Abstract

An aqueous enteric coating composition including hydroxypropylmethylcellulose, acetate succinate, and a basic amino acid.
AQUEOUS ENTERIC COATING COMPOSITION

CROSS-RELATED APPLICATION DATA

[0001] This Application claims priority to U.S. Provisional Application No. 62/160,203 filed May 12, 2015 the disclosure of which is incorporated herein by reference in its entirety.

FIELD OF THE INVENTION

[0002] The present invention relates to an aqueous enteric coating composition with improved processability.

BACKGROUND OF THE INVENTION

[0003] Enteric coatings are used on various tablets or pellets utilized to orally deliver a wide range of pharmaceuticals and nutraceuticals. Enteric coatings are typically applied to protect the pharmaceutical or nutraceutical being delivered from the acidic pH of the stomach. Most enteric coatings comprise one or more of hydroxypropylmethylcellulose phthalate, cellulose acetate phthalate, carboxymethylcellulose, methyl methacrylate-methacrylate copolymer, methacrylate-ethyl acrylate copolymer, methacrylate-methyl acrylate-methyl acrylate copolymer, hydroxypropylmethylcellulose acetate succinate, polyvinyl acetate phthalate and shellac.

[0004] One particular enteric coating composition is based on hydroxypropylmethylcellulose acetate succinate (HPMCAS) available as Shin-Etsu AQOAT® from Shin-Etsu Chemical Co., Ltd. (Japan). Existing coating methods utilizing HPMCAS, however, have some processing difficulties. There is a significant problem with respect to nozzle clogging in the spray apparatus. One solution is to cool the coating fluid to a temperature less than 10° C. and to reduce polymer concentration to less than 7 percent. Other solutions include suspending the HPMCAS in ammonia or to dissolve it in a solvent such as ethanol or acetone. Use of ammonia or solvents may be difficult to handle for large scale commercial purposes, as there are stability issues and potential environmental and safety issues. Other options are to use a special dual spray nozzle or to use a powder nozzle. These options require a significant capital investment in the spray technology.

SUMMARY OF THE INVENTION

[0005] The present invention aims to overcome the above problems and difficulties with an aqueous enteric coating composition that does not cause clogging in spray nozzles, avoids the use of ammonia or solvents and does not require expensive nozzle or spray technology.

[0006] The aqueous enteric coating composition comprises hydroxypropylmethylcellulose acetate succinate and a basic amino acid. In one embodiment, the aqueous enteric coating composition comprises 5 to 20 percent hydroxypropylmethylcellulose acetate succinate, 0.05 to 1.0 percent L-alginite or L-histidine, 0.5 to 10 percent plasticizer, 0.1 to 10 percent anti-tacking agent, 0.05 to 0.5 percent surfactant, and 65 to 95 percent water.

DETAILED DESCRIPTION OF EMBODIMENTS OF THE INVENTION

[0007] The foregoing and other aspects of the present invention will now be described in more detail with respect to the description and methodologies provided herein. It should be appreciated that the invention can be embodied in different forms and should not be construed as limited to the embodiments set forth herein. Rather, these embodiments are provided so that this disclosure will be thorough and complete, and will fully convey the scope of the invention to those skilled in the art.

[0008] The terminology used in the description of the invention herein is for the purpose of describing particular embodiments only and is not intended to be limiting of the invention. As used in the description of the embodiments of the invention and the appended claims, the singular forms “a”, “an” and “the” are intended to include the plural forms as well, unless the context clearly indicates otherwise. Also, as used herein, “and/or” refers to and encompasses any and all possible combinations of one or more of the associated listed items. Furthermore, the term “about,” as used herein when referring to a measurable value such as an amount of a compound, dose, time, temperature, and the like, is meant to encompass variations of 20%, 10%, 5%, 1%, 0.5%, or even 0.1% of the specified amount.

