(54) Title: SYSTEM AND METHOD FOR DIRECTED REQUEST FOR QUOTE

(57) Abstract: The disclosed systems and methods relate to allowing trading of over the counter ("OTC") foreign exchange ("FX") contracts on a centralized matching and clearing mechanism. The disclosed systems and methods allow for anonymous transactions, centralized clearing, efficient settlement and the provision of risk management/credit screening mechanisms to lower risk, reduce transaction cost and improve the liquidity in the FX market place. In particular, the disclosed embodiments increase speed of execution facilitating growing demand for algorithmic trading, increased price transparency, lower cost of trading, customer to customer trading, and automated asset allocations, recurring trades as well as clearing and settlement efficiencies.

BACKGROUND

[0003] Futures Exchanges, referred to herein also as an “Exchange”, such as the Chicago Mercantile Exchange Inc. (CME), provide a marketplace where futures and options on futures are traded. Futures is a term used to designate all contracts covering the purchase and sale of financial instruments or physical commodities for future delivery on a commodity futures exchange. A futures contract is a legally binding agreement to buy or sell a commodity at a specified price at a predetermined future time. Each futures contract is standardized and specifies commodity, quality, quantity, delivery date and settlement. An option is the right, but not the obligation, to sell or buy the underlying instrument (in this case, a futures contract) at a specified price within a specified time.

[0004] The foreign exchange market is the largest and most liquid financial market in the world, representing more than \$1.2 trillion worth of transactions each day. Also known as forex or FX, currency trading typically involves the simultaneous purchase of one currency while selling another currency. Currencies are typically traded in pairs, such as U.S. dollar/Japanese yen (USD/JPY) or Euro/U.S. dollar (EUR/USD), or via currency indexes, such as the CME\$INDEX(TM).

[0005] In order to capitalize on the foreign exchange market, CME also offers FX futures products, i.e. futures contracts where the underlying financial instrument is a foreign currency transaction, in addition to futures products based on other commodities and financial instruments. However, FX futures are not the only mechanisms by which foreign currencies may be traded. For example, the FX interbank market is a global network of the world's banks with no centralized location for trading. Much of the business is conducted over the-phone or electronically bank-to-bank. The FX market is a 24-hour-per-day market during the FX business week. The day starts in Asia, extends over to Europe and then into the U.S. daytime trading hours. Currencies are traded around the world, around the clock, from Monday morning (Sunday afternoon Chicago/New York time) in New Zealand/Asia to the close of the business week on Friday afternoon in Chicago/New York.

[0006] Over the Counter ("OTC") is the term often used to refer to currency trading instruments which are not classified as a "futures" instrument as defined above and not traded on a futures exchange such as CME, i.e. that which is not a futures contract is an OTC contract. Such OTC contracts include "forward" contracts, i.e. private agreements between buyers and sellers, i.e. bilateral contracts, for the future delivery of a commodity at an agreed price. While futures contracts are regulated by the Commodity Futures Trading Commission ("CFTC"), forward or OTC contracts are not so regulated, making them more flexible and an attractive device to certain investors and certain markets.

[0007] Speculators are active in the FX markets, as they are attracted to the opportunities that volatile and changing market conditions create. A multitude of economic forces impact the world's currencies. Some of the forces at work include interest rate differentials, domestic money supply growth, comparative rates of inflation, central bank intervention and political stability. In times of global uncertainty, some currencies may benefit from perceived "flight-to-safety" status. Or, if one country's economic outlook is perceived as strong by market forces, its currency may be firmer than another country's currency, where economic or political conditions are viewed with caution.

[0008] FX traders include governments, corporations and fund managers doing business with foreign countries, that need to exchange one currency for another, and speculators who seek to profit from price movements in the markets.

[0009] The highly liquid and volatile currency markets offer opportunities for speculators every day. Most speculators tend to focus on the so-called "majors," which are the most actively traded currencies and include the U.S. dollar, the euro, the Japanese yen, the British pound, the Swiss franc, the Australian dollar and the Canadian dollar.

[0010] While the OTC FX market offers advantages such as less regulation and more product flexibility, CME's futures exchange offers its own benefits, such as centralized and anonymous matching and clearing, as well as efficiency optimization and risk management/credit screening mechanisms not available in the present OTC markets. It would therefore be advantageous to be able to trade OTC FX products via the same mechanisms used to trade futures contracts in order to secure these same benefits and protections.

[0011] Accordingly, there is a need for systems and methods to allow OTC FX products to be traded in a centralized matching and clearing environment such as the environment utilized by CME's futures exchange.

BRIEF DESCRIPTION OF THE DRAWINGS

- [0020] Figure 8 depicts a block diagram of an exemplary system for trading OTC FX instruments having a directed request for quote system according to an alternative embodiment.

DETAILED DESCRIPTION OF THE DRAWINGS AND PRESENTLY PREFERRED EMBODIMENTS

[0021] The disclosed systems and methods relate to allowing trading of over the counter (“OTC”) foreign exchange (“FX”) contracts on a centralized matching and clearing mechanism, such as that of the Chicago Mercantile Exchange’s (“CME”) futures exchange system (the “Exchange”). The disclosed systems and methods allow for anonymous transactions, centralized clearing, efficient settlement and the provision of risk management/credit screening mechanisms to lower risk, reduce transaction costs and improve the liquidity in the FX market place. In particular, the disclosed embodiments increase speed of execution facilitating growing demand for algorithmic trading, increased price transparency, lower cost of trading, customer to customer trading, and automated asset allocations, recurring trades as well as clearing and settlement efficiencies.

[0022] Figure 1 shows a block diagram of an exemplary system 100 for trading OTC FX instruments according to the disclosed embodiments. The system 100 is essentially a network 102 coupling market participants 104 106, including traders 104 and market makers 106 with the Exchange 108. Herein, the phrase “coupled with” is defined to mean directly connected to or indirectly connected through one or more intermediate components. Such intermediate components may include both hardware and software based components. Further, to clarify the use in the pending claims and to hereby provide notice to the public, the phrases “at least one of <A>, , ... and <N>” or “at least one of <A>, , ... <N>, or combinations thereof” are defined by the Applicant in the

broadest sense, superseding any other implied definitions herebefore or hereinafter unless expressly asserted by the Applicant to the contrary, to mean one or more elements selected from the group comprising A, B, ... and N, that is to say, any combination of one or more of the elements A, B, ... or N including any one element alone or in combination with one or more of the other elements which may also include, in combination, additional elements not listed. The Exchange 108 provides the functions of matching 110 buy/sell transactions, clearing 112 those transactions, settling 114 those transactions and managing risk 116 among the market participants 104 106 and between the market participants and the Exchange 108, as well as request-for-quote functionality 118, as is discussed in more detail below. Figures 2A and 2B show more detailed block diagrams of the logical architecture of the system 100 of Figure 1. In particular, Figure 2A shows a block diagram of the system 100 according to one embodiment in which the Exchange 108 is interconnected with a second FX marketplace to allow existing FX market participants to transact over the Exchange as described herein. In this embodiment, the second FX marketplace is provided by Reuters. Figure 2B shows a block diagram of the system 100 according to a second embodiment in which the Exchange 108 further provides connectivity to existing FX market participants.

[0023] While the disclosed embodiments relate to the trading of OTC FX instruments, the mechanisms and methods described herein are not limited thereto and may be applied to any OTC product.

[0024] Typically, the Exchange 108 provides a "clearing house" which is a division of the Exchange 108 through which all trades made must be confirmed, matched and settled each day until offset or delivered. The clearing house is an adjunct to the Exchange 108 responsible for settling trading accounts, clearing trades, collecting and maintaining performance bond funds, regulating delivery and reporting trading data. Essentially mitigating credit. Clearing is the procedure through which the Clearing House becomes buyer to each seller of a futures contract, and seller to each buyer, also referred to as a "novation," and assumes responsibility for protecting buyers and sellers from financial loss by assuring performance on each contract. This is effected through the clearing process, whereby transactions are matched. A clearing member is a firm qualified to clear trades through the Clearing House. In the case of the CME's clearing house, all

clearing members not specifically designated as Class B members are considered Class A clearing members. In the CME there are three categories of clearing members: 1) CME clearing members, qualified to clear transactions for all commodities; 2) IMM clearing members, qualified to clear trades for only IMM and IOM commodities; and 3) IMM Class B clearing members, solely limited to conducting proprietary arbitrage in foreign currencies between a single Exchange-approved bank and the IMM and who must be guaranteed by one or more Class A non-bank CME or IMM clearing member(s). Note that a "member" is a broker/trader registered with the Exchange. As will be discussed below, in the disclosed embodiments, a new clearing member class may be introduced for the purposes of trading OTC FX, exclusively or along with other CME products, i.e. futures, as described herein. It will be appreciated that such classifications are implementation dependent.

[0025] In the presently disclosed embodiments, the Exchange 108 assumes an additional role as the central intermediary in OTC FX transactions, i.e., the Exchange 108 will become the buyer to each seller and seller to each buyer, and assume responsibility for protecting buyers and sellers from financial loss by assuring performance on each contract, as is done in futures transactions. As used herein, the term "Exchange" 108 will refer to the centralized clearing and settlement mechanisms, risk management systems, etc., as described below, used for futures trading, including the described enhancements to facilitate OTC FX transactions. By assuming this intermediary role and employing credit screening and risk management mechanisms, parties previously not able to trade OTC FX, because for example they were credit screened out, may now trade anonymously. In prior OTC FX markets, banks were the only sell-side to transactions. The presently disclosed embodiments permit traders to take either sell or buy-side positions and sell-side is no longer limited to banks.

[0026] While the disclosed embodiments will be described in reference to the CME, it will be appreciated that these embodiments are applicable to any Exchange 108, including those which trade in equities and other securities. The CME Clearing House clears, settles and guarantees all matched transactions in CME contracts occurring through its facilities. In addition, the CME Clearing House establishes and monitors financial

requirements for clearing members and conveys certain clearing privileges in conjunction with the relevant exchange markets.

[0027] As an intermediary, the Exchange 108 bears a certain amount of risk in each transaction that takes place. To that end, risk management mechanisms protect the Exchange via the Clearing House. The Clearing House establishes clearing level performance bonds (margins) for all CME products and establishes minimum performance bond requirements for customers of CME products. A performance bond, also referred to as a margin, is the funds that must be deposited by a customer with his or her broker, by a broker with a clearing member or by a clearing member with the Clearing House, for the purpose of insuring the broker or Clearing House against loss on open futures or options contracts. This is not a part payment on a purchase. The performance bond helps to ensure the financial integrity of brokers, clearing members and the Exchange as a whole. The Performance Bond to Clearing House refers to the minimum dollar deposit which is required by the Clearing House from clearing members in accordance with their positions. Maintenance, or maintenance margin, refers to a sum, usually smaller than the initial performance bond, which must remain on deposit in the customer's account for any position at all times. The initial margin is the total amount of margin per contract required by the broker when a futures position is opened. A drop in funds below this level requires a deposit back to the initial margin levels, i.e. a performance bond call. If a customer's equity in any futures position drops to or under the maintenance level because of adverse price action, the broker must issue a performance bond/margin call to restore the customer's equity. A performance bond call, also referred to as a margin call, is a demand for additional funds to bring the customer's account back up to the initial performance bond level whenever adverse price movements cause the account to go below the maintenance. As will be discussed below, additional functionality is provided in the disclosed embodiments to provide risk management for OTC FX transactions.

[0028] The accounts of individual members, clearing firms and non-member customers doing business through CME must be carried and guaranteed to the Clearing House by a clearing member. As mentioned above, in every matched transaction executed through the Exchange's facilities, the Clearing House is substituted as the buyer

to the seller and the seller to the buyer, with a clearing member assuming the opposite side of each transaction. The Clearing House is an operating division of the Exchange 108, and all rights, obligations and/or liabilities of the Clearing House are rights, obligations and/or liabilities of CME. Clearing members assume full financial and performance responsibility for all transactions executed through them and all positions they carry. The Clearing House, dealing exclusively with clearing members, holds each clearing member accountable for every position it carries regardless of whether the position is being carried for the account of an individual member, for the account of a non-member customer, or for the clearing member's own account. Conversely, as the contra-side to every position, the Clearing House is held accountable to the clearing members for the net settlement from all transactions on which it has been substituted as provided in the Rules. As will be explained below, these mechanisms will be augmented so as to handle OTC FX transactions.

[0029] More information about minimizing the risk to the Exchange 108 while similarly minimizing the burden on members, approximating the requisite performance bond or margin requirement as closely as possible to the actual positions of the account at any given time and improving the accuracy and flexibility of the mechanisms which estimate performance bond requirements, may be found in the following U.S. Patent Applications, all of which are incorporated by reference herein:

[0030] In the present OTC FX markets, liquidity and access to pricing is fragmented creating inefficiencies for market participants. Such fragmentation is due in part to traditional reliance on bi-lateral counterpart credit that compartmentalizes trading, as well as the legacy role of banks as market makers to non-bank traders/firm. The centrally cleared marketplace for OTC FX provided by the disclosed embodiments permits access to the best pricing, equal access for all market segments, and buy-side and sell-side, as well as operational efficiencies, as will be discussed.

[0031] In bi-lateral trading, buyers and sellers essentially consummate deals on their own. Sellers must accept each buyer's credit, buyers send payment directly to each seller and buyers must accept each seller's ability to perform on the contract. If either party wishes to close out a deal prior to delivery, they must negotiate exclusively with their original counterparty. Such bi-lateral trading creates inefficiencies for the FX buy-side. For example, bi-lateral trading creates inefficient pricing in that the market consists of multiple trading counterparties and the requirement to open and close positions with the same bank. Further, bi-lateral trading creates inefficient use of collateral, e.g. there may be requirements to place margin at several banks, and creates excessive operational risk, e.g. multiple back-office confirmation relationships.

[0032] Present FX trade settlement utilizes the Continuous Linked Settlement (“CLS”) Bank. Prior to the availability of the CLS Bank, FX trade settlements resulted in separate currency payments between trade counterparties, which incurred heightened risk that one party might default, especially in view of time zone differences, also known as “Herstaat Risk.” The CLS Bank eliminates ‘temporal’ settlement risk by settling both sides of dual currency payments by delivery-vs.-payment, thereby mitigating Herstaat Risk in daily settlements.

[0033] Straight-Through-Processing (“STP”) provides the benefits of reduction in errors during processing, acceleration of trade processing, real time risk management, automated account allocations, and back office staffing efficiencies. However, in the present OTC FX markets, the benefits of STP are limited by lack of standardization and real time delivery of both electronic trade affirmations and trade confirmations.

[0034] The disclosed embodiments offer reduced cost of market access, and thereby better access to best-pricing, lower infrastructure support costs and easier and less costly trade execution, price and volume transparency, efficient risk transfer, STP standardization and auditable prices and mark-to-market.

[0035] In particular, the disclosed embodiments feature centralized OTC FX execution and clearing via a centralized matching and clearing platform accessed, for example, via prime brokers/direct clearing. The disclosed systems and methods may be used by institutional participants in the OTC FX markets, such as banks, asset managers, leveraged trading firms (hedge funds, CTA’s, prop firms, etc.), and/or currency program and overlay managers. The disclosed systems and methods may support OTC FX products, such as Spot, FX forward swap and FX options instruments. The disclosed systems and methods utilize trade matching technology as well as graphic user interface (“GUI”) and application program interface (“API”) based methods of interaction. Further, a novel request for quote process is provided. In the disclosed embodiments, clearing takes place via the Exchange clearing house, such as the CME Clearing House. Daily settlements may still occur utilizing the CLS bank but with added efficiencies which will be discussed below. Collateralized risk margining is also provided as will be discussed below. Further, OTC STP protocols are supported.

