(54) Title: SUBSTITUTED IMIDAZOLES AS DUAL HISTAMINE H1 AND H3 AGONISTS OR ANTAGONISTS

(57) Abstract: The present invention discloses novel substituted imidazole compounds which have dual histamine-H1 and H3 receptor antagonist activity as well as methods for preparing such compounds. In another embodiment, the invention discloses pharmaceutical compositions comprising such imidazoles as well as methods of using them to treat allergy, inflammatory and CNS-related diseases and others.

WO 02/24659 A2

**SUBSTITUTED IMIDAZOLES AS DUAL HISTAMINE H₁ AND H₃ AGONISTS
OR ANTAGONISTS**

Field of the invention

The present invention relates to novel substituted imidazole compounds having valuable pharmacological properties, especially against inflammatory diseases and allergic conditions. Compounds of this invention are antagonists of the histamine receptors. Some are antagonists of the histamine-H₁ receptors. Some are antagonists of the histamine-H₃ receptors. Some are antagonists of both the H₁ and H₃ receptors, in other words dual H₁ and H₃ receptor antagonists. The invention disclosed in this application claims priority from provisional application, Serial No. 60/230,053 filed September 20, 2000, and is related to that in pending provisional applications, Serial No. 60/234,039, Serial No. 60/234,040, and Serial No. 60/234,038, all filed on September 20, 2000.

Background of the invention

The histamine receptors, H₁, H₂ and H₃ are well-identified forms. The H₁ receptors are those that mediate the response antagonized by conventional antihistamines. H₁ receptors are present, for example, in the ileum, the skin, and the bronchial smooth muscle of humans and other mammals. A well-known antagonist of H₁ receptors is loratadine, commercially available under the tradename CLARITIN[®] from Schering-Plough Corporation, Madison, New Jersey. Through H₂ receptor-mediated responses, histamine stimulates gastric acid secretion in mammals and the chronotropic effect in isolated mammalian atria.

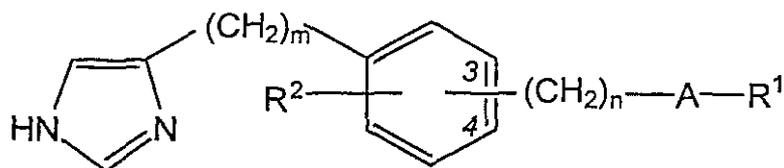

H₃ receptor sites are found on sympathetic nerves, where they modulate sympathetic neurotransmission and attenuate a variety of end organ responses under control of the sympathetic nervous system. Specifically, H₃ receptor activation by histamine attenuates norepinephrine outflow to resistance and capacitance vessels, causing vasodilatation.

U.S. Patent 4,767,778 (Arrang *et al.*) discloses certain imidazoles that behave as agonists of the H₃ receptors in rat brain. European Patent Application No. 0 420 396 A2 (Smith Kline & French Laboratories Limited) and Howson *et al.*

imidazole derivatives having an amidine group as H₃ agonists. Van der Groot *et al.* (*Eur. J. Med. Chem.* (1992) Vol. 27, pp. 511-517) describe isothiourea analogs of histamine as potent agonists or antagonists of the histamine-H₃ receptor, and these isothiourea analogs of histamine overlap in part with those of the two

where Ar₁ and Ar₂ may be phenyl and/or pyridyl. EPO 448,765 A1 (published March 30, 1990) discloses neuropeptide-Y antagonist imidazoles of the type:

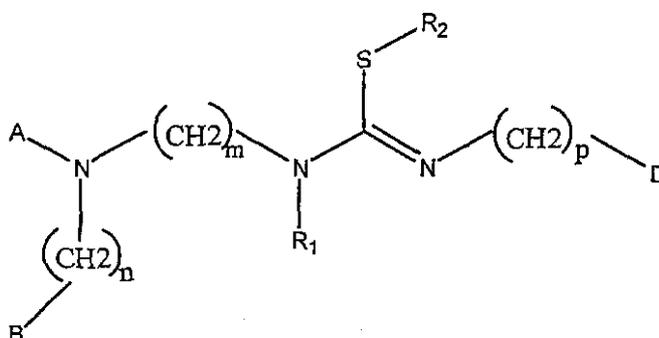

5 where Ar₁ and Ar₂ may be phenyl and/or pyridyl.

WO 98-58646 (assigned to Novo Nordisk A/S) discloses somatostatin SSTR4 receptor antagonist compounds of the type:

6

and

wherein m is 2-6; n is 1-3; p is 1-6; R₁ and R₂ are independently H or C1-C6 alkyl optionally substituted with halogen, amino, hydroxy, alkoxy or aryl; X is S, O, NH, NCOPh or N(CN); A is aryl optionally substituted with halogen, amino, hydroxy, nitro, C1-6 alkyl, C1-6 alkoxy, or aryl; and B and D are independently aryl optionally substituted with halogen, amino, hydroxy, C1-6 alkyl, C1-6 alkoxy, or aryl.

Compounds have been reported in the literature as having activity against both H₁ and H₂ receptors, i.e. dual antagonists against H₁ and H₂ receptors. Thus, for example, F. Schulze *et al.*, *European J. of Pharmaceutical Sciences*, 6 (1998), 177-186 report combined H₁/H₂ receptor antagonists. Other references in this category include F. Schulze *et al.*, *Arch. Pharm. (Weinheim)*, 327 (1994), 455-462; C. Wolf *et al.*, *Arch. Pharm. Pharm. Med. Chem.*, 329 (1996), 87-94; and C. Wolf *et al.*, *European J. of Pharmaceutical Sciences*, 6 (1998), 177-186. Non-imidazole histamine H₃ ligands, particularly substituted benzothiazole derivatives as H₃ antagonists and H₁ blocking activities have been reported by K. Walczynski *et al.*, *Il Farmaco*, 54 (1999), 684-694.

It would be useful to have compounds which are therapeutically effective as antagonists of both the H₁ and H₃ histamine receptors. The only such reported activity has been through a combination of two different chemical entities, one showing activity against H₁ receptors and the other showing activity against H₃ receptors. Thus, for example, U.S. patent 5,869,479 (issued February 9, 1999 to Schering Corporation) discloses the combination of a histamine-H₁ receptor antagonist and a histamine-H₃ receptor antagonist for the treatment of allergy-induced airway responses.

Pending provisional patent application, Serial No.60/234,039, filed September 20, 2000, discloses novel imidazole compounds having H₃ as well as dual H₁ and H₃ antagonist activity. The compounds disclosed therein have general formula in which an imidazole is linked to two cyclic moieties via intermediary moiety or moieties at least one of which intermediary moiety or moieties is a cyclic moiety.

Pending provisional patent application, Serial No. 60/234,038, filed September 20, 2000, discloses novel imidazole compounds having H₃ as well as dual H₁ and H₃ antagonist activity. The compounds disclosed therein have general formula in which an imidazole is linked to a tricyclic moiety via intermediary moiety or moieties which intermediary moiety or moieties are all acyclic moieties.

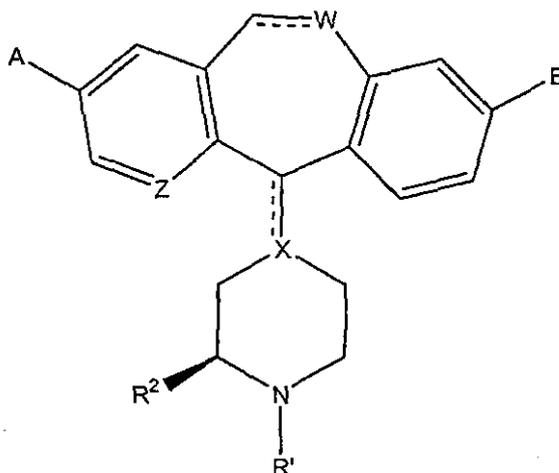

Pending provisional patent application, Serial No. 60/234,040, filed September 20, 2000, discloses novel imidazole compounds having H₃ as well as dual H₁ and H₃ antagonist activity. The compounds disclosed therein have general formula in which an imidazole is linked to two cyclic moieties via intermediary moiety or moieties which intermediary moiety or moieties are acyclic.

It would be a welcome contribution to the art to have novel substituted imidazole compounds.

It would be useful to have the same chemical entity showing dual activity against both H₁ and H₃ receptors.

It would be useful to have novel substituted imidazoles showing activity against both H₁ and H₃ receptors.

U.S. Patent 5,801,175 (issued September 1, 1998; Assignee: Schering Corporation) discloses compounds having the following general structural formula as inhibitors of G-protein function and for the treatment of proliferative diseases:

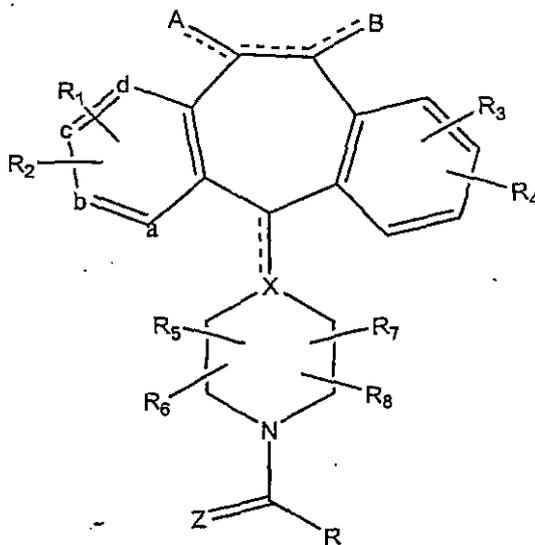

5

where A, B, W, X, Z, R' and R² are defined therein. Imidazoles as well as other types of compounds are disclosed therein.

U.S. Patent 5,719,148 (issued February 17, 1998; Assignee: Schering Corporation), U.S. Patent 4,826,853 (issued May 2, 1989; Assignee: Schering Corporation), and WO 96/30363 (published October 3, 1996; Assignee: Schering Corporation) disclose compounds having the following general structural formula as inhibitors of G-protein function and for the treatment of proliferative diseases:

10

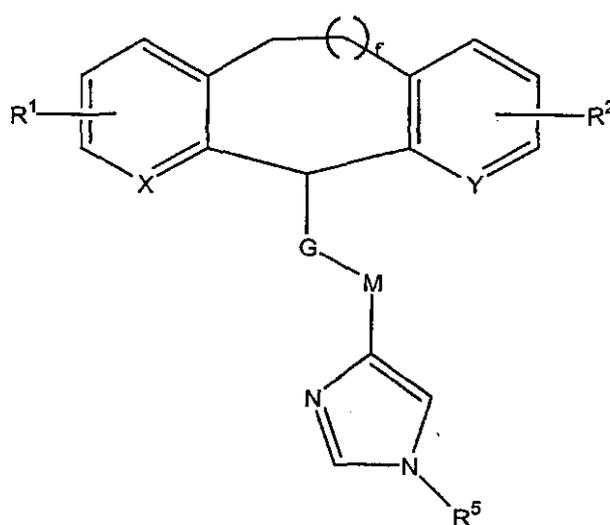

where the various elements are defined therein. Imidazoles as well as other types of compounds are disclosed therein. The above-noted U.S. patents 5,801,175 and 4,826,853 and WO 96/30363 are incorporated herein by reference.

It has now been found that certain imidazole compounds disclosed or referred-to in the above-noted U.S. patents 5,801,175 and 4,826,853 and WO 96/30363 surprisingly exhibit H₃ as well as dual H₁ and H₃ antagonist activity. The present application discloses surprising potency and use of such imidazoles which have the general formula in which an imidazole is linked to a tricyclic moiety via intermediary moiety or moieties at least one of which intermediary moiety or moieties is a cyclic moiety. The H₃ activity as well as dual H₁/H₃ activity of such compounds have not been disclosed before.

Summary of the invention

In one embodiment, this invention provides substituted imidazole compounds having H₃ antagonist activity as well as dual H₁ and H₃ antagonist activity. The inventive compounds are substituted imidazoles wherein the imidazole is linked to a tricyclic moiety via intermediary moiety or moieties at least one of said intermediary moiety or moieties is a cyclic moiety. The compounds have the general structure shown in Formula I:

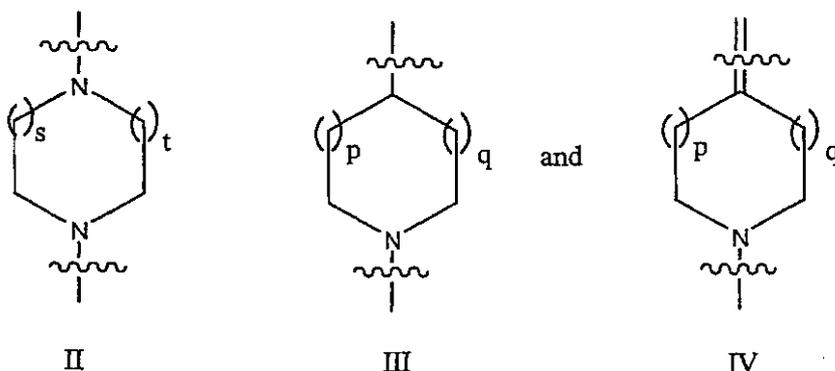

Formula I

wherein:

$f = 0, 1$ or 2 ;

X and Y are independently selected from the group consisting of N, CH or N-oxide;

- 5 G is a moiety selected from the group consisting of the moieties II, III and IV with the top end of said II, III and IV being linked to the tricyclic moiety and the bottom end of II, III and IV being linked to M:

where $s = t = 1$ or 2 ; and $p = q = 0, 1$ or 2 ;

M is a moiety selected from the group consisting of C_1 - C_8 alkyl;

- 10 $-C(O)-(CH_2)_y-$; $-(CH_2)_x-A-(CH_2)_y-$; $-C(O)-O-(CH_2)_d-$; and $-C(O)-NR^3-(CH_2)_d-$; where $A=O, S(O)_r-$, and $-NR^4-$;

$n = 0, 1, 2$ or 3 ;

x is a whole number in the range 2-5;

y is a whole number in the range 0-5;

- 15 d is a number in the range 0-5;

$r = 0, 1$ or 2 ;

R^1 and R^2 may each number 1-3 and are independently selected from the group consisting of hydrogen, lower alkyl, lower alkoxy, halogen, OCF_3 , $OCHF_2$, $-OH$, and $-N(R^4)_2$;

- 20 R^3 is selected from the group consisting of hydrogen, lower alkyl, and polyhaloloweralkyl;

R^4 is selected from hydrogen, lower alkyl, polyhalolower alkyl; and

R^5 is H, C_1 - C_6 alkyl or OH.

When used herein, the following terms have the given meanings:

lower alkyl (including the alkyl portions of lower alkoxy) – represents a straight or branched, saturated hydrocarbon chain having from 1 to 6 carbon atoms, preferably from 1 to 4;

aryl – represents a carbocyclic group having from 6 to 14 carbon atoms and having at least one benzenoid ring, with all available substitutable aromatic carbon atoms of the carbocyclic group being intended as possible points of attachment. Preferred aryl groups include 1-naphthyl, 2-naphthyl and indanyl, and especially phenyl and substituted phenyl;

cycloalkyl – represents a saturated carbocyclic ring having from 3 to 8 carbon atoms, preferably 5 or 6, optionally substituted.

heterocyclic – represents, in addition to the heteroaryl groups defined below, saturated and unsaturated cyclic organic groups having at least one O, S and/or N atom interrupting a carbocyclic ring structure that consists of one ring or two fused rings, wherein each ring is 5-, 6- or 7-membered and may or may not have double bonds that lack delocalized pi electrons, which ring structure has from 2 to 8, preferably from 3 to 6 carbon atoms, e.g., 2- 3- or 4-piperidiny, 2- or 3-piperazinyl, 2- or 3-morpholinyl, or 2- or 3-thiomorpholinyl;

halogen – represents fluorine, chlorine, bromine and iodine;

heteroaryl – represents a cyclic organic group having at least one O, S and/or N atom interrupting a carbocyclic ring structure and having a sufficient number of delocalized pi electrons to provide aromatic character, with the aromatic heterocyclic group having from 2 to 14, preferably 4 or 5 carbon atoms, e.g., 2-, 3- or 4-pyridyl, 2- or 3-furyl, 2- or 3-thienyl, 2-, 4- or 5-thiazolyl, 2- or 4-imidazolyl, 2-, 4- or 5-pyrimidinyl, 2-pyrazinyl, or 3- or 4-pyridazinyl, etc. Preferred heteroaryl groups are 2-, 3- and 4-pyridyl; such heteroaryl groups may also be optionally substituted.

The term "substituted", unless otherwise defined, refers to chemically suitable substitution with moieties such as, for example, alkyl, alkoxy, -CF₃, halogen or aryl. Furthermore, the term "alkyl", when chemically suitable, also includes alkylene and related moieties.

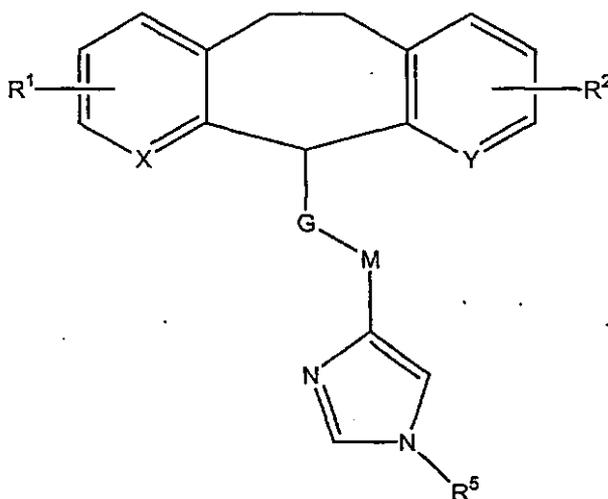

Also included in the invention are tautomers, enantiomers and other optical isomers of compounds of Formula I, as well as pharmaceutically acceptable salts and solvates thereof.

A further feature of the invention is pharmaceutical compositions
5 containing as active ingredient a compound of Formula I (or its salt, solvate or isomers) together with a pharmaceutically acceptable carrier or excipient.

The invention also provides methods for preparing compounds of Formula I, as well as methods for treating diseases such as, for example, inflammation, allergy, diseases of the GI-tract, cardiovascular disease, or disturbances of the
10 central nervous system as well as allergy-induced airway (e.g., upper airway) responses, nasal congestion and obesity. The methods for treating comprise administering to a mammalian patient (including human and animals) suffering from said disease or diseases a therapeutically effective amount of a compound of Formula I, or pharmaceutical compositions comprising a compound of Formula
15 I.

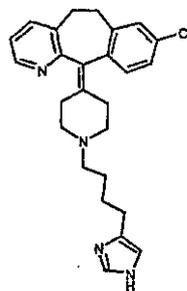

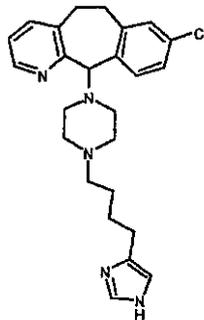

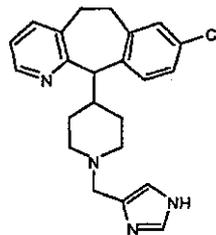

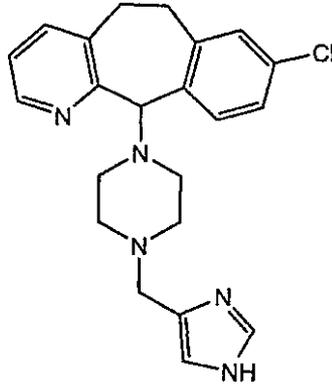

Detailed description of the invention

In one embodiment, the present invention provides novel imidazole
20 compounds of Formula I as compounds exhibiting H₁ antagonist activity, or H₃ antagonist activity or dual H₁ and H₃ antagonist activity:

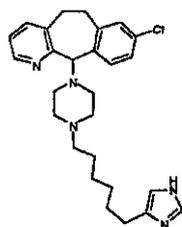

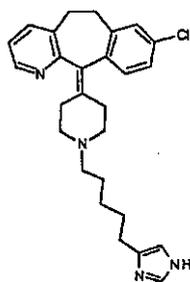

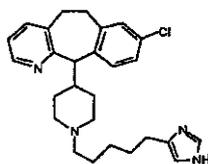

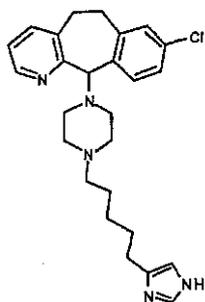

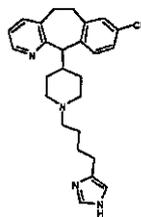

Formula I

where the various symbols are as defined above. Representative compounds of the invention which exhibit H₃ antagonist activity are listed below:

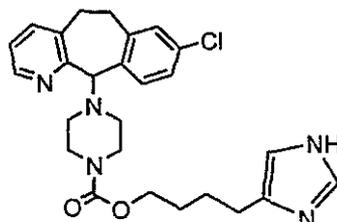

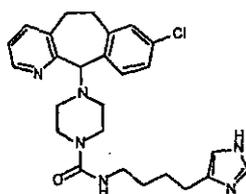

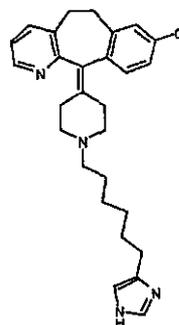

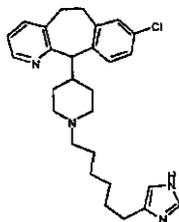

5

14

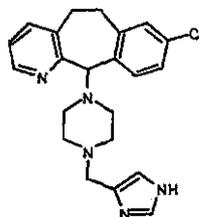

5

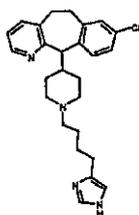

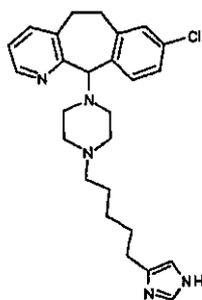

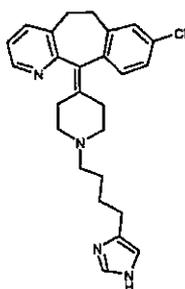

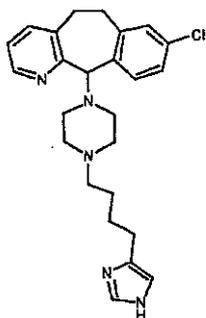

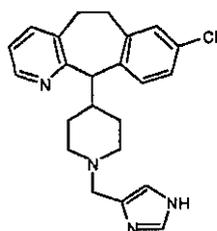

15

5 Some examples of compounds exhibiting both H₁ and H₃ activity include:

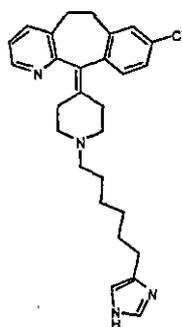

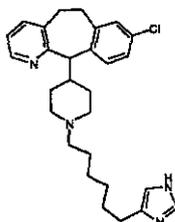

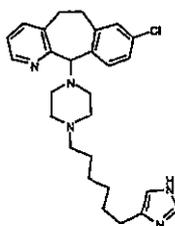

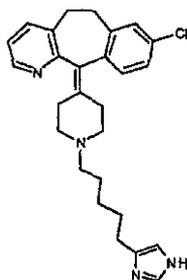

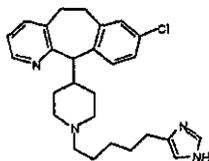

16

5

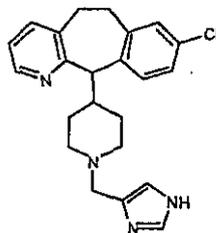

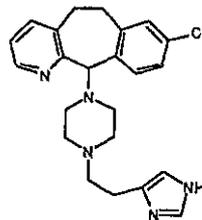

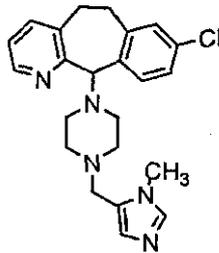

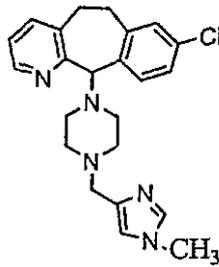

17

5

Representative compounds exhibiting H₁ antagonist activity include:

18

5

The compounds of the invention are basic and form pharmaceutically acceptable salts with organic and inorganic acids. Examples of suitable acids for such salt formation are hydrochloric, sulfuric, phosphoric, acetic, citric, oxalic, malonic, salicylic, malic, fumaric, succinic, ascorbic, maleic; methanesulfonic and other mineral and carboxylic acids well known to those skilled in the art. The salts are prepared by contacting the free base form with a sufficient amount of the desired acid to produce a salt in the conventional manner. The free base forms may be regenerated by treating the salt with a suitable dilute aqueous base solution such as dilute aqueous sodium hydroxide, potassium carbonate,

ammonia and sodium bicarbonate. The free base forms differ from their corresponding salt forms somewhat in certain physical properties, such as solubility in polar solvents, but the salts are otherwise equivalent to their corresponding free base forms for purposes of this invention.