[0009] It will be further understood that the terms “comprises” and/or “comprising,” when used in this specification, specify the presence of stated features, integers, steps, operations, elements, and/or components, but do not preclude the presence or addition of one or more other features, integers, steps, operations, elements, components, and/or groups thereof. Unless otherwise defined, all terms, including technical and scientific terms used in the description, have the same meaning as commonly understood by one of ordinary skill in the art to which this invention belongs.

[0010] The term “consists essentially of” (and grammatical variants), as applied to the methods in this invention, means the methods or compositions can contain additional steps as long as the additional steps or components do not materially alter the basic and novel characteristic(s) of the present invention.

[0011] The term “consisting of” excludes any additional step that is not specified in the claim.

[0012] Unless the context indicates otherwise, it is specifically intended that the various features of the invention described herein can be used in any combination.

[0013] Moreover, the present invention also contemplates that in some embodiments of the invention, any feature or combination of features set forth herein can be excluded or omitted.

[0014] All patents, patent applications and publications referred to herein are incorporated by reference in their entirety. In case of a conflict in terminology, the present specification is controlling.

[0015] As one of ordinary skill in the art may appreciate, the parameters described herein may vary greatly depending on the process, and/or formulation as well as the desired properties of the final product.

[0016] The present invention is directed to a novel aqueous enteric coating composition comprising hydroxypropylmethylcellulose acetate succinate (HPMCAS), a basic amino acid and additives such as plasticizers, surfactants, anti-tacking agents and the like.
In one embodiment, the HPMCAS is Shin-Etsu AQOATR® available from Shin-Etsu Chemical Co., Ltd. (Japan). Optionally, other enteric coating materials may be included. Exemplary other materials include hydroxypropylmethylcellulose phthalate, cellulose acetate phthalate, carboxymethylcellulose, methyl methacrylate-methacrylate copolymer, methacrylate-ethyl acrylate copolymer, methacrylate-methyl acrylate-methyl methacrylate copolymer, hydroxypropylmethylcellulose acetate succinate, polyvinyl acetate phthalate and shellac. Often such materials are included to allow the overall enteric coating to dissolve at different rates based on different pHs. The amount of HPMCAS in the composition may be from about 5 to about 20 percent by weight of the composition.

Suitable basic amino acids include one or more of L-alanine, L-histidine and L-lysine. The amount of basic amino acid in the composition may be from about 0.05 percent to about 1.0 percent by weight of the composition.

Plasticizers are added to assist in the melting characteristics of the composition. Exemplary of plasticizers that may be employed in this invention are triethyl citrate (TEC), triacetin, tributyl citrate, acetyl triethyl citrate (ATEC), acetyl tributyl citrate (ATBC), dibutyl phthalate, dibutyl sebacate (DBS), diethyl phthalate, vinyl pyrrolidone glycol tricetate, polyethylene glycol, polyoxyethylene sorbitan monolaurate, propylene glycol, propylene carbonate or castor oil; and combinations or mixtures thereof. The amount of plasticizers in the composition may be from about 0.5 to about 10 percent by weight of the composition.

Surfactants are added to modify surface characteristics of the coated material and include Phronics® (block copolymers of ethylene oxide and propylene oxide), lecithin, Aerosol OT® (sodium dioctyl sulfosuccinate), sodium laurel sulfate. Polyoxyl 40® hydrogenated castor oil, polyoxyethylene sorbitan fatty acid esters, i.e., the polysorbates such as Tween®, such as Tween 20, 60 & 80, the sorbitan fatty acid esters, i.e., sorbitan monolaurate, monoooleate, monopalmitate, monostearate, etc. such as Span® or Arlacel®, Emulsol®, Capmul®, or Sorbester®, Triton X-200, polyethylene glycol’s, gleyceryl monostearate, Vitamin E-TPGS® (d-alpha-tocopheryl polyethylene glycol 1000 succinate), sucrose fatty acid esters, such as sucrose stearate, sucrose oleate, sucrose palmitate, sucrose laurate, and sucrose acetate butyrate, and combinations and mixtures thereof. Preferred surfactants are Vitamin E-TPGS®, sodium laurel sulfate, sucrose fatty acid esters, lecithin, and the Phronic groups. The amount of surfactant in the composition may be from about 0.05 to about 0.5 percent by weight of the composition.