[0036] The disclosed embodiments provide value for the buy-side of OTC FX transactions. In particular, the disclosed systems and methods address customer demand for increased FX market efficiencies, pre-trade, trade and post-trade. For example, the disclosed embodiments provide access to trading lines and limits as well as audited and published FX price and volume data. Further, access to best pricing is provided as well as trade anonymity, improved execution speed, access to a primary liquidity pool, and access to multiple FX products. In addition, real time STP is provided as is efficient trade/position management via multi-lateral netting. Further all trading styles are accommodated, such as algorithmic trading, GUI/Keyboard trading and request for quote ("RFQ") based trading.

[0037] On the sell-side, the disclosed embodiments further provide value to banks. For example, they permit the ability to extend market making activities beyond the limits of bilateral credit relationships, e.g. trade with new customers, extend trading with existing customers, etc. Further, increased access to FX liquidity and accommodation of various trading styles is also provided. In addition, access to real time risk management and STP is provided along with credit and settlement risk mitigation.

[0038] In at least one of the disclosed embodiments, a hybrid market model may be provided which combines exchange central limit order book matching and bilateral trading of the OTC market with expanded electronic, anonymous access and clearing. Alternatively, other embodiments may provide sub-sets of this functionality.

[0039] The disclosed embodiments support one or more of the following FX instrument types: forwards, spot and swaps. Forwards refers to FX forward contracts that expire daily starting from tomorrow, i.e. the day after the transaction date, and running out for two years, for each currency-pair. A "Spot" refers the Forward which expires in two days after the transaction date. A swap is essentially a calendar spread, i.e. the simultaneous purchase (sale) of contract(s) in a near delivery month (first leg) and the sale (purchase) of an equal number of contract(s) in a far delivery month of the same contract (second leg), where the first leg is a Spot and the second leg is a further out Forward.

[0040] In one embodiment, a defined number of swap products are offered including Spot against the following (37 in total, assuming it the stated day or next day thereafter which is not a holiday in either currency):

- Tomorrow – Tom Next (T/N) – The Swap which has a first Forward leg expiring tomorrow and the next Forward leg as “Spot”
- The day after tomorrow – Spot Next (S/N)
- Swap Forwards at 1 week, 2 weeks, 3 weeks
- Monthly Swap Forwards from 1 month through 24 months
- Except if this date is on a weekend or a holiday in either currency, go to the first preceding week date which is not a holiday in either currency
- Except if the spot value date is the last date of the month, then go to the last week date of the N'th month following which is not a holiday in either currency.
- Swap Forwards at the 8 IMM dates over the next 2 years
- Broken-Dated Swap – Any Swap which is not one of the pre-defined Swaps above.

It will be appreciated that other product combinations may also be offered.

[0041] Further, the disclosed embodiments utilize Daily Rolling Instruments wherein the contract symbol used by the customers to reference a given Swap or Spot does not change, day-to-day, but the Swap legs do change each day, i.e. the temporal references within the instrument are treated as relative to the transaction date rather than being expressed in absolute form thereby necessitating a significantly increased symbol set to reference them:

- From the trader perspective, contract symbols for electronically matched instruments are “generic” – Fill messages include the value dates and prices of each leg;
- Instrument definitions would therefore include contract symbols like “USDSPYSP” for Spot and “USDJPY1M” to specify the 1 month, forward Swap.

[0042] Each day, new instruments are used:

- Forward for the 2 year date

- All Swap instruments are refreshed with new legs

The appropriate value dates for electronically matched contracts are assigned by the system at match time and provided to the user within the order entry/front office fill messages for each leg. For Directed Request For Quote ("Directed RFQ" or "DRFQ"), discussed in more detail below, users may enter the desired legs for a Directed RFQ using generic contracts, with the requested value dates. For example, a user wishing to do an RFQ for a forward outright, i.e. an order to buy or sell only one specific type of contract, with a specific value date should be able to specify that, without having to specify a unique contract that is associated internally with that value date.

[0043] Referring to Figure 3, in one embodiment, the Spot leg price is the mid-point between the bid/ask in the current Spot market or last traded within a specific time period; the other Forward leg price is made based on the Spot price plus the differential (e.g. "30" is a 0.0030 differential between the Spot and the Forward leg).

[0044] If the mid-point between the bid/ask in the current Spot market is stale, settlement information may be used. If the spot market is not liquid and no market data is currently being produced, customers will be kept up to date with secondary sources to minimize unexpected results when the leg price comes in. A business rule of having the Spot markets regularly quoted by market makers may be provided.

[0045] For some markets, the Swap does not use the Spot for that market, but rather an associated market. This is accomplished by doing a reciprocal ($1/\text{current-price}$) calculation of the spot, or spot mid-point in that associated market.

[0046] In the disclosed embodiments, for the purposes of determining the value date, value date conventions are employed. For example, the value-date convention for spot for USD/CAD is one business day and for all others it is two business days. A value date is valid for a currency pair if it is a banking business day for both currencies of the pair. Trading may physically occur on any weekday. However, for trading occurring on any given weekday, the rule for taking holidays into account when determining the value date for "spot" trading on that weekday differs depending on the currency in which the holiday occurs. For holidays in USD, you need only one full working day before you can settle a spot trade. For example: Wednesday July 4th (US Independence Day), a USD holiday; Monday's spot trading in USD/JPY has value date Thursday (because Wednesday is a

USD holiday); Tuesday's spot trading in USD/JPY also has value date Thursday (because you only need one USD working day). For holidays in currencies other than USD, two full working days before settlement may be required. For example: Wednesday December 7th (Pearl Harbor Day), a JPY holiday; Monday's spot trading in USD/JPY has value date Thursday (because Wednesday is a JPY holiday); Tuesday's spot trading in USD/JPY has value date Friday (because Wednesday is a JPY holiday and you need two full working days in JPY).

[0047] In the disclosed embodiments, support for the instruments listed in Table 1 is provided. It will be appreciated that the instrument offerings may vary and are implementation dependent. In particular, the Central Limit Order Book ("CLOB") will support Spot and/or standardized Swap forwards. The Directed RFQ mechanism, discussed in more detail below, will support Spot, Forwards (any date out to 2 years), Swap forwards (standardized cases), Broken-dated swaps, or combinations thereof.

Table 1

Currency Pair	Shorthand	Quoted In	Spot Trading Unit	Swap Trading Unit	Spot Tradable via CLOB	Swaps Tradable via CLOB	Number Contracts via CLOB	Number Contracts Including Forwards
Euro - USD	EUR/USD	USD	EUR	USD	x	x	38	541
USD - Japanese Yen	USD/JPY	JPY	USD	USD	x	x	38	541
British Pound - USD	GBP/USD	USD	GBP	USD	x	x	38	541
Australian Dollar - USD	AUD/USD	USD	AUD	USD	x	x	38	541
USD - Swiss Franc	USD/CHF	CHF	USD	USD	x	x	38	541
USD - Canadian Dollar	USD/CAD	CAD	USD	USD	x	x	38	541
Euro - Japanese Yen	EUR/JPY	JPY	EUR		x		1	504
Euro - British Pound	EUR/GBP	GBP	EUR		x		1	504
Euro - Swiss	EUR/CHF	CHF	EUR		x		1	504

Franc						
British Pound - Japanese Yen	GBP/JPY	JPY	GBP	x	1	504
Japanese Yen - USD	JPY/USD	USD	JPY	x	37	541
Swiss Franc - USD	CHF/USD	USD	CHF	x	37	541
Canadian Dollar - USD	CAD/USD	USD	CAD	x	37	541
<i>total</i>					343	6885

* Swaps are not listed for the non-USD currency pairs.

[0048] In disclosed embodiments, three currency-pairs will have a secondary market for the alternate listing (e.g. a ¥/\$ contract and a \$/¥ contract will both exist, as completely separate markets):

- Japanese Yen
- Swiss Franc
- Canadian Dollar

Forward outright instruments will be quoted in terms of one currency only (e.g. a \$/¥ Forward is quoted in JPY, not USD). Swap instruments will be quoted in differential.

[0049] In the disclosed embodiments, there are 10 currency pairs, but only 6 with swaps defined. Contract sizes will be 1 million units of the base currency. Instruments tick in tenths, not quarters nor in a variable tick table (VTT).

[0050] With regard to daily value date roll-over, users need only be notified that the value date has changed for the Spot and Swaps, rather than what the change is for each instrument. In one embodiment, users are notified as to what the current value dates are for each instrument. Participants can request value dates for each instrument from the marketplace.

[0051] A new flag on the Instrument Definition market data message is provided (the MO, em-oh) which is available for use in this market. One example usage could be in the situation where each instrument was listed individually. This flag could change daily for many of these instruments, as indicated by the "Tradable" flags in the table above.

[0052] In one embodiment, any of the listed forwards, while not on a central limit order book, may be traded via the Directed RFQ system (noted below). Traders may also use the Directed RFQ system to dynamically create a Broken-dated Swap market consisting of those Swaps not pre-defined (i.e. those which have a non-standard forward leg). These markets are also not on a central limit order book.

[0053] It will be appreciated that the foregoing instrument definitions and conventions are implementation dependent and suitable modifications to accommodate alternative instruments and conventions are contemplated herein. For example, while it is advantageous to utilize existing product symbology and instrument standards in the FX market place today, other symbology or standards, now available or later developed, may also be used with the disclosed systems and methods.

[0054] To facilitate clearing of OTC FX products using the clearing and settlement mechanism, the disclosed embodiments feature a new class of clearing member for banks and prime brokers addition to existing Clearing house members. Existing Exchange membership may be used to trade on this new market as well. Further, for the disclosed embodiments, only Institutional users will be permitted to use the platform (no retail). Clearing firms will have to guarantee that their customers meet the established criteria for access. These criteria may be based on capitalization. The same single risk pool will be used for the safeguard system. In alternative embodiments, the market participants may be defined differently.

[0055] With regard to market access, authorization may be required before order entry can occur. Authorization should occur at the SubscriberAlias (originating location of the order) as well as the TraderID (order originator) and/or Account (entity on behalf of which the order is being submitted) level of granularity but may effect the registration process. In one embodiment, authorization occurs by TraderID and/or Account. In one embodiment authorization is for the entire market rather than granular to currency pair

[0056] The application of a central counterparty to OTC FX transactions permits additional functionality to be offered to OTC FX market participants. In one embodiment, netting is provided which allows various FX positions to be netted together for settlement rather than separately settled, thereby reducing the number of settlement transactions and the associated transaction costs. The individual transactions are still

tracked and reported but the actual number of settlement transactions, for example, those sent to CLS, is reduced. In another embodiment, collateralization is provided which allows the value of an entity's FX account, which may change in value via debits and credits but not based on the actual movement of value, to be used against that entity's margin requirement of their futures trading account, thereby simplifying margin requirements and reducing the overall burden.

[0057] In one embodiment, as shown in Figure 2A, CME provides clearing and settlement functionality while a separate market, such as Reuters, provides matching functionality and access to sell-side entities, such as banks. In an alternate embodiment, as shown in Figure 2B, CME provide matching, clearing and settlement functionality. It will be appreciated that the division of functionality for in-taking, processing and completing a given transaction is implementation dependent.

[0058] In order to implement OTC FX within the clearing and settlement mechanisms of the Exchange, additional market functionality is needed, such as: match engine functionality; surveillance, market control and registration functionality; RFQ functionality; market data functionality; trade data functionality; clearing/trade reporting/straight-through-processing ("STP") functionality; fee functionality; and front-end/distribution functionality.

[0059] In particular, the match engine matches up sell-side and buy-side orders to complete trades. In one embodiment, the match engine utilizes a first-in-first-out ("FIFO") matching algorithm for Spot transactions and a FIFO with Lead Market Maker matching algorithm for Forward Swap transactions. In this embodiment, simple market maker protection is provided for Forward Swap transactions. Mass quoting is also permitted with Forward Swap transactions.

[0060] In one embodiment, specific features are provided for forward swap markets. In particular, approximately 10 to 20 Market Makers are targeted for the forward Swap markets, across all markets. Leg pricing for swaps is done on a differential basis, given the derived spot price and the swap differential.

[0061] In one embodiment, the allocation will respect the 1 million currency base unit contract size (i.e. products trade in base units of 1 million). The match engine is not required to have credit controls nor is it required to track the position of traders. Traders

must know the delivery/value dates of all leg fills. This can be accomplished either via the fill notification, a daily instrument creation market data message, or some other standardized electronic means.

[0062] Traders need to get leg fill notifications with prices immediately after a match. Accordingly, order entry leg messages back to the trader for forward swaps should reflect one Spot leg, with its associated value date, and a generic forward leg, with its associated value date. This is true regardless of whether the messages are generated as the result of an electronic match, or a Directed RFQ-based block trade. Further, order entry leg messages back to the trader for Spot contracts should reflect the generic Spot contract and its associated value date, regardless of whether the messages are generated as the result of an electronic match, or an Directed RFQ block trade. In addition, order entry leg messages back to the trader for forward out-rights should reflect the generic forward outright, and its associated value date. Note that such messages can only be the result of an execution from a Directed RFQ block trade, since forward out-rights will not be electronically matched.

[0063] The Trading Engine must produce information on a trade as to whether a given side was the aggressor order (i.e. the non-resting order). This is for the purposes of the fee functionality, discussed below.

[0064] Implied functionality, as discussed in more detail below, may also be provided.

[0065] The matching engine may support one or more of the following order types, or combinations thereof:

- Fill and Kill (“FAK”) & Limit orders;
- RFQ for quantity will be available for those markets which are traded in a central limit order book;
- Stop Orders and Stop Price Logic ;
- Good Til Cancel (“GTC”) order types;
- Good Til Day (“GTD”) order types ;
- Block trades;

[0066] The match engine may also provide consolidated fill reporting (front-office, back-office, and market data)

[0067] The Match Event/Trade Report to Clearing may need to include information about the entire spread. This will require either using the D1 message (as well as the M1) from the Match Engine to Clearing, or a new interface/message altogether. See the Section below on Clearing/Settlement for more information.

[0068] In one embodiment, the market will operate in continuous trading all week (24 hours x 5.5 days), with existing trade date rollover daily:

- Markets open at 11:45 AM Chicago time on Sunday for a Monday trade date. There may be no trade date rollover at 4:00 PM on Sunday;
- Markets close weekly at 4:00 PM on Friday;
- There is no maintenance window from 4:00 PM to 5:00 PM. There may be no IOP-like opening state;
- The cutoff to the next trading day occurs at 4 PM Chicago time (5pm New York time);
- Markets are open on most normal holidays;
- All orders remain on book. On trade date rollover the legs of that Swap are redefined (perhaps as an entirely new market, but with the same External ID/Contract Symbol); and
- If there is open interest in a Swap or Spot market on trade date rollover, the orders remain actionable in that “generic” market, but if traded will have new leg forward instruments.

