IMIDAZO-FUSED OXAZOLO[4,5-b]PYRIDINE and IMIDAZO-FUSED THIAZOLO[4,5-b]PYRIDINE BASED TRICYCLIC COMPOUNDS AND PHARMACEUTICAL COMPOSITIONS COMPRISING SAME

Field of the Invention

The present invention relates to imidazo-fused oxazolo[4,5-b]pyridine and imidazo-fused thiazolo[4,5-b]pyridine based tricyclic compounds, to methods of using the compounds in treating inflammatory and immune diseases, and cancer and to pharmaceutical compositions comprising same.

Background of the Invention

Accordingly, various classes of drugs have been researched and developed to inhibit TNF-α production at both transcriptional and translational levels, e.g.,
corticosteroids, rolipram (a phosphodiesterase IV inhibitor suppressing TNF-α mRNA synthesis), calphostin, and imidazole-type cytokine suppressing anti-inflammatory drugs (CSAIDs or P-38 inhibitors). These drugs are useful in treating a variety of diseases. See Dinarello, "Role of Pro- and Anti-Inflammatory Cytokines During Inflammation: Experimental and Clinical Findings," Review, Vol. 0393-974X (1997), at pp. 91-103.

Recently, attention has focussed on the role of Nuclear factor κB (NF-κB) in the activation pathway that leads to production of TNF-α and other inflammatory cytokines and gene products. Besides TNF-α, NF-κB is involved in the regulation of a variety of genes involved in immune function and inflammation. These include the cytokines IL-1, IL-2, IL-6, IL-2Rα, and GM-GSF, the chemokines IL-8, MCP-1 (CCR2), and RANTES, the adhesion molecules, intercellular adhesion molecule-1 (ICAM-1), vascular cellular adhesion molecule-1 (VCAM-1) and E-selectin, the proteases matrix metalloproteinase-1 (MMP-1), MMP-9 and MMP-13, and the pro-inflammatory enzymes cyclooxygenase -2 (COX-2), iNOS, and cPLA₂. Thus, inhibition of NF-κB and/or its activation pathway provides a means for treating various diseases including autoimmune diseases, inflammatory diseases, Alzheimer’s disease, atherosclerosis, oncogenesis, and so forth by a variety of modes of action (i.e. cytokine reduction, chemokine reduction, reduction of adhesion molecule expression, decreased expression of certain proteases implicated in inflammatory and immune disease processes, and decreased production of enzymes which produce pro-inflammatory mediators) which have been implicated in a variety of disease progression. See, e.g., Baldwin, "The NF-κB and IκB Proteins: New Discoveries and Insights," Annual Rev. Immunol., Vol. 14 (1996), at pp. 649-81; see also Christman et al., "Impact of Basic Research on Tomorrow’s Medicine, The Role of Nuclear Factor-κB in Pulmonary Diseases," Chest, Vol. 117 (2000), at pp. 1482-87, and Roshak, et al., "Small-molecule Inhibitors of NF-κB for the Treatment of Inflammatory Joint Disease." Current Opinion in Pharmacol, Vol. 2 (2002) pp. 316-321.

Additionally attention has focussed on inhibition of NF-κB and/or its activation pathway to provide a means for treating cancer. Genes which mediate either tumorigenesis or tumor metastasis are regulated by NF-κB. In addition NF-κB is know to

IκB is a cytoplasmic protein that controls NF-κB activity by retaining NF-κB in the cytoplasm. IκB is phosphorylated by the IκB kinase (IKK), which has two isoforms, IKK-α ("IKK-1") and IKK-β ("IKK-2"). When IKK phosphorylates IκB, NF-κB is rapidly released from the cytoplasm into the cell. Upon release into the cell, NF-κB translocates to the nucleus where it binds to the promoters of many genes and up-regulates the transcription of pro-inflammatory genes. Thus inhibitors of IKK-1 and/or IKK-2 would prevent translocation of NF-kB to the nucleus and prevent transcription of the pro-inflammatory gene products described above. For example see Burke, et al. “BMS-345541 is a Highly Selective Inhibitor of IκB Kinase that Binds at an Allosteric Site of the Enzyme and Blocks NF-κB dependent Transcription in Mice.” J. Biol. Chem. Vol. 278, (2003) pp. 1450-1456.

The therapeutic effects of glucocorticoids are mediated in part by their ability to inhibit NF-κB activity by two mechanisms, i.e., up-regulating IκB protein levels and inhibiting NF-κB subunits. The deleterious side effects of glucocorticoids (such as osteoporosis, hyperglycemia, fat redistribution, etc.) have been postulated to result from the interaction of glucocorticoids with the glucocorticoid receptor (GR) or the glucocorticoid response element (GRE). For example see Schacke, et al. “Mechanisms Involved in the Side Effects of Glucocorticoids” Pharmacol. and Therapeutics Vol 96 (2002) pp. 23-43. Thus inhibitors of IKK-1 and/or IKK-2 inhibitors should provide much of the therapeutic benefit of glucocorticoids with a greatly improved side effect profile.

As may be appreciated, those in the field of pharmaceutical research continue to seek to develop new compounds and compositions having increased effectiveness, bioavailability, and solubility, having fewer side effects, and/or providing the physician and patient with a choice of treatment options. Particularly in the area of immune response, individuals respond differently depending upon the type of treatment and chemical agent used. Mechanisms of action continue to be studied to aid in
understanding the immune response and in developing compounds effective for treating inflammatory and immune-related disorders.

The present invention provides for novel tricyclic compounds useful as inhibitors of IKK.

The invention may be embodied in other specific forms without departing from the spirit or essential attributes thereof. This invention also encompasses all combinations of alternative aspects of the invention noted herein. It is understood that any and all embodiments of the present invention may be taken in conjunction with any

DEFINITIONS

The following are definitions of terms used in this specification. The initial definition provided for a group or term herein applies to that group or term throughout the present specification, individually or as part of another group, unless otherwise indicated.

The term "substituted," as used herein, means that any one or more hydrogens on the designated atom or ring is replaced with a selection from the indicated group, provided that the designated atom's or ring atom's normal valency is not exceeded, and that the substitution results in a stable compound. When a substituent is keto (i.e., =O), then 2 hydrogens on the atom are replaced. The term "optionally independently substituted as valence allows", as used herein, means that the any one or more hydrogens on the designated variable is independently replaced with a selection from the indicated group, provided that the designated variable's normal valency is not exceeded, and that the substitution results in a stable compound.

When any variable (e.g., R\(^a\)) occurs more than one time in any constituent or formula for a compound, its definition at each occurrence is independent of its definition at every other occurrence. Thus, for example, if a group is shown to be substituted with 0-2 R\(^a\), then said group may optionally be substituted with up to two R\(^a\) groups and R\(^a\) at each occurrence is selected independently from the definition of R\(^a\). Also, combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

When a bond to a substituent is shown to cross a bond connecting two atoms in a ring, then such substituent may be bonded to any atom on the ring. When a substituent is listed without indicating the atom via which such substituent is bonded to the rest of the compound of a given formula, then such substituent may be bonded via any atom in such
substituent. Combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

The term "alkyl" as used herein by itself or as part of another group refers to straight and branched chain hydrocarbons, containing 1 to 20 carbons, alternatively, 1 to 10 carbons, or 1 to 8 carbons, such as methyl, ethyl, propyl, isopropyl, butyl, t-butyl, isobutyl, pentyl, hexyl, iso-hexyl, heptyl, 4,4-dimethylpentyl, octyl, 2,2,4-trimethylpentyl, nonyl, decyl, undecyl, dodecyl, the various branched chain isomers thereof, and the like. Lower alkyl groups, that is, alkyl groups of 1 to 4 carbon atoms, are an alternative embodiment.

"Halo" or "halogen" as used herein refers to fluoro, chloro, bromo, and iodo; and "haloalkyl" is intended to include both branched and straight-chain saturated aliphatic hydrocarbon groups, for example CF₃, having the specified number of carbon atoms, substituted with 1 or more halogen (for example -CᵥF₵ where v = 1 to 3 and w = 1 to (2v+1)).