5 Depending upon the substituents on the inventive compounds, one may be able to form salts with bases too. Thus, for example, if there are carboxylic acid substituents in the molecule, salts may be formed with inorganic as well as organic bases such as, for example, NaOH, KOH, NH₄OH, tetraalkylammonium hydroxide, and the like.

10 As stated earlier, the invention includes tautomers, enantiomers and other stereoisomers of the compounds also. Thus, as one skilled in the art knows, certain imidazole compounds may exist in tautomeric forms. Such variations are contemplated to be within the scope of the invention.

 Another embodiment of the invention discloses a method of making the
15 substituted imidazoles disclosed above. The compounds may be prepared by several processes well known in the art. In one method, the imidazole part (designated "the left side component" herein for simplicity purposes) and the diaryl part (designated "the right side component" herein for simplicity purposes) may be prepared separately. The left side component and the right side
20 component may contain reactive moieties attached to them which moieties are suitable to be reacted with each other under appropriate reaction conditions. Thus, for example, the left side component may contain a carbethoxy end, and the right side component may have an amine end. Under appropriate reaction conditions, the two components may be reacted together whereby an imidazole
25 containing a diaryl alkyl moiety linked through an extended amide chain is obtained. Other substituted imidazoles may be similarly prepared.

 Isolation of the compound at various stages of the reaction may be achieved by standard techniques such as, for example, filtration, evaporation of solvent and the like. Purification of the product, intermediate and the like, may
30 also be performed by standard techniques such as recrystallization, distillation, sublimation, chromatography, conversion to a suitable derivative which may be

recrystallized and converted back to the starting compound, and the like. Such techniques are well known to those skilled in the art.

The thus prepared compounds may be analyzed for their composition and purity as well as characterized by standard analytical techniques such as, for
5 example, elemental analysis, NMR, mass spectroscopy, and IR spectra.

The inventive compounds can readily be evaluated to determine activity at both H₁ and H₃ receptors by known methods, such as, for example, E. A. Brown
et al, *British J. Pharm.*, (1986) Vol. 80, 569. H₃ activity may be determined by,
for example, the guinea pig brain membrane assay and the guinea pig neuronal
10 ileum contraction assay, both of which are described in U.S. patent 5,352,707.
Another useful assay for H₃ activity utilizes rat brain membranes and is described
by West *et al.*, ("Identification of Two H₃-Histamine Receptor Subtypes",
Molecular Pharmacology, (1990), Vol. 33, 610-613. Several of the present
compounds were found to have high H₁ and H₃ antagonist activity which is
15 discussed more in the **EXAMPLES** section below.

In another embodiment, this invention provides pharmaceutical compositions comprising the above-described inventive imidazoles as an active ingredient. The pharmaceutical compositions generally additionally comprise a
20 pharmaceutically acceptable carrier diluent, excipient or carrier (collectively referred to herein as carrier materials). Because of their H₁ and H₃ antagonist activity, such pharmaceutical compositions possess utility in treating allergy, inflammation, nasal congestion, hypertension, glaucoma, sleeping disorders, states of hyper- and hypo-motility of the gastrointestinal tract, hypo- and hyper-activity of the central nervous system, Alzheimers, schizophrenia, migraines,
25 obesity and the like diseases.

In yet another embodiment, the present invention discloses methods for preparing pharmaceutical compositions comprising the inventive imidazole compounds as an active ingredient. In the pharmaceutical compositions and methods of the present invention, the active ingredients will typically be
30 administered in admixture with suitable carrier materials suitably selected with respect to the intended form of administration, i.e. oral tablets, capsules (either solid-filled, semi-solid filled or liquid filled), powders for constitution, oral gels,

elixirs, dispersible granules, syrups, suspensions, and the like, and consistent with conventional pharmaceutical practices. For example, for oral administration in the form of tablets or capsules, the active drug component may be combined with any oral non-toxic pharmaceutically acceptable inert carrier, such as lactose, starch, sucrose, cellulose, magnesium stearate, dicalcium phosphate, calcium sulfate, talc, mannitol, ethyl alcohol (liquid forms) and the like. Moreover, when desired or needed, suitable binders, lubricants, disintegrating agents and coloring agents may also be incorporated in the mixture. Powders and tablets may be comprised of from about 5 to about 95 percent inventive composition.

10 Suitable binders include starch, gelatin, natural sugars, corn sweeteners, natural and synthetic gums such as acacia, sodium alginate, carboxymethylcellulose, polyethylene glycol and waxes. Among the lubricants there may be mentioned for use in these dosage forms, boric acid, sodium benzoate, sodium acetate, sodium chloride, and the like. Disintegrants include starch, methylcellulose, guar gum and the like. Sweetening and flavoring agents and preservatives may also be included where appropriate. Some of the terms noted above, namely disintegrants, diluents, lubricants, binders and the like, are discussed in more detail below.

20 Additionally, the compositions of the present invention may be formulated in sustained release form to provide the rate controlled release of any one or more of the components or active ingredients to optimize the therapeutic effects, i.e. antihistaminic activity and the like. Suitable dosage forms for sustained release include layered tablets containing layers of varying disintegration rates or controlled release polymeric matrices impregnated with the active components and shaped in tablet form or capsules containing such impregnated or 25 encapsulated porous polymeric matrices.

30 Liquid form preparations include solutions, suspensions and emulsions. As an example may be mentioned water or water-propylene glycol solutions for parenteral injections or addition of sweeteners and pacifiers for oral solutions, suspensions and emulsions. Liquid form preparations may also include solutions for intranasal administration.

Aerosol preparations suitable for inhalation may include solutions and solids in powder form, which may be in combination with a pharmaceutically acceptable carrier such as inert compressed gas, e.g. nitrogen.

For preparing suppositories, a low melting wax such as a mixture of fatty acid glycerides such as cocoa butter is first melted, and the active ingredient is dispersed homogeneously therein by stirring or similar mixing. The molten homogeneous mixture is then poured into convenient sized molds, allowed to cool and thereby solidify.

Also included are solid form preparations which are intended to be converted, shortly before use, to liquid form preparations for either oral or parenteral administration. Such liquid forms include solutions, suspensions and emulsions.

The compounds of the invention may also be deliverable transdermally. The transdermal compositions may take the form of creams, lotions, aerosols and/or emulsions and can be included in a transdermal patch of the matrix or reservoir type as are conventional in the art for this purpose.

Preferably the compound is administered orally.

Preferably, the pharmaceutical preparation is in a unit dosage form. In such form, the preparation is subdivided into suitably sized unit doses containing appropriate quantities of the active components, e.g., an effective amount to achieve the desired purpose.

The quantity of the inventive active composition in a unit dose of preparation may be generally varied or adjusted from about 1.0 milligram to about 1,000 milligrams, preferably from about 1.0 to about 950 milligrams, more preferably from about 1.0 to about 500 milligrams, and typically from about 1 to about 250 milligrams, according to the particular application. The actual dosage employed may be varied depending upon the patient's age, sex, weight and severity of the condition being treated. Such techniques are well known to those skilled in the art.

Generally, the human oral dosage form containing the active ingredients can be administered 1 or 2 times per day. The amount and frequency of the administration will be regulated according to the judgment of the attending

clinician. A generally recommended daily dosage regimen for oral administration may range from about 1.0 milligram to about 1,000 milligrams per day, in single or divided doses.

5 Capsule - refers to a special container or enclosure made of methyl cellulose, polyvinyl alcohols, or denatured gelatins or starch for holding or containing compositions comprising the active ingredients. Hard shell capsules are typically made of blends of relatively high gel strength bone and pork skin gelatins. The capsule itself may contain small amounts of dyes, opaquing agents, plasticizers and preservatives.

10 Tablet- refers to a compressed or molded solid dosage form containing the active ingredients with suitable diluents. The tablet can be prepared by compression of mixtures or granulations obtained by wet granulation, dry granulation or by compaction.

15 Oral gels- refers to the active ingredients dispersed or solubilized in a hydrophillic semi-solid matrix.

Powders for constitution refers to powder blends containing the active ingredients and suitable diluents which can be suspended in water or juices.

20 Diluent - refers to substances that usually make up the major portion of the composition or dosage form. Suitable diluents include sugars such as lactose, sucrose, mannitol and sorbitol; starches derived from wheat, corn, rice and potato; and celluloses such as microcrystalline cellulose. The amount of diluent in the composition can range from about 10 to about 90% by weight of the total composition, preferably from about 25 to about 75%, more preferably from about 30 to about 60% by weight, even more preferably from about 12 to about 60%.

25 Disintegrants - refers to materials added to the composition to help it break apart (disintegrate) and release the medicaments. Suitable disintegrants include starches; "cold water soluble" modified starches such as sodium carboxymethyl starch; natural and synthetic gums such as locust bean, karaya, guar, tragacanth and agar; cellulose derivatives such as methylcellulose and sodium
30 carboxymethylcellulose; microcrystalline celluloses and cross-linked microcrystalline celluloses such as sodium croscarmellose; alginates such as alginic acid and sodium alginate; clays such as bentonites; and effervescent

mixtures. The amount of disintegrant in the composition can range from about 2 to about 15% by weight of the composition, more preferably from about 4 to about 10% by weight.

Binders - refers to substances that bind or "glue" powders together and make them cohesive by forming granules, thus serving as the "adhesive" in the formulation. Binders add cohesive strength already available in the diluent or bulking agent. Suitable binders include sugars such as sucrose; starches derived from wheat, corn rice and potato; natural gums such as acacia, gelatin and tragacanth; derivatives of seaweed such as alginic acid, sodium alginate and ammonium calcium alginate; cellulosic materials such as methylcellulose and sodium carboxymethylcellulose and hydroxypropylmethylcellulose; polyvinylpyrrolidone; and inorganics such as magnesium aluminum silicate. The amount of binder in the composition can range from about 2 to about 20% by weight of the composition, more preferably from about 3 to about 10% by weight, even more preferably from about 3 to about 6% by weight.

Lubricant - refers to a substance added to the dosage form to enable the tablet, granules, etc. after it has been compressed, to release from the mold or die by reducing friction or wear. Suitable lubricants include metallic stearates such as magnesium stearate, calcium stearate or potassium stearate; stearic acid; high melting point waxes; and water soluble lubricants such as sodium chloride, sodium benzoate, sodium acetate, sodium oleate, polyethylene glycols and d,l-leucine. Lubricants are usually added at the very last step before compression, since they must be present on the surfaces of the granules and in between them and the parts of the tablet press. The amount of lubricant in the composition can range from about 0.2 to about 5% by weight of the composition, preferably from about 0.5 to about 2%, more preferably from about 0.3 to about 1.5% by weight.

Glidants - materials that prevent caking and improve the flow characteristics of granulations, so that flow is smooth and uniform. Suitable glidants include silicon dioxide and talc. The amount of glident in the composition can range from about 0.1% to about 5% by weight of the total composition, preferably from about 0.5 to about 2% by weight.

Coloring agents - excipients that provide coloration to the composition or the dosage form. Such excipients can include food grade dyes and food grade dyes adsorbed onto a suitable adsorbent such as clay or aluminum oxide. The amount of the coloring agent can vary from about 0.1 to about 5% by weight of the composition, preferably from about 0.1 to about 1%.

Bioavailability - refers to the rate and extent to which the active drug ingredient or therapeutic moiety is absorbed into the systemic circulation from an administered dosage form as compared to a standard or control.

Conventional methods for preparing tablets are known. Such methods include dry methods such as direct compression and compression of granulation produced by compaction, or wet methods or other special procedures. Conventional methods for making other forms for administration such as, for example, capsules, suppositories and the like are also well known.

Another embodiment of the invention discloses use of the pharmaceutical compositions disclosed above for treatment of diseases such as, for example, allergy, inflammation, nasal congestion, hypertension, glaucoma, sleeping disorders, states of hyper- and hypo-motility of the gastrointestinal tract, hypo- and hyperactivity of the central nervous system, Alzheimers, schizophrenia, migraine, obesity and the like. The method comprises administering a therapeutically effective amount of the inventive pharmaceutical composition to a mammalian patient having such a disease or diseases and in need of such a treatment.

Those skilled in the art will realize that the term "upper airway" means the upper respiratory system- i.e., the nose, throat, and associated structures.

It will be apparent to those skilled in the art that many modifications, variations and alterations to the present disclosure, both to materials and methods, may be practiced. Such modifications, variations and alterations are intended to be within the spirit and scope of the present invention.

The following **EXAMPLES** are being provided to further illustrate the present invention. They are for illustrative purposes only; the scope of the invention is not to be considered limited in any way thereby.

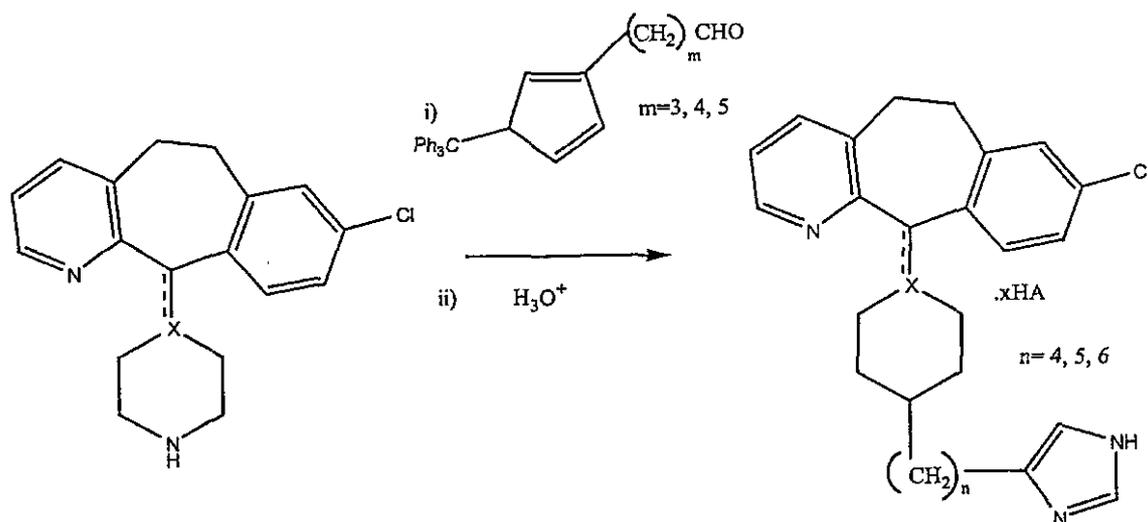

EXAMPLES

Unless otherwise stated, the following abbreviations have the stated meanings in the Examples below:

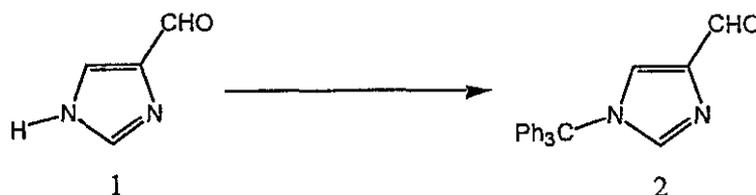

- DBU= 1,8-diazabicyclo[5.4.0]undec-7-ene
- 5 DBN= 1,5-diazabicyclo[4.3.0]non-5-ene
- EDCI= 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide
- HOBt= 1-hydroxybenzotriazole
- DCC= dicyclohexylcarbodiimide
- Dibal-H= diisobutylaluminum hydride
- 10 LAH= lithium aluminum hydride
- NaBH(OAc)₃= sodium triacetoxymethylborohydride
- NaBH₄= sodium borohydride
- NaBH₃CN= sodium cyanoborohydride
- LDA= lithium diisopropylamide
- 15 p-TsOH= p-toluenesulfonic acid
- m-CPBA= m-Chloroperbenzoic acid
- TMAD= N,N,N',N'-tetramethylazodicarboxamide
- CSA= camphorsulfonic acid
- NaHMDS= sodium hexamethyl disilylazide
- 20 HRMS= High Resolution Mass Spectrometry
- HPLC= High Performance Liquid Chromatography
- LRMS= Low Resolution Mass Spectrometry
- nM= nanomolar
- K_i= Inhibition Constant for substrate/receptor complex
- 25 pA₂= -logEC₅₀, as defined by J. Hey, *Eur. J. Pharmacol.*, (1995), Vol. 294, 329-335.
- Ci/mmol= Curie/mmol (a measure of specific activity)
- Tr= Triphenylmethyl
- Tris= Tris(hydroxymethyl)aminomethane
- 30

I. GENERAL SYNTHETIC METHOD 'A': REDUCTIVE AMINATION

I. General Method 'A': Reductive Amination

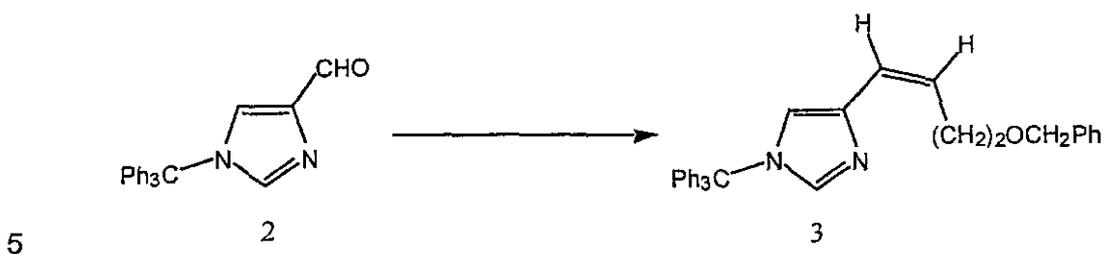

5

Example 1. Preparation of 1-(triphenylmethyl)-1H-imidazol-4-carboxaldehyde (2):

To a stirred suspension of aldehyde 1 (Aldrich Chemicals, Milwaukee,
 10 Wisconsin) (35.0g; 0.364 mol) and triethylamine (55.8 mL; 0.400 mol) in
 dichloromethane (2 L), was added a solution of triphenylmethyl chloride in
 dichloromethane (600 mL) while maintaining the reaction temperature at
 approximately 15 °C with a cooling bath. The resultant solution was allowed to
 warm to room temperature and stirred for 19 h. The solution was washed with a
 15 solution of saturated brine and water (1:3.5; 3 x 600 mL), followed by brine (1 x
 800 mL). It was dried over sodium sulfate; filtered to remove drying agent; and
 solvent removed under vacuum to obtain the desired tritylated product as an off-

white solid, mp 186.5-194 ° C. [Trituration of this product with ether yielded a cream-colored powder with mp 195-197 ° C.]

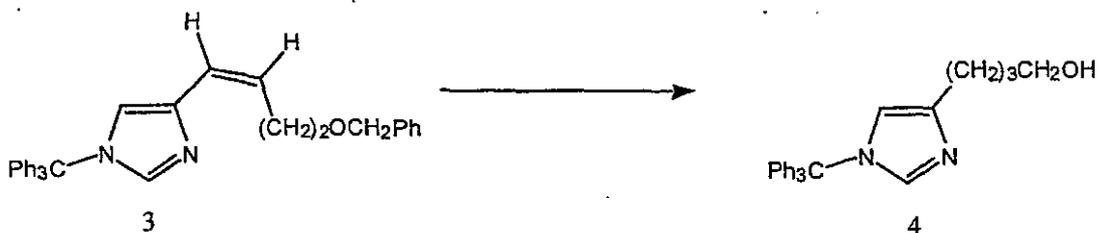

Example 2. Preparation of 4-[(Z)-4-(phenylmethoxy)-1-butenyl]-1-(triphenylmethyl)-1H-imidazole (3):

To a mechanically-stirred solution of aldehyde 2 in dry tetrahydrofuran (1 L), was added (3-benzyloxypropyl)triphenyl phosphonium bromide (30.02 g; 0.0611 mol). The resulting suspension was cooled to 15 ° C, and a 1.0 M solution (61.4 mL; 0.0614 mol) of potassium *t*-butoxide in tetrahydrofuran was added over 10 5 minutes. The reaction mixture was allowed to warm to room temperature and stirred for 2 h. The mixture was filtered through Celite; the filter was washed with tetrahydrofuran (2 x 150 mL); the filtrate and washings were combined and diluted with ether (800 mL); and refiltered through fresh Celite. The filtrate was 15 concentrated under vacuum, and the residue was chromatographed on silica gel, eluting with a gradient of hexanes-ethyl acetate (3:1 → 2:1), to obtain the title compound as a pale yellow powder, mp 101-104 ° C. FABMS: 471 (MH⁺; 6%); 243 (Ph₃C⁺; 100%).