[0069] The Surveillance, Market Control & Registration functionality provides audit, security and authentication services. In one embodiment, order management tools are provided such as CME’s FirmSoft, which is a browser-based order management tool that provides real-time visibility into working and filled orders, across multiple firm IDs, in the CME® Globex® Order Management database. Accessible through the CME portal (via the internet) or through a production connection to the CME Globex platform, CME FirmSoft provides important alternative access to working and filled orders during system failures

[0070] Globex Control Center (“GCC”) must have current capabilities provided with Eagle/Ghost for Market Surveillance

- a. Status/Cancel Working Orders

- b. Status Mass Quotes
- c. Status/Bust Trades
- d. Status Blocks
- e. Plus:
 - 1. Surveillance by value-date
 - 2. Agent shall use single Ghost instance to be able to perform status across FX Marketplace and other CME markets
 - 3. Status on Directed RFQ requests and responses can be done in the same way as RFQ's are currently, but with information on both parties available
 - 4. Differences in terms & convention between the end trader & GCC need to be taken into account for all tools (generic instruments, value dates, etc)

[0071] The system may make available the following audit reports

- Order & trade activity – overall and per market
- Directed RFQ request and response activity – overall and per market
- A given Market Maker's activity in the above

[0072] The Exchange will control the account numbers that are authorized in this market and for or each new participant, a unique account number is created

[0073] The set of registration data that should be collected for this marketplace is similar to existing data for other markets:

- 1. First Name
- 2. Last Name
- 3. Date of Birth
- 4. Social Security #
- 5. Work Phone
- 6. Work fax (mandatory)
- 7. Email (mandatory)
- 8. Mobile Phone
- 9. City of birth
- 10. Secondary School

11. Trader ID(s) authorized
12. Account #s (new addition but see below already part of TeleStat)
13. Interfaces used
 - a. iLink 2
 - b. EOS
 - c. Globex trader
 - d. Firmsoft
 - e. FX Marketplace
14. Contact type
 - a. Technical
 - b. Market
 - c. Firm Admin Primary
 - d. Firm Admin Secondary
15. TeleStat
 - a. Security Question
 - b. Security Answer
 - c. Trading Address
 - i. City
 - ii. Country
 - iii. State
 - d. Tag 50/Sender Sub ID
 - e. Firm and Account # Combinations
16. Authorized Contact Signature
17. Clearing Firm Representation and Agreement
 - a. Name of clearing firm
 - b. signature of officer
 - c. name of officer
 - d. title
 - e. date
18. Customer Representation and Agreement
 - a. name of customer

- b. signature of officer
- c. printed name of officer
- d. title
- e. date

[0074] The FX Marketplace may require an error trade policy that will be administered by the Globex Control Center ("GCC"). Existing error trade tools may be used. GCC should have current capabilities provided by ETP plus, as information about the spread will be passed to clearing, the ETP system should allow inquiry based on this criteria

[0075] The Clearing House will provide each day the most economically appropriate end of day settlement prices need to be determined for open contracts, with no need for operations or GCC support.

[0076] The disclosed embodiments also feature Directed Request For Quote (Directed "RFQ" or "DRFQ") functionality. In particular, this functionality permits anonymous and private requests for quote, i.e. the request-recipient is unaware of the identity of the requestor but responses are still routed back solely to the requestor. In prior OTC FX markets, transactions were bilateral, due to the need to manage credit risk, and therefore the transacting parties were known to each other, thereby stifling some potential transactions. Parties needed to know each other so as to evaluate credit risk, etc. In the presently disclosed embodiments, the centralized clearing mechanism buffers this credit risk to the parties, as was described above, and permits transacting parties to remain anonymous, with the clearing mechanism acting as the intermediary and risk buffer. Further, in prior RFQ systems, requests might be directed to particular market makers but the responses thereto, i.e. actionable quotes, were broadcast back to the market generally, increasing the risk/exposure of the responder. In the disclosed Directed RFQ system, requests are anonymized and then routed to all of the market makers, or alternatively only to an appropriate subset of market makers based on the interest profiles of the market makers and/or parameters of the request (discussed in more detail below). Responses/actionable quotes are then routed back only to the requestor rather than the entire market, thereby limiting the exposure of the actionable quotes and reducing the exposure of the responder(s). The automated nature of the disclosed system permits the

request/quote transactions to occur in parallel and at pace with the actual market in which the underlying products are being traded via the mechanisms available to all traders, thereby not inhibiting the participants participating in the market. While the disclosed embodiments may be described with respect to FX instruments, it will be appreciated the these embodiments are not limited thereto and may be utilized with other instruments such as futures or options instruments.

[0077] In one embodiment, the Directed RFQ functionality operates as follows:

1. A requestor wants to trade a specific amount of a particular instrument through a Directed RFQ. In one embodiment, the Directed RFQ communication includes size, price, side (optional), notional amount, product (currency pair), delivery date and Time to Live ("TTL"):
 - a. The specific size is can be down to the whole unit (\$1) is not constrained by the "contract size";
 - b. Directed RFQ has a minimum and maximum quantity range, defined by currency pair and product type. The minimum can be lower than the contract size (1 million);
 - c. The front-end should be able to display the quantity requested in terms of notional amount;
 - d. The trade is all-or-nothing between two counter-parties – partial fills or not possible (but may be possible in alternative embodiments);
 - e. In one embodiment, any market participant can submit a Directed RFQ;
 - f. In one embodiment, the requestor may specify sell-side or buy-side with the system hiding this information from the market makers;
2. A publicly distributed Directed RFQ is broadcast to all, or alternatively, subset of, market participants;
 - a. This initial Directed RFQ has auto-cancel functionality known as the Time-To-Live (TTL), which is entered by the requestor;
 - b. The TTL is part of the public Directed RFQ and is sent out over market data;
 - c. After the TTL expires, the initial Directed RFQ is cancelled;

- i. In one embodiment, all Directed RFQ Responses which have not been accepted are canceled;
 - ii. In one embodiment, no more Directed RFQ Responses are accepted;
3. The trading community responds to the public RFQ with a Directed RFQ Response (*new message type*);
 - a. Any market participant may respond to the Directed RFQ;
 - b. Each quote may have auto-cancel functionality known as the Time-To-Live (“TTL”);
 - c. The TTL is entered by the responder, as part of the Directed RFQ Response;
 - d. Expired responses receive cancel messages;
 - e. Responders can also cancel their quotes at any time;
4. A Directed RFQ system manages all Directed RFQ Responses it receives;
 - a. These responses are not put into the public order book, but are sent to the original requester only;
 - b. Only the Directed RFQ originator can observe Directed RFQ Responses, along with the TTL associated with each response;
 - c. Each quote is anonymous – containing only the price and TTL. In one embodiment, whether the request is a buy-side or sell-side request may be omitted;
5. The Directed RFQ originator can select from any of the live quotes in this private order book;
 - a. Once a quote is accepted, the Directed RFQ system then automatically sends in a Privately Negotiated Trade (“PNT”)/Block order for the exact notional amount, on behalf of the two parties;
 - b. All other quotes are immediately cancelled. Cancel messages to all other responders;
 - c. The Directed RFQ itself is “cancelled” and no more Directed RFQ Responses will be accepted for it;

5. Both parties receive normal iLink & Clearing trade reports, subject to the Consolidate Fill requirements below;
 - a. the system will optionally update the market volume and other market data statistics, based on appropriate configuration settings.

[0078] The Time to Live (“TTL”) parameter may be specified as an absolute time of expiration, such as a set time, or a relative time, e.g. a duration measured from some common reference or origin. In one embodiment, transmission delays in the DRFQ, or in the responses thereto, are accounted for in computing the TTL window and determining when responses are properly received therein. In one embodiment, Global Positioning System (“GPS”) receivers or some other form of universal time reference, such as a network time reference, e.g. network time protocol (“NTP”), at each point of transmission may be used to provide accurate time synchronization and transmission delay detection. Alternatively, the system may ignore transmission delays, relying on a central time keeping mechanism as the ultimate arbiter.

[0079] In embodiments where Directed RFQ’s are routed to only a select subset of market makers, the selection may be based on trader and/or market maker profile information known to the system. Selective routing thereby minimizes quote traffic. In both a broadcast and selective routing environment, incentives may be put in place to encourage recipient market makers to respond to the Directed RFQ. Incentives may include trading fee discounts or other incentives. Alternatively, penalties may be implemented to penalize recipient market makers who fail to respond. Penalties may include fines, increased trading fees, trading restrictions or other penalties.

[0080] The Directed RFQ mechanism manages all Directed RFQ traffic through the system. In one embodiment, in-bound requests are received and a unique identification number is generated and associated with the request, such as in a log. For example, the request messages/packets, having a particular data structure, may be received into a buffer storage which holds the request for subsequent processing. A counter or other number generator then generates a unique value which is concatenated or otherwise associated with the request, such as by being inserted into the data structure. The Directed RFQ is then pushed out to the market, i.e. broadcast to the market makers, all or a subset thereof, utilizing the identification number in place of the originator/requestor’s identification

information to identify the Directed RFQ. For example, the various data from the request data structure may be copied into a new message having a similar data structure including the unique identification number but omitting the originator/requestor's identification information. The central system maintains a cross reference database/log of the Directed RFQ identification numbers and the associated requestor identity so as to associate and route responses appropriately, e.g. at the same time an anonymous request message is generated, the data is stored the cross-reference database. This database may be maintained in a memory or other storage device.

[0081] In one embodiment, individual Directed RFQ Responses may have an associated TTL which extends beyond the expiration of the original Directed RFQ Request. This is acceptable, and Directed RFQ Responses which have not yet expired are fully executable against by the Directed RFQ originator.

[0082] In one embodiment, the Directed RFQ system is managed via a central server process. In the event of an "in flight" situation (such as a Directed RFQ Response being cancelled or otherwise expiring while the RFQ originator's acceptance is "on the wire"), whichever request is processed by the Directed RFQ central server first, wins. Other transaction coherency protection mechanisms may also be provided.

[0083] Mechanisms may also be provided to allow requestors to manage pending Directed RFQ requests and responders to manage pending responses. This would allow a requestor, for example, to track which Directed RFQ's are active, how long they have to live, the present response status, etc. For responders, the mechanisms permit them to know what actionable quotes are still live and how long they have to live. This would allow, for example, a responder to manage responses to multiple Directed RFQ's to the same product so as not to over expose themselves. For example, an application program interface ("API") may be provided which allows requestors and/or responders to access and/or modify the internal databases/tables maintained by the DRFQ system to manage requests and responses and their associated TTL's as will be described. The API may be a simple command and control interface which receives command/control messages, executes the command contained therein and sends back a response message to the sender based thereon. Alternatively, the API may be a web based interface providing a secure media-rich interactive client application permitting the described management tasks.

[0084] Figure 4 shows an exemplary business message flow for the Directed RFQ functionality of the disclosed embodiments. It will be appreciated that other messaging protocols may also be used to achieve the disclosed functionality. Further, it will be appreciated that the media over which the Directed RFQ messaging traffic flows is implementation dependent and may include wireless and wired networks, private and publicly accessible networks, or combinations thereof.

[0085] In response to a Directed RFQ, there may be multiple responses from various interested parties. These responses may be generated substantially simultaneously or over a window of time as the various parties receive and react to the Directed RFQ. Further, the transmission of the Directed RFQ as well as the responses thereto, may be subject to various network latencies between and among the disclosed system and the transacting parties. Further, each response may include different parameters, including a different TTL. In one embodiment, the Directed RFQ is matched to the first response which meets the request parameters, i.e. the business requirements specified by the request originator and all other responses are rejected. This matching may be automatically performed by the system or, alternatively, responses may be routed back to the originator who then selects the response they wish to trade with based on criteria of their choosing. In one embodiment, the originator may select a desired response based on at least the price wherein the system then automatically selects among the available responses at that price via the mechanisms described below. It will be appreciated that many different matching/selection mechanisms may be utilized ranging from fully automated systems to fully manual systems, and all such system are contemplated herein.

[0086] In an alternate embodiment, the Directed RFQ central server may maintain a private order book on behalf of the originator which maintained, for example, until the TTL of the Directed RFQ expires. Mechanisms may be provided which balance the parameters of each response against the parameters/requirements of the Directed RFQ so as to match the most optimal response(s) with the request. For example, a “window of opportunity” may be defined in which responses are allowed to accumulate before evaluating those responses and matching to the most optimal. Such factors considered in matching requests with responses may include the price, quantity, TTL (of the request and/or the response), or combinations thereof. Once the “window of opportunity” closes,

all subsequently received responses are rejected even if they may be more optimal than an accepted response. In one embodiment, the “window of opportunity” may be dynamic and may be based on the latest expiring response which meets one or more of the request parameters. Alternatively, the “window of opportunity” may be statically defined or may be defined by a parameter of the Directed RFQ itself, on a transaction by transaction basis, such as by the TTL of the Directed RFQ. Typically, the requestor will desire a long TTL on the responses to allow for the best selection of quotes while the responder will want a short TTL on the response to minimize exposure/risk. Once the window closes, the central server evaluates the received responses and takes the best price which matches the originator’s requirements (as stated in the Directed RFQ). The system may then execute a block trade on behalf of both parties to complete the transaction. In one embodiment, multiple responses which tie for the best price or otherwise meet the requirements may be subject to selection by First in First Out, or other arbitration mechanism such as round-robin. Once the transaction is complete, fill notifications are sent back to both parties, etc.

[0087] Given the transmission latencies noted above, a given response may arrive at the system later than a later-generated response or miss the TTL of a given Directed RFQ, and may therefore miss a matching opportunity, depending on the transmission latencies in the system. In one embodiment, logic is included to evaluate responses based on the time they are generated and the time they are actually received to mitigate “in-flight” discrepancies and otherwise maintain coherency between Directed RFQ’s and the responses thereto, ensuring equal opportunity to the market participants and minimizing re-transmission of requests and responses.

[0088] In one embodiment, Directed RFQ transactions occur outside of the normal central order book. In an alternative embodiment, a particular Directed RFQ may be allowed to match against the central order book where a suitable order is present.

[0089] In one embodiment, conditional responses to a Directed RFQ may be supported allowing a responder to attach conditions to their response/actionable quote. Matching of the response to the request factors in whether the specified conditions are met, in addition to other factors.

[0090] In an alternative embodiment, indicative quoting is also supported allowing market makers to publish indicative quotes to the market place and invite Directed RFQ's from interested parties prior to issuing actionable quotes.

[0091] Figure 6 depicts a block diagram of an exemplary system 600 for trading OTC FX instruments having a directed request for quote server 118 according to the disclosed embodiments. It will be appreciated that the DRFQ server 118 may be integrated with an exchange 108 or separate therefrom. Further, the DRFQ server 118 may be implemented in hardware, software or a combination thereof and may be further implemented as one or more discrete devices and/or software programs interconnected via a wired and/or wireless network. The system 600 includes the DRFQ server 118 coupled with an exchange 108, such as the Chicago Mercantile Exchange described above. The DRFQ server 118 is further coupled with a plurality of market participants, such as traders 104 and market makers 106, such as via network connections, wired or wireless, between the DRFQ server 118 and terminals and/or terminal application software used by the market participants 104, 106 to participate in the market. It will be appreciated that interconnections between the DRFQ server 118 and the market participants 104, 106 may be implemented via the exchange 108. In one embodiment, the market participants 104, 106 execute a client application interface which communicates with the DRFQ server 118 using a defined communications protocol to implement the disclosed functionality. This client application interface may be integrated with the market participant's other software used for trading on the exchange 108 or may be separate therefrom, such as a web based interface. The communications protocol may include a proprietary protocol, non-proprietary protocol, e.g. TCP/IP based, or combinations thereof, and may feature security protocols to protect the communications and error detection/correction and quality of service ("QOS") protocols to ensure reliable and expedient communications. It will be appreciated that the described functionality may be implemented as hardware and/or computer program logic/software at the server 118, on the terminals of the market participants 104, 106, at the exchange 108 or via a combination thereof.