The term "alkenyl" as used herein by itself or as part of another group refers to straight or branched chain radicals of 2 to 20 carbons, alternatively, 2 to 12 carbons, or 1 to 8 carbons in the normal chain, which include one to six double bonds in the normal chain, such as vinyl, 2-propenyl, 3-butenyl, 2-butenyl, 4-pentenyl, 3-pentenyl, 2-hexenyl, 3-hexenyl, 2-heptenyl, 3-heptenyl, 4-heptenyl, 3-octenyl, 3-nonanyl, 4-decenyln, 3-undecenyl, 4-dodecenyln, 4,8,12-tetradecatrienyl, and the like.

The term "alkynyl" as used herein by itself or as part of another group refers to straight or branched chain hydrocarbon groups having 2 to 12 carbon atoms, alternatively, 2 to 4 carbon atoms, and at least one triple carbon to carbon bond, such as ethynyl, 2-propynyl, 3-butylnyl, 2-butylnyl, 4-pentynyl, 3-pentynyl, 2-hexynyl, 3-hexynyl, 2-heptynylnyl, 3-heptynylnyl, 4-heptynylnyl, 3-octynyl, 3-nonynyl, 4-decylnyl, 3-undecynyl, 4-dodecylnyl and the like.

When the term "alkyl" is used together with another group, such as in "(aryl)alkyl", this conjunction is meant to refer to a substituted alkyl group wherein at least one of the substituents is the specifically named group in the conjunction. For
example, "(aryl)alkyl" refers to a substituted alkyl group as defined above wherein at least one of the substituents is an aryl, such as benzyl.

Where alkyl groups as defined above have single bonds for attachment to two other groups, they are termed "alkylene" groups. Similarly, where alkenyl groups as defined above and alkylnyl groups as defined above, respectively, have single bonds for attachment to two other groups, they are termed "alkenylene groups" and "alkynylene groups" respectively. Examples of alkyne, alkenylene and alkynylene groups include:

\[

In addition, when a compound of formula I contains both a basic moiety, such as, but not limited to an amine or a pyridine ring, and an acidic moiety, such as, but not limited to a carboxylic acid, zwitterions ("inner salts") may be formed and are included within the term "salt(s)" as used herein. Pharmaceutically acceptable (i.e., non-toxic, physiologically acceptable) salts are preferred, although other salts are also useful, e.g., in isolation or purification steps which may be employed during preparation. Salts of the compounds of the formula I may be formed, for example, by reacting a compound of the formula I with an amount of acid or base, such as an equivalent amount, in a medium such as one in which the salt precipitates or in an aqueous medium followed by lyophilization.

Exemplary acid addition salts include acetates (such as those formed with acetic acid or trihaloacetic acid, for example, trifluoroacetic acid), adipates, alginates, ascorbates, aspartates, benzoates, benzenesulfonates, bisulfates, borates, butyrates, citrates, camphorates, camphorsulfonates, cyclopentanepropionates, digluconates,
dodecylsulfates, ethanesulfonates, fumarates, glucoheptanoates, glycerophosphates, hemisulfates, heptanoates, hexanoates, hydrochlorides (formed with hydrochloric acid), hydrobromides (formed with hydrogen bromide), hydroiodides, 2-hydroxyethanesulfonates, lactates, maleates (formed with maleic acid), methanesulfonates (formed with methanesulfonic acid), 2-naphthalenesulfonates, nicotinates, nitrates, oxalates, pectinates, persulfates, 3-phenylpropionates, phosphates, picrates, pivalates, propionates, salicylates, succinates, sulfates (such as those formed with sulfuric acid), sulphonates (such as those mentioned herein), tartrates, thiocyanates, toluenesulfonates such as tosylates, undecanoates, and the like.

Exemplary basic salts include ammonium salts, alkali metal salts such as sodium, lithium, and potassium salts, alkaline earth metal salts such as calcium and magnesium salts, salts with organic bases (for example, organic amines) such as benzathines, dicyclohexylamines, hydrazines [formed with N,N-bis(dehydroabietyl)ethylenediamine], N-methyl-D-glucamines, N-methyl-D-glucamides, t-butyl amines, and salts with amino acids such as arginine, lysine and the like. Basic nitrogen-containing groups may be quaternized with agents such as lower alkyl halides (e.g., methyl, ethyl, propyl, and butyl chlorides, bromides and iodides), dialkyl sulfates (e.g., dimethyl, diethyl, dibutyl, and diamyl sulfates), long chain halides (e.g., decyl, lauryl, myristyl and stearyl chlorides, bromides and iodides), aralkyl halides (e.g., benzyl and phenethyl bromides), and others.

Compounds of the formula I, and salts thereof, may exist in their tautomeric form, in which hydrogen atoms are transposed to other parts of the molecules and the chemical bonds between the atoms of the molecules are consequently rearranged. It should be understood that all tautomeric forms, insofar as they may exist, are included within the invention. Additionally, inventive compounds may have trans and cis isomers and may contain one or more chiral centers, therefore existing in enantiomeric and diastereomeric forms. The invention includes all such isomers, as well as mixtures of cis and trans isomers, mixtures of diastereomers and racemic mixtures of enantiomers (optical isomers). When no specific mention is made of the configuration (cis, trans or R or S) of a compound (or of an asymmetric carbon), then any one of the isomers or a mixture of
more than one isomer is intended. The processes for preparation can use racemates, enantiomers, or diastereomers as starting materials. When enantiomeric or diastereomeric products are prepared, they can be separated by conventional methods, for example, by chromatographic or fractional crystallization. The inventive compounds may be in the free or hydrate form.

In addition, compounds of formula I may have prodrug forms. Any compound that will be converted in vivo to provide the bioactive agent (i.e., a compound of formula I) is a prodrug within the scope and spirit of the invention.

For example, pro-drug compounds of formula I may be carboxylate ester moieties. A carboxylate ester may be conveniently formed by esterifying any of the carboxylic acid functionalities found on the disclosed ring structure(s). Various forms of prodrugs are well known in the art. For examples of such prodrug derivatives, see:

It should further be understood that solvates (e.g., hydrates) of the compounds of formula I are also within the scope of the present invention. Methods of solvation are generally known in the art.

"Stable compound" and "stable structure" are meant to indicate a compound that is sufficiently robust to survive isolation to a useful degree of purity from a reaction mixture, and formulation into an efficacious therapeutic agent. The present invention is intended to embody stable compounds.
"Therapeutically effective amount" is intended to include an amount of a compound of the present invention alone or an amount of the combination of compounds claimed or an amount of a compound of the present invention in combination with other active ingredients effective to inhibit IKK or effective to treat or prevent inflammatory disorders.

As used herein, "treating" or "treatment" cover the treatment of a disease-state in a mammal, particularly in a human, and include: (a) preventing the disease-state from occurring in a mammal, in particular, when such mammal is predisposed to the disease-state but has not yet been diagnosed as having it; (b) inhibiting the disease-state, i.e., arresting its development; and/or (c) relieving the disease-state, i.e., causing regression of the disease state.

**Methods of Preparation**

Compounds of Formula I may be prepared by reference to the methods illustrated in the following Schemes I through III. As shown therein the end product is a compound having the same structural formula as Formula I. It will be understood that any compound of Formula I may be produced by Scheme I - III by the suitable selection of reagents with appropriate substitution. Solvents, temperatures, pressures, and other reaction conditions may readily be selected by one of ordinary skill in the art. All documents cited are incorporated herein by reference in their entirety. Starting materials are commercially available or readily prepared by one of ordinary skill in the art. Constituents of compounds are as defined herein or elsewhere in the specification.

The sequence described in Scheme I entails the nitration of 4-hydroxy pyridine, I-1 to provide the known compound I-2, followed by conversion to the corresponding known chloro-pyridine I-3. Subsequent addition of an amine such as methylamine provides the previously un-described compound I-4. Reduction of both nitro groups and simultaneous chlorination of the intermediate triaminopyridine occurs on treatment of I-4 with tin(II) chloride to produce I-5. This important intermediate can be reacted with triethyl orthoformate to provide fused imidazole I-6. Acylation either by reaction with an
acid chloride or other suitable carboxylic acid activation procedure would provide I-7, which upon heating closes to produce the tricyclic system I-8. Reaction with an amine produces the desired product I-9.