The overall composition may include about 65 to about 95 percent by water weight as the dispersing agent to provide the composition in aqueous form.

Other additives may include absorption enhancers, dissolution modifying agents, coloring aids, flavoring agents, and stabilizing agents (e.g., dibasic sodium phosphate).

The aqueous enteric coating composition may be used on tablets, pellets, granules, hard and soft capsules to deliver pharmaceuticals and nutraceuticals.

As used herein “pharmaceutical” is defined as any chemical substance intended for use in the medical diagnosis, cure, treatment, or prevention of disease, for example over-the-counter drugs (OTC) and prescription only medicines (POM). Exemplary active pharmaceutical components are listed in U.S. Pat. No. 6,723,358, column 9, line 25 to column 13, line 25, the disclosure of which is incorporated herein by reference in its entirety.

As used herein “nutraceutical” supplement include any nutrients that may provide health and medical benefits, including the prevention and treatment of disease. Examples include, but are not limited to, vitamins, minerals, probiotics, enzymes, herb and other botanical extracts, amino acid, concentrates, metabolites, constituents, etc.

Exemplary vitamins and minerals include, but are not limited to, vitamins A (in the form of, for example, palmitate or beta carotene), B-complex (such as B-1, B-2, B-6 and B-12), C, D, E and K; niacin; acid vitamins such as pantothenic acid and folic acid; biotin; minerals such as iron, calcium, magnesium, iodine, copper, phosphorus, zinc, manganese, potassium, chromium, cobalt, molybdenum, selenium, nickel, tin, silicon, vanadium and boron; nutraceutical supplements such as chlorophyll and fluoride; and the like. Various herbs and herbal remedies may be utilized as the nutraceutical supplements. The herbs are generally selected from those which have various medicinal or dietary supplement properties. Herbs are generally aromatic plants or plant parts that can be used medicinally or for flavoring. Examples include Ginseng, ginseng, valerian and the like. Suitable herbs may be used alone or in various mixtures in the filling described herein.

The present invention will be further illustrated by the following non-limiting examples.

**EXAMPLES**

**Example 1**

A stock solution of L-histidine was prepared by dissolving 3 g in 100 ml water. The pH of the solution was 7.47. The following formulation was prepared and evaluated:

**Conventional Formulation (No Amino Acid)**

<table>
<thead>
<tr>
<th>Component</th>
<th>Weight (wt %)</th>
</tr>
</thead>
<tbody>
<tr>
<td>HPMCAS (AS-MF)</td>
<td>7</td>
</tr>
<tr>

</tr>
<tr>
<td>SLS (Sodium laurel sulfate)</td>
<td>0.2</td>
</tr>
<tr>
<td>Water</td>
<td>ad 100 (Final wt 600 g)</td>
</tr>
</tbody>
</table>

SLS was dissolved in water. HPMCAS was then dispersed in a same amount of water. Talc was dispersed in a separate container and then added through high shear homogenizer as described earlier and then added to the above dispersion and mixed for another 30 minute. TEC was then added to the above dispersion and mixed for 30 minutes
SLS was dissolved in water. HPMCAS was then dispersed in a same amount of water. The L-histidine solution was added to the above dispersion slowly to increase the pH (target 5.6 to 5.8). After adding 100 ml the pH was measured as 5.3. Talc was dispersed in a separate container and pass through high shear homogenizer as described earlier and then added to the above dispersion and mixed for another 30 minute. TEC was then added to the above dispersion and mixed for 30 minutes.