[0092] As an operational example, in one embodiment, a first entity, such as a trader 104 sends a DRFQ to the DRFQ server 118 (labeled A). For example, the trader 104 utilizes their application interface to generate a DRFQ message including the specified

parameters according to a system-defined data structure, and transmit the DRFQ message to the DRFQ server 118 utilizing the system-defined communications protocol, which may include securing the DRFQ message, such as by encrypting it. The DRFQ A identifies the first trader 104, specifies an instrument, such as a particular FX instrument, that the first trader 104 is interested in trading, the time and date that the request was generated and/or transmitted and, in one embodiment, specifies a time to live for the request. The DRFQ A may further specify whether the first trader 104 is interested in buying or selling the specified instrument. A second trader 104 also sends a DRFQ to the DRFQ server 118 (labeled B), identifying the second trader 104 and specifying an instrument, an optional time to live and an optional buy or sell indication. It will be appreciated that the DRFQ's A and B may further specify other information necessary to accomplish the disclosed functionality and that such information is implementation dependent. Upon receipt of the DRFQ's A and B, the DRFQ server 118 may send acknowledgement (not shown) back to the first and second traders 104 to confirm the receipt of the DRFQ's A and B.

[0093] Upon receipt of the DRFQ's A and B, the DRFQ server 118, as will be described in more detail below, logs the time/date of receipt, anonymizes the DRFQ's A and B, determines one or more other entities, such as other market participants 104, 106, to which to transmit the anonymized DRFQ's A and B and transmits them thereto. In particular, the DRFQ server 118 removes the identity of the requesting trader 104 from the DRFQ A, B, while maintaining the ability to correlate the any responses back to the requesting trader 104. For example, the DRFQ server 118 may generate a unique identification code for the DRFQ A, B and log that identification code in a cross-reference log/database associated with the identity of the requesting trader 104. The identification code is then substituted in the DRFQ A, B for the identity of the requesting trader 104 such that the requesting trader 104 can only be identified from the DRFQ A, B using the cross-reference maintained by the DRFQ server 118.

[0094] Once anonymized, the DRFQ server 118 then identifies one or more other market participants, such as market makers 106, that would be interested in quoting for the instrument specified in the DRFQ A, B. In one embodiment, the anonymized DRFQ A, B may be broadcast to all market participants 104, 106 or all market makers 106. In

an alternative embodiment, the DRFQ server 118 may maintain interest profiles for each of the market participants 104, 106 which specify what those participants 104, 106 are interested in trading. These interest profiles may be maintained by the market participants 104, 106 themselves, such as in real time. Based on these interest profiles, the DRFQ server 118 selects one or more market participants 104, 106 to receive the anonymized DRFQ A, B. In the example of Figure 6, anonymized DRFQ A may be sent to first and second market makers 106 (labeled C and D) while DRFQ B may be sent only to the third market maker 106 (labeled E). In one embodiment, if the DRFQ A, B specifies the buy or sell intent of the requesting trader 104, this indication may be removed prior to transmitting the anonymized DRFQ A, B to the selected market participants.

[0095] The DRFQ server 118 may further note the time-to-live (“TTL”) specified for each DRFQ A, B. As was discussed above, the TTL determines how long the particular request will be kept “alive,” i.e. what is the window of time over which responses to the request will be considered. The TTL may be specified as an absolute expiration, e.g. 10:05 p.m, April 18, 2006, or may be specified as a duration measured from a particular origin, e.g. 1 hour from the time the transmission time of the request (specified in the request) or 1 hour from the receipt of the request by the DRFQ server 118. As an alternative to specifying the TTL in the DRFQ itself, the TTL may be automatically specified by the DRFQ server 118, such as a default TTL, which may be used, for example, when the DRFQ fails to specify the TTL or completely in place of a DRFQ specified TTL. As will be described in more detail below, the once the TTL elapses or otherwise expires, the associated DRFQ expires, i.e. the window of opportunity to receive actionable quotes in response to the request is closed. In one embodiment, a server process monitors all of the TTL’s of the pending requests and responses and determines when they expire. For example, each TTL may be used to set a counter maintained by a data structure which is decremented by the server process at a defined interval. When the counter value is determined to be zero, the server process generates an alert or alarm to indicate that the particular TTL has expired. This alert/alarm may trigger other server processes which implement the disclosed functionality. In one embodiment, the expiration of the TTL may cause the server 118 to transmit cancellation notices to all of

the market participants to which the associated DRFQ was sent, or alternatively, to those market participants 104, 106 who have not yet responded with an actionable quote in response thereto. Actionable quotes received before expiration of the TTL, but not accepted before expiration may be either cancelled or accepted, as will described below. Where the actionable quote is cancelled, a cancellation message may be sent back to the originating market participant 104, 106. Actionable quotes received after expiration of the TTL may be rejected or allowed as will be described below. Responses carrying actionable quotes which are in transit at the time the TTL expires, e.g. "in flight", may be allowed or other algorithms may be employed to ensure fair operation which accounts for such situations, e.g. actionable quotes having been generated/transmitted prior to expiration of the TTL may be accepted. Where time of transmission may be utilized as the basis of accepting actionable quotes, mechanisms may be implemented to ensure certainty that no more "in-flight" transmissions exist, such as an absolute cut-off time.

[0096] Once the particular market participants 104, 106 receive the anonymized DRFQ's C, D, E, they will evaluate them to determine whether or not they wish to respond with an actionable quote. If so, the market participants 104, 106 will send a response back to the DRFQ sever 118. The response (labeled F, G, H) may include an actionable quote and identify the DRFQ to which the actionable quote is in response, such as by specifying the unique identification code of the particular DRFQ C, D, E, which will allow the DRFQ server 118 to associate the response with the DRFQ originator. Alternatively, a market participant 104, 106 may ignore the DRFQ if they have no interest in responding or respond to say they will not be providing an actionable quote rather than simply ignoring the DRFQ, such as to provide a confirmation back to the DRFQ server 118 that the DRFQ was at least received.

[0097] The response F, G, H may further specify a TTL for the actionable quote, similar to the TTL for the DRFQ, specifying how long the quote will remain valid. The response TTL serves to mitigate the exposure of the market participant 104, 106 by limiting the life span over which the actionable quote may be accepted by the DRFQ originator. As with the request TTL's, response TTL's may be specified in the response or may be automatically specified by the server 118, such as by a default value in situations where no TTL is specified. The TTL may specified as an absolute time or may

be relatively specified such as by a specific duration measured from an origin, or the TTL may be specified based on an event, such as based on the expiration of the request TTL.

[0098] If the TTL of the response expires prior to acceptance of the associated actionable quote, the actionable quote may be cancelled. In such a situation, a cancellation message may be transmitted back to the response originator to inform them that their quote was not accepted prior to expiration of the TTL. Should the response be received after its TTL has expired, the response may be rejected with a suitable message being sent back to the originator. In one embodiment, the request TTL may be ignored so long as there is a response whose TTL has not yet expired.

[0099] In one embodiment, a market participant 104, 106 may explicitly cancel or rescind a previously submitted actionable quote so long as the cancellation request is received prior to acceptance of that quote. Mechanisms may further be provided so as to account for a cancellation which sent prior, but received subsequent, to acceptance of the actionable quote. For example, the time of transmission and receipt may be analyzed to determine when the cancellation was sent and acceptance of the quote may be cancelled if the actionable quote was properly cancelled.

[00100] Once actionable quotes are received by the DRFQ server 118, they must be processed against the associated DRFQ's to determine if they are acceptable or not to the DRFQ requestor. In one embodiment, each response/actionable quote received by the DRFQ server 118 is associated with the DRFQ originator, such as by cross referencing the DRFQ identifier and identify the originating entity. The actionable quote is then forwarded to the DRFQ originator for review (labeled I, J). As described, the responses/actionable quotes are sent only to the DRFQ originator rather than the entire market. This minimizes the exposure of the originator of the actionable quote by restricting who in the market may see it. In one embodiment, the actionable quotes are anonymized prior to sending the DRFQ originator. The actionable quote is forwarded along with the associated TTL so that DRFQ originator knows how long they have to make a decision. If the DRFQ originator wishes to accept the quote, they may return an acceptance message back to the DRFQ server 118. Alternatively, the DRFQ server 118 may automatically match acceptable actionable quotes and accept those quote based on the parameters specified in the DRFQ itself. In this embodiment, while the actionable

quotes may be forwarded back to the DRFQ originator for informational purposes, the acceptance of those quotes is automatically handled. In yet another alternative embodiment, the DRFQ originator may specify whether they want to specifically review and accept the quote or rely on the DRFQ server 118 to do so automatically. Where the DRFQ originator may respond with an acceptance to an actionable quote, mechanisms may be implemented to handle “in flight” issues such as where an acceptance is sent prior to expiration of the actionable quote TTL but received after expiration thereof or where the acceptance is sent prior to receipt of a cancellation of the actionable quote but received after the cancellation thereof. Such mechanisms ensure a fair market which operates in a definite/certain/unambiguous manner according to the expectations of the market participants.

[00101] In embodiments where the DRFQ server 118 may automatically accept actionable quotes, such acceptance may be based on whether the actionable quote is the first received of multiple actionable quotes received. Where the first actionable quote does not completely satisfy the DRFQ, the server 118 may allow partials fills, accepting actionable quotes in the order they are received until the entire DRFQ is satisfied. Again, mechanisms may be in place to ensure that an actionable quote sent prior to, but received after, another quote, is accepted first. Alternatively, the DRFQ server 118 may accumulate a number of actionable quotes over a window of time, such as the TTL of the request, or the shortest or longest TTL of a received actionable quote. Upon closing of this window of opportunity, the server 118 may then evaluate and accept the one or more actionable quotes which best meet the parameters of the DRFQ. In this embodiment, the DRFQ may further specify criteria for acceptance with the server 118 determining the degree to which the criteria are satisfied by the received actionable quotes. These criteria may include request lifetime, quantity, maximum price, minimum price, buy order, sell order, or combinations thereof. Where more than one actionable quote meets the criteria, the server 118 may allocate acceptance among one or more of those quotes. The server 118 may further notify each market participant as to whether their quote was accepted or not.

[00102] Once one or more actionable quotes are accepted in response to the DRFQ, the actionable quote is sent to an exchange, such as the CME, to be matched and completed.

[00103] As market participants 104, 106 may have multiple concurrent DRFQ's and actionable quotes pending at any given time, management functions are provided to allow the market participants 104, 106 to track pending/concurrent DRFQ's and/or actionable quotes and cancel or otherwise modify those pending DRFQ's and/or actionable quotes. For example, the server 118 may provide real time information showing the pending status of a DRFQ and all actionable quotes received in response thereto, showing the respective TTL's and a real time comparison/evaluation of the responses as measured against each other and the DRFQ. Further, the originator of the DRFQ or actionable quote may be permitted to extend the TTL if they so desire.

[00104] As was discussed, coherency issues exist when requests and responses thereto are characterized by an expiration period, such as a TTL as described. Transmission or other processing delays may cause "in flight" issues where messages sent before an expiration, arrive after or messages, such as acceptance and cancellation messages, cross in transit. Mechanisms to protect coherency in the market and maintain expectations among the participants 104, 106 of a definite, certain, consistent and unambiguous market may be established to minimize or eliminate coherency problems. For example, an acknowledgement protocol may be implemented requiring receipt of a message to be acknowledged within defined time window. Where a sender fails to receive the appropriate acknowledgement, they will assume a transmission failure and resend their message. Further, redundancies may also be added to ensure reliable message transmission. In addition, messages may be time-stamped with the time of transmission, the time of transmission being used to compare messages to ensure processing in the proper order, or otherwise compensate for out-of-order receipt. All of this information may further be logged to provide an audit trail allowing post-mortem evaluation of unexpected operation, failures, etc.

[00105] The DRFQ server 118, in conjunction with the exchange 108, then obviates the need for bilateral relationships between the market participants and buffers the risk of loss with respect to the instruments being traded among the market participants.

[00106] Figure 7 depicts a block diagram of one embodiment of a directed request for quote ("DRFQ") server 118 for use with the system of Figure 6. The DRFQ server 118 includes a request receiver 202 coupled with a network (not shown) and operative to receive a request for quote from a market participant as described above, a request transmitter 214 coupled with the request receiver 202 and the network and operative to transmit the request for quote to at least a subset of the plurality of market participants without identifying the request originator, a response receiver 216 coupled with the network and operative to receive at least one response from at least one of the market participants identifying the request for quote and including an actionable quote in response thereto, and a response transmitter 222 coupled with the response receiver 216 and operative to transmit the at least one response exclusively to the request originator. In one embodiment, the response transmitter 222 may further anonymize the responses/actionable quotes prior to sending them to the request originator. In an alternate embodiment, where the DRFQ specifies an intent to buy or sell, the request transmitter 214 may further transmit the request without identifying the intent. In one embodiment, the response receiver 216 is further operative to receive a cancellation of the actionable quote and prevent acceptance of the actionable quote in response thereto when the cancellation is received prior to acceptance.

[00107] In one embodiment the server 118 includes one or more processors (not shown), one or more memories (not shown) and/or other storage media coupled with the one or more processors and a network interface (not shown) coupled with the one or more processors and the network and operative to facilitate communications therebetween. Each of the request receiver 202, request transmitter 214, response receiver 216 and response transmitter 222 may be implemented in hardware, software/logic or a combination thereof. For example, the server 118 may further include first logic stored in the memory and executable by the processor(s) to receive a first communication comprising a request for quote via the network from one of the market participants as described above, second logic, coupled with the first logic, stored in the memory and executable by the processor(s) to transmit a second communication comprising the request for quote via the network to at least a subset of the other market participants without identifying the request originator, third logic stored in the memory and

executable by the processor(s) to receive at least one third communication comprising a response via the network from at least one other market participant, the response identifying the request for quote and including an actionable quote in response thereto, and fourth logic, coupled with the third logic, stored in the memory and executable by the processor(s) to transmit via the network a fourth communication comprising the response exclusively to the request originator. As was described above, the server 118 may be implemented in hardware, software or a combination thereof, further, while various components are discussed in terms of their discrete functions, it will be further appreciated that one or more of the described functions may be implemented in a single component or any one function may be performed by multiple discrete components, or combinations thereof, and is implementation dependent.

[00108] The server 118 further includes, as logic stored in the memory and executable by the processor(s), or otherwise as hardware/software or a combination thereof, an entity selector 212 coupled with the request receiver 202 and request transmitter 214 and operative to identify one or more of the other market participants in response to the request for quote which may be interested in providing a quote. In one embodiment, the entity selector may maintain an interest profile for each of the market participants wherein the entity selector identifies which market participants to send the DRFQ to based on the interest profile of the associated market participant.

[00109] As was described, the DRFQ server 118 anonymizes the DRFQ's before sending them to the interested market participants. In one embodiment, the server 118 includes a request identification log 210 coupled with the request receiver 202 and response transmitter 222, wherein the request receiver 202 is further operative to store an identification of the request originator in relation to the request for quote in the request identification log 210 and the request transmitter 222 is further operative to associate the received responses with the request originator based on the identification stored in the request identification log 210 and transmit the response based thereon. The request identification log 210 may be implemented in the memory or other storage medium and may include a database, table or other data structure(s) suitable to implement the disclosed functionality. In one embodiment, the server 118 may include, as logic stored in the memory and executable by the processor(s), or otherwise as hardware/software or a

combination thereof, a request identifier 208 coupled with the request receiver 202, the request transmitter 214 and the response transmitter 222, wherein the request identifier 208 is operative to generate a unique identification code having no externally discernable relation to the request originator and create a relationship between the unique identification code, the request for quote and the request originator, wherein the request transmitter 214 is further operative to transmit the unique identification code along with the request for quote, and further wherein the responses/actionable quotes received in response thereto include the unique identification code, the response transmitter 222 being further operative to transmit the responses to the request originator based the unique identification code from the response and the relationship provided by the request identifier 208. In one embodiment, the request identifier 208 may include a number generator, such as a random number generator, and may further be coupled with the identification log 210 to store the unique identification codes in relation to the identities of the associated DRFQ originators. Alternatively, the request identifier 208 may generate or assign unique identification codes based on events such as the time/date of the receipt of the request, based on an encoding of one or more of the parameters of the request, such as an encryption or hash thereof, or combinations thereof.