Example 3. Preparation of 1-(triphenylmethyl)-1H-imidazole-4-butanol (4):

20

A mixture of the olefinic ether 3 (18.27 g; 0.0388 mol) in anhydrous methanol (350 mL), 1.0 M ethereal hydrochloric acid (38.8 mL; 0.0388 mol) and 10% palladium-on-carbon catalyst was hydrogenated at 48 psi for 30 min. on a Parr shaker. The reaction mixture was then filtered through Celite and washed the filter cake with methanol. The combined filtrate and washings were concentrated and dried under high vacuum to obtain the title alcohol hydrochloride as an off-white solid, mp 144-146 °C.

Example 4. Preparation of ω-[1-(triphenylmethyl)-1H-imidazol-4-yl]-butanal (5):

In a dry flask equipped to provide an inert gas atmosphere, a solution of oxalyl chloride (2.18 mL; 0.0250 mol) in dry dichloromethane (50 mL) was prepared and cooled to -60°C in a CO₂-acetone bath. A solution of dimethylsulfoxide (3.60 mL; 0.0507 mol) in dry dichloromethane (10 mL) added dropwise over 5-10 min., while maintaining the reaction temperature at -55 to -60 °C. It was stirred an additional 5 min at -60 °C; then a solution of alcohol hydrochloride (4) (8.67 g; 0.0207 mol) in dry dichloromethane (140 mL) was added over 15-20 minutes, maintaining reaction temperature in the range of -55 to -60 °C. Stirring was continued at -60° C for one hour; then neat triethylamine (17.6 mL; 0.126 mol) was added at a rate such that the reaction temperature was maintained at -55 to -60 °C. The reaction was stirred for 5 min. at this temperature. The cooling bath was removed, and stirring continued at room temperature for 1.5 h. The reaction mixture was washed with water (4 x 50 mL), then with brine (75 mL); dried over anhydrous magnesium sulfate; and solvent was removed under vacuum to yield a viscous oil. To remove any remaining triethylamine hydrochloride, the residual oil was dissolved in diethyl ether (100 mL), washed with water (1x30 mL; 2x10 mL), then with brine (30 mL), and dried

15

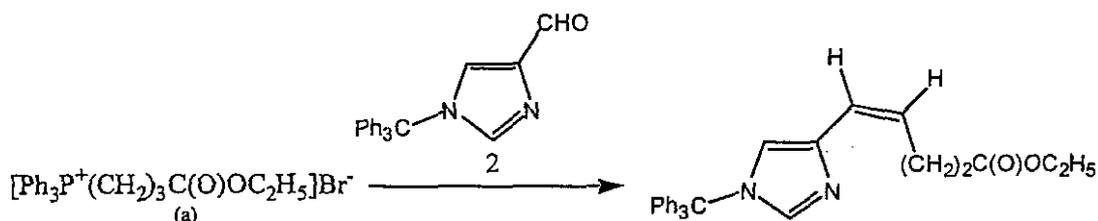

20

25

over anhydrous magnesium sulfate. Solvent was removed under vacuum to obtain the title aldehyde as a viscous yellow oil, sufficiently pure for further chemistry. FABMS: 381 (MH^+ ; 10%); 243 (Ph_3C^+ ; 100%).

Example 5. Preparation of ethyl 5-[1-(triphenylmethyl)-1H-imidazol-4-yl]-4-Z-pentenoate:

5

(i) Preparation of (ethoxycarbonylprop-1-yl)triphenylphosphonium bromide

(a): A mixture of triphenylphosphine (24.6 g; 0.0936 mol) and ethyl 4-bromobutyrate (14.4 mL; 0.101 mol) was heated from room temperature to 105° C over a period of 15-20 minutes, and heating of the resultant solution was continued at 105°C for 10 minutes. The solution was allowed to cool, but while still warm, diethyl ether (50 mL) was cautiously added via a condenser. The resultant gum was triturated to obtain a white powder. The supernatant was decanted, fresh diethyl ether (50 mL) was added, and trituration continued for 10 min. The product was filtered, the cake was washed with diethyl ether; and solvent removed under vacuum from the combined filtrate and washings to obtain a mixture of oil and solids. This mixture was heated to 100 °C, cautiously treated with diethyl ether (2 x 55 mL) and the trituration, filtration, and concentration sequence described above were repeated. The two batches of white solids obtained from this process were combined, triturated with toluene (150 mL) and filtered. The collected solids were washed with toluene and dried under high vacuum to obtain the title salt, mp 177-179 °C. FABMS: 377 (M^+ for cation; 84%).

(ii) Preparation of ethyl 5-[1-(triphenylmethyl)-1H-imidazol-4-yl]-4-Z-pentenoate: Under a nitrogen atmosphere, the triphenylphosphonium salt (a) (14.0 g; 0.0305 mol) was added to a stirred solution of aldehyde 2 (9.81 g; 0.029

25

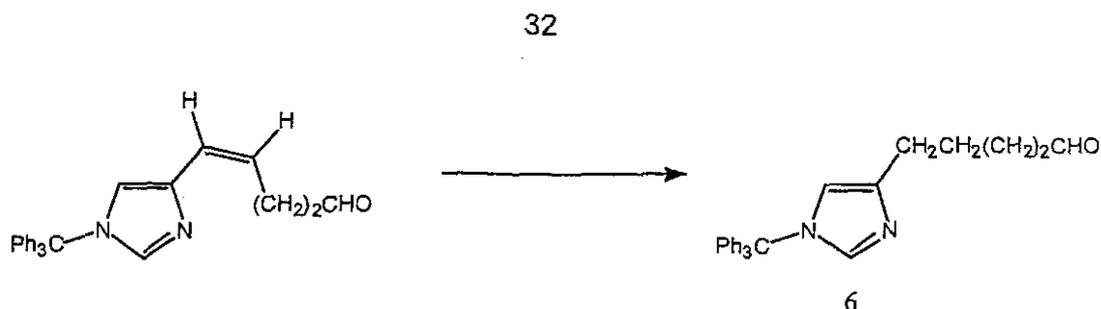

mol) in tetrahydrofuran (500 mL). The resulting suspension was cooled to 0-5 °C, 1M potassium *t*-butoxide in tetrahydrofuran (31 mL; 0.031 mol) was added over 3-5 min., and the mixture was stirred for 20 min. at 0-5 °C. Celite was added to the reaction mixture, which was stirred briefly and filtered. The filter cake was washed with diethyl ether, followed by dichloromethane. The combined filtrate and washings were concentrated under vacuum. The residual oil was chromatographed on silica gel, and eluted with a gradient of hexanes-ethyl acetate (3:1 → 2:1), to obtain the title compound as a white solid, mp 90-92.5 °C. FABMS: 437 (MH⁺; 3%); 243 (Ph₃C⁺; 100%).

10 Example 6 Preparation of 5-[1-(triphenylmethyl)-1H-imidazol-4-yl]-4-Z-pentenal:

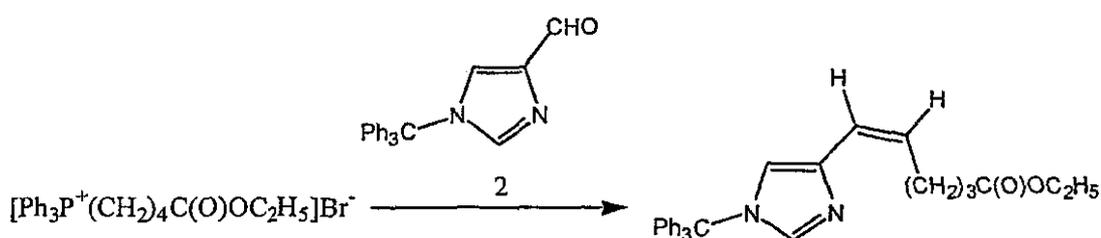

15 To a stirred solution of the ester (671 mg; 1.54 mmol) in dry dichloromethane (12 mL) contained in a cold bath, was added a 1.0M solution of DIBAL-H in toluene (3.08 mL; 3.08 mmol) over approximately 4 min., while maintaining the reaction temperature at -55 to -60 °C. After 8-10 min. of stirring at -58 °C, the reaction was quenched by the addition of methanol (0.4 mL) and water (6 mL). The reaction mixture was allowed to warm to room temperature. The gelatinous precipitate was removed by filtration through Celite. The filter cake was washed with dichloromethane, and the combined filtrate and washings were dried over anhydrous magnesium sulfate. The drying agent was filtered and solvent evaporated under reduced pressure to obtain the title aldehyde as a white powder, mp 117.5-120 °C. FABMS: 393 (MH⁺; 12%); 243 (Ph₃C⁺; 100%).

25 Example 7. Preparation of -[1-(triphenylmethyl)-1H-imidazol-4-yl]-pentanal (6):

A mixture of the unsaturated aldehyde (5.42 g; 13.8 mmol) and 5% palladium-on-charcoal catalyst (0.50 g) in anhydrous methanol (130 mL) for 30 min. was hydrogenated at 30-35 psi on a Parr shaker. The catalyst was filtered through Celite, and the filtrate evaporated under reduced pressure. The residue was dried under high vacuum to obtain the title compound as a yellow viscous oil or glass sufficiently pure for further chemistry. FABMS: 395 (MH^+ ; 5%); 243 (Ph_3C^+ ; 100%).

10 Example 8. Preparation of ethyl 6-[1-(triphenylmethyl)-1H-imidazol-4-yl]-5-Z-hexenoate:

Under a nitrogen atmosphere, aldehyde 2 (12.4 g; 0.0367 mol) was added to a vigorously stirred partial suspension of 4-carboethoxybutyl triphenyl phosphonium bromide (from Lancaster Chemicals, Windham, New Hampshire) (20.2 g; 0.0408 mol) in tetrahydrofuran (630 mL). The suspension was stirred until aldehyde dissolved. The resultant mixture was cooled to 0-5° C and 1M potassium *t*-butoxide in tetrahydrofuran (40.8 mL; 0.0408 mol) was added over 10 min., and the mixture stirred vigorously for 40 min. at 0-5 °C, then for 30 min. at 20 5-10 °C. Dry dichloromethane (100 mL) was added to dissolve any salt coating the walls of the flask, then the reaction mixture was allowed to warm to 20 °C. Celite was added to the reaction mixture, which was stirred briefly, filtered and

the filter cake was washed with dichloromethane. The combined filtrate and washings were concentrated under vacuum. The residual oil was chromatographed on silica gel, eluting with a gradient of hexanes-ethyl acetate (5:1 → 2:1), to obtain the title compound as a white powder, mp 78.5-85 °C.

5 FABMS: 451 (MH⁺; 2%); 243 (Ph₃C⁺; 100%).

Example 9. Preparation of 6-[1-(triphenylmethyl)-1H-imidazol-4-yl]-5-Z-hexenal:

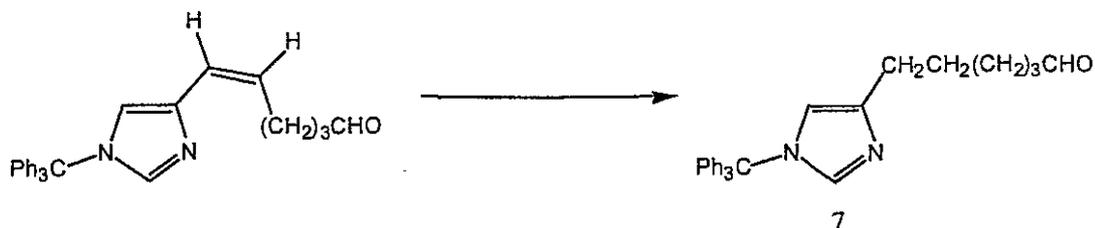

10 To a stirred solution of the title ester from Example 8 (3.98 g; 8.83 mmol) in dry dichloromethane (50 mL) contained in a cold bath, was added a 1.0M solution of DIBAL-H in toluene (17.7 mL; 17.7 mmol) over approximately 15 min., while maintaining the reaction temperature at -55 to -60 °C. After 45 min. of stirring at -58 to -60 °C, the reaction was quenched by the addition of methanol (2.3 mL)

15 and water (34 mL). The reaction mixture was allowed to warm to room temperature and then was filtered through Celite. The filter cake was washed with dichloromethane, and the combined filtrate and washings were dried over anhydrous magnesium sulfate. The drying agent was filtered and solvent evaporated under reduced pressure to obtain the title aldehyde as a viscous oil

20 sufficiently pure for use as described in Example 10. FABMS: 515 (impurity; 4%); 407 (MH⁺; 2%); 243 (Ph₃C⁺; 100%).

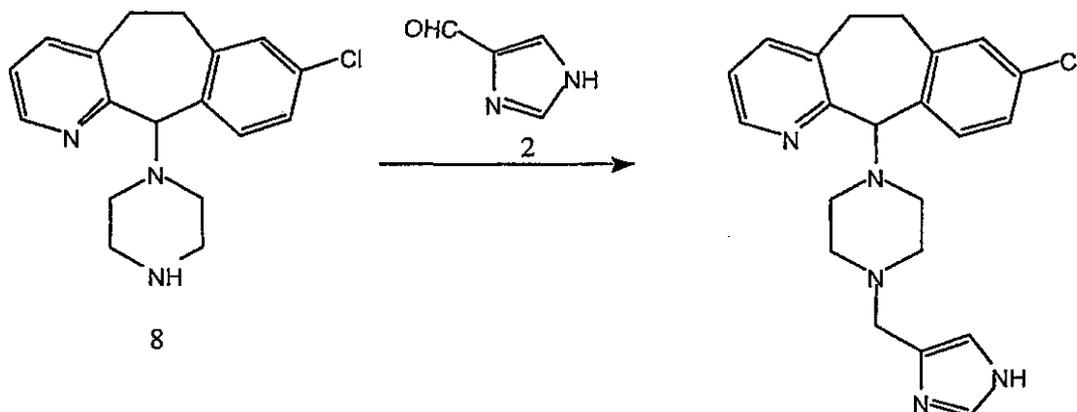

Example 10. Preparation of ω-[1-(triphenylmethyl)-1H-imidazol-4-yl]-hexenal (7):

34

A mixture of the unsaturated aldehyde from Example 9 (3.41 g; 8.39 mmol) and 5% palladium-on-charcoal catalyst (0.3 g) in anhydrous methanol (50 mL) was hydrogenated for 45 min. at 30-35 psi on a Parr shaker. The catalyst was filtered through Celite, the filtrate evaporated under reduced pressure and the residual oil chromatographed on silica gel. Elution with a gradient of hexanes-ethyl acetate (2:1 \rightarrow 1:1 \rightarrow 1:2) yielded the title compound, which, after drying under high vacuum, was isolated as a white, slightly waxy hygroscopic solid, mp 78-80.5 °C. FABMS: 451 (MH^+).

10 Example 11. Preparation of 1-(8-Chloro-6,11-dihydro-5H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-yl)-4-[(1H-imidazol-4-yl)-methyl]-piperazine:

15

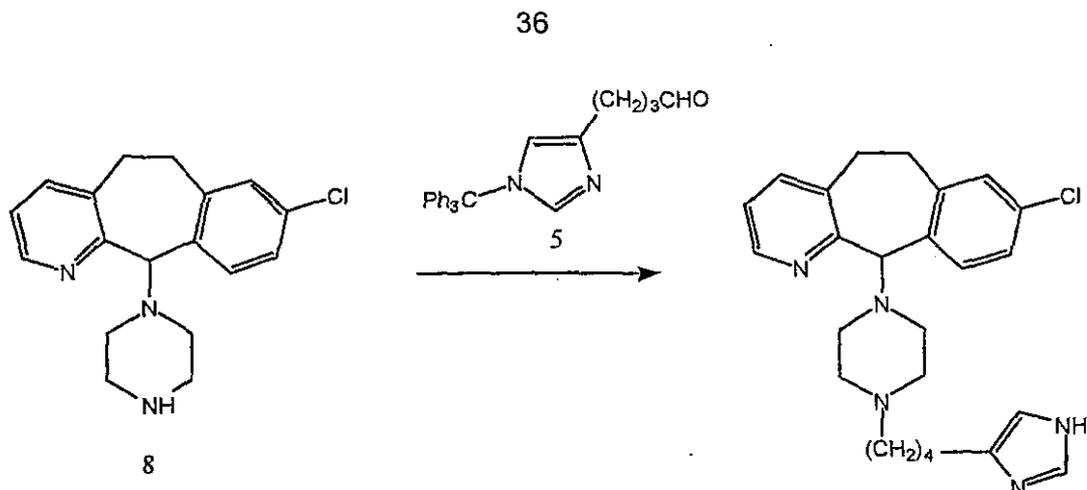

(i) To a stirred solution of 8-chloro-6,11-dihydro-11-(1-piperazinyl)-5H-benzo[5,6]cyclohepta[1,2-b]pyridine (8) (6.40 g; 0.020 mol) (disclosed in published application WO 95/10516, April 20, 1995) and 1H-imidazol-4-carboxaldehyde (2) (1.96 g; 0.020 mol) in anhydrous methanol (100 mL), was added anhydrous magnesium sulfate (4.91 g). The resultant suspension was

20

stirred at room temperature for 45 min. While maintaining the reaction temperature at 25-30° C by use of a water bath, solid sodium cyanoborohydride (4.05 g of 95%; 0.0612 mol) was added and the resultant mixture allowed to stir at room temperature for 4h. Another 0.64 g (0.0067 mol) of aldehyde 2 was added, and stirring was continued for another 16 h at room temperature. The reaction mixture was diluted with methanol (22 mL) and filtered. The filter cake was washed with methanol; the filtrate and washings were combined and solvent was removed under reduced pressure. The residue was dried under high vacuum to obtain an off-white glassy solid. This glass was redissolved in dichloromethane (175 mL)-methanol (30 mL), and washed with water (1 x 25 mL). The organic solution was dried over anhydrous magnesium sulfate, filtered, and solvent was removed under reduced pressure. The residue was chromatographed on silica gel, and eluting with a gradient of dichloromethane-methanol-concentrated ammonium hydroxide (95:5:0.1 → 90:10:0.1 → 85:15:0.1 → 80:20:0.1) yielded, after drying under high vacuum, the title compound as a white glass. FABMS: 394, 396 (MH⁺; 100, 39%); 228 (67%).

(ii) To a stirred solution of the free base form of the title compound (5.48 g; 0.0139 mol) in methanol (200 mL), was added an ~3.4M solution (12.3 mL; 0.0417 mol) of ethereal hydrogen chloride. Solvent was removed under reduced pressure, and the residual solids were stirred with ether (150 mL). The solid was filtered, dried under a rubber dam, and redissolved in methanol (100 mL). The solution was treated with ~3.4M solution (10 mL; 0.034 mol) of ethereal hydrogen chloride. The solvent was removed under reduced pressure, the residual solids stirred with ether (150 mL). The solids were filtered, dried partially under a rubber dam, and then further dried under high-vacuum to obtain the hydrochloride salt of the title compound as a white powder that analyzed as a 2.8 hydrochloride hemihydrate, mp 190.5-192° C (dec; darkens ~180 °C). C₂₂H₂₄ClN₅•2.8 HCl•0.5 H₂O. FABMS: 394, 396 (MH⁺; 64/25%).

Example 12. Preparation of 8-Chloro-6,11-dihydro-11-[4-[4-(1H-imidazol-4-yl)butyl]-1-piperazinyl]-5H-benzo[5,6]cyclohepta[1,2-b]pyridine:

(i) To a stirred solution of 8-Chloro-6,11-dihydro-11-(1-piperazinyl)-5H-benzo[5,6]cyclohepta[1,2-b]pyridine (8) (348 mg; 1.11 mmol), ω-[1-(triphenylmethyl)-1H-imidazol-4-yl]-butanal (5) (459 mg; 1.21 mmol) and methanesulfonic acid (0.07 mL; 1.11 mmol) in anhydrous methanol (15 mL), was added anhydrous magnesium sulfate (267 mg). The resultant suspension was stirred at room temperature for 30 min. A 1.0M solution of sodium cyanoborohydride in tetrahydrofuran (0.78 mL; 0.78 mmol) was added and the resultant mixture allowed to stir at room temperature for 4.5 h. The mixture was filtered through Celite, and the filtrate evaporated under reduced pressure. The residue was dissolved in dichloromethane (20 mL) and washed successively with 1.1M sodium bicarbonate (10 mL), water (3 x 10 mL), and brine (15 mL). The organic layer was dried over anhydrous magnesium sulfate, filtered and solvent evaporated under reduced pressure. The gummy residue was chromatographed on silica gel, eluting with a gradient of dichloromethane-methanol-concentrated ammonium hydroxide (95:5:0.1 → 90:10:0.1), to obtain the imidazole-N-tritylated precursor of the title compound as a glassy solid. After drying under high vacuum, the product was subjected to detritylation without further treatment or characterization as below:

(ii) A methanol (75 mL) solution of the N-tritylated product (512 mg; 0.755 mmol) of the previous step and 1.0M hydrochloric acid in ether (8.7 mL; 8.7 mmol) were refluxed under a nitrogen atmosphere for 5 h. Solvent was removed under reduced pressure and the residue was triturated with ether. The mixture was filtered, and the collected solid washed with ether, and dried under high

vacuum to obtain the HCl salt of the title compound as a white solid, mp 165-170° C (dec). C₂₅H₃₀ClN₅ • 2.8 HCl • 1.9 H₂O. FABMS: 436, 438 (MH⁺; 49/18%).