Reaction of I-7 to produce a fused thiazole system is outlined in Scheme II. Reaction of the intermediate amide I-7 with Lawesson’s reagent at elevated temperature produces the thioamide which closes to produce II-1. Reaction with an amine produces the desired tricyclic compound II-2.

Fused thiazoles with substituents not readily incorporated by the procedure of Scheme II can be produced as depicted in Scheme III. Intermediate I-6 is reacted with
potassium ethylthioxanthate to produce intermediate III-1. This potassium salt may be
directly trapped with an alkyl halide or a alkyl halide containing synthetic resin to
produce III-2. Reaction of III-2 with an amine produces the desired compound III-3. This
route has the advantage of manipulating functionality at the other end of the molecule.

Thus product III-3 can be oxidized to the sulfone III-4, which in addition to being a
compound of Formula I, is also a useful intermediate. Displacement of the sulfone group
by an amine at elevated temperature produces compound III-5, which is also a compound
of Formula I. Alternatively hydrolysis of the sulfone group with aqueous sodium
hydroxide followed by treatment with phosphorous oxychloride produces intermediate
III-6 which upon reaction with either a boronic acid or organotin reagent with a
palladium catalyst will produce compounds III-7 which are also a compound of Formula I.
Scheme III

An additional useful method of preparing compounds of Formula I are described in scheme IV. Reaction of III-4 with hydrazine produces IV-1. Reaction with copper (II) bromide produces IV-2 which can be reacted in an analogous manner to III-6 to produce compounds III-7. Alternatively IV-1 can be condensed with ketoesters or diketones to produce compounds IV-3 which are also compounds of Formula I.
Additional useful methods for the preparation of compounds of Formula I are described in Scheme V. Reaction of thiophosgene with I-6 produces the isothiocyanate V-1. Reaction with either a substituted amine of ammonia provides the useful intermediate V-2. Treatment of V-2 with an appropriate base such as sodium methoxide at elevated temperatures provides intermediate V-3. Reaction of V-3 with an amine will produce compounds of structure III-5. In the case where V-1 was reacted with ammonia, further reaction by diazotization and treatment with copper (II) bromide will provide intermediate V-4. Reaction of V-4 with either a boronic acid or organotin reagent with a palladium catalyst will produce compounds V-5 which after reaction with an amine will produce compounds of structure III-7.
Alternatively compounds of Formula I can be produced by the method outlined in Scheme VI. Displacement of either a sulfoxide or a halide intermediate with the salt of an alcohol provides compounds V-1 which are also a compound of Formula I.
Alternatively compounds of Formula I can be produced by the method outlined in Scheme VII. Intermediate V-4 can be selectively carbonylated in the presence of a palladium catalyst, to produce carboxylic acid ester VII-1. Hydrolysis of the ester with aqueous sodium hydroxide produces carboxylic acid VII-2. Reaction with an amine produces compound VII-3 which is a compound of Formula I. Coupling of carboxylic acid VII-3 with amines produces amides VII-4 which are also compounds of Formula I.

Scheme VII

In another embodiment, the present invention is directed to a process for preparing a compound of Formula (II) from a compound of Formula (III)

(III) → (II)
comprising reacting the compound of Formula (III) with an orthoester of formula R²-C(OR)₃, wherein R is alkyl to obtain the compound of Formula (II), wherein R¹, R², and R³ are as described elsewhere. The reaction may be performed in an inert solvent. The reaction is typically run at temperatures from above room temperature, such as about 40°C, to the boiling point of the solvent.

Suitable inert solvents include, but are not intended to be limited to, ether solvents such as dimethoxymethane, tetrahydrofuran, 1,3-dioxane, 1,4-dioxane, furan, diethyl ether, ethylene glycol dimethyl ether, ethylene glycol diethyl ether, diethylene glycol dimethyl ether, diethylene glycol diethyl ether, triethylene glycol dimethyl ether, or t-butyl methyl ether. Other solvents include, but are not intended to be limited to DMF, NMP, acetonitrile, alcoholic solvents such as methanol, ethanol, propanol, i-propanol, and butanol, and hydrocarbon solvents such as benzene, cyclohexane, pentane, hexane, hexanes, toluene, cycloheptane, methylcyclohexane, heptane, ethylbenzene, m-, o-, or p-xylene, mesitylene, octane, indane, nonane, or naphthalene.

A1

**A1.1: 3,5-Dinitro-1H-pyridin-4-one**

![Chemical Structure](image)

A1.1

4-Hydroxypyridine (40.0g, 0.42 mol) was added portionwise to fuming nitric acid (140 ml) and sulfuric acid (500 ml). The resulting mixture was heated to 140°C for 12 hours. The reaction mixture was cooled in an ice-bath and cautiously poured onto ice (500 ml). The yellow solid which precipitated was collected by filtration and dried under
vacuum to yield A1.1 (70.0g, 90%). $^1$H-NMR (DMSO-$d_6$) δ: 4.06 (2H, s). HPLC: 98.9%, ret. time = 0.173 min., LC/MS (M-H)$^+$ = 184.

**Scale-up:**

250 g of 4-hydroxy pyridine was mixed with 3.2 L of concentrated sulfuric acid at 0-5° C and 900mL fuming nitric acid was added dropwise to it maintaining the temperature in the same range. The reaction mass was refluxed over night. The mass was cooled down and poured over crushed ice. It was then filtered and washed with 2L of water, to provide A1.1 in 52% yield as a pale yellow solid.

**A1.2: (3,5-Dinitro-pyridin-4-yl)methylamine**

![Structure](image)

A1.1 (10.0 g, 0.051 mol) was added portionwise to a mixture of phosphorus oxychloride (25mL) and PCl$_5$ (17.0g, 0.082 mol). The reaction mixture was heated to reflux under a nitrogen atmosphere for 12 hours. The reaction mixture was allowed to cool to room temperature and the phosphorus oxychloride removed in vacuo. The residue was suspended in dry THF (50mL) and cooled to 0°C. Methylamine (32mL, 2.0M in THF, 0.064 mol) was added dropwise over 20 minutes under a nitrogen atmosphere and the resulting solution was allowed to warm to room temperature over 1 hour. The reaction mixture was evaporated in vacuo and the residue suspended in ethyl acetate (200mL) which was then filtered and the filtrate evaporated in vacuo to leave the crude product. The crude product was recrystallised from methanol (100mL) to give A1.2 as a tan solid (7.2g, 71% for two steps). HPLC: 98%, ret. time = 1.58 min., LC/MS (M+H)$^+$ = 199.
Scale-up:
500ml of POCl₃ was added to 150g of A1.1. 250g of PCl₅ was added to it and refluxed until it became clear solution. Then about half the quantity of POCl₃ was removed under vacuum. Then 3 X 100 ml xylene was added slowly to the reaction mass and stripped off. The residue was dissolved in 400ml of xylene and 2L of 2M solution of CH₃NH₂ was added to it slowly at 0-20° C. It was stirred at RT over night and the solvent was removed. The residue was recrystallized from methanol to provide A1.2 in 58% yield as a yellow to brown solid.

A1.3: 2,6-Dichloro-N°-methyl-pyridine-3,4,5-triamine

A solution of A1.2 (60.0 g, 0.30 mol) in concentrated hydrochloric acid (300 ml) was heated to 90° C. Tin (II) chloride (85.0g, 0.45 mol) was added portionwise over 1 hour with vigorous effervescence noted for the first equivalent of tin chloride added. The reaction mixture was heated for a further hour before the addition of more tin chloride (28.0g, 0.15 mol) and continued heating for 2 more hours. The reaction mixture was cooled to 0°C and cautiously basified with concentrated ammonium hydroxide (200ml). The precipitated solid was filtered off and the filtrate extracted with ethyl acetate (5 x 200ml). The combined organics were dried (MgSO₄) and evaporated in vacuo to leave A1.3 as a brown solid (28.0g, 46%). HPLC: 98%, ret. time = 1.58 min., LC/MS (M+H)⁺ = 208.

