ABSTRACT

A skin lightening composition for lightening the natural skin color of a user, and for treating disorders of hyperpigmentation. The active ingredient is methyl sulfanyl methane (MSM), a naturally occurring sulfur compound which may be safely administered topically or orally and which is highly effective for decreasing the ratio of dark melanin to light melanin, and thereby lightening the skin color of a user. The skin lightening composition additionally comprises a liquid solution or a cosmetic carrier such as a cream, a lotion, or a gel, for ease of topical application. Additionally, the skin lightening composition is provided in liquid or solid form for oral ingestion. Topical preparations of the skin lightening composition contain MSM in an amount equal to approximately 1 to 20 weight percent MSM relative to the weight of the entire composition. Orally ingestible preparations of the skin lightening composition contain approximately 200 mg to 5000 mg MSM per serving.
SKIN LIGHTENING COMPOSITION

BACKGROUND OF THE INVENTION

[0001] 1. Field of the Invention

[0002] The invention generally relates to a composition of matter, and in particular relates to a skin lightening composition for lightening the natural skin color of a user, and also for treating disorders of hyperpigmentation.

[0003] 2. Description of the Related Art

[0004] Skin lighteners are used by millions of individuals for lightening their natural skin color for cosmetic reasons. Skin lighteners are also useful for treating the excessively dark skin color caused by a dermatological condition known as hyperpigmentation, characterized by abnormally increased pigmentation. A number of compounds are known to lighten skin tone when applied topically. The most popular of these is hydroquinone, which is safe, effective, and available without a prescription. Despite its overall safety and effectiveness, hydroquinone has been known to cause dermatological ochronosis, a progressive discolouration and degeneration of the skin, when used over an extended period of time.

[0005] Alternative compounds for lightening skin color are available. However, most of the synthetic or herbal compounds discovered have side effects and are not as effective as hydroquinone. Accordingly, there is a need for a skin lightening composition comprising methyl sulfonyl methane, a nontoxic, natural metabolite which is effective for lightening the natural skin color of a user and for treating disorders of hyperpigmentation, and which has no side effects.

[0006] A variety of formulations have been devised for lightening skin, some which do not utilize hydroquinone. For example, U.S. Pat. No. 6,497,860 to Kawato appears to show a skin lightening composition comprising a reducing agent and a cosmetically acceptable carrier for the reducing agent, and which is substantially free of hydroquinone.

[0007] A variety of formulations have been devised which contain methyl sulfonyl methane. By way of example, U.S. Pat. No. 6,328,987 to Marini appears to show a skin care composition for improving the appearance of aged or damaged skin, containing alpha interferon and optionally containing methyl sulfonyl methane. Additionally, U.S. Pat. No. 4,296,130 to Herschler appears to show a method for softening skin and strengthening nails, comprising topically applying methyl sulfonyl methane to the skin and nails. Furthermore, U.S. Pat. No. 6,573,299 to Petrus appears to show a method for the prevention and treatment of the aging eye by the application of a topical composition which optionally comprises methyl sulfonyl methane. Also, U.S. Pat. No. 4,477,469 to Herschler appears to show a preparation containing methyl sulfonyl methane that is applied topically, for softening skin and strengthening nails.

[0008] While these formulations and methods of using formulations may be suitable for the particular purpose employed, or for general use, they would not be as suitable for the purposes of the present invention as disclosed hereafter.

SUMMARY OF THE INVENTION

[0009] It is an object of the invention to provide a skin lightening composition which is effective in lightening the natural skin color of a user and for treating disorders of hyperpigmentation, and which is safe when topically applied to human skin. Accordingly, the active ingredient of the skin lightening composition is methyl sulfonyl methane, which is highly effective in lightening the natural skin color of a user and for treating disorders of hyperpigmentation, and which is safe when topically applied to human skin.

[0010] It is another object of the invention to provide a skin lightening composition that is also safe and effective when orally ingested. Accordingly, methyl sulfonyl methane is a natural metabolite found in the human body, is nontoxic, and is suitable for long-term use by oral ingestion.