By substituting respectively the homologous aldehydes 6 (from example 7) and 7 (from example 10) in the foregoing reaction processes, the following

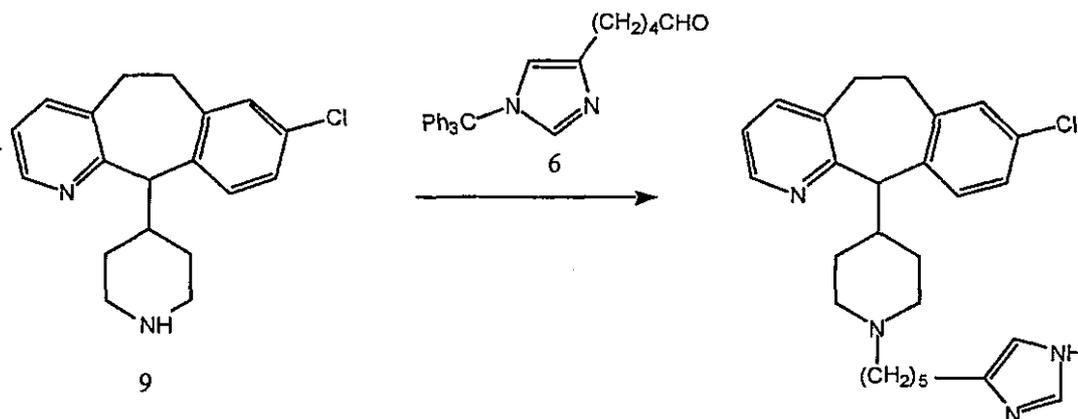

5 analogues of the title compound were prepared:

8-Chloro-6,11-dihydro-11-[4-[5-(1H-imidazol-4-yl)pentyl]-1-piperazinyl]-5H-benzo[5,6]cyclohepta[1,2-b]pyridine, trihydrochloride, 1.15 hydrate, 0.5 diethyl ether C₂₆H₃₂ClN₅ • 3 HCl • 1.15 H₂O • 0.5 C₄H₁₀O. FABMS: 450, 452 (MH⁺; 100/35%).

10 8-Chloro-6,11-dihydro-11-[4-[6-(1H-imidazol-4-yl)hexyl]-1-piperazinyl]-5H-benzo[5,6]cyclohepta[1,2-b]pyridine, trihydrochloride, 0.5 hydrate, 0.5 methanolate C₂₇H₃₄ClN₅ • 3 HCl • 0.5 H₂O • 0.5 CH₄O. FABMS: 464, 466 (MH⁺; 8/3%).

Example 13. Preparation of 8-chloro-6,11-dihydro-11-[1-[5-(1H-imidazol-4-yl)pentyl]-4-piperidinyl]-5H-benzo[5,6]cyclohepta[1,2-b]pyridine:

15

(i) To a stirred solution of 8-Chloro-6,11-dihydro-11-(4-piperidinyl)-5H-benzo[5,6]cyclohepta[1,2-b]pyridine (9) (499 mg; 1.59 mmol) (disclosed in
20 published application WO 95/10516, April 20, 1995), ω-[1-(triphenylmethyl)-1H-imidazol-4-yl]-pentanal (6) (699 mg; ~90% pure; 1.59 mmol) and methanesulfonic acid (0.10 mL; 1.59 mmol) in anhydrous methanol (100 mL), was added anhydrous magnesium sulfate (380 mg) The resultant suspension was stirred at

room temperature for 45 min. A 1.0M solution of sodium cyanoborohydride in tetrahydrofuran (1.12 mL; 1.12 mmol) was added and the resultant mixture stirred at room temperature for 22h. The reaction mixture was filtered through Celite, and solvent evaporated under reduced pressure. The residue was dissolved in
5 dichloromethane (25 mL) and washed successively with 1.1M sodium bicarbonate (15 mL) and water (2x10 mL). The organic layers were dried over anhydrous magnesium sulfate; filtered; solvent evaporated under reduced pressure and dried under high vacuum to obtain a pink glassy solid. The residual solid was chromatographed on silica gel, eluting with a gradient of 3.9M ammonia
10 in methanol-dichloromethane (3:97 → 5:95), to obtain the imidazole-N-tritylated precursor of the title compound, which, after drying under high vacuum, was an off-white foam, mp 75-78° C (melted to a viscous gum). FABMS: 451 (MH⁺; 20%); 243 (Ph₃C⁺; 100%).

(ii) A methanol (35 mL) solution of the N-tritylated product (426 mg; 0.675
15 mmol) from the previous step and 1.0M hydrochloric acid in ether (7.8 mL; 7.8 mmol) were refluxed under a nitrogen atmosphere for 12.5 h. The solvent was removed under reduced pressure and the residue partitioned between dichloromethane (25 mL) and 1.1M sodium bicarbonate solution (25 mL). The aqueous layer was extracted with dichloromethane (2 x 20 mL). The solvent was
20 removed from the combined extracts to obtain a residual glass which was chromatographed on silica gel, eluting with a gradient of 3.9M ammonia in methanol-dichloromethane (5:95 → 10:90), to obtain the title compound, which, after drying under high vacuum, was a white powder, mp 65-68° C (melted to a viscous gum). C₂₇H₃₃ClN₄• 1.5 H₂O. CIMS: 449 (MH⁺; 100%); 477 ([M +
25 C₂H₅]⁺; 24%).

(iii) To a stirred solution of the title compound (128 mg; 0.285 mmol) in methanol (5 mL), was added a 1.0M solution (1.0 mL; 1.0 mmol) of ethereal hydrogen chloride. Solvent was removed under reduced pressure, the residue dried under high-vacuum over phosphorus pentoxide, to obtain the
30 trihydrochloride salt of the title compound as a white powder, mp 164-170° C (dec

to a viscous gum). $C_{27}H_{33}ClN_4 \cdot 3 HCl \cdot H_2O \cdot 0.5 CH_4O$ (MeOH). FABMS: 449 (MH^+ ; 55%).

By substituting the homologous aldehydes 5 (example 4) and 7 (example 10) in the foregoing reaction processes, the following analogues of the title compound were prepared:

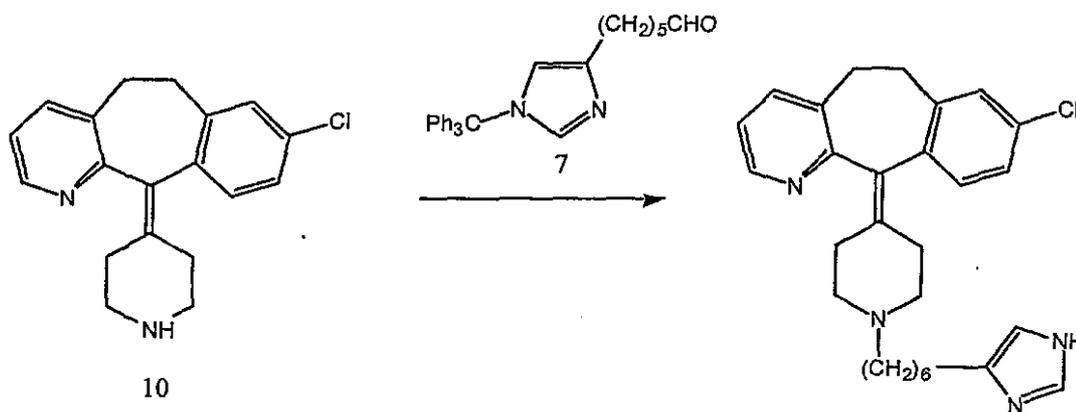

8-Chloro-6,11-dihydro-11-[1-[4-(1H-imidazol-4-yl)butyl]-4-piperidiny]-5H-benzo[5,6]cyclohepta[1,2-b]pyridine, trihydrochloride, 1.1 hydrate, mp 175-178° C (dec). $C_{26}H_{31}ClN_4 \cdot 3 HCl \cdot 1.1 H_2O$. FABMS: 435, 437 (MH^+ ; 7/2%).

8-Chloro-6,11-dihydro-11-[1-[6-(1H-imidazol-4-yl)hexyl]-4-piperidiny]-5H-benzo[5,6]cyclohepta[1,2-b]pyridine, trihydrochloride, 1.5 hydrate.

$C_{28}H_{35}ClN_4 \cdot 3 HCl \cdot 1.5 H_2O$. FABMS: 463, 465 (MH^+ ; 100/44%).

Example 14. Preparation of 8-Chloro-6,11-dihydro-11-[1-[6-(1H-imidazol-4-yl)hexyl]-4-piperidinyliidene]-5H-benzo[5,6]cyclohepta[1,2-b]pyridine :

15

(i) To a stirred solution of 8-Chloro-6,11-dihydro-11-(4-piperidinyliidene)-5H-benzo[5,6]cyclohepta[1,2-b]pyridine (10) (284 mg; 0.914 mmol), (disclosed in published application WO 95/10516, April 20, 1995), -[1-(triphenylmethyl)-1H-imidazol-4-yl]-hexanal (7) (393 mg; 0.962 mmol) and methanesulfonic acid (0.06 mL; 0.914 mmol) in anhydrous methanol (10 mL), was added anhydrous magnesium sulfate (220 mg). The resultant suspension was stirred at room temperature for 30 min. A 1.0M solution of sodium cyanoborohydride in

20

tetrahydrofuran (0.64 mL; 0.64 mmol) was added and the resultant mixture allowed to stir at room temperature for 23h. The reaction mixture was filtered through Celite, and the filtrate evaporated under reduced pressure to obtain the mesylate salt of the imidazole-N-tritylated precursor of the title compound as a pink glass, which was detritylated without further purification. FABMS: 703 (MH^+ ; 35%); 243 (Ph_3C^+ ; 100%).

(ii) A methanol (10 mL) solution of the N-tritylated mesylate salt product (828 mg; 0.675 mmol) from the previous step and 1.0M hydrochloric acid in ether (10 mL; 10 mmol) were refluxed under a nitrogen atmosphere for 10 h. Solvent was removed under reduced pressure and the residue partitioned between dichloromethane (25 mL) and 1.1M sodium bicarbonate solution (25 mL). The aqueous layer was extracted with dichloromethane (2 x 20 mL). The combined extracts were washed with water (3 x 20 mL), dried over anhydrous magnesium sulfate, filtered and solvent removed from the filtrate to obtain a yellow glass. This solid was chromatographed on silica gel, eluting with a gradient of 3.9M ammonia in methanol-dichloromethane (5:95 \rightarrow 10:90), to obtain the title compound as a free base. FABMS: 461 (MH^+ ; 11%).

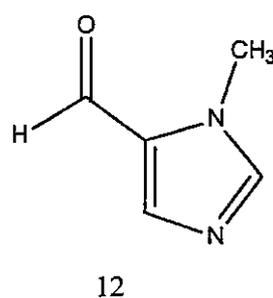

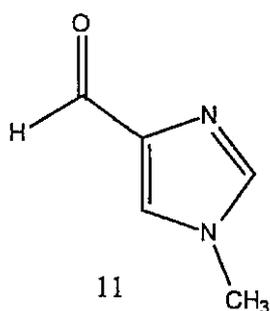

(iii) To a stirred solution of the title compound (142 mg; 0.297 mmol) in methanol (3 mL), was added a 1.0M solution (1.0 mL; 1.0 mmol) of ethereal hydrogen chloride. Solvent was removed under reduced pressure, and the residue dried under high-vacuum over phosphorus pentoxide to obtain the trihydrochloride salt of the title compound as a light pink powder. $C_{28}H_{33}ClN_4 \cdot 3 HCl \cdot 0.6 H_2O \cdot 0.5 CH_4O$ (MeOH). FABMS: 461 (MH^+ ; 100%).

By substituting the homologous aldehydes 5 (example 4) and 6 (example 7) in the foregoing reaction processes, the following analogues of the title compound were prepared:

8-Chloro-6,11-dihydro-11-[1-[4-(1H-imidazol-4-yl)butyl]-4-piperidinylidene]-5H-benzo[5,6]cyclohepta[1,2-b]pyridine, 2.8 hydrochloride, dihydrate, mp 162-165° C (dec). $C_{26}H_{29}ClN_4 \cdot 2.8 HCl \cdot 2 H_2O$. CIMS: 433, 435 (MH^+ ; 100/36%); 461, 463 ($[M + C_2H_5]^+$; 16/6%).

8-Chloro-6,11-dihydro-11-[1-[5-(1H-imidazol-4-yl)pentyl]-4-piperidinyliidene]-5H-benzo[5,6]cyclohepta[1,2-b]pyridine, 2.9 hydrochloride, 0.5 methanolate. $C_{27}H_{31}ClN_4 \cdot 2.9 HCl \cdot 0.5 CH_4O$ (MeOH). FABMS: 447 (MH^+ ; 100%).

5 Example 15:

(i) Compounds (11) and (12) were prepared by reacting commercially
10 available 4-imidazolecarboxaldehyde with CH_3I following known procedures.

By substituting analogous aldehydes (11) and (12), and reacting according to the procedure found in Example 12, the following compounds were prepared:

15 1-(8-Chloro-6,11-dihydro-5H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-yl)-4-
[(1-methyl-1H-imidazol-4-yl)-methyl]-piperazine, 4 hydrochloride.

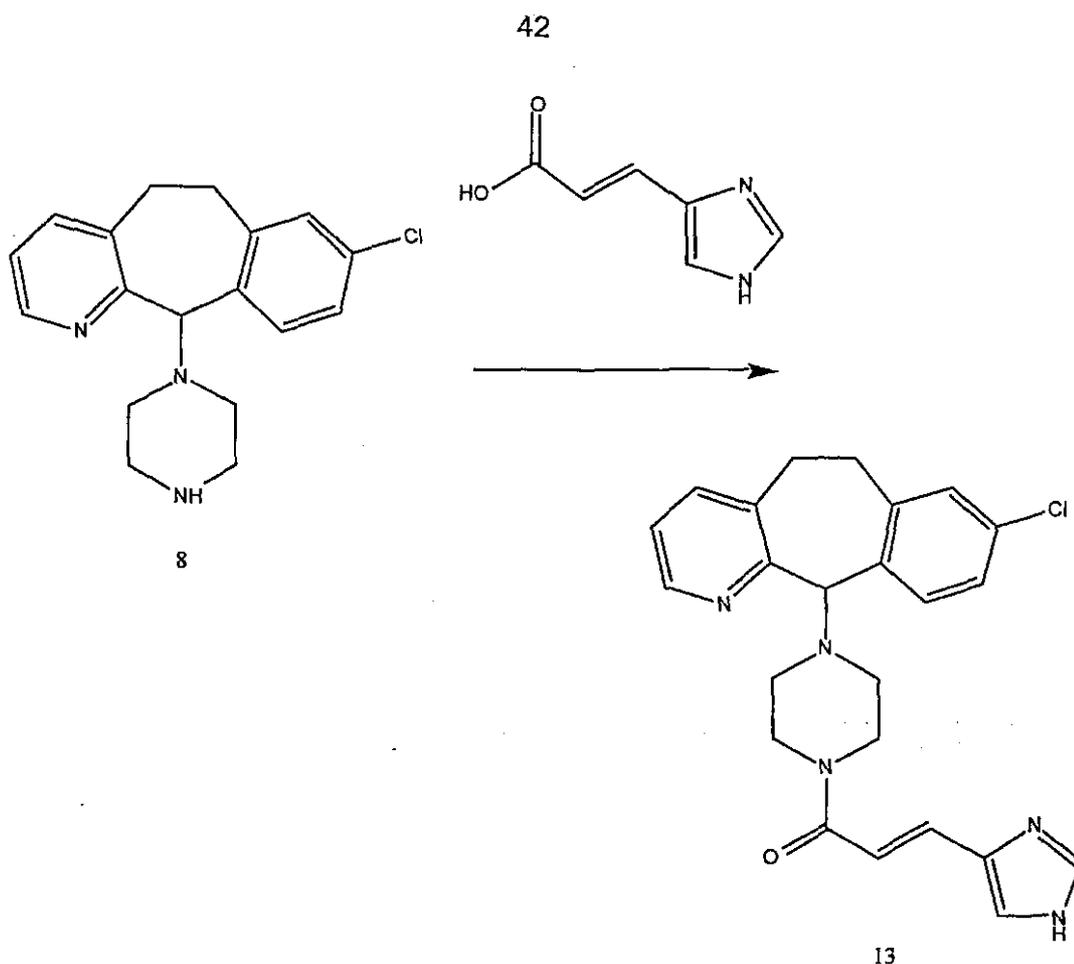

$C_{23}H_{26}ClN_5 \cdot 4HCl$

and

20 1-(8-Chloro-6,11-dihydro-5H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-yl)-4-
[(1-methyl-1H-imidazol-5-yl)-methyl]-piperazine, 4 hydrochloride.

$C_{23}H_{26}ClN_5 \cdot 4HCl$.

Example 16. Preparation of 1-(8-chloro-6,11-dihydro-5H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-yl)-4-[3-(1H-imidazol-4-yl)-1-oxo-propyl]piperazine(14):

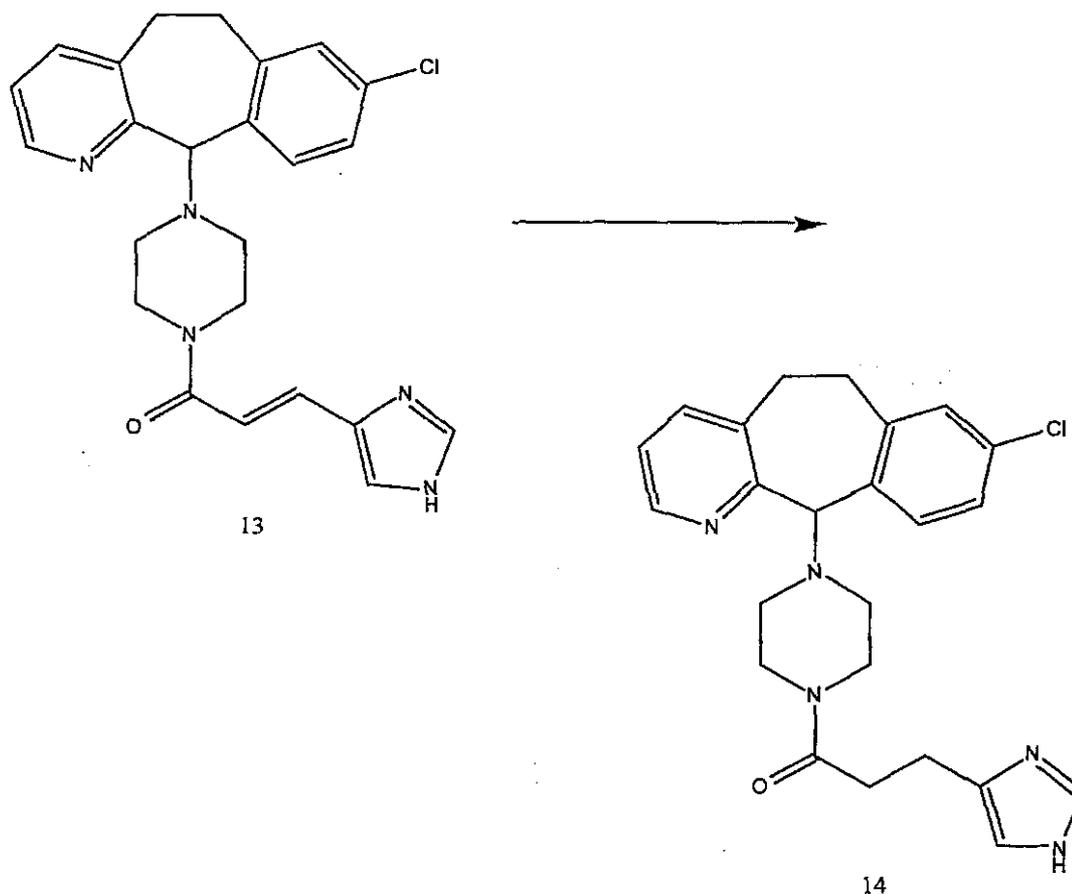

(i) Preparation of 1-(8-Chloro-6,11-dihydro-5H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-yl)-4-[(E)-3-(1H-imidazol-4-yl)-1-oxo-2-propenyl]piperazine (13):

To a suspension of urocanic acid (1.38 g; 10.0 mmol) (from Aldrich
 5 Chemicals) in N,N-dimethylformamide (175 mL) under an inert atmosphere, was added 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (1.92 g; 10.0 mmol) and hydroxybenzotriazole (1.08 g; 8 mmol). The resultant mixture was warmed to 40° C and stirring continued until all solids dissolved (~10 min.). To the resultant solution was added 8-chloro-6,11-dihydro-11-(1-piperaziny)-5H-benzo[5,6]cyclohepta[1,2-b]pyridine (8) (2.51 g; 8.0 mmol); and the resultant
 10 solution was allowed to stir at room temperature for 18.5 h. Then water (250 microliters; 13.9 mmol) was added, and the solution was stirred briefly before concentrating under reduced pressure. The residual oil was partitioned between dichloromethane (100 mL) and water (100 mL). The organic extract was dried by
 15 filtration through anhydrous magnesium sulfate and solvent removed under

reduced pressure. The residue was chromatographed on silica gel, eluting with dichloromethane-methanol-concentrated ammonium hydroxide (90:9:0.5), to obtain the title compound as a yellow powder that decomposed to a frothy gum at 160 °C. SIMS: 434 (MH⁺; 50%).

5

(ii) A mixture of unsaturated amide 13 (200 mg; 0.463 mmol) and 10% palladium-on-charcoal catalyst (40 mg) in anhydrous methanol (40 mL) was hydrogenated for 2.5 h. at 50 psi on a Parr shaker. A second portion (20 mg) of catalyst was added, and hydrogenation continued at 50 psi for a further 7h. A third portion (20 mg) of catalyst was added and hydrogenation continued for a final 2 hours. The catalyst was filtered through Celite, solvent evaporated under reduced pressure and the residue dried under high vacuum to obtain the free

10

base form of the title compound as a yellow powder. FABMS: 436 (MH^+ ; 55%); 402 (8%); 228 (63%).

(iii) The free base form of the title compound (155 mg; 0.356 mmol) was dissolved in a mixture of dichloromethane (0.75 mL) and diethyl ether (0.75 mL).

- 5 The cloudy solution was filtered through a syringe filter (0.45 micron), and the filtrate was treated with 1.0M ethereal hydrochloric acid (1.8 mL; 1.8 mmol). The hygroscopic precipitate that formed was crystallized from methanol-ethyl acetate to obtain the salt of the title compound as a white powder that decomposed at 165.5 °C and analyzed as $C_{24}H_{26}ClN_5O \cdot 2.35 HCl \cdot 2.2 H_2O \cdot 0.033 C_4H_8O_2$
- 10 (EtOAc). FABMS: 436 (MH^+ ; 100%); 434 (15%); 402 (13%); 228 (70%).