Scale-up:
100g of A1.2 was dissolved in 600ml conc. HCl and cooled to 0°C. 170g of SnCl₂·2H₂O was added portion wise. The reaction mixture was then heated to 90° C in an oil bath for 2-3 hours. TLC indicated the complete consumption of the starting material and conversion to mono reduced product. A further portion of 170 g of
SnCl₂·H₂O was added after raising the temperature to 100°C. The conversion of mono reduced product to final compound was ensured by TLC. Then the reaction mass was cooled down to 0°C and cautiously basified with 1L aqueous ammonia. The solid was filtered off and the filtrate was extracted with 6 X 500 ml of ethyl acetate. The paste like mass was again dissolved in 4 X 500 ml of ethyl acetate and the combined extracts were concentrated to afford 45g of the crude. The crude on purification by filtration column gave 28g (27%) of A1.3 as a yellow solid.

**A1.4: 7-Amino-4,6-dichloro-1-methyl-1H-imidazo[4,5-c]pyridine**

Triethylorthoformate (25.0ml, 0.15mol) was added in one portion to a suspension of A1.3 (28g, 0.14mol) in dry acetonitrile (400ml). The reaction mixture was heated to reflux for 4 hours and then cooled to room temperature. The reaction mixture was evaporated *in vacuo* to leave A1.4 as a brown powder. ¹H-NMR (DMSO-d₆) δ: 8.20 (1H, s), 5.49 (2H, br. s), 4.07 (3H, s). HPLC: 98%, ret. time = 0.78 min., LC/MS (M+H)+ = 218.

Benzoyl chloride (1.2 g, 10.1 mmol) in dry acetonitrile (100ml) was added in one portion to a suspension of the amine A1.4 (2.0g, 9.2 mmol) and the resulting mixture was heated to 70°C for six hours. The reaction mixture was concentrated *in vacuo* to leave the crude product which was precipitated with methanol and filtered to give pure...
A1.5 (1.3g, 44 %). ¹H-NMR (DMSO-d₆) δ: 8.30 (1H, s), 8.20 (2H, app. d, J = 1 Hz), 7.87 (2H, app. t, J = 6 Hz), 7.70 (2H, app. t, J=8 Hz), 5.55 (1H, s), 4.15 (3H, s).
HPLC: 98%, ret. time = 1.20 min., LC/MS (M+H)⁺ = 320.

**Example A20**

8-Methyl-5-methylamino-2-[3-[2-(tetrazol-5-yl)(E)-ethenyl]phenyl]-8H-imidazo[4,5-d]oxazolo[5,4-b]pyridine
A20

Vinyl tetrazole (21mg, 0.21mmol) was added in one portion to a solution of bromide A3 (51mg, 0.14mmol) in dry DMF (1ml). Palladium acetate (1mg, 1.4x10^{-5} mol), phosphorus acid tris(4-methylphenyl)ester (1mg, 2.8x10^{-5} mol) and triethylamine (0.02ml, 0.14mmol) were each added in one portion and the resulting mixture heated in the microwave at 120°C for 900s. The DMF was removed in vacuo and the residue acidified with 1N hydrochloric acid (2ml). The aqueous phase was extracted with ethyl acetate (3x20ml), the combined organics dried (MgSO₄) and evaporated in vacuo to leave a crude residue which was purified by preparative hplc to give A20 (38mg, 42%) as a white solid. HPLC: 98%, ret. time = 1.57 min., LC/MS (M+H)^+ = 374.17.

Example A21 & A22

10% Palladium on carbon (200mg) was added in one portion to a solution of A20 (190mg, 0.51 mmol) in dry methanol (25ml) under a nitrogen atmosphere. The reaction vessel was repeatedly (4x) evacuated and purged with hydrogen and allowed to stir at room temperature for 12 hours. The reaction mixture was filtered through a pad of celite and washed with copious amounts of methanol. Evaporation of the solvent in vacuo afforded the crude product which was purified by preparative HPLC to give A21 as a tan brown solid (128mg, 67%). HPLC: 98%, ret. time = 1.41 min., LC/MS (M+H)^+ = 376.15.

A22 was prepared in a similar manner to A21 starting from the dimethylamine-olefin precursor: (36mg, 45%). HPLC: 98%, ret. time = 1.58 min., LC/MS (M+H)^+ = 390.14.
Examples A23-A27

Example A73

8-Methyl-5-methylamino-2-(3-aminomethyl)phenyl-8H-imidazo[4,5-d]oxazolo[5,4-b]pyridine

A16 (2.10g, 7.0mmol) was suspended in THF (70 mL) and stirred at room temperature. Lithium aluminum hydride 1.0 molar solution in THF (7 mL, 7.0 mmol) was added dropwise. The reaction mixture was observed to be exothermic, and allowed to stir at room temperature overnight. HPLC/ LC MS showed complete conversion to product. The reaction mixture was carefully quenched by the sequential addition of 7 mL of water, followed by 7 mL of 15% aqueous sodium hydroxide, followed by 21 mL of water followed by stirring for 1h. The reaction mixture was filtered though a pad of Celite® and the solvent removed under vacuum. The crude product was triturated with hexane, filtered and air dried to yield 1.91g of crude product. A second trituration with methanol/THF yielded 1.8 g (85%) of A73. ¹H NMR (CD₃OD) δ 8.28 (1H, s), 8.20

**Examples A75 -A160**

Examples A75 –A160 described in Table A7 were prepared by a solution phase library methodology. To an individual well of a 48-position MiniBlock® reactor was added 112
μL of a 0.50 M solution of the appropriate carboxylic acid in dimethylacetamide (DMA) (0.056 mmol, 1.7 equiv); 60 μL of a 0.93 M solution of 1-hydroxybenzotriazole in DMA (0.056 mmol, 1.7 equiv); 46 mg of polystyrene-supported N,N'-diisopropylcarbodiimide (PS-DIC) (1.21 mmol/g, 1.7 equiv); and 330 μL of 1,2-dichloroethane (DCE). The reactor was agitated via orbital shaker for 10 min. Finally, 300 μL of a 0.11 M solution of A73 in DMA (0.033 mmol, 1.0 equiv) was added to the reactor well, and the reactor was agitated for 14 h at rt. The crude product was filtered, rinsed with additional DMA, then purified by standard preparative HPLC-MS (H$_2$O/MeOH/0.1% TFA, gradient 35–90% MeOH over 15 min, 20×100mm 5μm YMC ODS-A column) utilizing mass-directed fractionation. The purified sample was reconstituted in 1:1/MeOH:DCE, transferred to a tared 2.5 mL plastic microtube, dried via centrifugal evaporation and weighed. The final product was analyzed by HPLC-MS H$_2$O/MeOH/0.1% TFA, gradient 10-90% MeOH over 4 min, 4 mL/min, 4.6 x 50 mm 5 um Phenomenex Primesphere column Retention time and observed mass are reported.

For those compounds which were derived from amino acid (Example 143-Example 156) acid labile protecting groups were utilized. These examples were coupled as described above and the protecting group(s) were removed by being taken up in 1 mL of 2:1/DCE:TFA for 1 hour, then concentrated again. Purification was performed by standard preparative HPLC-MS as described above.

**Examples A161-A169**
Examples A161-A169 described in Table A8 were prepared by a solution phase library methodology. To an individual well of a 48-position MiniBlock® reactor was added 35 mg of sodium carbonate (0.33 mmol, 10 equiv); 180 µL of a 0.50 M solution of the appropriate chloroformate in tetrahydrofuran (THF) (0.090 mmol, 2.7 equiv); and 220 µL of a 0.15 M solution of A73 in THF (0.033 mmol, 1.0 equiv). The reactor was agitated via orbital shaker overnight at rt. The crude product was filtered, rinsed with additional THF, and dried via centrifugal evaporation; the dried sample was reconstituted in 2 mL of 1:1/DMSO:MeOH, then purified by standard preparative HPLC-MS (H₂O/MeOH/0.1% TFA, gradient 35–90% MeOH over 15 min, 20×100mm 5µm YMC ODS-A column) utilizing mass-directed fractionation. The purified sample was reconstituted in 1:1/MeOH:DCE, transferred to a tared 2.5 mL plastic microtube, dried via centrifugal evaporation and weighed. The final product was analyzed by HPLC-MS (H₂O/MeOH/0.1% TFA).