[00110] As was described above, the DRFQ's and/or responses thereto, may specify a TTL. The server 118 includes, as logic stored in the memory and executable by the processor(s), or otherwise as hardware/software or a combination thereof, a Request Expiration Processor 206 and Response Expiration Processor 220 to process the TTL's of the requests and responses as was described above. The processors 206, 220 log the TTL's of the requests and responses and monitor the TTL to determine when they expire. In one embodiment, the processors 206, 220 may maintain the requests, responses and their associated TTL's in a table or other suitable data structure wherein the data structure further includes a decremented value which is initialized as the TTL value and subsequently decremented at regular intervals by the processors 206, 220 until they reach a zero or negative value signifying expiration thereof. Upon expiration, the processors 206, 220 perform the described actions, such as canceling the requests and/or responses and/or sending cancellation/expiration messages to the appropriate entities. In embodiments featuring a default TTL for either the requests or responses, the appropriate

processor 206, 220 may specify the default TTL to be used. The operations of the request and response expiration processor 206, 220 may further implement the coherency mechanisms described above. For example, in one embodiment, wherein the responses are further characterized by time of transmission and a time of receipt different from the time of transmission, the request and/or response expiration processor 206, 220 may further include a synchronization processor (not shown) coupled with the response receiver 216 and/or request receiver 202 to compensate for the difference between the time of transmission and the time of receipt.

[00111] The server 118 further includes, as logic stored in the memory and executable by the processor(s), or otherwise as hardware/software or a combination thereof, a matching processor 226 coupled with the request receiver 202 and the response receiver 216 and operative to determine acceptance of the actionable quotes which are received in response to the DRFQ's sent to the market participants. As described, the matching processor 226 may accept quotes based on instructions from the DRFQ originator, may automatically accept quotes by comparing the DRFQ against the received actionable quotes or based on some other criteria, such as on a first received or best match basis, or a combination thereof. In embodiments where the DRFQ originator may evaluate and accept one or more of the actionable quotes, an acceptance receiver 224 is provided as logic stored in the memory and executable by the processor(s), or otherwise as hardware/software or a combination thereof, which is coupled with the matching processor 226 and operative to receive the acceptance from the DRFQ originator. The acceptance receiver 224 may also be coupled with the response expiration processor 220 to determine if the acceptance was received prior expiration of the TTL of the actionable quote. In one embodiment, if the acceptance is received too late, the acceptance may be rejected and an appropriate message sent back to the DRFQ originator.

[00112] In embodiments which provide for automated acceptance of the actionable quotes, the server 118 may permit the DRFQ to further specify at least one criteria for acceptance of an actionable quote in response thereto. The matching processor 226 would then determine the degree to which the criteria are satisfied by the actionable quote(s) received. The criteria may include request lifetime, quantity, maximum price, minimum price, buy order, sell order, or combinations thereof. Where multiple

actionable quotes are received, the matching processor 226 may determine which of those actionable quotes best satisfies the DRFQ. In one embodiment, the matching processor 226 may allocate the DRFQ among multiple actionable quotes that best match the specified criteria.

[00113] The matching processor 226 may further send notifications to those market participants 104, 106 whose quotes were not accepted informing them of such.

[00114] The DRFQ server 118 further includes, as logic stored in the memory and executable by the processor(s), or otherwise as hardware/software or a combination thereof, an exchange transmitter 228 coupled with the matching processor 226 and operative to transmit the request for quote and the accepted actionable quote(s) to an exchange upon acceptance, as was described.

[00115] In addition, in one embodiment, the DRFQ server 118 further includes, as logic stored in the memory and executable by the processor(s), or otherwise as hardware/software or a combination thereof, a request manager 204 and/or a response manager 218. The request manager 204 permits DRFQ originators to manage multiple pending DRFQ's, for example to allow them to cancel a pending DRFQ or modify its TTL, or other parameter such as the acceptance criteria which define an acceptable actionable quote. The response manager 218 permits respondents to DRFQ's to modify their pending actionable quotes such as by canceling them, modifying their TTL or modifying some other parameter. The request manager 204 and/or response manager 218 may be implemented as an API, such as web based API, to which the market participants use a client application, such as a web browser, to interact.

[00116] The DRFQ server 118 may further include, as logic stored in the memory and executable by the processor(s), or otherwise as hardware/software or a combination thereof, a risk manager 230 which monitors all of the pending DRFQ's and pending actionable quotes, along with the identities of the associated participants. The risk manager 230 may compute, on a real time or other basis, the various exposures/risks of loss of each participant, compute margin requirements, identify trading anomalies or irregularities, such as fraud or illegal activity, or combinations thereof. The risk manager 230 may report this data to the market participants and/or to the exchange or operator of the DRFQ server 118.

[00117] Figure 8 depicts a block diagram of an exemplary system 800 for trading OTC FX instruments having a directed request for quote system according to an alternative embodiment. Each box shown in Figure 8 represents a specific computer, or set of computers, performing a unique function as described. The system 800 operates as follows:

1. A DRFQ Requestor 802 sends in a new request for quote to the DRFQ Server 808. This could be an RFQ for size (quantity), for price, or both.
 - a. The DRFQ Server 808 accepts the DRFQ Request from the DRFQ Requestor 802 and responds with an acknowledgement message (not shown), directly back to the DRFQ Requestor 802.
 - b. If the DRFQ Request was malformed or if it was otherwise invalid (due to instrument/market definition or timing), the DRFQ Server 808 could reject the Request with a reject message sent direct back to the Requestor (not shown).
2. The DRFQ Server 808 publicly publishes an anonymous DRFQ, all market participants receive this message via CME's Market Data interfaces. The DRFQ has a unique identifier which the DRFQ Server 808 can use to map it back to the original DRFQ Request.
3. Various market participants 804, 806 may respond with actionable DRFQ Responses. These DRFQ Response will fulfill the DRFQ Request and use the unique identifier as a reference.
4. The DRFQ Server 808, either via a query to the DRFQ Requestor 802 or via some normalized/algorithmic booking means, determines the best DRFQ Response and matches up the two sides of the transaction.
 - a. OPTIONAL: Message segments 4 below show the DRFQ Server 808 sending the query to the DRFQ Requestor 802. This could be the best DRFQ Response matching the original DRFQ Request 802 or it could be the entire set of DRFQ Responses. In either case, it is anonymous data. The DRFQ Requestor 802 can then choose which DRFQ Response to use for the transaction.

- b. OPTIONAL: The algorithmic selection criteria could be best price, best size, best time, or some set therein. It could also have a Market Maker feature which allowed certain DRFQ Responders 804, 806 priority over others.
5. The DRFQ Server 808 will send an acknowledgement to the DRFQ Responders 804, 806, letting each know the status of their DRFQ Response. It could be cancelled, in the case where it did not meet the selection criteria
6. The DRFQ Server 808, having both sides of the transaction in hand, will create a Block trade and send it into the Trading Engine 810.
7. The Trading Engine 810 sends FIX Fill Notification messages (normal/current practice) to the two parties associated with the trade.
8. The Trading Engine 810 then sends the trade information to the Clearing Systems 812 whereupon normal CME clearing processes take effect.

[00118] In one embodiment, Mass Quoting and associated market maker protections are supported for Directed RFQ trade flow. Where market maker protections are triggered, by either a Directed RFQ or CLOB-based mechanism, both the MassQuotes in the existing CLOB markets would be canceled and, additionally, any active Directed RFQ responses would also be immediately cancelled by the system.

[00119] In one embodiment, the market maker protections include those provided by the CME Falcon trading engine and include protections specified in Table 2 below.

Table 2

10. Falcon provides Enhanced Market Maker Protection
 - 10.1 Falcon restricts the number of fills, the number of matched trades, or the number of contracts occurring within a CME defined time interval.
 - 10.1.1 The restriction time is defined at the Group Level.
 - 10.1.2 Market Maker protection applies to MASS QUOTER's only.
 - 10.1.3 Market Maker Protection (MM Protection) applies to incoming Mass Quotes and resting Mass Quotes only.
 - 10.1.4 Market Maker Protection applies to each side of a Quote separately.
Note: Market Maker Protection does not apply to Orders submitted by a Market Maker.
 - 10.1.5 The CME defined time interval (variable N) is input via FAS and is applied at the Group level.
 - 10.1.5.1 The variable N is only applied to Products eligible for Mass Quotes.

- 10.1.5.2 The variable N is based on a Trading Engine established heartbeat.
- 10.1.5.3 The heartbeat will commence randomly at start-up.
- 10.1.5.3.1 The heartbeat will commence at the same time for each Group.
- 10.1.5.4 The variable N may be changed on a real-time basis.
- 10.1.5.4.1 A variable N change takes place at the end of the current N period.
- 10.1.5.5 The variable N is maintained for MASS QUOTERs at the Group Level.
- 10.1.5.6 N resets at the end of N time period, whether market action occurs (execution/quote entry/etc.) or not.
- 10.1.5.7 Mass Quoters setting/resetting MM Protection to Y enter the N time period in progress.
Note: no unique N time clock for MQ.
- 10.1.5.8 N variable is maintained at Millisecond level-ssSSSS.
- 10.2 Falcon realizes three protection mechanisms applied at the group level for MASS QUOTERs: New Fill Protection (X), Execution Protection (Y), Quantity Protection (Z)
- 10.2.1 New Fill Protection (X)-Falcon tracks the total new quote executions per new quote side for all instruments within a Group for a MASS QUOTER.
- 10.2.1.1 A count starts at 1 for a Group when an execution occurs for a new quote side.
 - 10.2.1.1.1 The size of the executions and number of executions do not affect the count for the specific instrument's quote side.
 - 10.2.1.1.2 Executed Cancel/Replace and New Mass Quotes occurring within the N time period for an instrument's quote side within a group increment the count by 1.
- 10.2.1.2 The count increments by 1 for a Group for every execution occurring against a new quote on a quote side for an instrument group within the N time interval.
Note: New quote is defined a modification of an existing quote or a quote entered after a total fill for an instrument.
- 10.2.1.3 New Fill Protection (X) is determined by the MASS QUOTER and is modifiable at the FAS.
 - 10.2.1.3.1 Setting the New Fill Protection to 0 turns off the protection.
- 10.2.1.4 The count X is reset every time a new N time interval starts.
- 10.2.1.5 Mass Quote Cancels do not impact the value of X.
- 10.2.1.6 MM protection is triggered when X is greater than or equal to the MASS QUOTER defined X value.
- 10.2.2 Execution Protection (Y) -Falcon tracks the total number of executions per quote side for all instruments within a Group for a MASS QUOTER.
- 10.2.2.1 A count starts at 1 for a Group when an execution occurs for a quote side.
- 10.2.2.2 The count increments by 1 for a Group for every execution occurring against a quote on a quote side for an instrument (in the Group) within the N time interval.
- 10.2.2.3 Execution Protection (Y) is determined by the MASS QUOTER and is modifiable at the FAS.
 - 10.2.2.3.1 Setting the Execution Protection (Y) to 0 turns off the protection.
- 10.2.2.4 The count Y is reset every time a new N time interval starts.
- 10.2.2.5 Mass Quote Cancels have no impact on the value of Y
- 10.2.2.6 MM protection is triggered when Y is greater than or equal to the MASS QUOTER defined Y value.
- 10.2.3 Quantity Protection (Z) -Falcon sums the total quantity of executed trades per quote side for all instruments within a Group for a MASS QUOTER.
- 10.2.3.1 Aggregation starts for a Group when an execution occurs for a quote side.
- 10.2.3.2 The sum increases for a Group by the trade quantity amounts occurring against quotes on a quote side for an instrument (in the Group) within the N time interval.[Note: quantity in instrument, not leg totals of instrument]
- 10.2.3.3 Quantity Protection (Z) is determined by the MASS QUOTER and is modifiable at the FAS.
 - 10.2.3.3.1 Setting the Quantity Protection (Y) to 0 turns off the protection.
- 10.2.3.4 The sum Z is reset every time a new N time interval starts.
- 10.2.3.5 Mass Quote Cancels have no impact on the value of Z

- 10.2.3.6 MM protection is triggered when Z is greater than or equal to the MASS QUOTER defined Z quantity value.
- 10.3 Market Makers determine the X, Y, and Z values at the Group Level.
 - 10.3.1 Falcon engine maintains the MM defined X,Y,Z values at the Group Level.
 - 10.3.2 X,Y,Z values are entered and maintained via the FAS at the Group level.
 - 10.3.3 X,Y,Z values are modifiable on a real-time basis.
 - 10.3.3.1 Changes do not take effect until the end of the N time period.
 - 10.3.4 X, Y, and Z data type is Long
 - 10.3.5 X, Y, and Z values can be between 0 and max. value.
 - 10.3.6 X, Y, and Z cannot be negative.
 - 10.3.7 If the Fill Protection count is greater than X, or the number of executions greater than Z, or the quantity of contracts traded is equal to or greater than Y per Group within the N interval, MM Protection is triggered.
 - 10.3.7.1 When MM Protection is activated, Falcon cancels the Quotes for all instruments within the Group for the MASS QUOTER's SenderCompID.
 - 10.3.7.1.1 Quote Entries within the Mass Quote message which trigger MM protection are cancelled and added to the Number of Cancels Accepted field. Cancel/Replace QuoteEntries are only counted once.
 - 10.3.7.1.2 The QuoteEntry which triggers MM Protection generates an execution.
 - 10.3.7.1.3 Any remaining quantity is cancelled and added to the Number of Cancels Accepted field.
 - 10.3.7.2 Falcon sends a Mass Quote Cancel Confirmation message with a Quote Status of F.
 - 10.3.7.3 MM Protection is not enforced when the X, Y, Z variables are met in mid-matching.
 - 10.3.7.4 MM Protection is triggered after the quote which causes the X, Y, or Z variable to trigger completes a matching process.
 - 10.3.7.5 Mass Quote messages which trigger MM Protection are returned an Ack before cancellation message.
 - 10.3.8 When MM Protection is triggered, Falcon does not accept any new Mass Quotes for a MASS QUOTER in the triggered Group.
 - 10.3.8.1 Falcon rejects Mass Quotes for the MASS QUOTER in the Group.
Message Reject Code and Reason Text will denote that MM Protection has been initiated.
Message Reject Code = 00
Message Reason Text = " "
 - 10.3.8.1 Falcon accepts Quotes in the triggered Group if the Market Maker Protection reset flag Tag 9773 has been reset to Y in a Mass Quote Msg by the MASS QUOTER.
 - 10.3.8.1.1 The value received from the MASS QUOTER is echoed back to the MASS QUOTER.
 - 10.3.8.1.2 If the value of the reset flag is N and MM Protection is in effect, Falcon sends the following reject:
Quote status = 5
Reject code = 98
Reason Text = "Market Maker Protection"
 - 10.3.8.1.3 After the MASS QUOTER submits the Protection Reset flag set to 'Y', they may continue to enter Mass Quotes with the flag set back to 'N'.
 - 10.3.8.2 Falcon accepts Quotes in the triggered Group if the Market Maker Protection reset flag Tag 9773 has been reset to Y for the MASS QUOTER by the GCC via FAS.
 - 10.3.8.3 The MM Protection is triggered if an inbound Mass Quote message contains more than 110 invalid quotes.
 - 10.3.8.3.1 If more than 110 quotes within a Mass Quote message are invalid, the Falcon rejects the entire message and cancels all resting quotes in the Group for the MASS QUOTER.
 - 10.3.8.3.1.1 Reject and cancellation occur whether MM Protection flag is on or off.
 - 10.3.8.3.1.2 Mass Quote Cancel Confirmation Message set as follows: Cancel_Status = "F",
Reject_Code = 00, Reason_Text = " "

- 10.3.8.3.1.3 Falcon will continue to reject Mass Quotes until the MASS QUOTER receives a Protection reset flag in a Mass Quote Message
- 10.3.8.3.1.4 Subsequent Mass Quotes Messages received before reset will be rejected and sent a Mass Quote Confirmation message with a Quote Status of 5.
Message Reject Code = 98
Message Reason Text = "Market Maker Protection"
- 10.3.8.4 In the event of a Falcon Engine restart, new MassQuote Messages are accepted regardless of the Protection Reset flag.
- 10.3.8.5 Falcon does not reset Market Maker Protection status when entering the close or pause state.
- 10.3.8.6 Falcon does reset Market Maker Protection on the last scheduled close of a trading week.
- 10.3.8.7 MM Protection is on if X, Y, Z has values present.
- 10.3.8.8 MM Protection is off if X and Y and Z have 0 values.
- 10.3.8.9 MM Protection default value is 0 for X and Y and Z.
- 10.4 Over two N time periods, the worst case exposure for a Mass Quoter is two times the X or Y or Z variable minus 2 of that variable.
- 10.5 Falcon executes ACKs for MQ quotes before Canceling when MM Protection is triggered.

