *Edessa mediatubunda*, *Thyanta perditor*, *Chinavia marginatum*, *Horcias nobilellus*, *Taedia stigmata*,

*Dysdercus peruvianus*, *Neomegalotomus parvus*, *Leptoglossus zonatus*, *Niesthrea sidea*, *Lygus hesperus*, and *Lygus lineolaris*.

40. The method of claim 39, wherein contacting comprises:

- a) planting a transgenic seed capable of producing a transgenic plant that expresses the nucleic acid molecule, wherein the stink bug feeds on the transgenic plant, or part thereof; or
- b) applying a composition comprising the nucleic acid molecule to a seed or plant, or part thereof, wherein the stink bug feeds on the seed, the plant, or a part thereof.

41. The method of claim 39, wherein the transgenic seed and transgenic plant is a soybean seed and a soybean plant.

42. The method of claim 39, wherein the seed or plant is a soybean seed or soybean plant.

43. A method of controlling a stink bug comprising contacting the stink bug with a nucleic acid molecule that is or is capable of producing the interfering RNA molecule of claims 1-8 for inhibiting expression of a target gene in the stink bug , and contacting the stink bug with at least a second insecticidal agent for controlling stink bugs.

44. A method of controlling a stink bug comprising contacting the stink bug with a nucleic acid molecule that is or is capable of producing the interfering RNA molecule of claims 1-8 for inhibiting expression of a target gene in the stink bug , and contacting the stink bug with at least a second insecticidal agent for controlling stink bugs, thereby controlling the stink bug, wherein said second insecticidal agent comprises a *B. thuringiensis* insecticidal protein,.

45. A method of controlling a stink bug comprising contacting the stink bug with a nucleic acid molecule that is or is capable of producing the interfering RNA molecule of claims 1-8 for inhibiting expression of a target gene in the stink bug, and contacting the stink bug with at least

a second insecticidal agent for controlling stinkbugs, thereby controlling the stink bug, wherein said second insecticidal agent does not comprise a *B. thuringiensis* insecticidal protein,.

46. The method of claim 43, wherein the second insecticidal agent comprises a patatin, a protease, a protease inhibitor, a urease, an alpha-amylase inhibitor, a pore-forming protein, a lectin, an engineered antibody or antibody fragment, or a chitinase.

47. The method of claim 45, wherein the second insecticidal agent comprises a *Bacillus cereus* insecticidal protein, a *Xenorhabdus* spp. insecticidal protein, a *Photorhabdus* spp. insecticidal protein, a *Brevibacillus laterosporous* insecticidal protein, a *Lysinibacillus sphearicus* insecticidal protein, a *Chromobacterium* spp. insecticidal protein, a *Yersinia entomophaga* insecticidal protein, a *Paenibacillus popilliae* insecticidal protein, or a *Clostridium* spp. insecticidal protein.

48. A method of reducing an stink bug population on a transgenic plant expressing a Cry protein, a hybrid Cry protein or modified Cry protein comprising expressing in the transgenic plant a nucleic acid molecule that is or is capable of producing an interfering RNA molecule of claim 1, which inhibits expression of a target gene in an stink bug thereby reducing the stink bug population.

49. A method of identifying an orthologous target gene for using as a RNAi strategy for the control of a plant pest, said method comprising the steps of:

- a)producing a primer pair that will amplify a target selected from the group comprising or consisting of SEQ ID NO: 55-162, 700-805
- b)amplifying an orthologous target gene from a nucleic acid sample of the plant pest,
- c)identifying a sequence of an orthologous target gene,
- d)producing an interfering RNA molecule, wherein the RNA comprises at least one dsRNA, wherein the dsRNA is a region of double-stranded RNA comprising annealed complementary strands, one strand of which comprises a sequence of at least 19 contiguous

nucleotides which is at least partially complementary to the orthologous target nucleotide sequence within the target gene, and

e) determining if the interfering RNA molecule of step (d) has insecticidal activity on the plant pest;

wherein if the interfering RNA has insecticidal activity on the plant pest target gene, an orthologous target gene for using in the control of a plant pest has been identified.

50. A method of reducing the level of a target RNA transcribed from a target gene in a stink bug comprising contacting the stink bug with a composition comprising the interfering RNA molecule of any one of claims 1 to 8, wherein the interfering RNA molecule reduces the level of the target RNA in a cell of the stink bug.

51. The method of claim 50, wherein production of the protein encoded by the target RNA is reduced.

52. The method of claim 51, wherein the protein comprises an amino acid sequence with at least 85% identity to SEQ ID NO: 325-378, SEQ ID NO: 485-537, or SEQ ID NO: 646-699.