Results:

Coagulation Behavior

The coating dispersion was passed through a 60 mesh screen. The conventional formulation showed coagulation at room temperature and a considerably amount of aggregated mass are remaining on the screen. The Formulation of Example 1 showed no coagulation was remaining mass on the screen was minimal.

The coating experiment was also performed using: Equipment: A table-top side-vented pan coater (Glatt GMPC-I, batch size: 500 g)

Core tablets: Placebo tablets (prepared mainly from lactose and cornstarch)

With the conventional formulation, the coating could not be performed due to the coagulation at room temperature. Using Formulation A, the coating went well without nozzle clogging.

Another amino acid L-arginine was used as stabilizer. 10 g of L-arginine was dissolved in 100 mL water as a stock solution.
Having thus described certain embodiments of the present invention, it is to be understood that the invention defined by the appended claims is not to be limited by particular details set forth in the above description as many apparent variations thereof are possible without departing from the spirit or scope thereof as hereinafter claimed.

Example 4

Coloring agent (titanium oxide) was added:

Having thus described certain embodiments of the present invention, it is to be understood that the invention defined by the appended claims is not to be limited by particular details set forth in the above description as many apparent variations thereof are possible without departing from the spirit or scope thereof as hereinafter claimed.

That which is claimed:

1. An aqueous enteric coating composition comprising:
   a) hydroxypropylmethylcellulose acetate succinate; and
   b) a basic amino acid.

2. The aqueous enteric coating composition according to claim 1, further comprising a plasticizer, a surfactant, and an anti-tacking agent.

3. The aqueous enteric coating composition according to claim 2, wherein the plasticizer comprises triethyl citrate (TEC), triacetin, tributyl citrate, acetyl triethyl citrate (ATEC), acetyl tributyl citrate (ATBC), dibutyl phthalate, diethyl sebacate (DBS), diethyl phthalate, vinyl pyrrolidone glycol triacetate, polyethylene glycol, polyoxyethylene sorbitan monolaurate, propylene glycol, propylene carbonate, castor oil, and combinations or mixtures thereof.

4. The aqueous enteric coating composition according to claim 2, wherein the surfactant is selected from the group consisting of sodium lauryl sulfate, succrose fatty acid esters, lecithin, and d-alpha-tocopheryl polyethylene glycol, and combinations and mixtures thereof.

5. The aqueous enteric coating composition according to claim 2, wherein the anti-tacking agent is selected from the
group consisting of stearyl alcohol, stearic acid, glycerol monostearate (GMS), talc, magnesium stearate, silicon dioxide, amorphous silicic acid, and fumed silica, and combinations or mixtures thereof.

7. A pharmaceutical composition comprising a tablet, pellet, granule, hard capsule or soft capsule coated with the aqueous enteric coating composition of claims 1 and a pharmaceutical or nutraceutical.

8. An aqueous enteric coating composition comprising:
   a) 5 to 20 percent hydroxypropylmethylcellulose acetate succinate;
   b) 0.05 to 1.0 percent L-alginine, L-histidine or L-lysine;
   c) 0.5 to 10 percent plasticizer;
   d) 0.1 to 10 percent anti-tacking agent;
   e) 0.05 to 0.5 percent surfactant; and
   65 to 95 percent water.

9. The aqueous enteric coating composition according to claim 8, wherein the surfactant is selected from the group consisting of sodium lauryl sulfate, sucrose fatty acid esters, lecithin, and d-alpha-tocopheryl polyethylene glycol, and combinations and mixtures thereof.

10. The aqueous enteric coating composition according to claim 8, wherein the anti-tacking agent is selected from the group consisting of stearyl alcohol, stearic acid, glycerol monostearate (GMS), talc, magnesium stearate, silicon dioxide, amorphous silicic acid, and fumed silica, and combinations or mixtures thereof.

11. A pharmaceutical composition comprising a tablet, pellet, granule, hard capsule or soft capsule coated with the aqueous enteric coating composition of claim 8 and a pharmaceutical or nutraceutical.