B1

A mixture of A1.5 (43 mg; 0.13 mmol) and Lawesson’s reagent (80 mg; 0.2 mmol) in 2 ml of toluene was heated to 110 °C for 5 hrs. After cooling to room temperature, 1,8-diazabicyclo[5.4.0]undec-7-ene (0.06 mL; 0.4 mmol) was added and the reaction mixture was allowed to stir for 60 hrs. The volatiles were removed in vacuo and the residue was dissolved in 2 ml of N,N-dimethylacetamide. Filtration and concentration afforded a crude residue that was purified by preparative thin layer chromatography (20 x 20 cm; 1mm thick silica gel plate) using ethyl acetate as the eluent. Extraction of the pure band with ethyl acetate, filtration and concentration afforded 21 mg (75%) of B1.1 as an off-white solid. HPLC: 95.1% at 1.89 min (retention time) (Phenominex S5 ODS column 4.6 x 50 mm eluting with 10-90% aqueous methanol over 2 minutes containing 0.1% TFA, 4 mL/min, monitoring at 254 nm); MS (ES): m/z 301.05 [M+H]+

B2

B2.1: N,8-dimethyl-2-(methylthio)-5-chloro-8H-imidazo[4,5-d]thiazolo[5,4-b]pyridine

B2.1

A1.4 (2.17 g, 10 mmol) and potassium thioxanthate (3.05g, 20mmol) were added to 20 mL of DMP and heated for 2.5h at 145 °C. The reaction mixture was cooled to room temperature then placed in an ice bath and cooled to ~ 0 °C. Methyl iodide (1.24mL,

The combined organic layers were dried over magnesium sulfate, filtered, and evaporated to provide a cream colored solid. The crude product was triturated with hot ethyl acetate (~ 75 mL) which was allowed to cool to room temperature, and the product collected by filtration. 1.49g (55%) of B2.1 was isolated as a cream colored solid, which was >95% pure by LCMS ((M+H)^+ = 271.16, 273.17).

B2.1 (540 mg, 2 mmol) and 1.5 mL of methylamine in ethyl alcohol (12 mmol) was added to n-butanol (5 mL) and heated to 180 °C in a sealed tube for 4h, and cooled to room temperature. HPLC indicated that the reaction had not proceeded to completion. Additional methylamine in ethyl alcohol (12 mmol) was added and the reaction vessel sealed and heated for an additional 4h. The reaction mixture was cooled to room temperature and the volatile solvent removed under vacuum. The residue was triturated with water and the residue dried under high vacuum to provide 428mg (91%) of B2 as a white powder. (M+H)^+ = 266.25. (HPLC > 95%).

B2 was crystallized from ethyl acetate to produce crystals suitable for x-ray diffraction. The x-ray experimental data is summarized in Table B1, and the graphic depiction of B2 is shown below.

mother liquor was allowed to stand for one day. (M+H)^+ = 297.00 (HPLC > 98%).

**Example B6**

N.8-dimethyl-2-(1-piperidinyl)-8H-imidazo[4,5-d]thiazolo[5,4-b]pyridin-5-amine

**B6**

**B5** (26 mg, 0.087 mmol), potassium carbonate (14 mg, 0.10 mmol) and piperidine
(0.4 mL, 344 mg, 4.0 mmol) were dissolved in DMA (0.2 mL), and heated to 200 °C for
1h. in a microwave oven. The volatile components were removed under high vacuum,
and the residue was partitioned between ethyl acetate (30 mL) and brine (30 mL). The
organic layer was separated, dried over magnesium sulfate, filtered and concentrated to
provide the crude product. The crude product was purified by preparatory HPLC to provide 17 mg (45%) of B6 as a gray powder. (M+H)^+ = 303.31 (HPLC > 98%).

Example B7

2-(hexahydro-1H-azepin-1-yl)-N,8-dimethyl-8H-imidazo[4,5-d]thiazolo[5,4-b]pyridin-5-amine

![Diagram of B7]

B7.1: N,8-dimethyl-2-(methylsulfonyl)-8H-imidazo[4,5-d]thiazolo[5,4-b]pyridin-5-acetamide

![Diagram of B7.1]

A suspension of B5 (900 mg, 3.03 mmol) in AcOH (10 mL) and Ac_2O (10 mL) was heated to 125°C in a sealed tube, which became homogeneous after 5 min, with stirring overnight. The reaction was cooled to room temperature, concentrated and the residue triturated with EtOAc to provide 890 mg (87%) of B7.1 as a tan solid: MS (ES): m/z 340 [M+H]^+ (HPLC 99%).
B7.2: 2-(hexahydro-1H-azepin-1-yl)-N,8-dimethyl-8H-imidazo[4,5-d]thiazolo[5,4-b]pyridin-5-amine

A solution of B7.1 (0.5 mL of a 0.088 M solution in NMP) and azepane (homopiperazine) (1mL of a 1M solution in NMP) was heated in a Personal Chemistry® microwave at 200°C for 30 min. NaOH (2N, 0.25 mL) was added and reheated in the microwave at 150°C for 10 min. AcOH (0.5 mL) was added and purified directly by preparative HPLC to afford 2.2 mg (16%) B7 as a film: MS (ES): m/z 317 [M+H]^+ (HPLC 98%).

Examples B8-B28

Examples B8–B28 described in Table B1 were prepared in a similar manner to that used for Example B7 step B7.2 with the appropriate amine substituted for azepane (homopiperazine).

Example B29

B29

B29.1: N⁸-dimethyl-2-hydroxy-8H-imidazo[4,5-d][1]thiazolo[5,4-b]pyridine-2,5-diamine

To a stirred mixture of B2 (5.22 g, 19.6 mmol) in MeOH (80 mL) was added a suspension of Oxone (35 g) in H₂O (80 mL). After 3h, the reaction was partially concentrated, diluted with H₂O, neutralized with NaHCO₃ then the solid collected by filtration. To the sulfone intermediate (3.22 g) as a suspension in H₂O (25 mL) was added 5N NaOH and heated to 120°C for 3h. The reaction was acidified with 20 mL AcOH and the solid collected by filtration to afford 2.22 g (48%) B29.1 as a tan solid: MS (ES): m/z 236 [M+H]^+ (HPLC 95%).

Alternative synthesis of B29.1:

Potassium hydroxide (840 mg, 15 mmol) in 10 ml of hot ethanol and hydroxylamine hydrochloride (695 mg, 10 mmol) in 10 ml of hot ethanol were mixed and allowed to cool to room temperature. The resulting suspension was filtered and the
filtrate was added to B5 (297 mg; 1 mmol). After refluxing for 3 hrs, the reaction mixture was allowed to cool to room temperature and stand 3 days. After filtering, the filter cake was washed with ethanol and ethyl ether to give a 240 mg of a violet powder. A 35 mg portion of this powder was purified by preparatory HPLC to provide 13 mg (38%*) of B29.1 as a yellow powder. (M+H)$^+$ = 236.11 (HPLC > 99%).

*based on 35 mg sample.

B29.2: N$^5$-8-dimethyl-2-chloro-8H-imidazo[4,5-d]thiazolo[5,4-b]pyridine-2,5-diamine

A mixture of B29.1 (1.00 g, 4.25 mmol), pyridine (0.35 mL) in POCl$_3$ (20 mL) was heated to 140°C with stirring for 48h. The reaction was cooled to rt, concentrated, the residue partitioned between 1% H$_2$SO$_4$ and CHCl$_3$, the aqueous phase separated and extracted with THF (2x). The combined organic phases were dried (MgSO$_4$), filtered and concentrated to dryness. The residue was triturated with CHCl$_3$/EtOAc 1:10 to provide 975 mg (90%) S2 as a beige solid: MS (ES): m/z  254 [35Cl M+H]$^+$ (HPLC 98%).