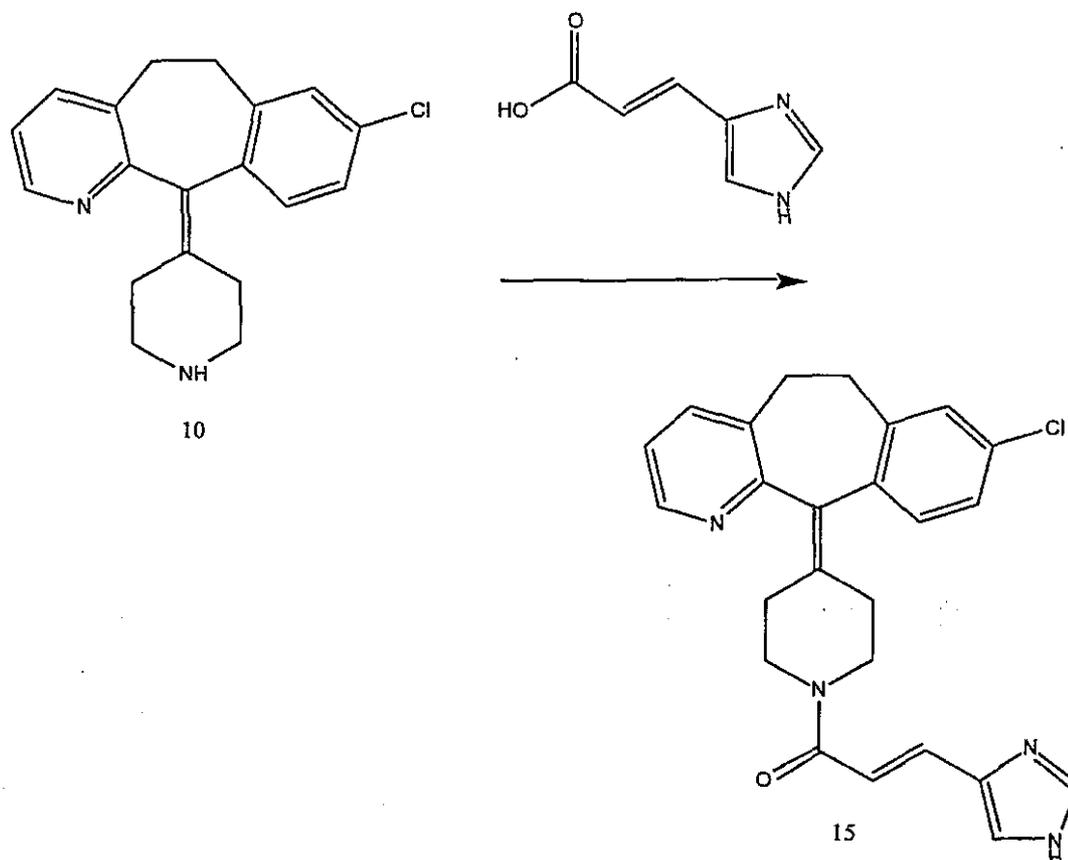

Example 17. 4-(8-chloro-5,6-dihydro-11H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-ylidene)-1-[3-(1H-imidazol-4-yl)-1-oxopropyl]-piperidine (16):

(i) Preparation of 4-(8-Chloro-5,6-dihydro-11H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-yl)-4-[(E)-3-(1H-imidazol-4-yl)-1-oxo-2-propenyl]-piperidine (15):

- 15 To a solution of urocanic acid (from Aldrich Chemicals) (1.8 g; 12.9 mmole) in anhydrous N,N-dimethylformamide (65 ml) was added 8-Chloro-6,11-dihydro-11-(4-piperidinylidene)-5H-benzo[5,6]cyclohepta[1,2-b]pyridine(10) (4 g; 12.9 mmole), 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (2.15 g;

45

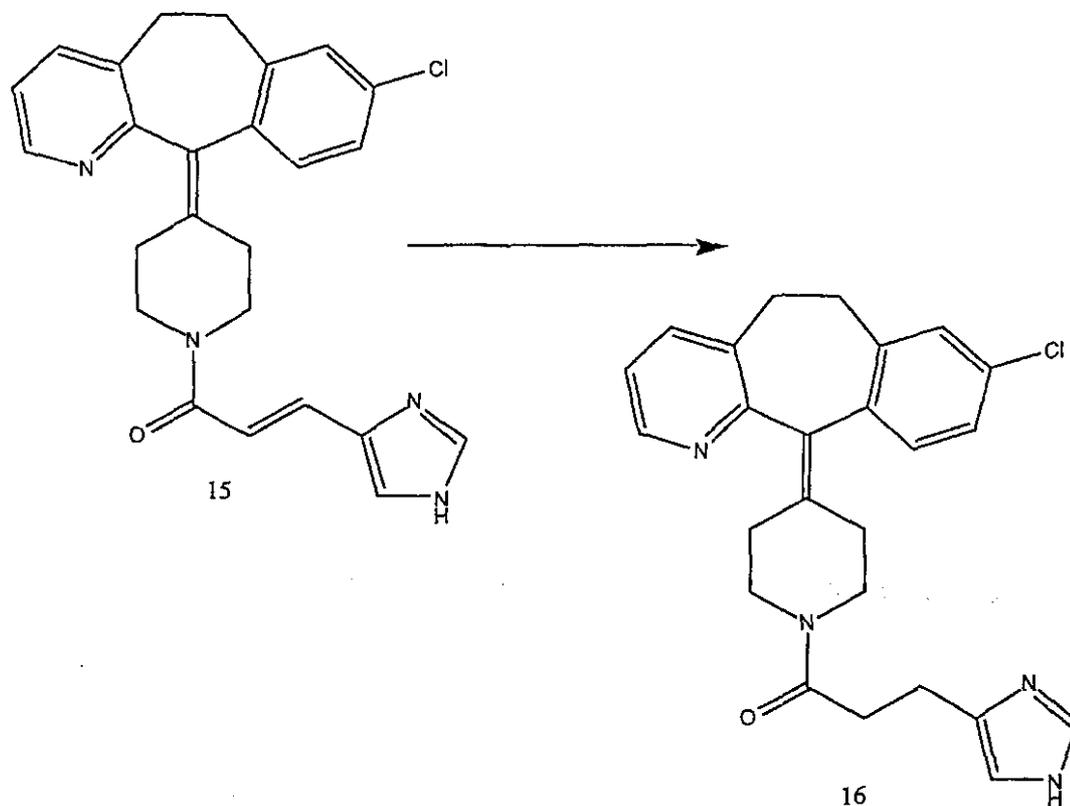

11.2 mmoles) and hydroxybenzotriazole (1.74 g; 12.9 mmoles). The reaction

5 mixture was stirred for 48 hours at room temperature. Water was added, and it was then extracted with ethyl acetate several times. The organic layers were combined and washed with brine. The organics were dried over sodium sulfate and concentrated. The residue was purified by flash chromatography to give compound (15) (24%).

10 (ii) A mixture of unsaturated amide (15) (1.3 g; 3.0 mmoles) and 5% palladium-on-charcoal catalyst (1.3g) in methanol (40 ml) was hydrogenated under a pressure of 60 psi at room temperature. The reaction was monitored by thin layer chromatography. When the starting material disappeared, the reaction

of mixture was filtered through a bed celite, concentrated under reduced pressure

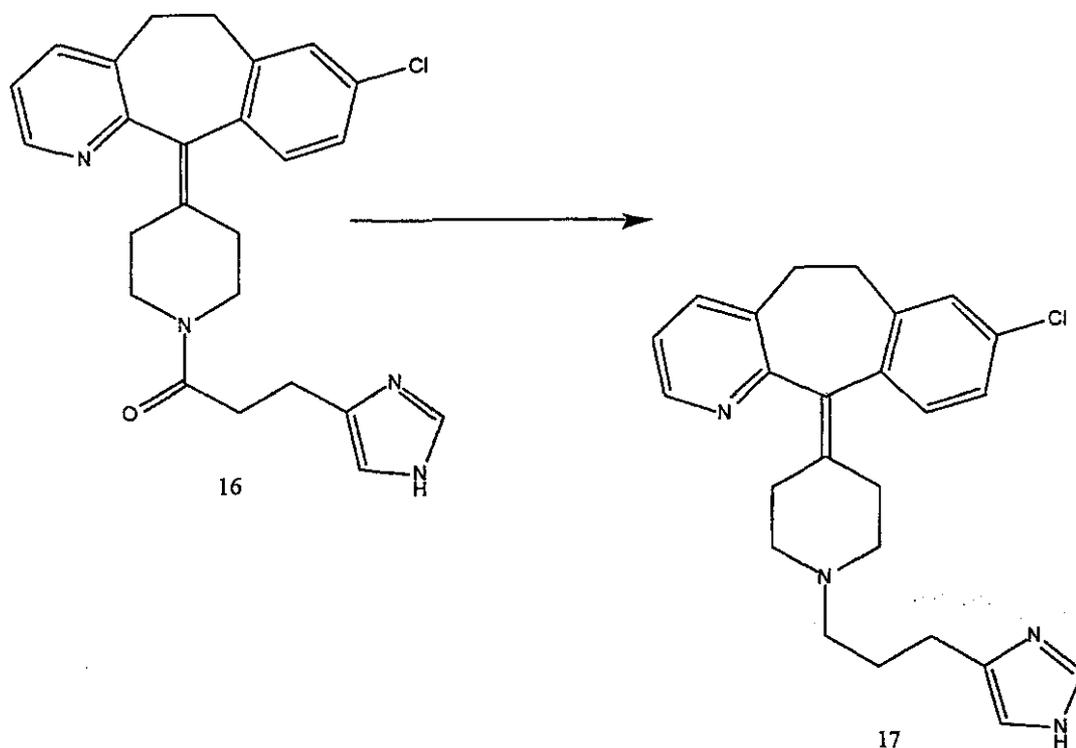

and purified by preparative thin layer chromatography to give the title compound (16), ($C_{25}H_{25}ClN_4O \cdot 2HCl \cdot 0.3C_4H_{10}O \cdot 2H_2O$) (54%).

5 Example 18 Preparation of 8-chloro-5,6-dihydro-11-[1-[3-(1H-imidazol-4-yl)propyl]-4-piperidinylidene]-11H-benzo[5,6]cyclohepta[1,2-b]pyridine (17):

To a solution of compound (16) (0.65g; 1.5 mmol) in anhydrous tetrahydrofuran (70 ml) was added a 1.0M solution of lithium aluminum hydride in tetrahydrofuran (4.6 ml; 4.6 mmol). The mixture was stirred at room temperature
10 for 1.75 h. then diluted with ethyl ether and quenched with dropwise addition of

saturated ammonium chloride solution. To saturated ammonium chloride

solution. To carbonate and then extracted with ethyl acetate. The combined organic extracts were dried over sodium sulfate, filtered and concentrated.

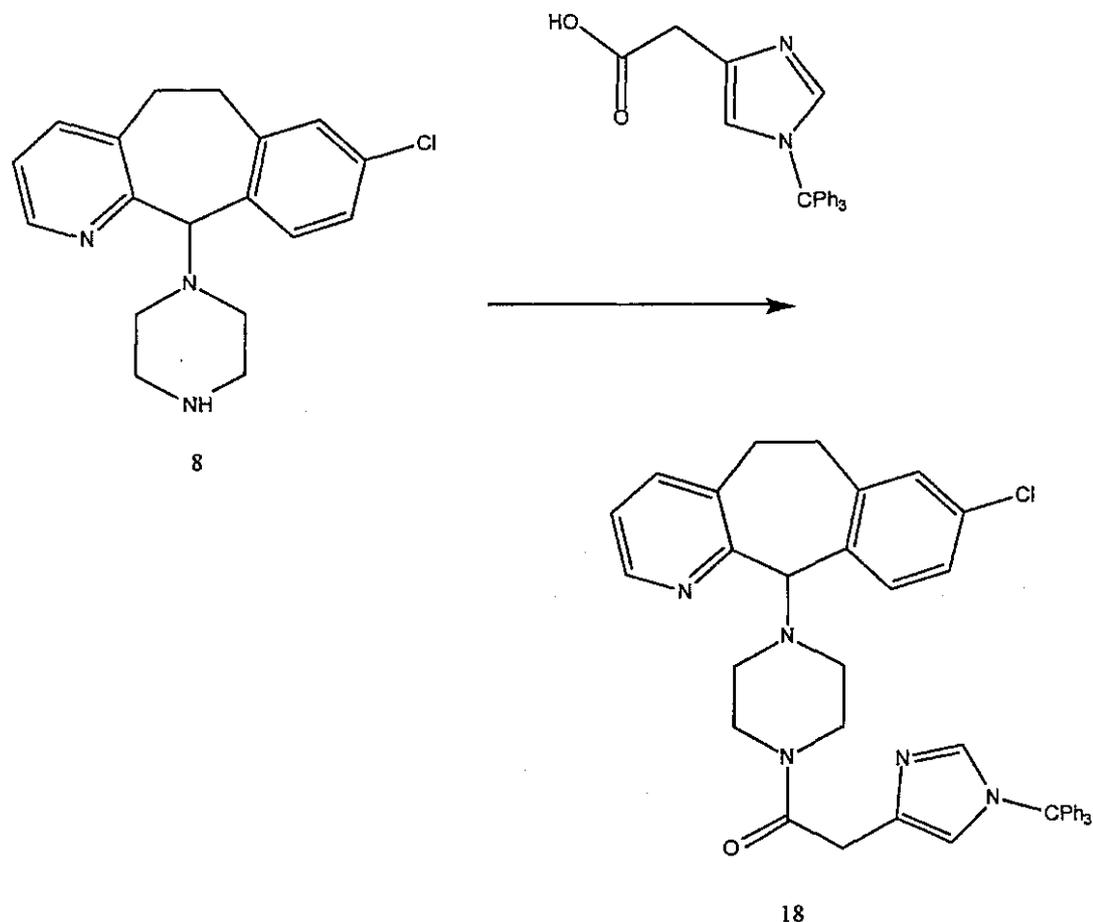

- 5 Purified by flash chromatography to give title compound (17) ($C_{25}H_{27}ClN_4 \cdot 3HCl \cdot 1.8 H_2O$) (79%).

Example 19. Preparation of 8-chloro-6,11-dihydro-11-[4-[2-(1H-imidazol-4-yl)ethyl]-1-piperazinyl]-5H-benzo[5,6]cyclohepta[1,2-b]pyridine:

- 10 (i) To a solution of compound (8) (0.1g; 0.32 mmole) in anhydrous dichloromethane (15 ml) cooled to 0° C was added the trityl protected urocanic acid (0.14g; 0.38 mmole), 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (0.092 g; 0.48 mmoles) and hydroxybenzotriazole (0.065 g; 0.48 mmoles). The reaction was stirred for 3 h. at room temperature, then quenched with saturated solution of sodium carbonate. The aqueous layer was extracted

48

with ethyl acetate. The combined organic layers were then washed with brine,

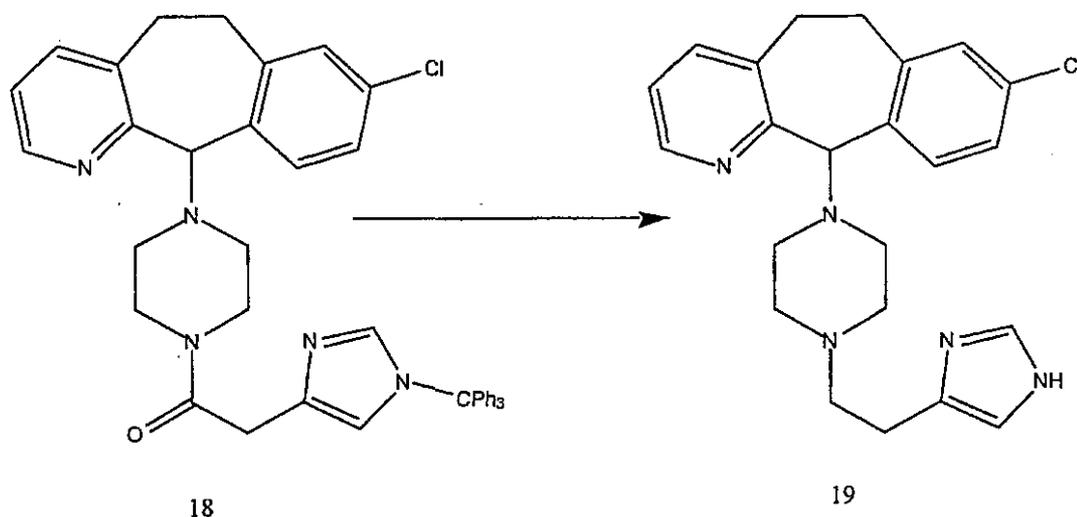

dried over potassium carbonate, filtered and concentrated. The product was purified by flash chromatography eluting with a gradient of 4M ammonia in methanol-dichloromethane (1:9 - 5:95) to afford compound (18) (77%).

(ii) To a solution of compound (18) (1.09g; 1.6 mmole) in tetrahydrofuran (5 ml) was added a 1.0M solution of lithium aluminum hydride in tetrahydrofuran (4.8 ml; 4.8 mmole). The reaction stirred for 3 h. at room temperature, then was diluted with diethyl ether and quenched with saturated aqueous sodium sulfate.

10 The solid was extracted with ethyl acetate. The combined organic layers were

49

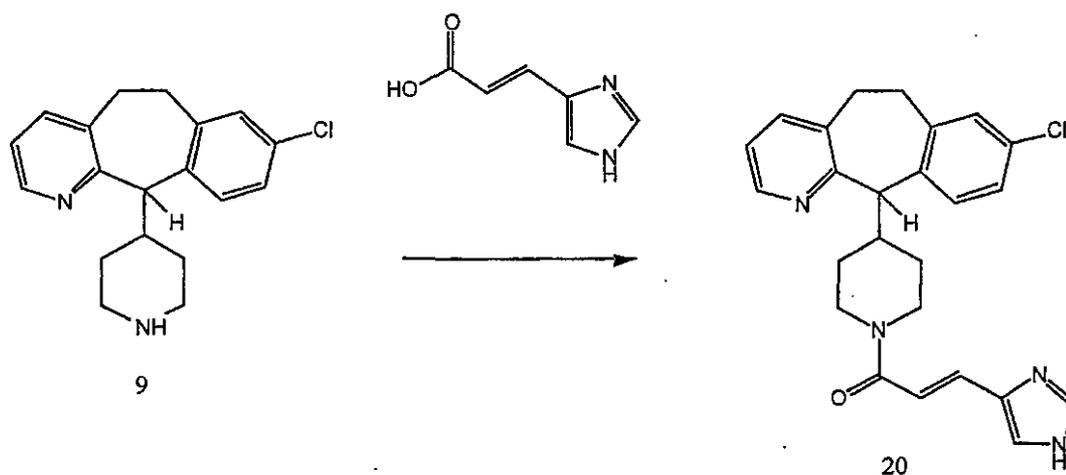

dried over potassium carbonate, filtered and concentrated. The residue was

purified by flash chromatography eluting with a gradient of 4M ammonia in methanol-dichloromethane (1:9 - 5:95) (85%).

- 5 (iii) Using a similar procedure as in Example 12 the product from Step 2 was ditritylated to afford the HCl salt of the title compound as a white solid, ($C_{23}H_{26}ClN_5 \cdot 4 HCl$)

10 Example 20. Preparation of a mixture of 4-(8-Chloro-6,11-dihydro-5H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-yl)-1-[3-(1H-imidazol-4-yl)-1-oxopropyl]piperidine (21) and 4-(6,11-dihydro-5H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-yl)-1-[3-(1H-imidazol-4-yl)-1-oxopropyl]piperidine (22):

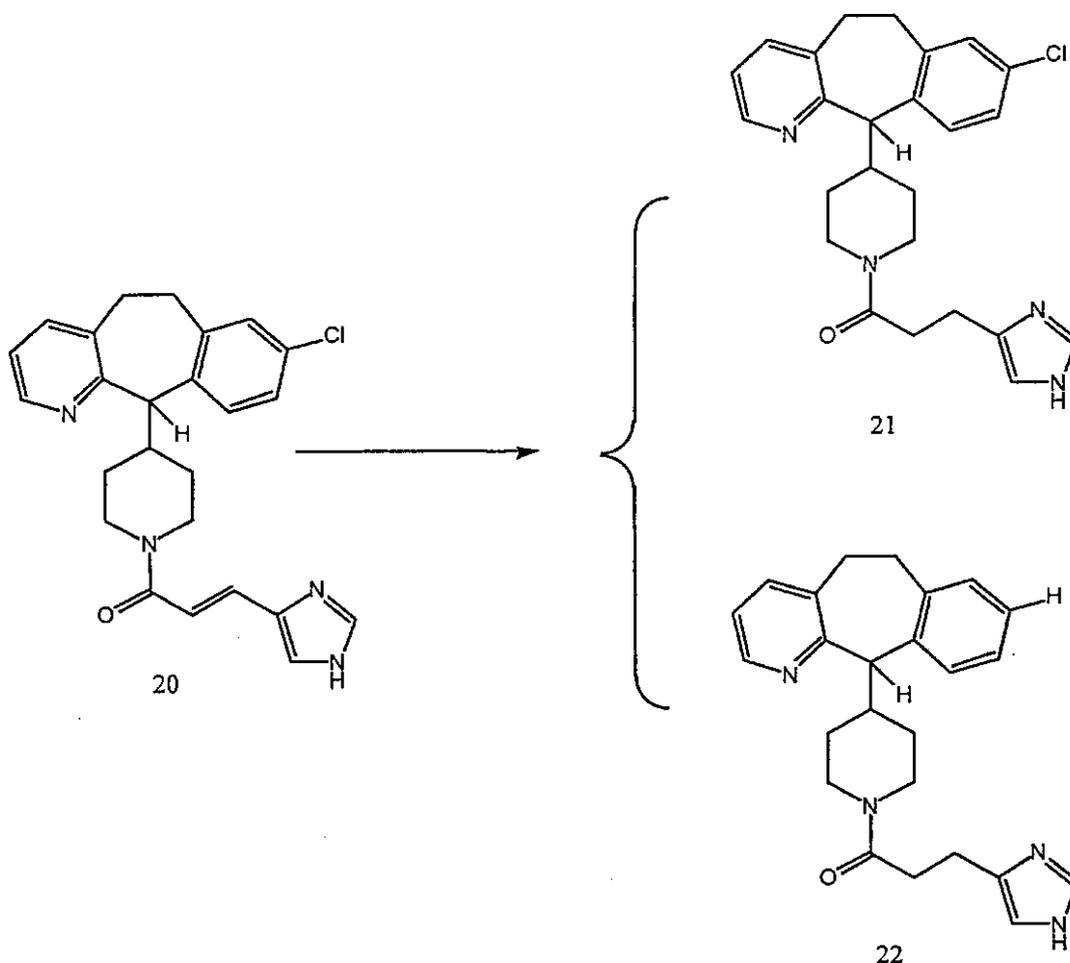

(i) Preparation of 4-(8-chloro-6,11-dihydro-5H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-yl)-1-[(E)-3-(1H-imidazol-4-yl)-1-oxo-2-propenyl]piperidine (20):

To a suspension of urocanic acid (258 mg; 1.87 mmol) in N,N-dimethylformamide (32.5 mL) under an inert atmosphere, was added 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (358 mg; 1.87 mmol) and hydroxybenzotriazole (201 mg; 1.49 mmol). The resultant mixture was warmed to 40 °C, and stirring was continued until all solids dissolved (~10 min.). To the resultant solution was added 8-chloro-6,11-dihydro-11-(4-piperidinyl)-5H-benzo[5,6]cyclohepta[1,2-b]pyridine (9) (467 mg; 1.49 mmol), and the resultant solution was allowed to stir at room temperature for 17 h. Water (67 microliters; 3.7 mmol) was added, the solution was stirred briefly, and was then concentrated under reduced pressure. The residual oil was partitioned between dichloromethane (100 mL) and water (50 mL). It was treated with small volumes of methanol, and the resultant mixture was allowed to stand for 2 h. or as needed to obtain separation of the emulsified layers. The organic extract was dried by filtration through a pad of silica gel in a sintered glass funnel, eluting with dichloromethane-methanol-concentrated ammonium hydroxide (90:9:0.5). The solvent was removed from the filtrate under reduced pressure to obtain the title compound as a fluffy tan solid. CIMS: 433, 435 (MH⁺; 100/47%); 461 ([M + C₂H₅]⁺; 18%).