[0011] It is yet another object of this invention to provide a skin lightening composition suitable for use with a wide variety of different cosmetic "carriers", for ease of application to a user's skin. Accordingly, topical preparations of the skin lightening composition may be dissolved in a liquid solution, or in a carrier such as a cream, a lotion, or a gel. (Orally ingestible preparations may be in liquid, tablet, capsule, or powder form).

[0012] The invention is a skin lightening composition for lightening the natural skin color of a user, and for treating disorders of hyperpigmentation. The active ingredient is methyl sulfonyl methane (MSM), a naturally occurring sulfur compound which may be safely administered topically or orally and which is highly effective for decreasing the ratio of dark melanin to light melanin, and thereby lightening the skin color of a user. The skin lightening composition additionally comprises a liquid solution or a cosmetic carrier such as a cream, a lotion, or a gel, for ease of topical application. Additionally, the skin lightening composition is provided in liquid or solid form for oral ingestion. Topical preparations of the skin lightening composition contain MSM in an amount equal to approximately 1 to 20 weight percent MSM relative to the weight of the entire composition. Orally ingestible preparations of the skin lightening composition contain approximately 200 mg to 5000 mg MSM per serving.

[0013] To the accomplishment of the above and related objects the invention may be embodied in the form described in the following description. Attention is called to the fact, however, that the examples given are illustrative only. Variations are contemplated as being part of the invention.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

[0014] The skin lightening composition according to the present invention is safe and effective for lightening the natural skin color of a user, and also for treating disorders of hyperpigmentation, which are characterized by abnormally increased pigmentation. The active ingredient of the skin lightening composition is methyl sulfonyl methane (MSM), a naturally occurring sulfur compound found in the tissues and body fluids of higher mammals, and in fresh fruits and vegetables, meat, milk, seafood, and grains. Sulfur helps the body maintain the three dimensional conformation of proteins required for their proper activity. Sulfur is required for cell regeneration and collagen production in connective tissues of the skin, and in muscles, cartilage, organs and bone. MSM affects the synthesis of the melanin pigments, as will be described.
Melanin is the pigment that largely determines skin color, and is synthesized by the melanocytes in the basal layer of the epidermis. There are two melanin pigments, eumelanin and pheomelanin. Eumelanin is black and pheomelanin is yellow. The ratio of these two pigments in the skin determines how dark or light the skin will be. The synthesis of eumelanin and pheomelanin requires the amino acid tyrosine and the enzyme tyrosinase. Tyrosinase catalyzes the conversion of tyrosine into biochemical intermediates dopa and dopaquinone. Dopaquinone is the precursor of both eumelanin and pheomelanin in the process of melanogenesis, the biochemical processes which synthesize the melanins. Differences in the ratio of melanin pigments create wide variations in human skin color, ranging from “white” skin color to “black” skin color. Darker skinned individuals have a higher eumelanin to pheomelanin ratio.

To lighten skin color, the skin lightening composition targets melanogenesis. In particular, MSM causes dopaquinone to be diverted towards the production of pheomelanin, rather than eumelanin, by safely and effectively increasing intracellular sulfur levels. Under a high intracellular sulfur concentration, melanogenesis automatically leads to an increased synthesis of sulfhydryl-dopa conjugates resulting in the synthesis of the lighter colored pheomelanin instead of the darker colored eumelanin, which is the basis of the activity of MSM in the skin lightening composition.

MSM has been previously used in supplements for treating acne, arthritis, muscle pain, and skin damage and aging. MSM can be used safely and effectively for lightening the natural skin color of a user and for treating disorders of hyperpigmentation. Methylsulfonylmethane is all natural, nontoxic, non-allergenic, and non-psychedelic, and is safe and effective when administered topically or orally ingested, even over prolonged periods of time. Moreover, MSM has no undesirable pharmacological effects when taken in conjunction with other substances.