B29.3: N$^2$-(2-ethoxyethyl)-N$^5$-8-dimethyl-8H-imidazo[4,5-d]thiazolo[5,4-b]pyridine-2,5-diamine

To a solution of B29.2 (10 mg, 0.039 mmol) in NMP (0.5 mL) was added a solution of ethoxyethyamine (1mL of a 0.5M solution in NMP) and K2CO3 (10 mg) and then heated to 140°C overnight. The reaction was cooled to room temperature, AcOH (0.50 mL) was added, filtered and purified directly by preparative HPLC to afford 3.3 mg (28%) B29 as a film: MS (ES): m/z 307 [M+H]$^+$ (HPLC 100%).
Examples B30-B50

Examples B30 –B50 described in Table B2 were prepared in a similar manner to that used for Example B29 by reacting B29.2 with the appropriate amine substituted for ethoxyethylamine.

**Example B51**

2-fluoro-N-[8-methyl-5-(methylamino)-8H-imidazo[4,5-d]thiazolo[5,4-b]pyridin-2-yl]-benzamide
B51

5 **B51.1: N-Methyl-4-methoxybenzylamine**

B51.1

A mixture of p-methoxybenzaldehyde (25 ml; 200 mmol) and 8M methylamine in ethanol (100 ml; 800 mmol) in 100 ml of ethanol was stirred at rt for 18 hours. After removing the volatiles *in vacuo*, the residue was dissolved in 300 ml of fresh ethanol and sodium borohydride (8.5 g; 225 mmol) was added portionwise over 1.5 hr. Following the addition, the reaction mixture was concentrated to ~ 1/3 volume and water (50 ml) was added. After cooling in an ice bath, the stirred mixture was carefully acidified to pH ~2 with 5% aqueous H$_2$SO$_4$. After stirring 15 minutes, the mixture was basified to pH 14 with 6N NaOH and extracted with ethyl ether (400 ml). The ether layer was washed with water (200 ml), brine (100 ml) and dried over MgSO$_4$. Concentration afforded 28.04 g (93%) of **B51.1** as a colorless liquid. (M+H)$^+$ = 152.13 (HPLC > 94%).

20 **B51.2: N,8-dimethyl-N-[(4-methoxyphenyl)methyl]-2-(methylthio)-8H-imidazo[4,5-d]thiazolo[5,4-b]pyridin-5-amine**
A mixture of B2.1 (279 mg; 1 mmol) and B51.1 (0.5 ml; 3 mmol) in 1.5 ml of n-BuOH was heated to 180 °C. for 1 hr in a microwave apparatus. After removing the volatiles in vacuo, the residue was partitioned between EtOAc (50 ml) and water (50 ml). The organic layer was washed with brine (25 ml), dried (MgSO4) and concentrated to afford a light yellow gum. Ethyl ether (5 ml) was added, followed by hexane (10 ml). The mixture was concentrated by a 1/3 and the resulting semi-solid was stirred under hexane for 18 hr. Filtration and drying afforded 345 mg (90%) of B51.2 as a light yellow powder. \((M+H)^+ = 386.23\) (HPLC > 99%).

B51.3: 8-Methyl-2-(methylsulfonyl)-N-methyl-N-((4-methoxyphenyl)methyl-8H-imidazo[4,5-d]thiazolo[5,4-b]pyridin-5-amine

Hydrogen peroxide, 30% (11 ml) was added to a suspension of B51.2 (3.72 g; 9.66 mmol) and sodium tungstate dehydrate (330 mg; 0.97 mmol) in 50 ml of MeOH at 0
C. After stirring 24 hr at rt, additional hydrogen peroxide, 30% (11 ml) and tungstate dehydrate (80 mg; 0.23 mmol) were added and the reaction mixture was heated to 55 °C for 6 hr. After adding 50 ml of 10% sodium sulfite solution, the MeOH was removed in vacuo and the suspension was filtered. The filter cake was rinsed with water and dried to afford 3.50 g (87%) of B51.3 as an off white powder. (M+H)⁺ = 418.22 (HPLC > 90%).

B51.4: 8-Methyl-2-hydrazino-N-methyl-N-(4-methoxyphenyl)methyl-8H-imidazo[4,5-d]thiazolo[5,4-b]pyridin-5-amine

A mixture of B51.3 (3.5 g; 8.4 mmol), hydrazine hydrate (15 ml) and ethanol (15 ml) was heated to 120 °C for 3 hrs. After cooling to room temperature, 15 ml of ethanol was added and the suspension was filtered. The filter cake was rinsed with ethanol and dried to afford 2.7 g (88%) of B51.4 as an off white solid. (M+H)⁺ = 370.29 (HPLC > 81%).

B51.5: 8-Methyl-2-azido-N-methyl-N-(4-methoxyphenyl)methyl-8H-imidazo[4,5-d]thiazolo[5,4-b]pyridin-5-amine
A suspension of B51.4 (2.72 g; 7.37 mmol) in 15 ml of AcOH and 5 ml of water was stirred until complete dissolution was observed (~15 minutes). The solution was cooled to an internal temperature of -5 °C with vigorous stirring. A solution of sodium nitrite (0.51 g; 7.4 mmol) in 7 ml of water was added dropwise over ~10 minutes, while maintaining the internal temperature at -6 °C to -4 °C. The reaction starts as a light orange solution that becomes darker orange early in the addition. Approximately half way through the addition a solid begins to form and by the end of the addition the reaction mixture is a very thick, dark purple suspension. Immediately after the addition was completed, the reaction mixture is partitioned between EtOAc (500 ml) and ice cold 2N NaOH (300 ml). After separating the layers, the aqueous layer was thoroughly agitated with EtOAc (250 ml) until two clear layers were observed. The combined organic layers were washed with water (300 ml) and this water layer was back extracted with CHCl₃ (100 ml). The combined organic layers were dried (MgSO₄) and concentrated to afford 2.8 g (99%) of B51.5 as a dark green solid. (M+H)⁺ = 381.26 (HPLC= 75%).

B51.6: 8-Methyl-2-amino-N-methyl-N-(4-methoxyphenyl)methyl-8H-imidazo[4,5-d]thiazolo[5,4-b]pyridin-5-amine
B51.6

A solution of B51.5 (2.8 g; 7.37 mmol) in 50 ml of warm THF was added dropwise over 30 minutes to a suspension of lithium aluminum hydride (0.92 g; 23 mmol) in 50 ml of ethyl ether at 0 °C. After stirring 30 minutes at 0 °C and 1 hr at rt, the reaction mixture was re-cooled to 0 °C. Freshly prepared saturated sodium sulfate solution was carefully added until gas evolution ceased. After stirring 15 minute, MgSO₄ was added and the suspension was filtered though Celite®. The filter cake was washed with hot THF (2 x 50 ml), hot EtOAc (2 x 50 ml) and hot CHCl₃ (2 x 50 ml).

The dark green filtrate was concentrated and the residue was chromatographed on a 5 x 15 cm silica gel column using a gradient of 1L each: 25% EtOAc/Hex, 50% EtOAc/Hex, 75% EtOAc/Hex, EtOAc and 500 ml of 5%MeOH/EtOAc. Concentration of the pure fractions afforded 1.07 g (41%) of B51.6 as an olive green powder. (M+H)^+ = 355.29 (HPLC > 97%).

B51.7: 2-fluoro-N-[8-methyl-5-(methylamino)-8H-imidazo[4,5-d]thiazolo[5,4-b]pyridin-2-yl]- benzamide

A mixture of B51.6 (9.2 mg; 1 mL of a 0.026M solution in THF), 2-fluorobenzoyl chloride (1mL of a 0.04M solution in THF) and pyridine (50 μL) were shaken in a 1 dram vial for 72h. HPLC analysis showed incomplete reaction, therefore more 2-fluorobenzoyl chloride (50 μL, neat material) and pyridine (500 μL) were added and the
reaction shaken overnight. The reaction was concentrated on the Speedvac then treated with NH$_3$/MeOH solution and shaken overnight. The reaction was concentrated, diluted with DMF and purified by preparative HPLC. The purified and concentrated intermediate was subsequently treated with TFA (1 mL) and shaken for 4h, then concentrated on the speedvac, diluted with DMF and purified by preparative HPLC to provide 5.6 mg (60%) B51 as a film: MS (ES): m/z 357 [M+H]$^+$ (HPLC 100%).