(ii) Preparation of a mixture of 4-(8-Chloro-6,11-dihydro-5H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-yl)-1-[3-(1H-imidazol-4-yl)-1-oxopropyl]piperidine and 4-(6,11-dihydro-5H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-yl)-1-[3-(1H-imidazol-4-yl)-1-oxopropyl]piperidine (21, 22):

25

A mixture of unsaturated amide 20 (480 mg; 1.11 mmol), 1.0M ethereal hydrochloric acid (1.1 mL; 1.1 mmol) and 10% palladium-on-charcoal catalyst (216 mg) in anhydrous methanol (40 mL) was hydrogenated for 20 h. at 50 psi on a Parr shaker. The catalyst was filtered through Celite, the solvent evaporated under reduced pressure, and the residual solid partitioned between dichloromethane (30 mL) and saturated aqueous sodium bicarbonate (20 mL). The aqueous layer was extracted with dichloromethane (10 mL). The organic extracts were combined, washed with water (20 mL), followed by brine (20 mL) and dried by filtration through anhydrous sodium sulfate. Solvent was removed from the filtrate under reduced pressure, and the residue dried under high vacuum to obtain a fluffy white solid, which exhibited a homogeneous single spot with traces of minor impurities in a variety of TLC systems (varied proportions of

dichloromethane-methanol-ammonium hydroxide). Spectroscopic and elemental analysis data revealed the product to be an approximately 2:1 mixture of the expected double bond reduction product (M₁) and its dechlorinated derivative

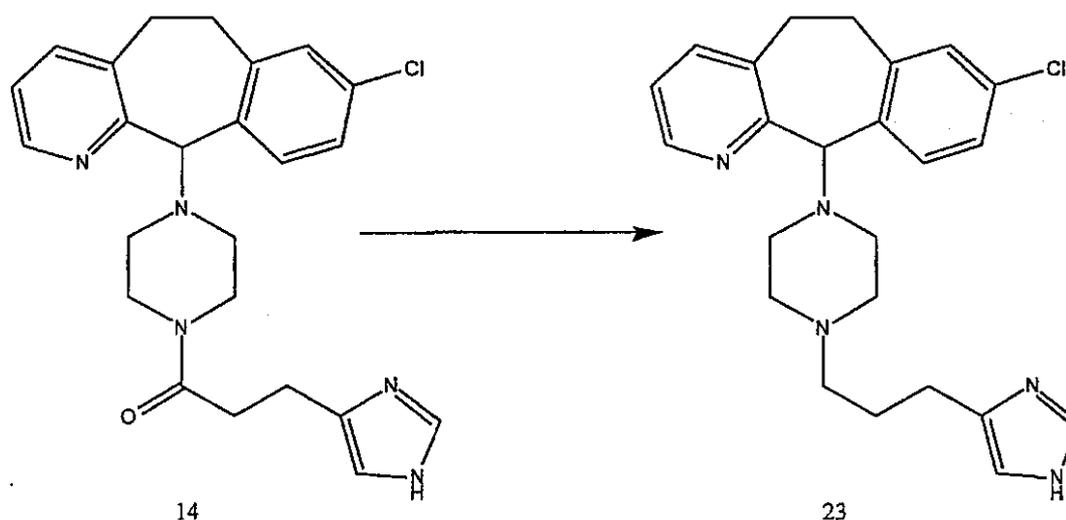

(M₂). FABMS: 435, 437 (M₁H⁺; 70/25%); 401 (M₂H⁺; 100%). Spectroscopic and

5 elemental analyses were in accord with the following formulas:

C₂₅H₂₇ClN₄O•0.5 and C₂₅H₂₈N₄O•H₂O•0.125 CH₂Cl₂.

Example 21. Preparation of 1-(8-chloro-6,11-dihydro-5H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-yl)-4-[3-(1H-imidazol-4-yl)-propyl]piperazine (23):

10

(i) To a solution of 1-(8-chloro-6,11-dihydro-5H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-yl)-4-[3-(1H-imidazol-4-yl)-1-oxo-propyl]piperazine(14) (310 mg; 0.711 mmol) in tetrahydrofuran (10 mL) stirred under an inert atmosphere, was added via syringe a 1.0M solution of lithium aluminum hydride in tetrahydrofuran (1.60 mL; 1.60 mmol) in small portions over approximately 3 min. The reaction solution was stirred at room temperature for 3 h. The reaction was quenched with vigorous stirring by the cautious, dropwise addition of water (61 microliters), followed successively by 15% aqueous sodium hydroxide (61 microliters) and water (183 microliters). The resultant precipitate was filtered, and solvent removed from the filtrate under reduced pressure. The residue was partitioned between dichloromethane (25 mL) and water (20 mL). The organic layer was

15

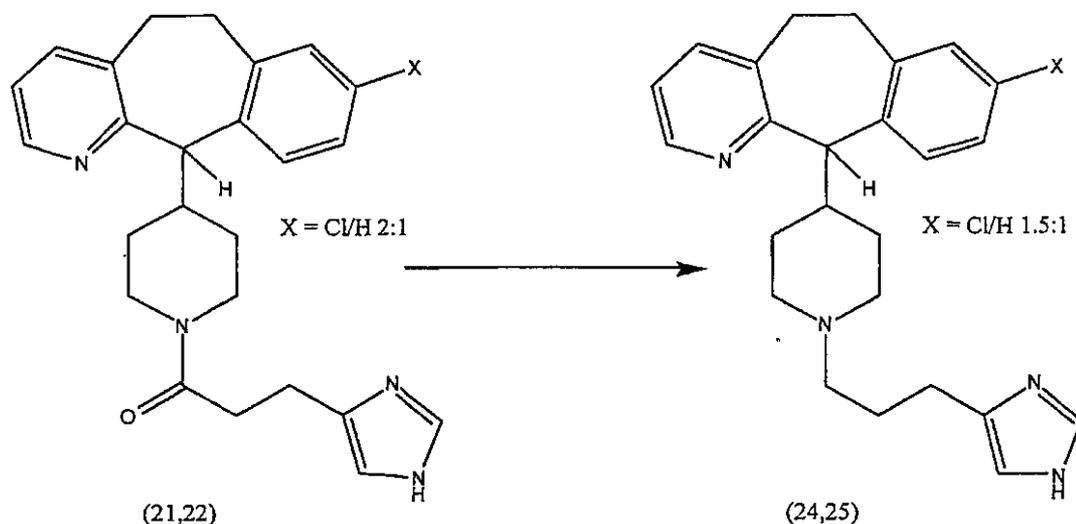

20

washed with brine (20 mL); filtered through anhydrous sodium sulfate; and solvent removed from the filtrate to obtain the free base form of the title compound as a yellow powder. This was chromatographed on silica gel, eluting with dichloromethane-methanol-concentrated ammonium hydroxide (90:9:0.5), to
5 obtain the title compound as an off-white powder that decomposed at ~91-98 °C. CIMS: 422,424 (MH^+ ; 100/32%); 450, 452 ($[M + C_2H_5]^+$; 14/6%).

(ii) To a vigorously stirred solution of the above free base (66 mg; 0.152 mmol) in dichloromethane (2.75 mL), was added diethyl ether (8 mL), followed by 0.115M ethereal maleic acid (2.75 mL; 0.316 mmol). The resultant precipitate
10 was triturated in the reaction medium for approximately 5 min. The supernatant was decanted, and fresh ether (15 mL) was added. This process was repeated twice more. The hygroscopic solid was then quickly filtered and dried under high vacuum over phosphorus pentoxide to obtain a maleate salt form of the title compound. FABMS: 422, 424 (MH^+ ; 86/31%); 228, 230 (53/19%).
15 Spectroscopic and elemental analyses were in accord with the following formula: $C_{24}H_{28}ClN_5 \cdot 2 C_4H_4O_4 \cdot 0.8 H_2O \cdot 0.6 C_4H_{10}O$ (Et₂O).

Example 22. Preparation of a mixture of 8-Chloro-6,11-dihydro-11-[1-[3-(1H-imidazol-4-yl)propyl]-4-piperidinyl]-5H-benzo[5,6]cyclohepta[1,2-b]pyridine(24) and 6,11-dihydro-11-[1-[3-(1H-imidazol-4-yl)propyl]-4-piperidinyl]-5H-benzo[5,6]cyclohepta[1,2-b]pyridine(25):
20

54

(i) To a solution of the mixture of unsaturated amides (21,22) (275 mg; 0.414 mmol) in tetrahydrofuran (8 mL) stirred under an inert atmosphere, was added via syringe, a 1.0M solution of lithium aluminum hydride in tetrahydrofuran (1.28 mL; 1.28 mmol) in small portions over 3-4 min. The reaction was stirred at room temperature for 4 h. The vigorously stirred reaction was quenched by the cautious, dropwise addition of water (49 microliters), followed successively by 15% aqueous sodium hydroxide (49 microliters) and water (147 microliters). The resultant precipitate was filtered, and solvent removed from the filtrate under reduced pressure. The residue was partitioned between dichloromethane (20 mL) and water (20 mL). The organic layer was washed with brine (20 mL); filtered through anhydrous sodium sulfate; and solvent removed from the filtrate under reduced pressure. The residue was chromatographed on silica gel, eluting with dichloromethane-methanol-concentrated ammonium hydroxide (90:9:0.5), to obtain the free base form of the title mixture as a white powder. Spectroscopic and elemental analyses were in accord with the following formula:

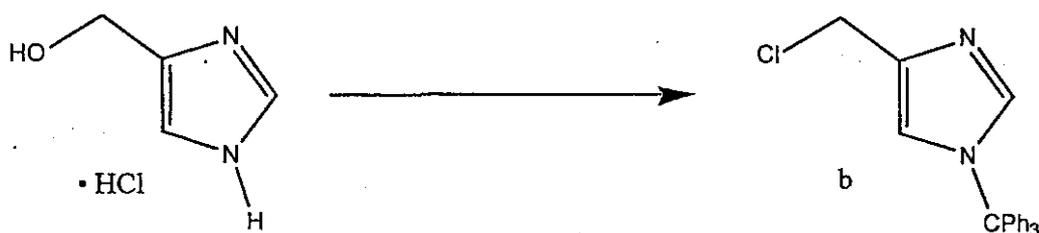

$\text{C}_{25}\text{H}_{29}\text{ClN}_4 \cdot 0.75 \text{C}_{25}\text{H}_{30}\text{N}_4 \cdot 1.25 \text{H}_2\text{O}$.

(ii) To a vigorously stirred solution of the above free base mixture (85 mg; ~0.203 mmol) in dichloromethane (1 mL), was added diethyl ether (3 mL), followed by 0.115M ethereal maleic acid (5.29 mL; 0.608 mmol). The resultant precipitate was triturated in the reaction medium for approximately 5 min. The

supernatant was decanted, and fresh ether (3 mL) was added. This process was repeated twice more; then the hygroscopic solid was quickly filtered and dried under high vacuum to obtain the maleate salt form of the title mixture.

Spectroscopic and elemental analysis data revealed the product to be an approximately 1.5:1 mixture of the chlorinated reduction product (M₁) and its dechlorinated derivative (M₂). FABMS: 421, 423 (M₁H⁺; 65/29%); 387 (M₂H⁺; 100%). Spectroscopic and elemental analyses were in accord with the following formula: C₂₅H₂₉ClN₄•0.68 C₂₅H₃₀N₄•3.6 C₄H₄O₄•4 H₂O•.0.5 C₄H₁₀O (Et₂O).

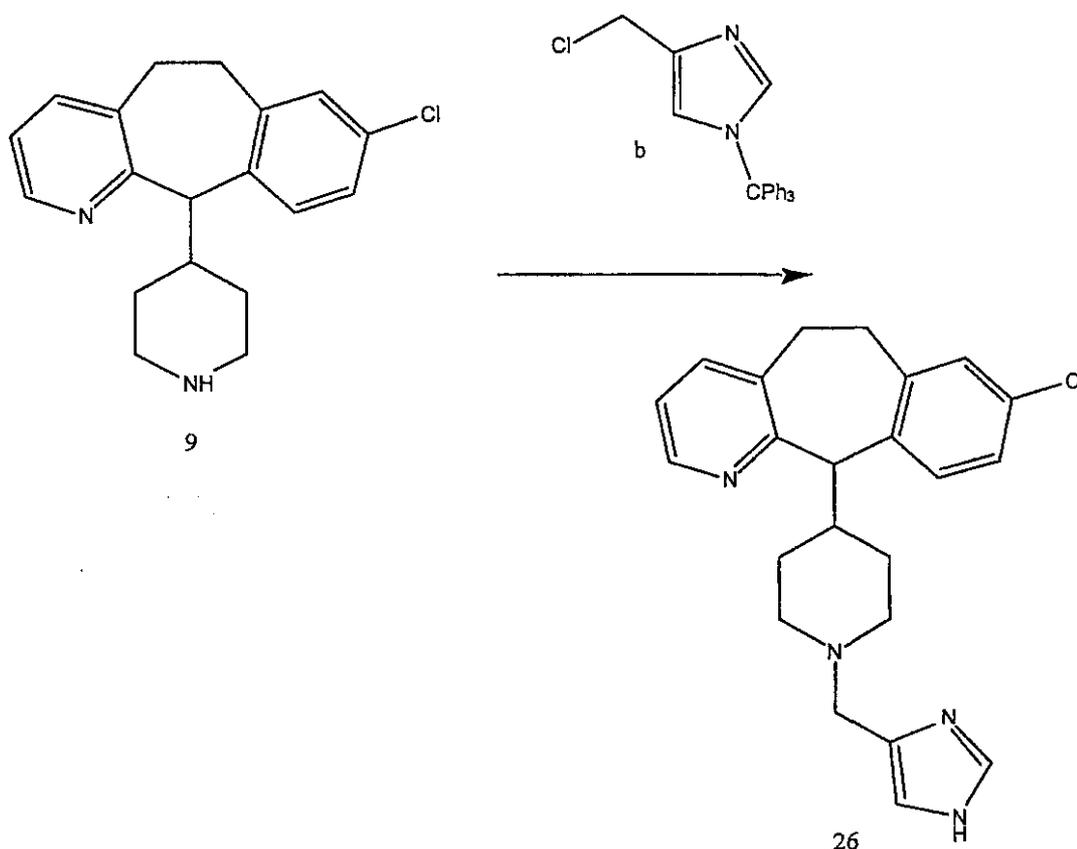

10 Example 23. Preparation of 1-trityl-4-chloromethyl imidazole:

(i) Commercially available 4-hydroxymethyl imidazole hydrochloride (from Aldrich) and triphenyl methyl chloride were reacted according to literature procedure (Kelley, *J. Med. Chem* 20(5), 721, (1977)).

(ii) The product from Example 23 (i) was suspended in benzene (464 ml) and azeotroped to dryness by distilling off 50 ml. of benzene. Then triethyl amine (27.76 ml) was added. The resultant mixture was cooled to zero degrees centigrade, and thionyl chloride was added dropwise over 10 minutes. After 35 minutes, ethyl acetate and water were added. The aqueous layer was separated and washed with ethyl acetate. The combined organic extracts were washed with saturated sodium bicarbonate then brine, dried over potassium carbonate, filtered and concentrated. Drying under high vacuum protected from light yielded the title compound (b).

Example 24. Preparation of 8-chloro-6,11-dihydro-11-[1-(1H-imidazol-4-ylmethyl)-4-piperidinyl]-5H-benzo[5,6]cyclohepta(1,2-b)pyridine (26):

5 (i) To a solution of compound (9) (0.5g; 1.9 mmole) in anhydrous dichloromethane (10ml) was added the trityl protected imidazolechloride (b) from Example 23 (0.68g; 1.9 mmole) and triethyl amine (0.264 ml; 1.9 mmole). The reaction was stirred overnight at room temperature. Water (10ml) and ethyl acetate (20 ml) were added successively to the mixture. The aqueous layer was
10 separated and then extracted with ethyl acetate (2 x 10ml). The combined organic layers were dried over magnesium sulfate, filtered and concentrated. The residue was purified by flash chromatography (36%).

(ii) By using a similar procedure as in Example 12, the trityl precursor was deprotected to give the HCl salt of the title compound as a white solid (26),

15 $C_{23}H_{25}ClN_4 \cdot 3 HCl \cdot 1.5 H_2O$.

By substituting compound (10) (Example 14) in the foregoing reaction process, the following compound was made: 8-chloro-6,11-dihydro-11-(1-(4-imidazolylmethyl)-4-piperidylidene)-5H-benzo[5,6]cyclohepta[1,2-b]pyridine, $C_{23}H_{23}ClN_4 \cdot 3 HCl$.

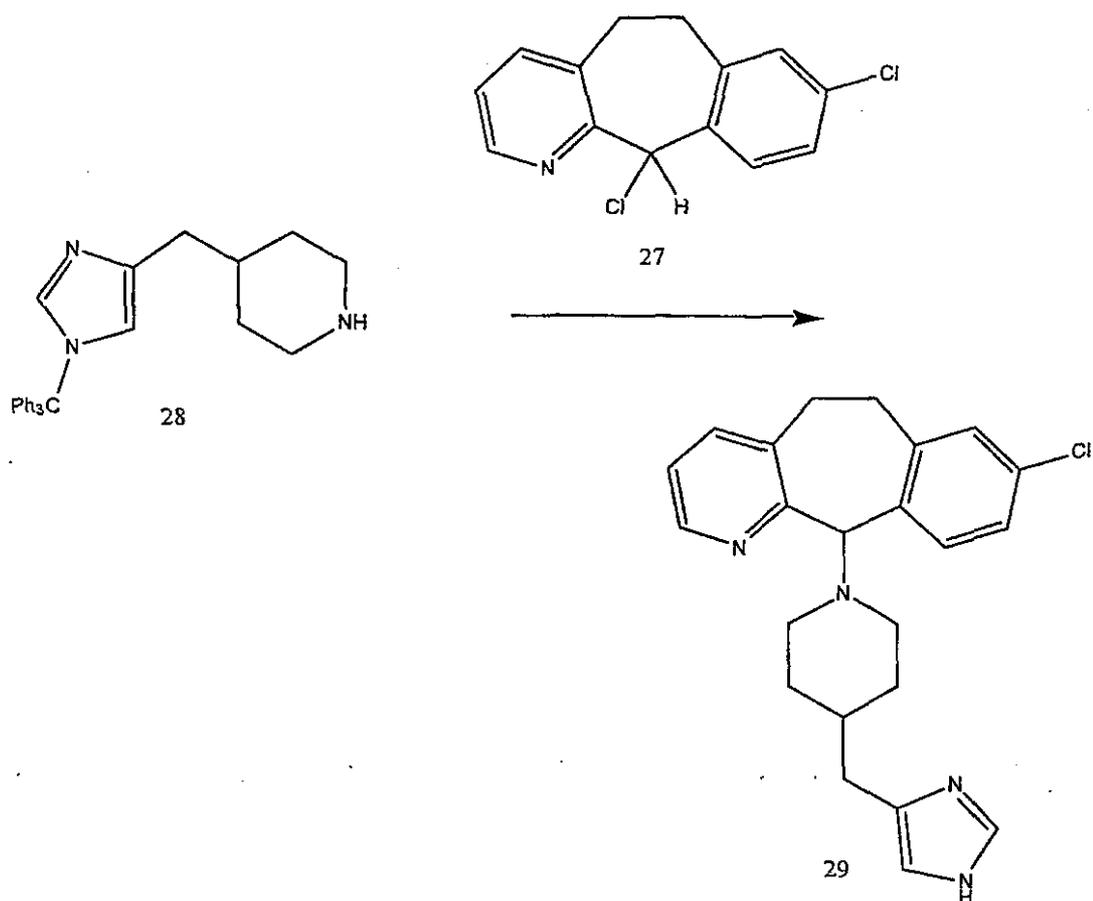

5 Example 25. Preparation of compound (27):

This is disclosed in published application WO 95/10516.