[00120] In the disclosed embodiments, the Market Data functionality ensures that market data is efficiently and accurately communicated to the market participants. All market data for these markets may be in notional terms, i.e. expressed as the face value of the underlying instruments on which derivatives are traded, but other representations may be used.

[00121] Market data for the Central Limit Order Book may include:

- The market depth of the Top of Book MA message (and Implied Top of Book MY message) at 5.
- Consolidated fills
- Spreads and legs and/or spread quantities

[00122] Market data for the Directed RFQ may include:

- The request message (and expiration message);
- The fill and fill price.

[00123] In the disclosed systems, quotes and order book updates are anonymous and Traders cannot directly advertise their quotes.

[00124] Market statistics may include:

- Update volume, high, low, last from central limit order book;

- For block trades in this market, the market data statistics, such as the overall volume, high, low and last, will be updated based on the existing rules (these rules are defined in the EOS 2.0 RFC/Blocks feature set);
- For Directed RFQ

[00125] In the disclosed embodiments, for Swap trades, market data for Spot and the Forward outright legs is disseminated. For reciprocal markets, those which use a Spot from another associated market, this market data must be rounded in some fashion.

[00126] In the disclosed embodiments, the Trade Data functionality ensures that trade and order data is efficiently and accurately communicated to the market participants.

[00127] Consolidated fill notifications need to be distributed immediately after a match, independent of the venue the match occurred:

- Notification to the front-end;
- Notification to the clearing house;
- Notification to the trade (account) owner's clearing firm ;
- Notification to a trader's back office system (open question);
- Notification to market data (conditional on venue);

[00128] Consolidated Fill:

- Front-end - sending only a single fill notification per aggressor order, per price level, regardless of the number of counterparties;
- This could be accomplished either via modifying existing iLink FIX messages (and overall messaging model) or via message aggregation on the front-end;
- Back-end – similar to the front-end consolidation, there would only be a single notification per aggressor order, per price level, regardless of the number of counterparties and individual trades involved. It may be critical to this portion of the Consolidated Fill is that the consolidation rules match the Front-end rules exactly.

[00129] Fill notifications should include

- Forward swaps - the Swap with the differential, the Spot leg with its associated value date, and the forward leg with its associated value date.

- o This will require either using the D1 message (as well as the M1) from the Match Engine to Clearing, or a new interface/message altogether. D1 and M1 are trade messages sent by the trading engine to the clearing and reporting organizations. See the Section below on Clearing/Settlement for more information;
- Spot contracts - the generic Spot contract and its associated value date;
- Forward out-rights - the generic forward out-right, and it's associated value date.

[00130] In the disclosed embodiments, counterparty information may not be included in the fill notification:

- To the front-end;
- To the clearing firm.

[00131] Trade reporting maintains the original trade price & date to match cash market convention. Trade reporting is currently done via FIX ML and TREX, while the industry standards in OTC FX such as TOF, TWIST, & SWIFT. In the disclosed embodiments, clearing supports trade messages in these major OTC FX formats. In one embodiment, DealHub or a similar service can be used to convert from an originating CME format to one of these OTC FX standards.

[00132] Trade reporting is done in notional amount, rather than in quantity of the contract, using FIX ML as an originating CME formats.

[00133] In the disclosed embodiments, the Clearing/Trade Reporting/STP functionality essentially performs the trading functions of the Exchange. Clearing handles all instrument creation & modification for the Match Engine. As noted above, the Swap contract symbols do not change daily. In one embodiment, each day the most economically appropriate end-of-day settlement prices for open contracts needs to be determined, so as to mark open positions to market. Daily settlements will result in unrealized gain/loss. Pending deliveries, unrealized losses will be collateralized (rather than daily banking of that mark-to-market amount).

[00134] The collateral requirements are based on:

- The exact amount of unrealized gain/loss so far;

- The maximum reasonably likely loss over the next trading day, as determined by SPAN according to parameters we set; and
 - CLS requirements for capital against expected settlement obligations;
- [00135]** Settlement / trade reporting contains information on the spread traded as well as the outright legs (with the implied linkage between legs & spread present):
- Clearing will optionally compress trades, based on client/CLS need (note that this is not pre-netting, as that would zero out a buy & sell whereas compression would not);
 - Clearing will optionally pre-net trades, based on client/CLS need;
 - This pre-netting or compression can be done on a per currency level of granularity;
 - All settlements will be made through Continuous Linked Settlement Bank (CLS);
 - For normal open positions with the two-day value date convention, we will be sending transactions to CLS between 4 and 5pm Chicago time – needs to be validated against existing OTC practices;
 - Normal clearing settlement-cycle timelines will not be affected and will remain 7pm for completion of all post-trade activity prior to the second day before the value date; and
 - Settlement reports are generated for each clearing firm enumerating each account's specific activity.

[00136] In an alternative embodiment, support for Bilateral Credit, Give-Up's, Average Pricing (APS) and Single Line Entry of Differential Spreads (SLEDS) is provided.

[00137] Post-Trade Account number modifications are not allowed in this market

[00138] For Clearing/Trade Reporting, as mentioned above, the disclosed embodiments may use one of several options which are implementation dependent:

1. Pre-net each side by trade; or
2. Pre-net each side by trade date .

[00139] CME Clearing House can settle directly through CLS for each clearing firm. If that clearing firm has CLS standing instructions for a given account, CME can clear through CLS to the account level.

[00140] In the disclosed embodiments, the Fee functionality permits the Exchange to charge transaction fees and other wise obtain compensation for use of the provided trading mechanisms. The Fee functionality accounts for trading and other activities and appropriately obtains compensation from the transacting parties.

[00141] For the purposes of Fees, this will be a new class of market participant.

[00142] The system will have the ability to fee by the following:

- Discrete quantity tiers; and/or
- Aggressor orders.

[00143] All quantity is in notional terms.

[00144] This market will be a “Payout” versus a “Revenue Share”

[00145] The attributes or qualities of a Market Maker, for the purposes of Fees only, can be defined in the following terms:

- SubscriberAlias – Where the order is coming from (i.e. a desk);
- TraderID – Who the order is coming from; and
- Account – For whom is this order.

[00146] The buy/sell file from Clearing must include the ‘aggressor order’ indicator as well as information about what product this trade was a part of (specifically, in the case of a Swap, the buy/sell file typically only includes the legs, with no reference to the spread).

[00147] There is the potential for a negative fee.

[00148] The Fee functionality handles the new transaction type which is the Block trade resulting from a Directed RFQ which is different from a normal Block or Ex-Pit transaction.

[00149] In one embodiment, a variable fee structure may be provided in which fees vary as a function of the risk of the transaction and/or of the trading party.

[00150] The Front-End/Distribution functionality of the disclosed embodiments include the interfaces, e.g. Application Program Interfaces (“API’s”), GUI, etc. which

permit the receipt of orders, Directed RFQ's, etc. from the market participants and the dissemination of trade and market data to the market participants.

[00151] Access and market data for Independent Software Vendor ("ISV") and Proprietary front-ends into the Central Limit Order Book ("CLOB") and Directed RFQ will be available through API's:

- In one embodiment, CME will distribute this new market via iLink 2.0, CME's market data API, only, with the required API enhancements to encompass the new order types and this marketplace; and
- This market will use the existing market data infrastructure.

[00152] API access will be made available to any approved entity as determined by FX Marketplace:

- FX Marketplace must be able to prevent selected front-ends and data centers from accessing it (for example EBS);
- ISVs may also be permitted to create access for authorized users (i.e. OTC market ISVs) via a GCC operated registration process. These markets are not generally available to all traders on the ISV network;

[00153] A front end may take one of three forms:

- Deal with Reuters, using the existing CME interfaces (updated iLink 2.0 API, Clearing link described above, market data);
- New product development, either internal or through a joint venture dependency; or
- Update and existing CME front end (EOS / GL / CME.com).

[00154] In one embodiment, the front-end is browser based, rather than a stand-alone application. The front-end must know the real-time, full product definitions, inclusive of value dates for Spot and Swap markets. ISV's may also be permitted to create access for authorized users (i.e. OTC market ISV's). This system is not generally available to all traders on the ISV network.

[00155] The Distribution/Front-End system employed here would optionally conform to the Consolidated Fill guidelines mentioned above. In one embodiment, the system has the ability to deliver this information in the required industry formats currently used in the OTC FX space.

In one embodiment, additional trading functionality is provided to transacting parties. For example, in one embodiment, Implied Spreads in Currencies are provided. This function permits implying/interpolating price in one of multiple inter-related markets based on (sufficient) pricing data known in the remaining markets. Exemplary inter-related markets are: spot rate/swap rate/forward outright; cross currency (A/B, B/C, A/C) (across or within product lines), e.g. dollar/yen-yen/euro-dollar/euro; and between broken dates. In the case of an incoming order for a swap market in currency A/B, the swap is broken down into its two forward legs for said currency pair. These legs can be used to imply open interest in reciprocal markets or in those forward markets using either specific currency.

[00156] In another embodiment, Intra-Firm Match Avoidance protections are provided to prevent a particular entity from transacting with itself. The system prevents firms or traders from matching with themselves in any of the central limit order book markets. This may be accomplished using information on the order at the trader, desk, or firm level of granularity. When an aggressor order is matching the resting book and the opposite order has been deemed to be unmatchable, there are several options: The aggressor order is cancelled before any matching occurs; or The aggressor order matches normally and any resting order it attempts to match with, which is deemed unmatchable, is cancelled immediately. In either case, appropriate fill and cancellation messages are sent to the parties involved, per normal operations of those actions (order cancel and trade).

[00157] In another embodiment, Universal Pass Through is provided which allows parties to swap interest rates among currencies where the clearing house takes over the credit risk/funds transfer mechanism.

[00158] In another embodiment, shown in Figure 5A, Flexible Hybrid Central Counter-party Cross-Margining or Cross Collateralization is supported. In particular, one-bucket and two-bucket cross-margining or collateralization processes are combined into a single streamlined process. Cross-Margining or Cross-Collateralization allows for a reduction in margin or collateral amount requirements for trading in either OTC or exchange traded derivatives markets. This reduction is possible because assessed risk is

reduced when offsetting (risk-offset or ‘Spreadable’) positions are cleared by the same or affiliated “clearing members” or market participant firms at the cross-margin participating central-counterparty clearing organization(s).

[00159] In the present embodiment, both one-bucket and two-bucket cross-margining or collateralization processes are combined into a one streamlined and single process by combining ‘One-pot Approach’ and ‘Two-pot Approach’ to support both OTC and exchange traded derivatives clearing transactions. Process 1: 1 Pot Approach is initially achieved with two or multiple partnering parties. Process 2: 2 Pot Approach is achieved with one or multiple partnering parties dealing with risk-offset eligible positions after the process 1 is done.

[00160] Referring to Figures 5B and 5C, the 1 Pot Approach is shown:

- Clearing Transactions Scope Participants: clearing members of exchange or counter-parties in the OTC market
- Multiple contracts or products of all types (both OTC and exchange traded) at different exchanges or counter-parties
- All Cross-Margin Activity = Joint Cross-Margin/collateral Account
 - o Identified with a Separated into Cross-Margin Origin
 - o It is separate from participant’s normal clearing at respective clearing organizations, entities or counter-parties.
- Only ALLOW Cross-Margin/Collateral Eligible Trades to Clear in the Joint Cross-Margin/Collateral Accounts
 - o Trades executed directly into the Cross-Margin Accounts
 - o Positions can be transferred between a normal Clearing Account and Cross-Margin Clearing/Collateral Account.
 - o Separate Position Records/Data is submitted for the Cross-Margin process Origin
- Banking Settlement or collateralization only Dedicated to the Joint Cross-Margin Accounts
 - o Treated as Separate Origin
 - o Separate Bank Accounts, Wires, Transactions, etc.

[00161] Referring to Figure 5D, the 2 Pot Approach is shown:

- Transactions of Participating Clearing Organizations = Occurs at Each Clearing Org. + Offset Risk = 2 Pot
- No Joint Cross-Margin Accounts
 - o No Separation from Clearing Member's Primary Clearing Account at respective clearing organizations
 - o Hold Collateral in the Same Separate Firm Accounts
- Each Participating Organization Calculates its PB Requirements, Offset and Share Offset, Gain & Loss Guarantee Information
 - o Positions Remain at each participating organization origin
 - o No Need for Position Transfer into Cross-Margin Account
 - o No Separate Position Change Submission (PCS) report is Needed
- Transparent Transaction
 - o For example,
- CME offers credit on cross-margin eligible contracts for offsetting positions at the opposite clearing organizations
- Opposite Clearing Org. will offer credits on their positions.
 - o No Dedicated Banking Settlement for Cross-Margin Purposes
- No Separate Bank Accounts, Wires, Transactions, etc.
- Transactions become part of current banking transactions.

[00162] In the 2 Pot approach, Cross-Margin Offsets are Calculated as follows:

Internal Process for Cross-Margin Eligible Product:

1. Do all Internal Intra-Commodity Spreading.
2. Do all Internal Inter-Commodity Spreading.
3. Look at the available cross-margin delta positions at other clearing organizations to see if additional spreads could be formed from CME's remaining delta positions.
4. Allocate Prioritized Spread Credit to each Clearing Organization
 - i.e. Multiple organization cross-margin program.
 - Assign Priority from Highest to Lowest spread credit amounts based on the information from other participating clearing organizations.
 - Calculate the Spread Allocation based on the priority.

[00163] Figure 5E shows the process for dealing with positions that were not originally offset. Figure 5F shows how cross-margining utilizes X-margin margin that was not offset. Figure 5G demonstrates how cross-margining matches positions of similar absolute risk at two or more clearing organizations.