**Examples B52-B98**

Examples B52–B98 described in Table B3 were prepared in a similar manner to that used for Example B51 by reacting B51.6 with the appropriate acid chloride.

**Example B99**

1. 1-[4-[8-methyl-5-(methylamino)-8H-imidazo[4,5-d]thiazolo[5,4-b]pyridin-2-yl]phenyl]-ethanone
To a mechanically stirred solution of B2.1 (12.00 g, 44.32 mmol) in MeOH (150 mL) and H₂O (150 mL) was added Oxone (160.9 g, 0.262 mol). This suspension was stirred for 48 h, at which time the stirring was stopped, the reaction was partially concentrated, diluted with H₂O, brought to pH~7 with 5N NaOH and the resulting solid collected by filtration, washed with H₂O and dried under vacuum overnight. B99.1 was obtained (11.30 g, 84%) as a cream solid: MS (ES): m/z 303 [³⁵Cl M+H]⁺ (HPLC 99%).

To a stirred suspension of B99.1 (11.22 g, 37.06 mmol) in EtOH (150 mL) was added hydrazine hydrate (30 mL). This suspension was stirred overnight, at which time the stirring was stopped and the solid collected by filtration, washed with EtOH and dried under vacuum overnight to afford 9.26 g (98%) B99.2 as a cream solid: MS (ES): m/z 255 \([^{35}\text{Cl} \text{M+H}^+\text{]}\) (HPLC 95%).

![Diagram of B99.3]

To a stirred solution of CuBr\(_2\) (24.50 g, 0.1097 mol) in AcOH (120 mL) and H\(_2\)O (20 mL) was added portionwise over 10 min B99.2 (9.26 g, 36.36 mmol) and stirred for 4h. The reaction was diluted with H\(_2\)O (700 mL) and the solid collected by filtration, washed sequentially with H\(_2\)O, conc. NH\(_4\)OH (2x) until very little blue copper complex eluted and H\(_2\)O, then dried. N-methylpyrrolidinone(NMP) was heated at 120°C in a sealed reaction vessel for 4 hours at room temperature. The reaction mixture was concentrated in vacuo, and partitioned between ethyl acetate and water. The organics were combined, concentrated in vacuo and the residue chromatographed using Reverse-Phase PREP LC. **B99.3.3** was obtained as a white solid. (0.112g., 47%). After 3h, the reaction was diluted H$_2$O, the resulting solid was collected by filtration, washed with H$_2$O, dried to afford 694 mg (78\%) \textbf{B99} as a yellow solid: m/z 338 [M+H]$^+$ (HPLC 98\%).

\textbf{Example B100}

N,8-dimethyl-2-[3-[1-{(2-phenylethyl)amino}ethyl]phenyl]-8H-imidazo[4,5-d]thiazolo[5,4-b]pyridin-5-amine

NaBH₄ (3.79 mg in 1mL EtOH, 90 µmol) was added and the contents again shooken for 20h. MeOH/AcOH (1:1, 1mL) was added, followed by dilution up to 9 mL with MeOH. The reaction was eluted through a Silicycle 1.5g SCX cartridge. The filtrate was concentrated, then treated with NH₃/MeOH solution and concentrated on the SpeedVac. The residue was dissolved in 2mL DMF, filtered then purified by preparative HPLC to provide 5.3 mg (40%) B100 as a film: MS (ES): m/z 443 [M+H]⁺ (HPLC 96%).

**Examples B101-B122**

Examples B101 -B122 described in Table B4 were prepared in a similar manner to that used for Example B100 by reacting B99 with the appropriate amine substituted for phenethylamine.

Example B172

8-methyl-5-(methylamino)-8H-imidazo[4,5-d]thiazolo[5,4-b]pyridine-2-carboxylic acid

B172

B172.1: 8-methyl-5-chloro-8H-imidazo[4,5-d]thiazolo[5,4-b]pyridine-2-carboxylic acid methyl ester

A mixture of \textbf{B99.3} (4.00 g; 13.18 mmol), PdCl\(_2\)(PPh\(_3\))\(_2\) (277 mg, 0.395 mmol), Et\(_3\)N (2.75 mL, 19.7 mmol) in CH\(_3\)CN (60 mL) and MeOH (60 mL) was stirred under an atmosphere of CO (100 psi) in a bomb at 60°C. After 24h, the reaction was cooled to rt and depressurized. The solution was concentrated to dryness and triturated with hot EtOAc. Upon cooling, the solid was collected by filtration to afford 3.38g (91%) of \textbf{B172.1} as a yellow solid: MS (ES): m/z 283 \[^{35}\text{Cl}\ M+H]^+ (HPLC 95%)..

B172.2: 8-methyl-5-chloro-8H-imidazo[4,5-d]thiazolo[5,4-b]pyridine-2-carboxylic acid
B172.2

To a stirring solution of B171.1 (3.38 g; 12.0 mmol) in THF (700 mL) was slowly
added NaOH (1N, 40 mL). After 40 min, the reaction was concentrated to dryness, 25
mL cold H₂O was added, acidified with 40 mL 1N HCl and the resulting solid collected
by filtration. After drying under high vacuum, 1.717 g (53%) of B172.2 was obtained as
a colourless solid: MS (ES): m/z 269 [35Cl M+H]⁺ (HPLC >99%).

B172.3: 8-methyl-5-(methylamino)-8H-imidazo[4,5-d]thiazolo[5,4-b]pyridine-2-
carboxylic acid

Starting with B172.2 (1.71 g) and dividing into 150 mg lots, to each lot was added
MeNH₂ (33wt% in EtOH, 1.8 mL) and the suspension heated for 20 min at 150°C in
Personal Chemistry microwave reactor. Once cooled to rt, the solid was collected by
filtration. The combined crude solids were dissolved in a solution of 50 mmol NH₄OAc
in H₂O (50 mL), purified on C18 column eluted with 50 mmol NH₄OAc in H₂O solution
and gradient with MeOH. Fractions containing product were combined and concentrated.
The resulting solid was dissolved in H₂O then lyophilized to provide 605 mg (36%) of
B172 as a colourless solid: MS (ES): m/z 264 [M+H]⁺ (HPLC 95%).

Example B173

\[
\begin{align*}
N,N\text{-diethyl-8-methyl-5-(methylamino)-8H-imidazo[4,5-d]thiazolo[5,4-b]pyridine-2-carboxamide}
\end{align*}
\]

B173
To a stirring solution of B172 (32.4 mg, 0.123 mmol) in NMP (0.50 mL) was added Et₂NH (0.043 mL, 0.246 mmol) followed by PyBop (64.1 mg, 0.123 mmol). After 30 min, to the reaction was added AcOH (1 mL), DMF (1mL). This solution was applied directly onto a preparative HPLC to provide 14 mg (36%) of B173 as a pale yellow solid: MS (ES); m/z 318 [M+H]^+ (HPLC 99%).

**Examples B174-B217**

Examples B174–B217 described in Table B7 were prepared in a similar manner to that used for Example B173 by reacting B172 with the appropriate amine.

A mixture of B11.6 (90 mg; 0.25 mmol), phenylchloroformate (0.07 ml; 0.55 mmol) and pyridine (0.05 ml; 0.65 mmol) in 0.5 ml of dichloromethane was stirred 3 hrs at rt. After partitioning the reaction mixture between EtOAc (30 ml) and water (30 ml), the organic layer was washed with brine (30 ml), dried (MgSO₄) and concentrated to afford 145 mg (98%) of B217.1 as a green oil. (M+H)⁺ = 595.11 (HPLC > 90%).