Example 26. Preparation of compound (28):

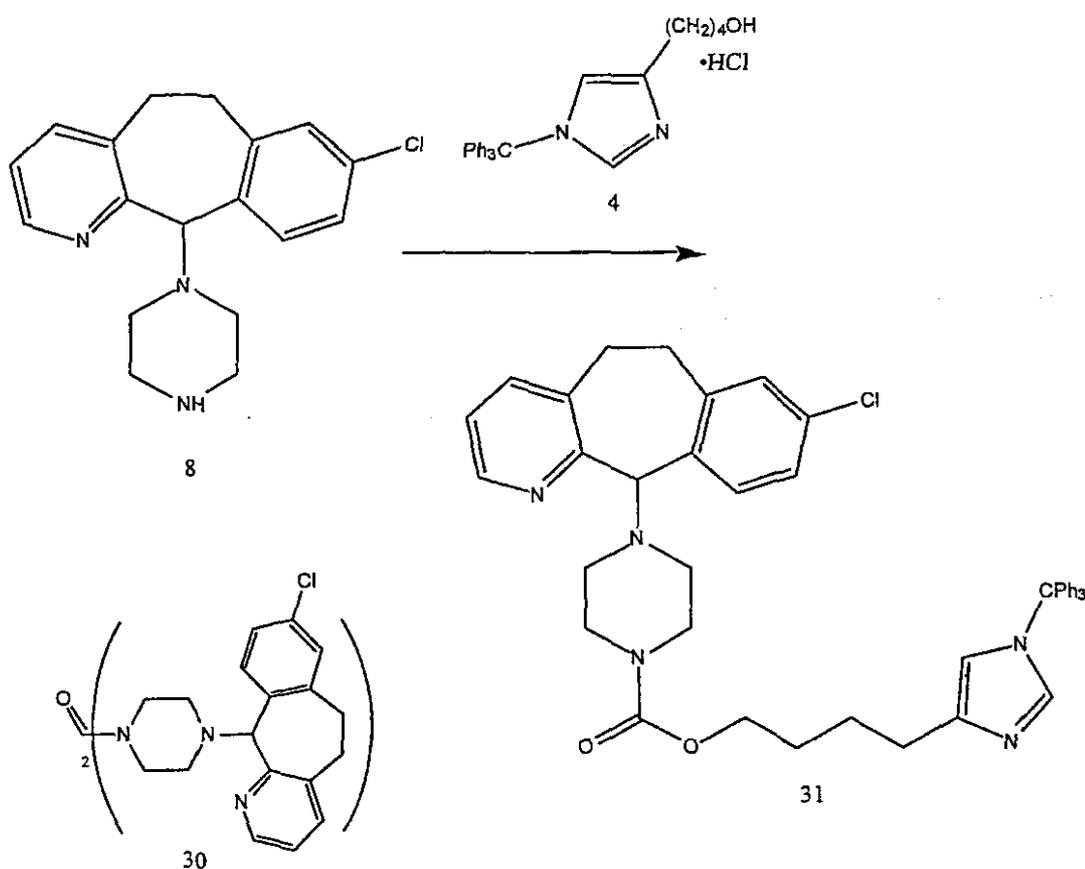

This is disclosed in US patent 5,463,074.

10 Example 27. Preparation of 11-[4-[(1H-imidazol-4-yl)methyl]-1-piperidinyl]-8-chloro-6,11-dihydro-5H-benzo[5,6]cyclohepta[1,2-b]pyridine (29):

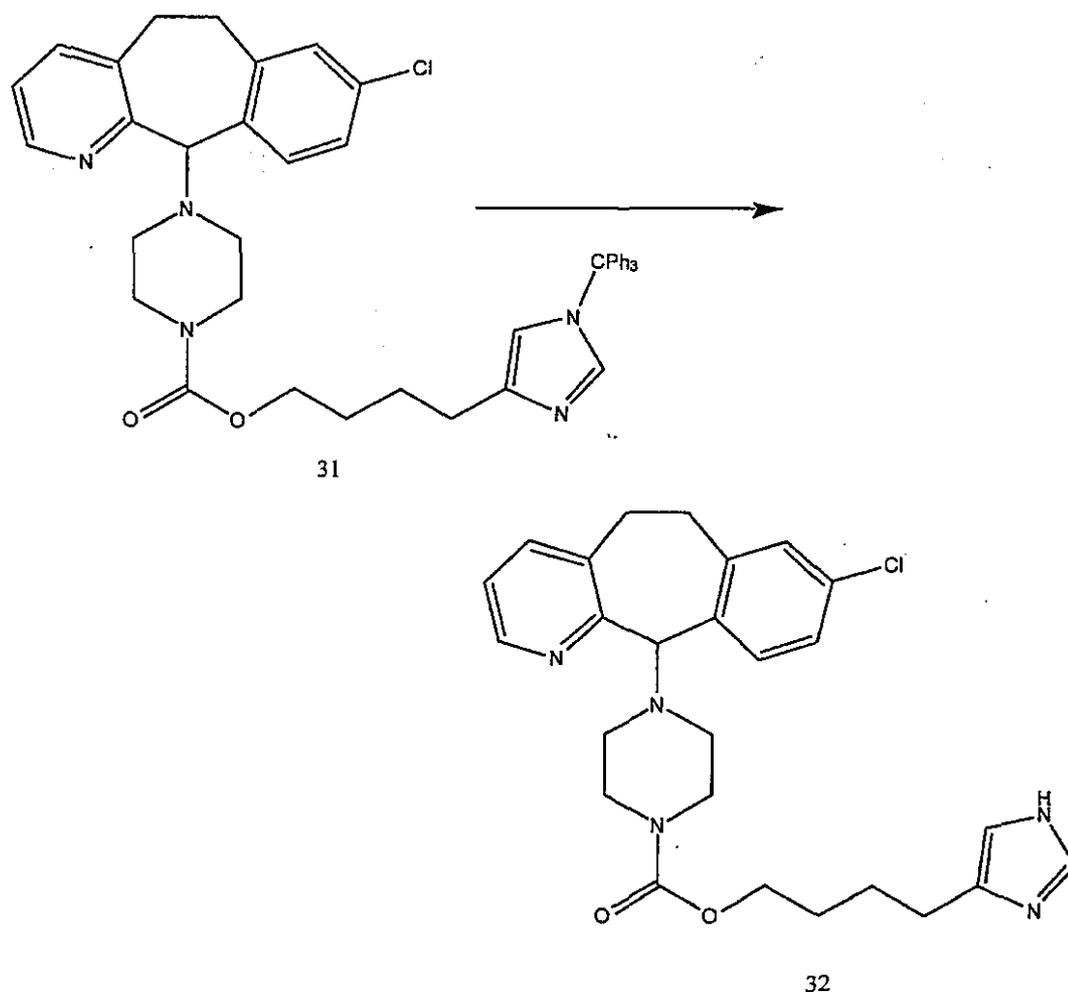

Compounds (27) and (28) were combined and reacted via the method reported in Example 24. The product was obtained as the HCl salt of the title compound (29), $C_{23}H_{25}ClN_4 \cdot 3 HCl \cdot 2 H_2O$ CIMS:393 (MH⁺)

Example 28. 4-(1H-imidazol-4-yl)butyl 4-(8-chloro-6,11-dihydro-5H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-yl)-1-piperazinecarboxylate (31):

- (i) To a stirred suspension of sodium hydride (200 mg of 60% dispersion; 10 5.0 mmol) in dry tetrahydrofuran (25 mL), was added portionwise alcohol hydrochloride (4) (1.05 g; 2.5 mmol) over a period of 10 min. The resultant suspension was stirred at room temperature for 3.5 h. The piperazine derivative (8) (706 mg; 2.25 mmol) was added, the mixture was diluted with dry tetrahydrofuran (25 mL), and the resultant suspension allowed to stir overnight at 15 room temperature. Triethylamine (0.35 mL; 2.5 mmol) was added, followed by the addition over about 4 min. of a solution of triphosgene (252 mg; 0.849 mmol)

in dry dichloromethane (2.5 mL) (mild exotherm). The resultant suspension was stirred at room temperature for 6 h; then the solids were filtered and washed with ethyl acetate. The filtrate and washings were combined, and solvent removed under reduced pressure. Chromatography of the residue on silica gel, eluting with a gradient of ethyl acetate-methanol (98:2 → 95:5), yielded the title tritylated product (31) as a white glassy foam. ESIMS: 722 (MH^+ ; 85%); 243 (Ph_3C^+ ; 100%). [A more polar fraction corresponding to symmetrical urea (30) was also isolated.]

10

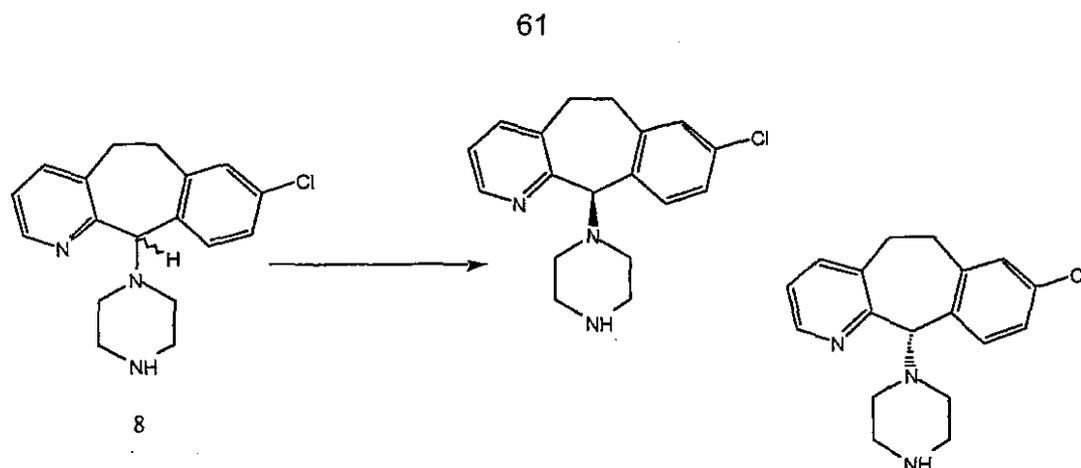

(ii) A mixture of the above tritylated carbamate (31) (310 mg; 0.430 mmol) and 15% aqueous hydrochloric acid (10 mL) in methanol (10 mL) was refluxed for

1.5 h. 6M HCl (4 mL) and methanol (1 mL) were added and reflux continued for another hour. Solvent was removed under reduced pressure. The residue was partitioned between dichloromethane (25 mL) and 1.1M aqueous sodium bicarbonate (13 mL). The aqueous layer was extracted with dichloromethane (3
5 x 25 mL), and the combined organic extracts were washed with water (2x) and brine. The organic layers were dried over anhydrous magnesium sulfate; drying agent was filtered, solvent removed under reduced pressure and the residue dried under high vacuum to obtain the title product (32) as a free base. FABMS:
460 (MH⁺; 100%).

10 (iii) To a solution of the free base of the title product (98.4 mg; 0.205 mmol) in methanol (4.5 mL), was added 1.0M ethereal hydrochloric acid (0.72 mL; 0.72 mmol). The solvent was removed under reduced pressure, and the residue dried under high vacuum, over phosphorus pentoxide, to obtain the hydrochloride salt
of the title product as a pale yellow foam. CIMS: 480 (MH⁺; 97%); 251 (54%);
15 228 (100%). Spectroscopic and elemental analyses were in accord with the following formula: C₂₆H₃₀ClN₅O₂•2.6 HCl•4 H₂O•0.7 CH₄O (MeOH).

Example 29. Preparation of (+)-(8-Chloro-6,11-dihydro-5H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-yl)-4-[(1H-imidazol-4-yl)methyl]-piperazine(33) and (-)-(8-Chloro-6,11-dihydro-5H-benzo[5,6]cyclohepta[1,2-
20 b]pyridin-11-yl)-4-[(1H-imidazol-4-yl)methyl]-piperazine (34).

(i) A hot (steam bath) mixture of the racemic piperazine compound (8) (1g) in 8% aqueous acetonitrile (10 ml) was filtered leaving about 0.33g residue. A hot solution of N-acetyl-L-leucine (0.55g) in 8% aqueous acetonitrile (10 ml) was added to the filtrate followed by 8% aqueous acetonitrile (8 ml). The solution was
25 allowed to stand and cool. After 24.5 h., the crystals were filtered and allowed to

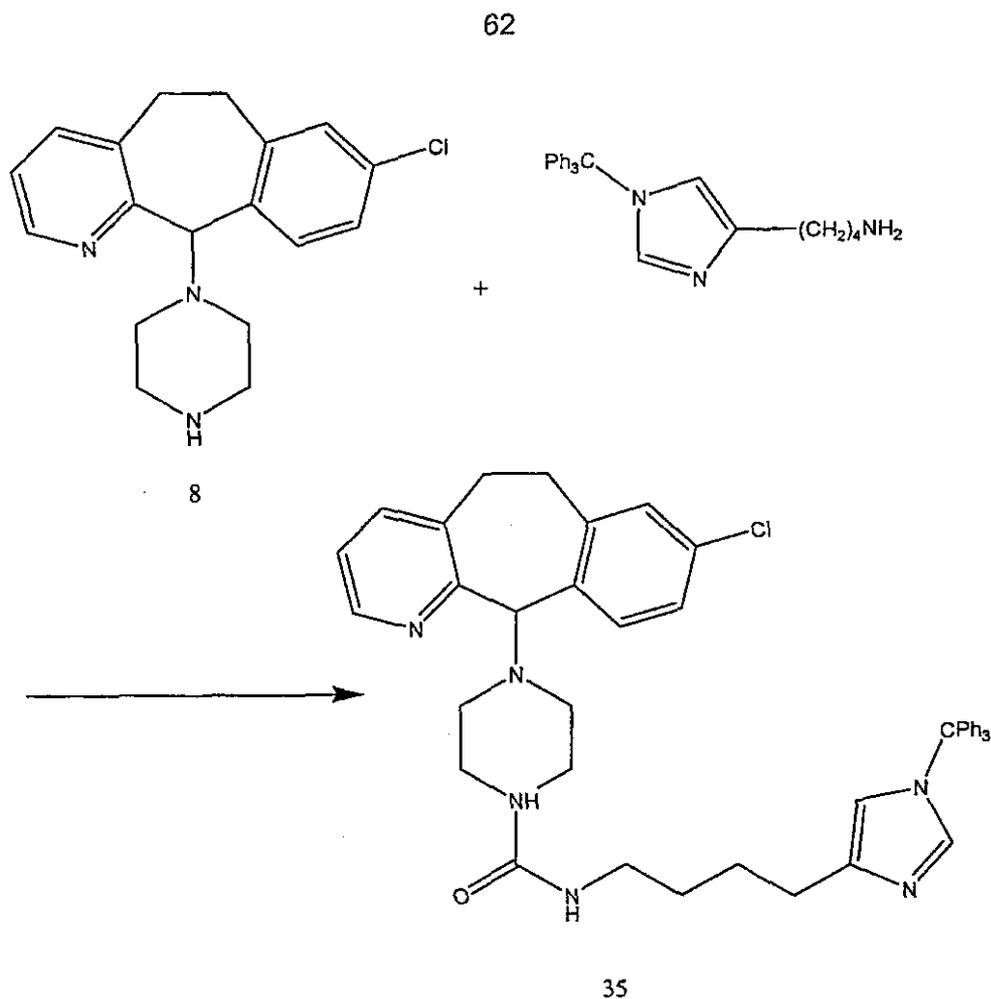

dry. The crystals were then stirred with potassium carbonate (0.11g; 0.8 mmole), water (10ml) and dichloromethane (10ml). The aqueous layer was separated and
 5 extracted with dichloromethane (5ml). The combined extracts were washed with brine, dried over sodium sulfate, filtered and concentrated to a white foam. The procedure was repeated twice more with the original racemic mixture to afford a total of 0.59g having 82-90% ee. This material was then recycled in the same manner to afford 0.13g with 100% ee. The combined mother liquors were
 10 concentrated and basified as above, then treated in the same manner with N-acetyl-D-leucine twice to give 0.39g with 100% ee of the opposite enantiomer.

(ii) By reacting the respective (+) and (-) enantiomers of compound (8) with the trityl protected chloroimidazole following the procedure found in Example 13, the following compounds were made:

15 (+)-(8-Chloro-6,11-dihydro-5H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-yl)-4-[(1H-imidazol-4-yl)methyl]-piperazine, $C_{22}H_{24}ClN_5 \cdot 4HCl \cdot 3H_2O$ CIMS: 394 (MH+).

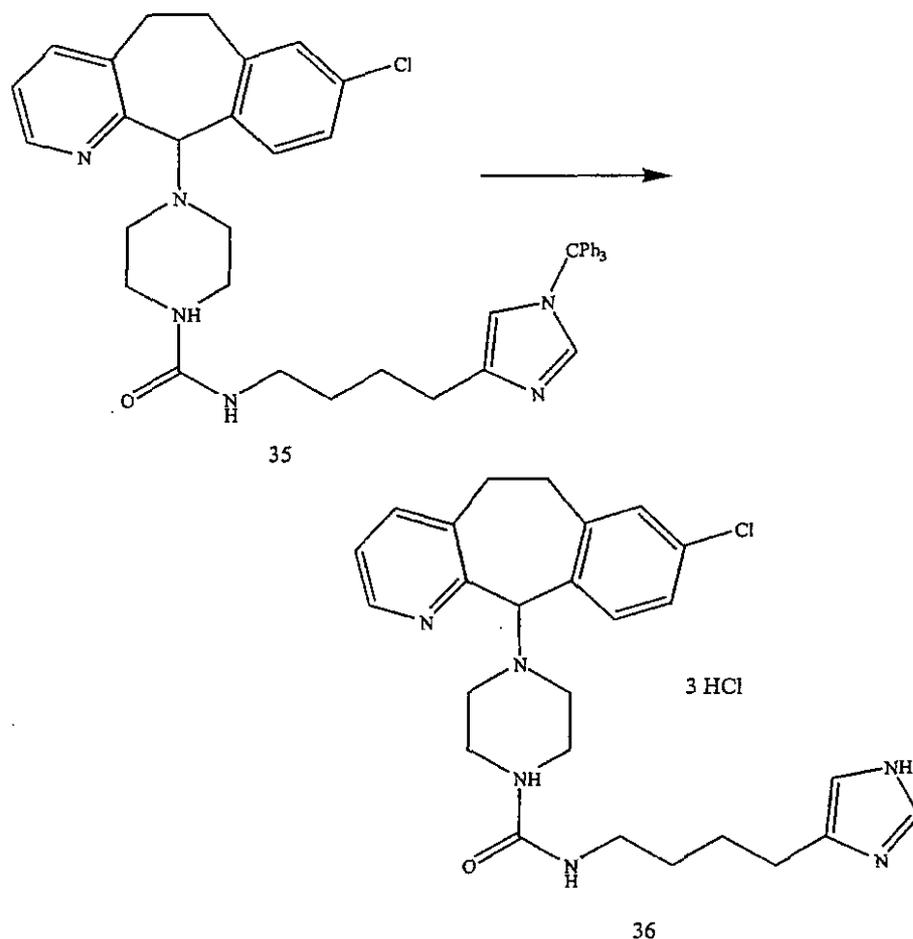

(-)-(8-Chloro-6,11-dihydro-5H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-yl)-4-[(1H-imidazol-4-yl)methyl]-piperazine, $C_{22}H_{24}ClN_5 \cdot 4HCl \cdot 4H_2O$ CIMS: 394
 20 (MH+).

Example 30. Preparation of 4-(8-Chloro-6,11-dihydro-5H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-yl)-N-[4-(1H-imidazol-4-yl)butyl]-1-piperazinecarboxamide(36):

(i) A solution of compound 8 (47.7 mg; 0.152 mmol) and triethylamine (0.025 ml; 0.177 mmol) in CH_2Cl_2 (0.5 ml) was added dropwise over 10 minutes at 20°C to a stirred solution of triphosgene (16.4 mg; 0.0555 mmol) in CH_2Cl_2 (0.4 ml). After stirring the reaction mixture for an additional 20 minutes at room temperature, a solution of the amine (literature compound: Wolin, R. *et al*, *Bioorg. Med. Chem. Lett.* **8** (1998) 2157-162.) (57.2 mg; 0.15 mmol) and triethylamine (0.015 ml; 0.177 mmol) in dichloromethane (0.5 ml) was added dropwise over 7 minutes at 20°C . The yellow-green reaction was stirred at room temperature for 20.5 h. The crude reaction mixture was loaded on silica gel and chromatographed, eluting with a gradient of ethyl acetate-methanol (95:5→90:10), to obtain the tritylated product as a solid (35). FABMS:721 (MH^+).

63

(ii) By using a similar procedure as in Example 12, the trityl precursor was deprotected to give the HCl salt of the title compound (36) as a light tan solid. FABMS: 479 (MH⁺). HRMS: (C₂₆H₃₂ClN₆O) calc. 479.2326, meas. 479.2320.

5 **General Procedure for H₁-Receptor Binding Assay:** The procedure used was based on that disclosed in V.T. Tran *et al*, "Histamine H₁ receptors identified in mammalian brain membranes with [H-3]mepyramine", *Proc. Natl. Acad. Sci. U.S.A.* **75** (1978) 6290-6294.

I: Tissue preparation protocol for histamine H₁ receptor binding assay:

- 10 1. The tissue source was male Sprague-Dawley rat brain. These were purchased, stripped and frozen (available from Rockland Corporation, Gilbertsville, Pennsylvania). The buffer used was ice-cold 50 mM Tris-HCl, pH 7.5. (The pH was determined at 25° C.)

2. The brains were spread out on plastic wrap on the benchtop and allowed to thaw for 10 - 15 min. After this, everything was kept ice-cold.

3. Two brains were put in each 50 ml round bottom centrifuge tube and 25 ml of buffer was added. Then they were broken up with a Polytron (from Brinkmann
5 Instruments, Westbury, New York) equipped with a PT-10 tip at setting 6 for 30 sec.

4. The volume in the tube was brought up to 45 ml and mixed and the particulate material was centrifuged at 1000 xg (3000 rpm, SS-34 rotor) for 10 min to remove nuclei and unbroken cells.

10 5. Pellets were discarded and the supernatants were centrifuged 10 min at 50,000 xg (20,000 rpm, SS-34 rotor).

6. The high-speed pellets were resuspended in a volume of Tris buffer equal to the original (4 ml), the contents of all tubes were pooled, and a sample was taken for BCA protein assay. The material was aliquotted, 45 ml per round-
15 bottom tube, and the resuspension was recentrifuged. The yield of protein was approximately 20 mg/brain, so there was about 40 mg of protein per tube.

7. Pellets were frozen at $-80^{\circ}C$.

II. H₁ Histamine receptor binding assay:

Materials: 96-well, deep-well, polypropylene plates, [³H] pyrilamine, 20-30
20 Ci/mmol, from Dupont NEN Life Science Products, Boston, Massachusetts), chlorpheniramine maleate (from Schering-Plough Corporation, Kenilworth, New Jersey) as standard, stored as frozen 10^{-5} , 10^{-6} , 10^{-7} , 10^{-8} M solutions.