[00164] Allocation of Savings on Proportional Basis:

- Cross-Margining with Multiple Organizations,
 - o Allocation of its Positions and Margin necessary
 - o Allocations Will Optimize Members' Margin Reductions
 - Amounts are First Allocated to Products With Best Correlations
 - If Equally Correlated, Allocations Are Pro-Rata Based on Margin Amounts Submitted by Each Clearing Organization

Exchange	CME	LCH	GSCC
Eligible Contract	Eurodollar	Euribor	Treasury Eq.
Eligible Delta	1000	-700	-500
Spread Credit %		80%	35%
Spreads Formed	1000	-700	-300
Remaining Delta	0	0	-200

[00165] The 2 pot approach offers the advantages of: flexibility in managing collateral is unaffected using "Two Pot" Approach; avoids legal and operational complexities of establishing and maintaining joint margin Accounts in a multiple-clearing organization cross margining environment; the ability to pledge margin collateral for liquidity purposes is unaffected; and there is no operational impact except in performing an audit trail.

[00166] In another embodiment, pricing of the swap legs, using the mid-point in the spot market is provided, with error handling where the spot market is illiquid. In particular, as used herein, "Spot" refers to the day on which deals agreed today are actually carried out. In the foreign exchange markets, spot is usually two working days

ahead; so for deals concluded on Tuesday, spot is Thursday; for deals concluded on Friday, spot is Tuesday (unless bank holidays intervene). A spot deal is a simple exchange of two volumes of currency to take place two working days ahead – in other words, with a value date of spot. The foreign exchange rates commonly quoted in the media are spot rates – the rates agreed in today's spot deals. The term "Outright/Forward" refers to a simple Forward exchange of two volumes of currency where the value date is any date other than spot. The rate for the deal is normally quoted as a premium or a discount ('negative premium') on top of the current spot rate. So the formula for the dealt rate (the rate specifying the relationship between the two volumes) is:

Dealt Rate = Spot Rate + Premium, or

Dealt Rate = Spot Rate - Discount

[00167] In a swap deal, a volume of one currency is exchanged for a volume of a second currency. After an agreed period, the transaction is reversed. It is possible for the volumes in the second 'leg' of the transaction to differ from the first. For example, a deal might specify that at spot:

Bank A pays 5,000,000 US Dollars to Bank B

Bank B pays 7,565,000 Swiss Francs to Bank

A (Rate 1.5130)

...and that three months later:

Bank B pays 5,000,000 US Dollars to Bank A

Bank A pays 7,530,000 Swiss Francs to Bank

B (Rate 1.5060)

The difference in the rates of the second currency for the two legs of the swap deal arises from differences in the deposit rates for the two currencies, and expectations about variations in the spot rates.

[00168] In one embodiment, the disclosed system will:

- Price a Spot and Forwards in absolute terms (i.e. the rate); and
- Price Swap in differential terms.

When a trade on a Swap occurs, the system has the agreed upon differential between the Spot and the Forward leg. At this point, the system anchors the Spot for the transaction as the mid-point between the bid/ask in the current Spot market.

[00169] Additionally, four alternative mechanisms for how to assign the leg prices to the CME FX Swaps are provided if there are no bid and ask prices for a given currency in CME FX Spot:

1. Use Reuters contributor spot FX pages (such as EUR=, JPY=, CAD=, GBP=, CHF=, AUD=) and take the average of the spot bid and ask quotations at the time of the trade;
2. Use Reuters Dealing Terminal Quotations (perhaps utilizing information from CME GFX) for the target currencies and calculate the average of the spot bid and offer to use in assigning SWAP leg prices;
3. Use a combination of Reuters Dealing Terminal Quotations for its strong currencies and CME GFX spot resources for the EBS strong currencies;
4. Use CME currency futures prices (bid and ask on CME Globex) for the nearby (most active) contract month and use Reuters forward points (or a combination of Reuters and Bloomberg forward points) to the IMM dates to strip out the synthetic spot bid and ask for pricing the CME SWAP leg prices. Simply average the bid and ask of these synthetic spot prices to assign the CME SWAP leg prices. This may be similar to CME trading floor operations' plans to use an analogous version of this technique to set CME FX futures settlement prices for the expiring months during the one-week rollover period by using the next deferred, more actively-traded CME FX futures contract prices and forward points to back out the expiring CME FX futures settlement price.) CME trading floor operations has a program that could possibly be modified to back out spot bid and asks from CME FX futures prices; or
5. Use the last price in the Spot market, through a certain age. If the last spot price was too old, this spot price would be backstopped by the "daily settlement price" used to determine unrealized gains and losses (thus, never more than 24 hours old). However, number 4 above could work as an alternative for any time there is no spot, and if there are no futures bids and offers on CME Globex, then it could be backstopped by the last spot,

and if no last spot price that day, could further be backstopped by the last daily settlement price.

[00170] It is therefore intended that the foregoing detailed description be regarded as illustrative rather than limiting, and that it be understood that it is the following claims, including all equivalents, that are intended to define the spirit and scope of this invention.

WE CLAIM:

1. A method of trading financial instruments among a plurality of entities participating in a market, the method comprising:
 - receiving a request for quote from a first entity of the plurality of entities, the request for quote identifying the first entity and specifying an interest in trading a first instrument;
 - transmitting the request for quote to at least a subset of the plurality of entities without identifying the first entity;
 - receiving at least one response from at least one second entity of the subset, the at least one response identifying the request for quote and including an actionable quote in response thereto; and
 - transmitting the at least one response exclusively to the first entity.
2. The method of claim 1, wherein the subset comprises the entire plurality of entities.
3. The method of claim 1, further comprising incentivising the subset to respond to the transmitted request for quote.
4. The method of claim 1, wherein the subset comprises at least one market maker.
5. The method of claim 1, wherein the transmitting of the at least one response further includes transmitting the at least one response to the first entity without identifying the at least one second entity.
6. The method of claim 1, further comprising identifying the at least one second entity of the plurality of entities in response to the request for quote, the at least one second entity being identified as being interested in providing a quote for the first instrument, the subset including at least the at least one second entity.

7. " The method of claim 6, further comprising maintaining an interest profile for each of the plurality of entities wherein the identifying is based on the interest profile of the associated at least one second entity.
8. The method of claim 1, further comprising:
 - logging an identification of the first entity in relation to the request for quote; and
 - associating the at least one response with the first entity based on the logging;
 - wherein the transmitting of the at least one response is based thereon.
9. The method of the claim 1, further comprising:
 - generating a unique identification code having no relation to the first entity;
 - creating a relationship between the unique identification code, the request for quote and the first entity; and
 - wherein the transmitting of the request for quote further includes transmitting the unique identification code along with the request for quote, and further wherein the at least one response includes the unique identification code, the transmitting of the at least one response to the first entity being based the unique identification code from the at least one response and the relationship.
10. The method of claim 1 further comprising maintaining the anonymity of the first entity with respect to at least the subset of the plurality of entities.
11. The method of claim 1 further comprising obviating a need for a bilateral relationship between the first entity and the at least one second entity.
12. The method of claim 1 further comprising buffering risk of loss with respect to the first instrument as between the first entity and the at least one second entity.
13. The method of claim 1 wherein the request for quote further specifies a time period which may expire, the method further comprising determining when the time period has expired.

14. The method of claim 13, wherein the time period is specified by the first entity.
15. The method of claim 13, wherein the time period is automatically specified.
16. The method of claim 13, further comprising canceling the request for quote upon expiration of the time period.
17. The method of claim 13, further comprising canceling the actionable quote upon expiration of the time period.
18. The method of claim 13, further comprising rejecting the at least one response when the at least one response is received subsequent to the expiration of the time period.
19. The method of claim 13, further comprising specifying the time period as a specific point in time.
20. The method of claim 13, further comprising specifying the time period as the elapse of a specified duration measured from a defined origin.
21. The method of claim 1 wherein the actionable quote further specifies a first time period which may expire, the method further comprising determining when the first time period has expired.
22. The method of claim 21, wherein the first time period is specified by the at least one second entity.
23. The method of claim 21, wherein the first time period is automatically specified.
24. The method of claim 21, further comprising determining whether the actionable quote has been accepted and canceling the actionable quote upon expiration of the first time period when the actionable quote has not been accepted prior to expiration of the first time period.

25. " "The method of claim 24 further comprising transmitting a cancellation message to the at least one second entity in response to the canceling.
26. The method of claim 21, further comprising rejecting the at least one response when the at least one response is received subsequent to the expiration of the first time period.
27. The method of claim 21, further comprising specifying the first time period as a specific point in time.
28. The method of claim 21, further comprising specifying the first time period as the elapse of a specified duration measured from a defined origin.
29. The method of claim 21 wherein the request for quote further specifies a second time period which may expire, the method further comprising determining when the second time period has expired and permitting acceptance of the actionable quote as long as the first time period has not expired.
30. The method of claim 1, further comprising receiving a cancellation of the actionable quote and preventing acceptance of the actionable quote in response thereto when the cancellation is received prior to acceptance.
31. The method of claim 1, further comprising determining acceptance of the actionable quote.
32. The method of claim 31, wherein the determining further comprises receiving the acceptance from the first entity.
33. The method of claim 31, wherein the determining further comprises automatically accepting the actionable quote.
34. The method of claim 33, further comprising automatically accepting the actionable quote of a first of the at least one response to be received.

35. " The method of claim 33, further comprising automatically accepting the best actionable quote out of all of the at least one response to be received.
36. The method of claim 31, wherein the request for quote further specifies at least one criteria for acceptance of an actionable quote in response thereto, the determining further comprising determining a degree to which the at least one criteria are satisfied by the actionable quote of the received at least one response.
37. The method of claim 36, wherein the at least one criteria includes at least one of request lifetime, quantity, maximum price, minimum price, buy order, sell order, or combinations thereof.
38. The method of claim 36, further comprising receiving a plurality of responses from a plurality of second entities of the subset, each of the plurality of responses identifying the request for quote and including an actionable quote in response thereto, the determining further comprising determining at least one of the actionable quotes of the plurality of responses which best satisfies the at least one criteria.
39. The method of claim 38, wherein the determining further comprises determining at least two of the actionable quotes of the plurality of responses best satisfy the at least one criteria, the method further comprising allocating acceptance among the at least two actionable quotes.
40. The method of claim 39, further comprising notifying the second entity associated with unaccepted actionable quotes that the unaccepted actionable quotes were not accepted.
41. The method of claim 31, further comprising sending the request for quote and the actionable quote to an exchange upon acceptance.
42. The method of claim 1, wherein the request for quote further specifies an intent of the first entity to one of buy or sell the first instrument, the transmitting the request

- for quote further comprising transmitting the request for quote without identifying the intent.
43. The method of claim 1, further comprising permitting the first entity to manage a plurality concurrently pending requests for quote.
44. The method of claim 1, further comprising permitting the at least one second entity to manage a plurality of concurrent actionable quotes.
45. The method of claim 1, wherein the at least one response is further characterized by time of transmission and a time of receipt different from the time of transmission, the method further comprising compensating for the difference between the time of transmission and the time of receipt.
46. The method of claim 1 wherein plurality of entities are coupled with a network, the receiving a request for quote further comprising receiving a request for quote via the network, the transmitting the request for quote further comprising transmitting the request for quote via the network, the receiving at least one response further comprising receiving at least one response via the network, and the transmitting the at least one response further comprising transmitting the at least one response via the network.
47. A system for trading financial instruments among a plurality of entities coupled with a network and participating in a market, the system comprising:
- a request receiver coupled with the network and operative to receive a request for quote from a first entity of the plurality of entities, the request for quote identifying the first entity and specifying an interest in trading a first instrument;
 - a request transmitter coupled with the request receiver and the network and operative to transmit the request for quote to at least a subset of the plurality of entities without identifying the first entity;
 - a response receiver coupled with the network and operative to receive at least one response from at least one second entity of the subset, the at least one response identifying the request for quote and including an actionable quote in

- response thereto; and
- a response transmitter coupled with the response receiver and operative to transmit the at least one response exclusively to the first entity.
48. The system of claim 47, wherein the response transmitter is further operative to transmit the at least one response to the first entity without identifying the at least one second entity.
49. The system of claim 47, further comprising an entity selector coupled with the request receiver and request transmitter and operative to identify the at least one second entity of the plurality of entities in response to the request for quote, the at least one second entity being identified as being interested in providing a quote for the first instrument, the subset including at least the at least one second entity.
50. The system of claim 49, wherein the entity selector is further operative to maintain an interest profile for each of the plurality of entities wherein the entity selector identifies the at least one second entity based on the interest profile of the associated at least one second entity.
51. The system of claim 47 further comprising a request identification log coupled with the request receiver and response transmitter, wherein the request receiver is further operative to store an identification of the first entity in relation to the request for quote in the request identification log and the request transmitter is further operative to associate the at least one response with the first entity based on the identification stored in the request identification log and transmit the at least one response based thereon.
52. The system of the claim 47, further comprising a request identifier coupled with the request receiver, the request transmitter and the response transmitter, wherein the request identifier is operative to generate a unique identification code having no relation to the first entity and create a relationship between the unique identification code, the request for quote and the first entity, wherein the request transmitter is further operative to transmit the unique identification code along

with the request for quote, and further wherein the at least one response includes the unique identification code, the response transmitter being further operative to transmit the at least one response to the first entity based the unique identification code from the at least one response and the relationship.

53. The system of claim 47 further comprising a risk manager coupled with the request receiver and response receiver and operative to buffer a risk of loss with respect to the first instrument as between the first entity and the at least one second entity.
54. The system of claim 47 wherein the request for quote further specifies a time period which may expire, the system further comprising a request expiration processor coupled with the request receiver and operative to determine when the time period has expired.
55. The system of claim 54, wherein the time period is specified by the first entity.
56. The system of claim 54, wherein the time period is automatically specified by the request expiration processor.
57. The system of claim 54, wherein the request expiration processor is further operative to cancel the request for quote upon expiration of the time period.
58. The system of claim 54, wherein the request expiration processor is further operative to cancel the actionable quote upon expiration of the time period.
59. The system of claim 54, wherein the request expiration processor is further operative to reject the at least one response when the at least one response is received subsequent to the expiration of the time period.
60. The system of claim 54, wherein the time period is specified as a specific point in time.
61. The system of claim 54, wherein the time period is specified as the elapse of a specified duration measured from a defined origin.

62. The system of claim 47 wherein the actionable quote further specifies a first time period which may expire, the system further comprising a response expiration processor coupled with the response receiver and response transmitter and operative to determine when the first time period has expired.
63. The system of claim 62, wherein the first time period is specified by the at least one second entity.
64. The system of claim 62 wherein the first time period is automatically specified by the response expiration processor.
65. The system of claim 62, wherein the response expiration processor is operative to determine whether the actionable quote has been accepted and cancel the actionable quote upon expiration of the first time period when the actionable quote has not been accepted prior to expiration of the first time period.
66. The system of claim 65 wherein the response transmitter is further operative to transmit a cancellation message to the at least one second entity in response to the canceling.
67. The system of claim 62, wherein the response expiration processor is further operative to reject the at least one response when the at least one response is received subsequent to the expiration of the first time period.
68. The system of claim 62, wherein the first time period is specified as a specific point in time.
69. The system of claim 62, wherein the first time period is specified as the elapse of a specified duration measured from a defined origin.
70. The system of claim 62 wherein the request for quote further specifies a second time period which may expire, the system further comprising a request expiration processor coupled with the request receiver and the response expiration processor

and operative to determine when the second time period has expired and permit acceptance of the actionable quote as long as the first time period has not expired.