B271.2: N-methyl-N'-[8-methyl-5-(methylamino)-8H-imidazo[4,5-d]thiazolo[5,4-b]pyridin-2-ylurea

A solution of 2M methylamine in THF (0.5 ml; 1 mmol) was added to a solution of B271.1 (25 mg; 0.042 mmol) in 1 ml of THF at rt. After standing 18 hr at rt, the volatiles were removed in vacuo and the residue was treated with 0.5 ml of TFA. After standing 1.5 hr at rt, the TFA was removed in vacuo and the residue was co-evaporated from heptane (2 x 2 ml). The solid residue was triturated with ethyl ether:MeOH, 9:1. After filtering, the filter cake was washed with ethyl ether and hexane. Drying afforded 12 mg (98%) of B271 as a dark green powder. (M+H)⁺ = 292.14 (HPLC > 99%).

### Utility

The compounds and compositions of this invention are useful in treating conditions that are characterized by the activity of IKK, release of NF-κB, and/or enhanced levels of TNF-α. The term “treating” or “treatment” denotes prevention, partial alleviation, or cure of the disease or disorder or its symptoms or consequences. Inhibition or suppression of IKK, NF-κB and/or TNF-α may occur locally, for example, within certain tissues of the subject, or more extensively throughout the subject being treated for such a disease. Inhibition or suppression of IKK, NF-κB and/or TNF-α may occur by one or more mechanisms, e.g., by inhibiting or suppressing any step of the pathway(s). The term “NF-κB-associated condition” refers to diseases that are characterized by release of NF-κB from the cytoplasm (e.g., upon phosphorylation of IκB). The term “TNF-α-associated condition” is a condition characterized by enhanced levels of TNF-α. In the instant specification, the term “NF-κB-associated condition” will include a TNF-α-associated condition but is not limited thereto as NF-κB is involved in the activity and upregulation of other pro-inflammatory proteins and genes. The term “inflammatory or immune disease” is used herein to encompass IKK-associated conditions, NF-κB-associated conditions, and TNF-α-associated conditions, e.g., any condition, disease, or disorder that is associated with activity of IKK, NF-κB and/or enhanced levels of TNF-α.
The inventive compounds and compositions are useful for treating a variety of diseases including, but not limited to, treatment of transplant rejections (e.g., kidney, liver, heart, lung, pancreas, bone marrow, cornea, small bowel, skin allografts, skin homografts and heterografts, etc.) or tolerance to organ transplantation; rheumatoid arthritis, psoriatic arthritis, multiple sclerosis, inflammatory bowel disease (such as Crohn’s disease and ulcerative colitis); antiviral and autoimmune diseases including herpes simplex type 1 (HSV-1), herpes simplex type 2 (HSV-2), cytomegalovirus, Epstein-Barr, human immunodeficiency virus (HIV), Addison’s disease (autoimmune disease of the adrenal glands), idiopathic adrenal insufficiency, and autoimmune polyglandular disease (also known as autoimmune polyglandular syndrome); Alzheimer’s, Parkinson’s, and Creutzfeldt-Jacob diseases; septic shock; prevention of reperfusion injury; inflammatory diseases such as osteoarthritis, acute pancreatitis, and chronic pancreatitis; inflammatory disorders of the central nervous system, including HIV encephalitis, cerebral malaria, and meningitis, atherosclerosis, and ataxia telangiectasia; inflammatory states of the cardiac system including heart failure, respiratory allergies including asthma, hayfever, and allergic rhinitis; fungal infections such as mycosis fungoides; and psoriasis, glomerulonephritis, serum sickness, lupus (systemic lupus erythematosus), urticaria, scleroderma, contact dermatitis, dermatomyositis, alopecia, atopic eczemas, and ichthyosis. The term “inflammatory or immune disease” as used herein includes all of the above-referenced diseases and disorders.

Topical administration is generally preferred for skin-related diseases, and systematic treatment preferred for cancerous or pre-cancerous conditions, although other modes of delivery are contemplated. For example, the compounds may be delivered orally, such as in the form of tablets, capsules, granules, powders, or liquid formulations including syrups; topically, such as in the form of solutions, suspensions, gels or ointments; sublingually; buccally; parenterally, such as by subcutaneous, intravenous, intramuscular or intrasternal injection or infusion techniques...

Dosage unit formulations containing non-toxic, pharmaceutically acceptable vehicles or diluents may be administered. The compounds may be administered in a form suitable for immediate release or extended release. Exemplary compositions for rectal administration include suppositories which may contain, for example, suitable non-irritating excipients, such as cocoa butter, synthetic glyceride esters or polyethylene glycols, which are solid at ordinary temperatures but liquefy and/or dissolve in the rectal cavity to release the drug.

The effective amount of a compound of the present invention may be determined by one of ordinary skill in the art, and includes exemplary dosage amounts for a mammal of from about 0.05 to 100 mg/kg of body weight of active compound per day, which may be administered in a single dose or in the form of individual divided doses, such as from 1 to 4 times per day. It will be understood that the specific dose level and frequency of dosage for any particular subject may be varied and will depend upon a variety of factors, including the activity of the specific compound employed, the metabolic stability and length of action of that compound, the species, age, body weight, general health, sex and diet of the subject, the mode and time of administration, rate of excretion, drug combination, and severity of the particular condition. Subjects for treatment include animals, most preferably mammalian species such as humans, and domestic animals such as dogs, cats, horses, and the like, subject to IKK, NF-κB and/or TNF-α associated conditions.

The inventive compounds and compositions may be employed alone or in combination with each other and/or other suitable therapeutic agents useful in treating IKK, NF-κB and/or TNF-α associated conditions. Exemplary of such other therapeutic agents include corticosteroids, rolipram, calphostin, CSAIDs, 4-substituted imidazo [1,2-A]quinoxalines as disclosed in US Pat. No. 4,200,750; Interleukin-10, glucocorticoids,
salicylates, nitric oxide, and other immunosuppressants; nuclear translocation inhibitors, such as deoxyxygualin (DSG); non-steroidal anti-inflammatory drugs (NSAIDs) such as ibuprofen, celecoxib and rofecoxib; steroids such as prednisone or dexamethasone; antiviral agents such as abacavir; antiproliferative agents such as methotrexate, leflunomide, FK506 (tacrolimus, Prograf); cytotoxic drugs such as azathiprine and cyclophosphamide; TNF-α inhibitors such as tenidap, anti-TNF antibodies or soluble TNF receptor, and rapamycin (sirolimus or Rapamune) or derivatives thereof; and other cancer drugs and treatments, including radiation treatments and daunorubicin.

The above other therapeutic agents, when employed in combination with the compounds of the present invention, may be used, for example, in those amounts indicated in the Physicians' Desk Reference (PDR) or as otherwise determined by one of ordinary skill in the art.

The inventive compounds have been tested and have shown activity as inhibitors of IKK, IκB, NF-κB and/or TNF-α. For example, THP-1 (human monocytic cell line) obtained from ATCC was cultured in RPMI-1640 supplemented with 10% FBS, sodium pyruvate, HEPES, 5-mercaptoethanol, Penicillin/Streptomycin. To a 96-well plate containing THP-1 cells (1.4x10⁶/mL, 2.5x10⁵ cells/well) in 180 μL RPMI-1640 was added 10 μL of the test compound in 10% DMSO. Typically, test compound concentrations of 0.1-100 μM were used in the assay. After one hour at 37°C, 10 μL of 1000 ng/mL lipopolysaccharide (LPS from Salmonella typhosa, Sigma) was added to each well. After an additional 6 hours at 37°C, the supernatants were collected following a 5 minute centrifugation of the plate to pellet the cells. The amount of TNFα in these supernatants was then measured using a TNFα-specific ELISA (Pharmingen). After subtracting out the amount of TNFα in a control that had not been treated with LPS, the percent inhibition was calculated versus a control that was treated with LPS but with no test compound added. The compounds of this invention are active in vivo in the LPS-induced TNFα secretion model. Likewise, assays known in the field are applied to establish the activity of the compounds as inhibitors of IKK, IκB, and/or the NF-κB pathway.