1. FDCL and comparative compounds for assay were independently solubilized at 1 mg/ml DMSO by vortexing, or if necessary by sonication. The first
25 dilution, 100-fold, was made in 50 mM Tris-HCl, pH 7.5, at room temperature. The three or four subsequent ten-fold serial dilutions were made in 1% DMSO/50 mM Tris-HCl, pH 7.5. Drug solutions and assay plates were kept at room temperature during the course of the assay set up.

2. Test compounds were assayed at four or five concentrations: 1, 0.1, 0.01,
30 0.001, and 0.0001 $\mu g/ml$. Twenty μl of drug solution was pipeted into each of three wells. A chlorpheniramine maleate standard was assayed at 10^{-9} to 10^{-6} M, 20 μl of each of the appropriate solutions being pipeted into triplicate wells. Total

and nonspecific (10^{-5} M chlorpheniramine maleate) binding were determined at least in quadruplicate. For total binding, 20 μ l of buffer was pipeted and for nonspecific 20 μ l of 10^{-5} M chlorpheniramine maleate was pipeted into each well.

3. $[^3\text{H}]$ Pyrilamine was diluted approximately 2000-fold with ice-cold mM Tris-HCl, pH 7.5 (to a working concentration of 20-25 nM), and put on ice.
4. A frozen tissue pellet was thawed in a 25°C water bath, resuspended in 50 mM Tris-HCl, pH 7.5, at 1.7-2 mg/ml by brief break-up on the Polytron, and put on ice.
5. Twenty μ l of diluted $[^3\text{H}]$ pyrilamine was added to each well.
- 10 6. One hundred fifty μ l of tissue suspension was added to each well.
7. The top of the plate was covered and it was placed in a 25°C shaking water bath (about 60 oscillations/min) for 30 min..
8. Samples were filtered on a Tomtec Mach 2 harvester (available from Tomtec Corporation, Orange, Connecticut) through a GF/B filter mat (from
15 Wallac, Inc., Gaithersburg, Maryland) presoaked in 0.3% polyethylenimine. Each sample was thrice washed with ice-cold 50 mM Tris-HCl, pH 7.5 dried 20 sec on the Tomtec, and dried 3-4 min in a microwave oven on a paper towel. The filter was impregnated with MELTILEX brand wax scintillant (from Wallac Corporation) and counted on a Betaplate scintillation counter (from Wallac Corporation).
- 20 9. Specific binding was determined as the difference between total and nonspecific binding. The percent inhibition in the presence of inhibitor or standard was determined using the formula:
$$[1 - (\text{sample binding} - \text{nonspecific binding}) / \text{specific binding}] \times 100$$

For compounds that inhibit more than 50% at 1 μ g/ml, an IC_{50} value was
25 interpolated from proximate concentrations. The value was converted to a nM value using the compound formula weight and a K_i value was calculated using the equation of *Cheng and Prusoff* ($K_i = \text{IC}_{50} / (1 + [L] / K_D)$). [*Y-C. Cheng and W.H. Prusoff*, "Relationship between the inhibitory constant (K_i) and the concentration of inhibitor which causes 50 per cent inhibition (IC_{50}) of an enzymatic reaction",
30 *Biochem. Pharmacol.* 22 (1973) 3099-3108]. Lower value of K_i indicates greater binding affinity.

General Procedure for H₃-Receptor Binding Assay

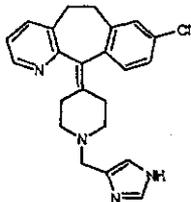

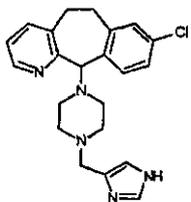

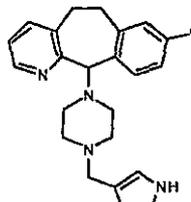

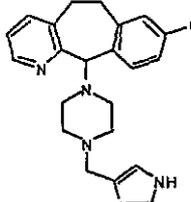

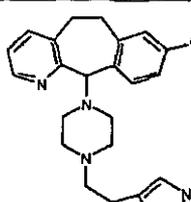

The source of the H₃ receptors in this experiment was guinea pig brain. The animals weighed 400-600 g. The brain tissue was homogenized with a solution of 50 mM Tris, pH 7.5. The final concentration of tissue in the
5 homogenization buffer was 10% w/v. The homogenates were centrifuged at 1,000 x g for 10 min. in order to remove clumps of tissue and debris. The resulting supernatants were then centrifuged at 50,000 x g for 20 min. in order to sediment the membranes, which were next washed three times in homogenization buffer (50,000 x g for 20 min. each). The membranes were
10 frozen and stored at -70°C until needed.

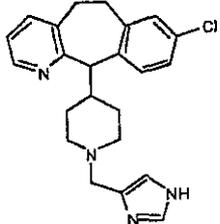

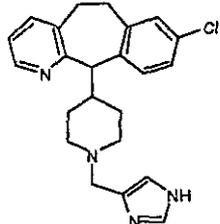

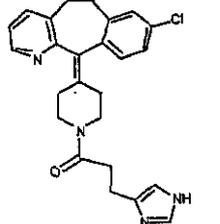

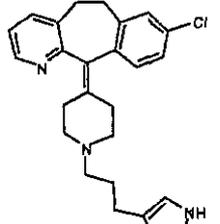

All compounds to be tested were dissolved in DMSO and then diluted into the binding buffer (50 mM Tris, pH 7.5) such that the final concentration was 2 µg/ml with 0.1% DMSO. Membranes were then added (400 µg of protein) to the reaction tubes. The reaction was started by the addition of 3 nM [³H]R-α-methyl
15 histamine (8.8 Ci/mmol) or 3 nM [³H]N^α-methyl histamine (80 Ci/mmol) and continued under incubation at 30°C for 30 min. Bound ligand was separated from unbound ligand by filtration, and the amount of radioactive ligand bound to the membranes was quantitated by liquid scintillation spectrometry. All incubations were performed in duplicate and the standard error was always less than 10%.
20 Compounds that inhibited more than 70% of the specific binding of radioactive ligand to the receptor were serially diluted to determine a K_i (nM). The results are given in the Table 1 for the HCl salt of the indicated compound.

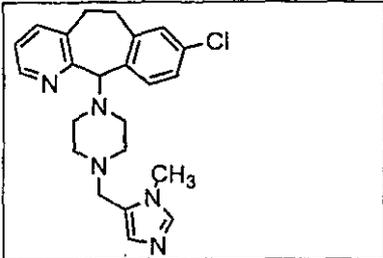

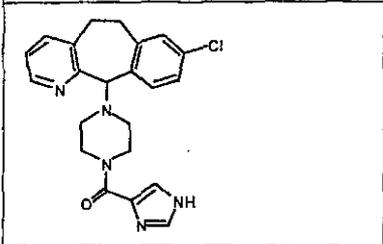

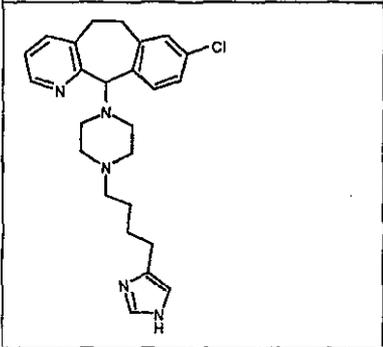

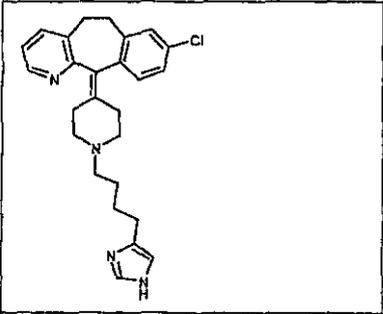

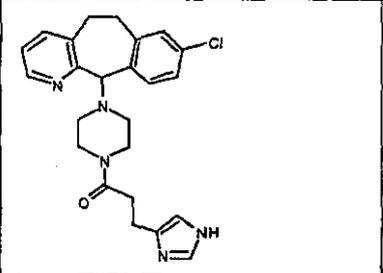

25

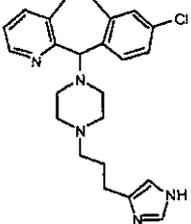

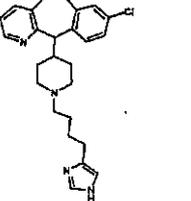

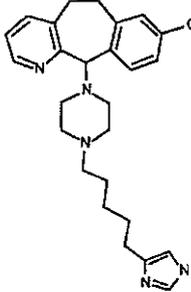

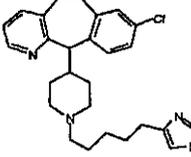

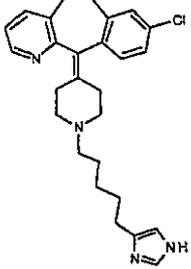

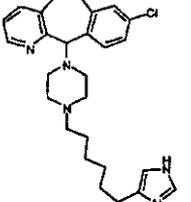

30

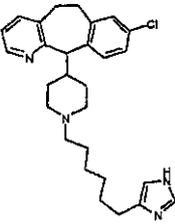

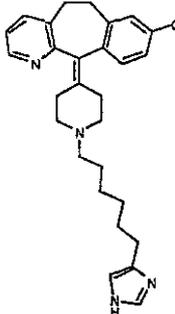

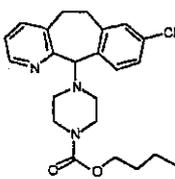

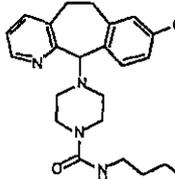

Table 1

STRUCTURE	H ₃ Ave KI (nM)	H ₃ % Inhibition	H ₁ Ave KI (nM)	H ₁ % inhibition
	660		16	
	150		36.8	
Racemic				
	121		4.6

	41		8	

	27.5		5.5	
	33.5		12	
	148			36
	47		250	

From these test results, it would be apparent to the skilled artisan that the compounds of the invention have utility in treating inflammation, allergy, diseases of the GI-tract, cardiovascular disease, nasal congestion, disturbances of the
5 central nervous system and the like diseases stated earlier.

CLAIMS

What is claimed is:

1. A compound, including enantiomers, stereoisomers and tautomers thereof, or pharmaceutically acceptable salts or solvates of said compound, said
- 5 compound having the general structure shown in Formula I:

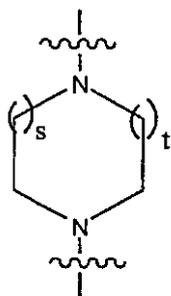

Formula I

wherein:

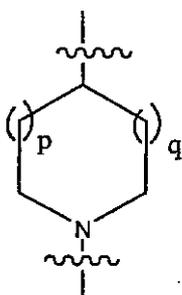

$f = 0, 1$ or 2 ;

- 10 X and Y are independently selected from the group consisting of N, CH or N-oxide;

G is a moiety selected from the group consisting of the moieties II, III and IV with the top end of said II, III and IV being linked to the tricyclic moiety and the bottom end of II, III and IV being linked to M:

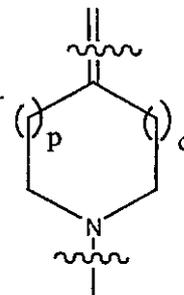

II

III

and

IV

where $s = t = 1$ or 2 ; and $p = q = 0, 1$ or 2 ;

M is a moiety selected from the group consisting of C_1 - C_8 alkyl;

$-C(O)-(CH_2)_y-$; $-(CH_2)_x-A-(CH_2)_y-$; $-C(O)-O-(CH_2)_d-$; and $-C(O)-NR^3-(CH_2)_d-$; where $A=O, S(O)_r$, and $-NR^4$;

5 $n = 0, 1, 2$ or 3 ;

x is a whole number in the range 2 - 5 ;

y is a whole number in the range 0 - 5 ;

d is a number in the range 0 - 5 ;

$r = 0, 1$ or 2 ;

10 R^1 and R^2 may each number 1 - 3 and are independently selected from the group consisting of hydrogen, lower alkyl, lower alkoxy, halogen, OCF_3 , $OCHF_2$, $-OH$, and $-N(R^4)_2$;

R^3 is selected from the group consisting of hydrogen, lower alkyl, and polyhaloloweralkyl;

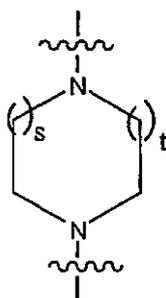

15 R^4 is selected from hydrogen, lower alkyl, polyhalolower alkyl; and

R^5 is H , C_1 - C_6 alkyl or OH .

2. The compound of claim 1, wherein R_1 and R_2 are independently selected from H , halogen, hydroxy or lower alkoxy, and f is 1 .

3. The compound of claim 2, wherein X is N and Y is CH .

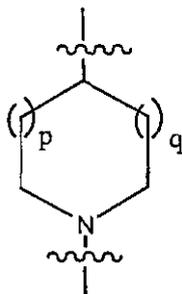

20 4. The compound of claim 2, wherein G is:

wherein s and t are as defined.

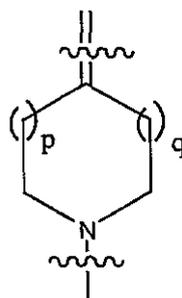

5. The compound of claim 2, wherein G is:

74

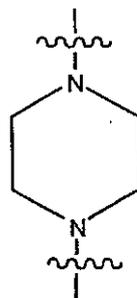

where p and q are as defined.

6. The compound of claim 2, wherein G is:

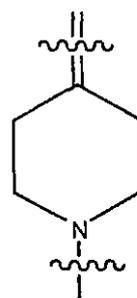

5 where p and q are as defined.

7. The compound of claim 4, wherein G is:

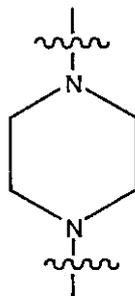

and M is an alkyl group containing 1-6 carbon atoms.

8. The compound of claim 6, wherein G is:

and M is an alkyl group containing 1-6 carbon atoms.

9. The compound of claim 1, where X is N, Y is CH, R¹ is H, R² is Cl, and R⁵ is H.
10. The compound of Claim 5, wherein p = q = 1, and M is an alkyl group containing 1-6 carbon atoms.
11. The compound of claim 2, wherein M is -C(O)-(CH₂)_g-, wherein g is a number 0-3.
12. The compound of claim 2, wherein M is -C(O)-NR³-(CH₂)_d-, wherein d is a number 0-5.
- 10 13. The compound of claim 1, wherein G is:

M is an alkyl group containing 1-6 carbon atoms, X is N, Y is CH, R¹ and R⁵ are H and R² is Cl.

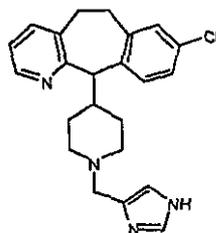

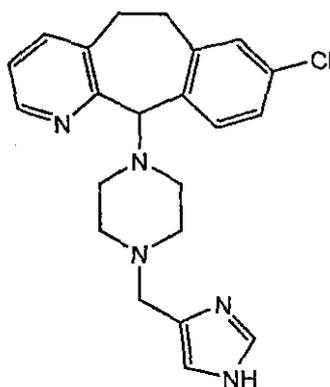

14. A pharmaceutical composition comprising as an active ingredient a compound of claim 1.
15. A pharmaceutical composition for use in treating inflammation, allergy, allergic rhinitis, nasal congestion, diseases of the GI-tract, cardiovascular disease, or disturbances of the central nervous system as well as allergy-induced airway responses and obesity, said composition comprising as an active ingredient a compound of claim 1.
16. The pharmaceutical composition of claim 18 additionally comprising a pharmaceutically acceptable carrier.
17. A method of treating inflammation, allergy, diseases of the GI-tract, cardiovascular disease, nasal congestion or disturbances of the central nervous system as well as allergy-induced airway responses and obesity, said method comprising administering to a mammalian patient in need of such treatment a

pharmaceutical composition which comprises therapeutically effective amounts of a compound of claim 1.

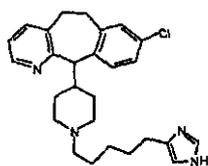

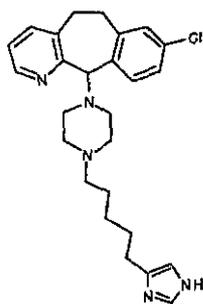

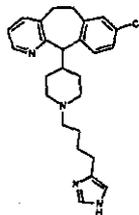

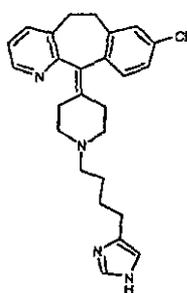

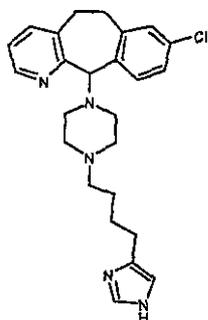

18. The use of a compound of claim 1 for the manufacture of a medicament for the treatment of inflammation, allergy, nasal congestion, diseases of the GI-tract,
5 cardiovascular disease, or disturbances of the central nervous system as well as allergy-induced airway responses and obesity.

19. A method of preparing a pharmaceutical composition for treating inflammation, allergy, nasal congestion, diseases of the GI-tract, cardiovascular disease, or disturbances of the central nervous system as well as allergy-induced
10 airway responses and obesity, said method comprising bringing into intimate contact a compound of claim 1 and a pharmaceutically acceptable carrier.

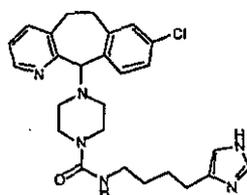

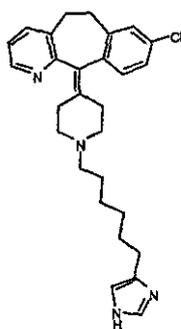

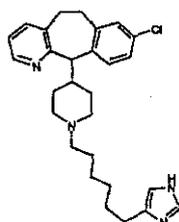

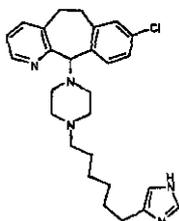

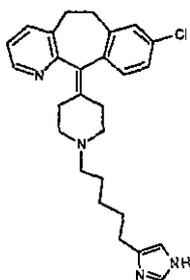

20. A compound exhibiting H₃ antagonist activity, including enantiomers, stereoisomers and tautomers of said compound, or pharmaceutically acceptable salts or solvates of said compound, said compound being selected from the
15 compounds of structures listed below:

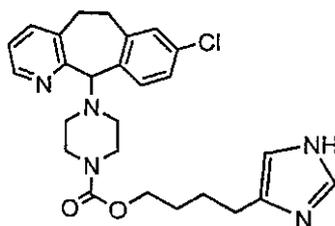

77

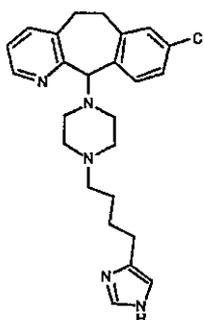

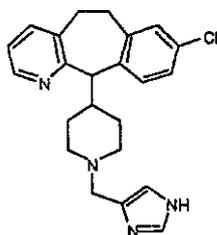

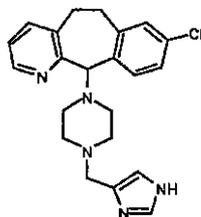

78

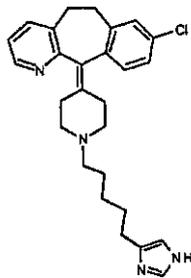

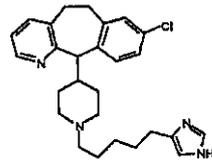

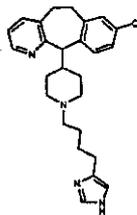

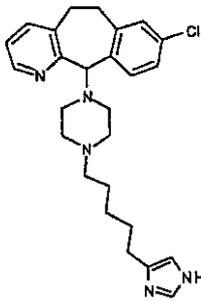

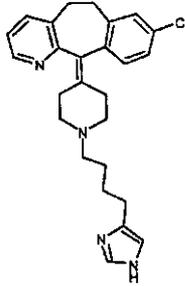

79

21. A compound exhibiting both H₁ and H₃ antagonist activity, including enantiomers, stereoisomers and tautomers of said compound, or pharmaceutically acceptable salts or solvates of said compound, said compound
- 5 being selected from the compounds of structures listed below:

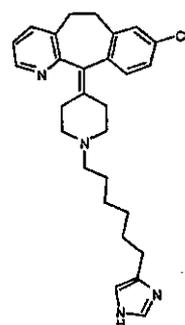

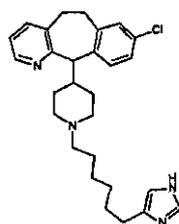

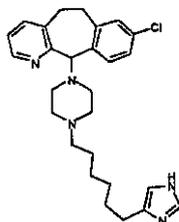

80

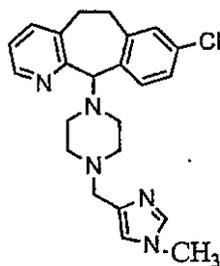

5

81

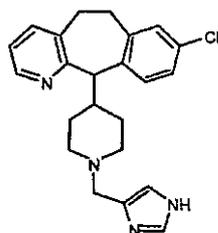

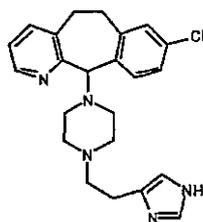

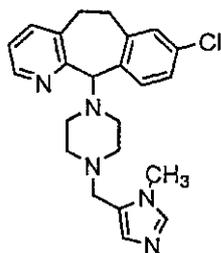

5

22. A compound exhibiting H₁ antagonist activity, including enantiomers, stereoisomers and tautomers of said compound, or pharmaceutically acceptable salts or solvates of said compound, said compound being selected from the compounds of structures listed below:

10

82

23. A pharmaceutical composition for treating inflammation, allergy, diseases
5 of the GI-tract, cardiovascular disease, nasal congestion or disturbances of the
central nervous system as well as allergy-induced airway responses and obesity,
said composition comprising therapeutically effective amount of a compound of
claim 20, claim 21 or claim 22 and a pharmaceutically acceptable carrier.

↘ 作为双重组胺H₁和H₃激动剂或拮抗剂的取代咪唑

本发明公开了新的取代咪唑化合物及制备这些化合物的方法，所述化合物具有双重组胺-H₁和H₃受体拮抗活性。

在另一个实施方案中，本发明公开了包含这种咪唑的药物组合物，以及使用它们治疗变态反应、炎症和中枢神经系统相关疾病以及其他疾病的方法。