71. The system of claim 47, wherein the response receiver is further operative to receive a cancellation of the actionable quote and prevent acceptance of the actionable quote in response thereto when the cancellation is received prior to acceptance.
72. The system of claim 47, further comprising a matching processor coupled with the request receiver and the response receiver and operative to determine acceptance of the actionable quote.
73. The system of claim 72, further comprising an acceptance receiver coupled with the matching processor and operative to receive the acceptance from the first entity.
74. The system of claim 72, wherein the matching processor is further operative to automatically accept the actionable quote.
75. The system of claim 74, wherein the matching processor is further operative to automatically accept the actionable quote of a first of the at least one response to be received.
76. The system of claim 74, wherein the matching processor is further operative to automatically accept the best actionable quote of all of the at least one response to be received.
77. The system of claim 72, wherein the request for quote further specifies at least one criteria for acceptance of an actionable quote in response thereto, the matching processor further operative to determine a degree to which the at least one criteria are satisfied by the actionable quote of the received at least one response.

78. The system of claim 77, wherein the at least one criteria includes at least one of request lifetime, quantity, maximum price, minimum price, buy order, sell order, or combinations thereof.
79. The system of claim 77, wherein the response receiver receives a plurality of responses from a plurality of second entities of the subset, each of the plurality of responses identifying the request for quote and including an actionable quote in response thereto, the matching processor being further operative to determine at least one of the actionable quotes of the plurality of responses which best satisfies the at least one criteria.
80. The system of claim 79, wherein the matching processor is further operative to determine at least two of the actionable quotes of the plurality of responses best satisfy the at least one criteria and allocate acceptance among the at least two actionable quotes.
81. The system of claim 80, wherein the matching processor is further operative to notify the second entity associated with unaccepted actionable quotes that the unaccepted actionable quotes were not accepted.
82. The system of claim 72, further comprising an exchange transmitter coupled with the matching processor and operative to transmit the request for quote and the accepted actionable quote to an exchange upon acceptance.
83. The system of claim 47, wherein the request for quote further specifies an intent of the first entity to one of buy or sell the first instrument, the request transmitter being further operative to transmit the request for quote without identifying the intent.
84. The system of claim 47, further comprising request manager coupled with the request receiver and operative to permit the first entity to manage a plurality concurrently pending requests for quote.

85. " The system of claim 47, further comprising a response manager coupled with the response receiver and operative to permit the at least one second entity to manage a plurality of concurrent actionable quotes.
86. The system of claim 47, wherein the at least one response is further characterized by time of transmission and a time of receipt different from the time of transmission, the system further comprising a synchronization processor coupled with the response receiver and operative to compensate for the difference between the time of transmission and the time of receipt.
87. A system for trading financial instruments among a plurality of entities coupled with a network and participating in a market, the system comprising:
- means for receiving a request for quote via the network from a first entity of the plurality of entities, the request for quote identifying the first entity and specifying an interest in trading a first instrument;
 - means for transmitting the request for quote via the network to at least a subset of the plurality of entities without identifying the first entity;
 - means for receiving at least one response via the network from at least one second entity of the subset, the at least one response identifying the request for quote and including an actionable quote in response thereto; and
 - means for transmitting via the network the at least one response exclusively to the first entity.
88. A system for trading financial instruments among a plurality of entities coupled with a network and participating in a market, the system comprising a processor, a memory coupled with the processor and a network interface coupled with the processor and the network and operative to facilitate communications therebetween, the system further comprising:
- first logic stored in the memory and executable by the processor to receive a first communication comprising a request for quote via the network from a first entity of the plurality of entities, the request for quote identifying the first entity and specifying an interest in trading a first instrument;

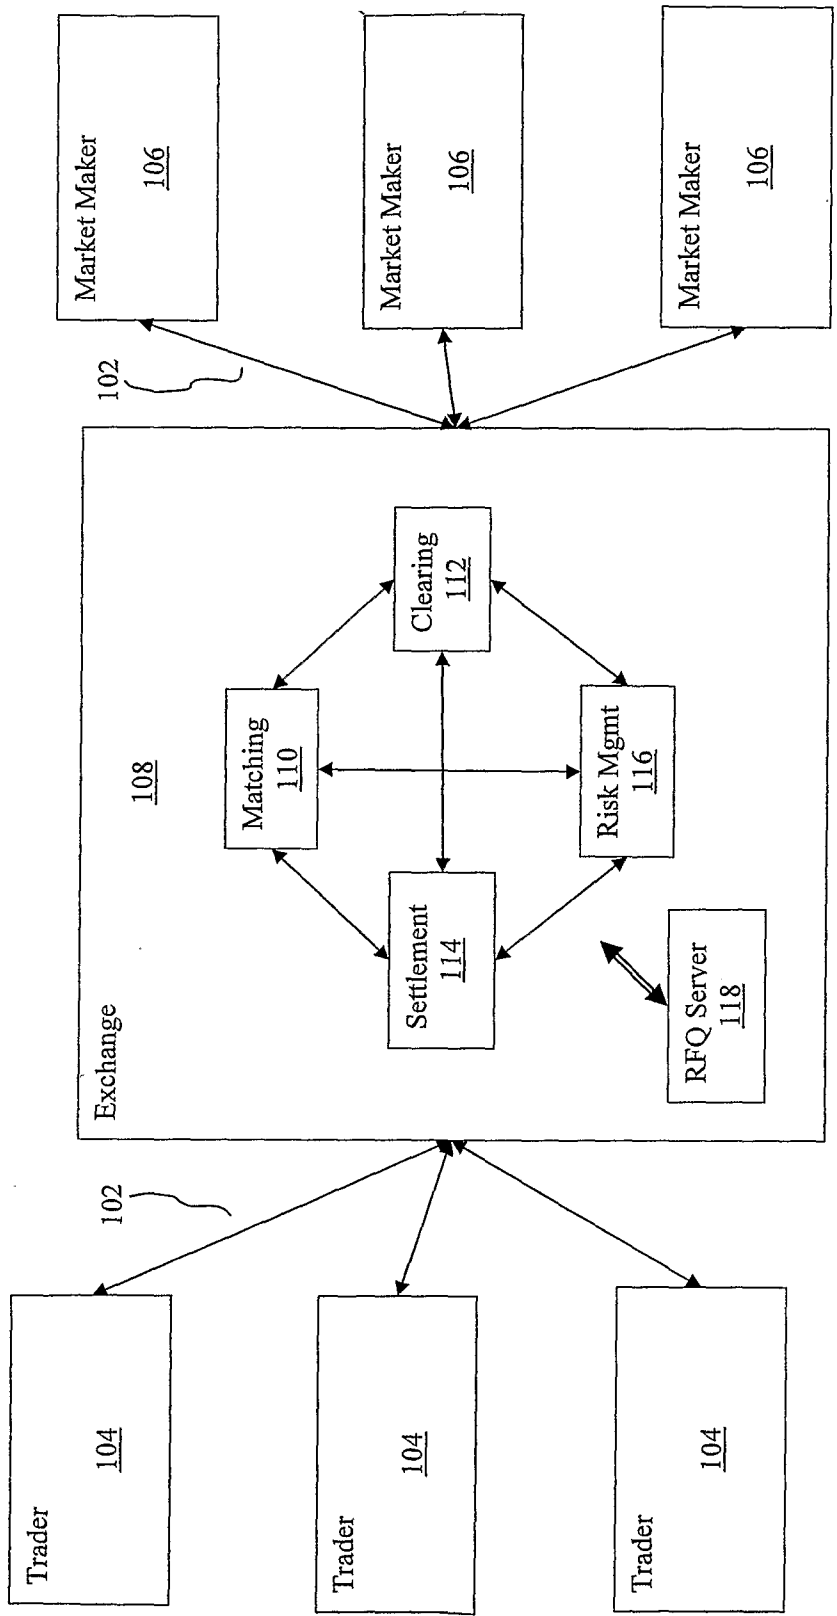

second logic, coupled with the first logic, stored in the memory and executable by the processor to transmit a second communication comprising the request for quote via the network to at least a subset of the plurality of entities without identifying the first entity;

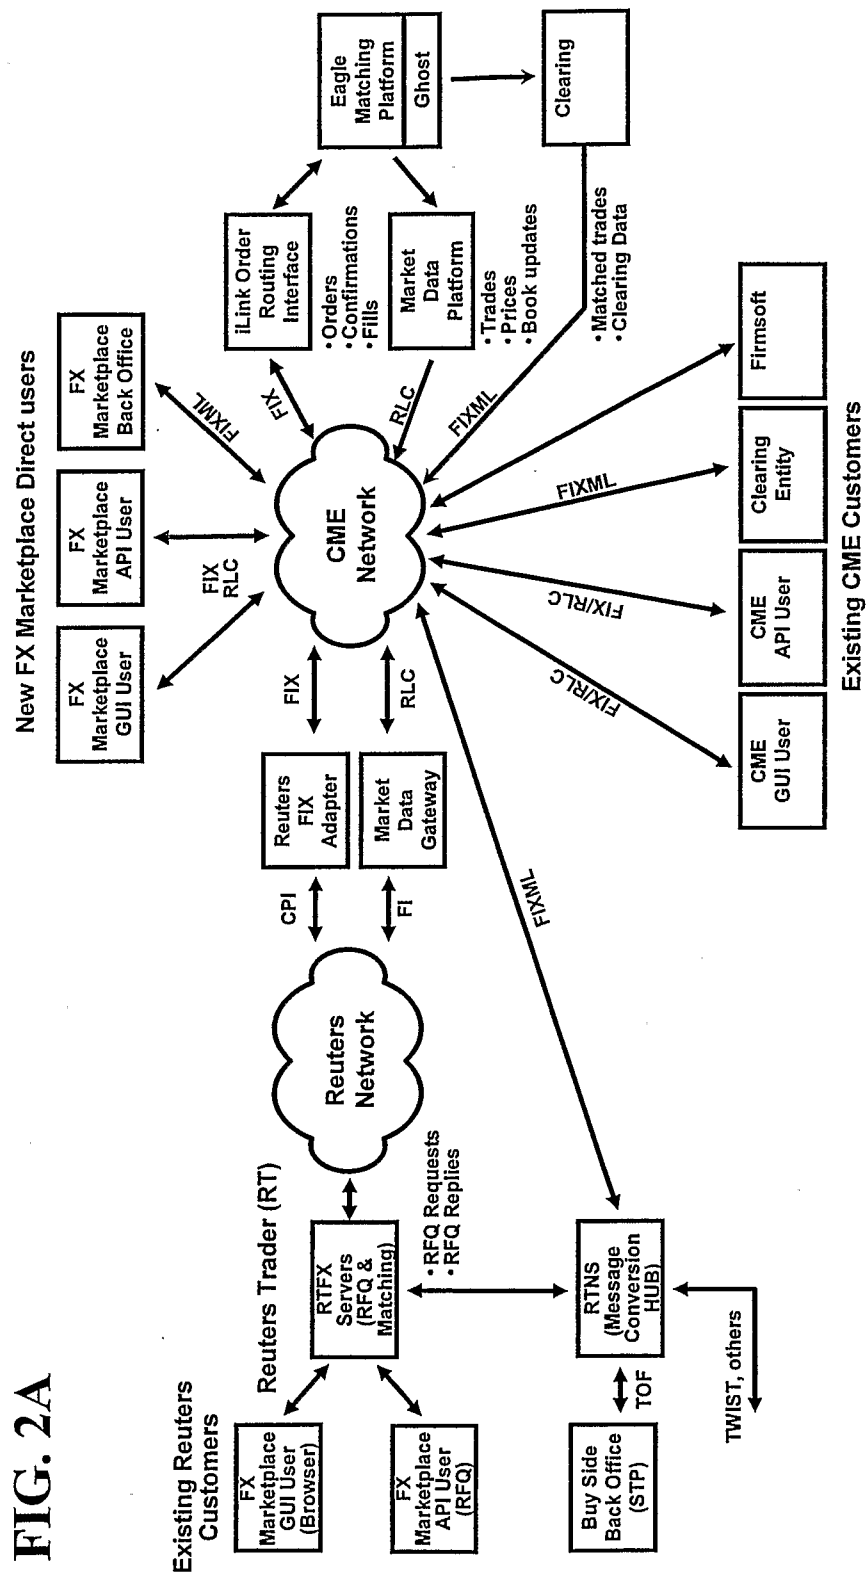

third logic stored in the memory and executable by the processor to receive at least one third communication comprising a response via the network from at least one second entity of the subset, the response identifying the request for quote and including an actionable quote in response thereto; and

fourth logic, coupled with the third logic, stored in the memory and executable by the processor to transmit via the network a fourth communication comprising the response exclusively to the first entity.

T/N	-1.12	-1.10	1.288238	1.288240	1.288088	1.288390
SN	-1.13	-1.08	1.288237	1.288242	1.288087	1.288392
1W	-8.25	-8.05	1.287525	1.287545	1.287375	1.287695
1M	-37.90	-37.40	1.284560	1.284610	1.284410	1.284760
2M	-73.20	-71.60	1.281030	1.281190	1.280880	1.281340
3M	-111.40	-108.90	1.277210	1.277460	1.277060	1.277610
4M	-149.40	-146.90	1.273410	1.273660	1.273260	1.273810
5M	-182.90	-179.90	1.270060	1.270360	1.269910	1.270510
6M	-219.30	-218.00	1.266420	1.266550	1.266270	1.266700
9M	-324.75	-322.75	1.255875	1.256075	1.255725	1.256225
1Y	-426.50	-422.50	1.245700	1.246100	1.245550	1.246250
2Y	-833.00	-745.00	1.205050	1.213850	1.204900	1.214000

Spot leg of a swap is done at "mid-point" of the spot bid/offer.

In this example, the spot leg is priced at 1.2884.

Forward leg of a swap is anchored off the mid-point of outright spot bid/ask, i.e. 1.2884 in this example. Further, the forward points are expressed in multiples of the "finest tick" in the spot price, i.e. 0.0001 in this example.

Thus, the forward leg of the 2yr Swap (on the bid side) is $1.2884 \div 0.0001 \times (-833.00) = 1.205050$

The offer side of the same swap is $1.2884 \div 0.0001 \times (-745.00) = 1.213850$

Precision of the forward leg (both in swaps and outright forwards) is two additional significant figures vs. the spot quotes.

Outright forward bids are anchored off the Spot bid. Same multiplier applies

e.g. 2yr Outright Bid = $1.2882 \div 0.0001 \times (-833.00) = 1.204900$

Similarly, outright forward offers are anchored off the Spot offer.

e.g. 2yr Outright Offer = $1.2885 \div 0.0001 \times (-745.00) = 1.214000$

INTERNATIONAL SEARCH REPORT

International application No.

PCT/US 06/27762

A. CLASSIFICATION OF SUBJECT MATTER

IPC(8) - G06Q 40/00 (2007.01)

USPC - 705/37

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC(8) - G06Q 40/00 (2007.01)

USPC - 705/37

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched
USPC - 705/1, 35, 36R, 37; 700/90, 91

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

Google - OTC FX financial exchange; FXMarketSpace; FXMarketSpace -jobs already

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.

Y		3, 22 and 63
Y	US 2005/0044027 A1 (RODGERS et al.) 24 February 2005 (24.02.2005) entire document	22 and 63
Y	US 2004/0254804 A1 (PETERFFY et al.) 16 December 2004 (16.12.2004) entire document	3

☐ Further documents are listed in the continuation of Box C.

* Special categories of cited documents:

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier application or patent but published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

"&" document member of the same patent family

Date of the actual completion of the international search