The skin lightening composition is provided in two types of preparations. In particular, the skin lightening composition is provided in topical preparations which are applied directly to the skin, and also in orally ingestible preparations. Topical preparations of the skin lightening composition comprise MSM dissolved or mixed within a vehicle. The vehicle may be a liquid solution, or it may be a cosmetic carrier such as a cream, a lotion, or a gel. Topical preparations of the skin lightening composition contain MSM at an amount equal to approximately 1 to 20 weight percent MSM relative to the weight of the entire skin lightening composition. Liquid solutions for topical application may include MSM in aqueous or non-aqueous solutions or emulsions. It is contemplated that the skin lightening composition may be combined with other cosmetics, such as moisturizers or perfumes, in order to provide a skin lightening composition with properties in addition to its skin lightening properties. By way of example, the skin whitening formula may comprise a moisturizing face and body cream into which the MSM has been blended. It is additionally contemplated that the skin lightening composition will be provided as a solid mixture, e.g., a mixture of MSM with vitamins and minerals that a user can mix with water and use for washing the face and body. Alternately, the skin whitening formula may be supplied as a liquid solution which may be directly used as a face and body wash.

Orally ingestible preparations of the skin lightening composition are provided in liquid or in solid form, and contain approximately 200 mg to 5000 mg MSM per serving. Orally ingestible preparations of the skin whitening formula may be in an edible form such as a tablet, a pill, a capsule, or in powder form. MSM can also be orally ingested in a nutritious mixture that contains vitamins, minerals, herbs, antioxidants, proteins, and/or amino acids.

In conclusion, herein is presented a skin lightening composition for lightening the natural skin color of a user, and also for treating disorders of hyperpigmentation. The invention is illustrated by example throughout the written description. It should be understood that numerous variations are possible, while adhering to the inventive concept. Such variations are contemplated as being a part of the present invention.

What is claimed is:

1. A topical preparation of a skin lightening composition, suitable for direct application to the face and body of a user, for lightening the natural skin color of the user and for treating disorders of hyperpigmentation, comprising:

   methyl sulfonyle methane, a naturally occurring sulfur compound which lightens the skin; and

   a vehicle; and

   wherein the methyl sulfonyle methane is dissolved within the vehicle at an amount equal to approximately 1 to 20 weight percent methyl sulfonyle methane relative to the weight of the entire skin lightening composition.

2. The topical preparation of a skin lightening composition as recited in claim 1, wherein the vehicle is a liquid solution.

3. The topical preparation of a skin lightening composition as recited in claim 2, further comprising a perfume.

4. The topical preparation of a skin lightening composition as recited in claim 3, further comprising a nutrient chosen from a class of nutrients consisting of vitamins and minerals.

5. The topical preparation of a skin lightening composition as recited in claim 1, wherein the vehicle is a cosmetic carrier chosen from a class of cosmetic carriers consisting of creams, lotions, and gels, wherein the methyl sulfonyle methane is blended within said cosmetic carrier at an amount equal to approximately 1 to 20 weight percent methyl sulfonyle methane relative to the weight of the entire skin lightening composition.

6. The topical preparation of a skin lightening composition as recited in claim 5, further comprising a perfume.

7. The topical preparation of a skin lightening composition as recited in claim 6, further comprising a nutrient chosen from a class of nutrients consisting of vitamins and minerals.

8. An orally ingestible preparation of a skin lightening composition, comprising:

   approximately 200 mg to 5000 mg methyl sulfonyle meth-
   ane per serving; and

   an edible form chosen from a class of edible forms
   consisting of tablets, pills, capsules, and powders; and

   wherein the methyl sulfonyle methane is contained within the edible form.
9. The orally ingestible preparation of a skin whitening formula as recited in claim 8, further comprising at least one nutrient chosen from a class of nutrients consisting of vitamins, minerals, antioxidants, proteins, and amino acids, and wherein said at least one nutrient is contained within the edible form.

10. A method for lightening the natural skin color of a user and for treating disorders of hyperpigmentation, utilizing a topical preparation of a skin lightening composition comprising methylsulfonyl methane and a vehicle, wherein the methylsulfonyl methane is dissolved within the vehicle at an amount equal to approximately 1 to 20 weight percent methylsulfonyl methane relative to the weight of the entire skin lightening composition, said method comprising the step of directly applying the skin lightening composition to the face and body of a user, and thereby lightening the skin of the face and the body.