53. The method of claim 50, wherein the interfering RNA is from a transgenic organism expressing the interfering RNA.

54. The method of claim 53, wherein the transgenic organism is a transgenic plant, a transgenic microorganism, a transgenic bacterium, or a transgenic endophyte.

55. The method of claim 50, wherein the interfering RNA is lethal to a stink bug.

56. The method of claim 55, wherein the stink bug is selected from the group consisting of *Euschistus heros*, *Nezara viridula*, *Piezodorus guildinii*, *Halyomorpha halys*, *Chinavia hilare*, *Euschistus servus*, *Dichelops melacanthus*, *Dichelops furcatus*, *Edessa meditabunda*, *Thyanta*

*perditor*, *Chinavia marginatum*, *Horcias nobilellus*, *Taedia stigmosa*, *Dysdercus peruvianus*, *Neomegalotomus parvus*, *Leptoglossus zonatus*, *Niesthrea sidea*, *Lygus hesperus*, and *Lygus lineolaris*.

57. A method of conferring stink bug tolerance to a plant, or part thereof, comprising introducing into the plant, or part thereof, the interfering RNA molecule, the nucleic acid molecule, the nucleic acid construct, and/or the composition of any of the respective preceding claims, thereby conferring tolerance of the plant or part thereof to the stink bug.

58. A method of reducing plant damage to a plant fed upon by a stink bug, comprising introducing into cells of the plant the interfering RNA molecule, the nucleic acid molecule, the nucleic acid construct, and/or the composition of any of the respective preceding claims, thereby reducing plant damage to the plant.

59. A method of producing a transgenic plant cell having toxicity to a stink bug, comprising introducing into a plant cell the interfering RNA, the nucleic acid molecule, the nucleic acid construct, and/or the composition of any of the respective preceding claims, thereby producing the transgenic plant cell having toxicity to the stink bug compared to a control plant cell.

60. A plurality of transgenic plant cells produced by the method of claim 59.

61. A plurality of transgenic plant cells of claim 60, wherein the plant cells are grown under conditions which include natural sunlight.

62. A method of producing a transgenic plant having enhanced tolerance to stink bug feeding damage, comprising introducing into a plant the interfering RNA molecule, the nucleic acid molecule, or the nucleic acid construct of any of the respective preceding claims, thereby producing a transgenic plant having enhanced tolerance to stink bug feeding damage compared to a control plant.

63. The method of claim 62, wherein the introducing step is performed by transforming a plant cell and producing the transgenic plant from the transformed plant cell.

64. The method of claim 62, wherein the introducing step is performed by breeding two plants together.

65. A method of enhancing control of a stink bug population comprising providing the transgenic plant or plant part of claim 25 and applying to the plant or plant part a chemical pesticide.

66. The method of claim 65, wherein the chemical pesticide is a carbamate, a pyrethroid, an organophosphate, a fiprole, a neonicotinoid, an organochloride, a nereistoxin, or a combination thereof.

67. The method of claim 65, wherein the chemical pesticide comprises an active ingredient selected from the group consisting of carbofuran, carbaryl, methomyl, bifenthrin, tefluthrin, permethrin, cyfluthrin, lambda-cyhalothrin, cypermethrin, deltamethrin, chlorpyrifos, chlorethoxyfos, dimethoate, ethoprophos, malathion, methyl-parathion, phorate, terbufos, tebupirimiphos, fipronil, acetamiprid, imidacloprid, thiacloprid, thiamethoxam, endosulfan, bensultap, and a combination thereof.

68. The method of claim 67, wherein the active ingredient is delivered in a product selected from the group consisting of Furadan®, Lanate®, Sevin®, Talstar®, Force®, Ammo®, Cymbush®, Delta Gold®, Karate®, Ambush®, Pounce®, Brigade®, Capture®, ProShield®, Warrior®, Dursban®, Fortress®, Mocap®, Thimet®, AAstar®, Rampart®, Counter®, Cygon®, Dicap®, Regent®, Cruiser®, Gaucho®, Prescribe®, Poncho®, Aztec®, and a combination thereof.

69. A method of providing a soybean grower with a means of controlling a stink bug pest population in a soybean crop comprising (a) selling or providing to the grower transgenic soybean seed that comprises an interfering RNA molecule, a nucleic acid molecule, a nucleic acid construct, and/or a composition of the invention; and (b) advertising to the grower that the transgenic soybean seed produce transgenic soybean plants that control a stink bug pest population.
