A process is disclosed for making CF₃CF=CH₂ or mixtures thereof with CFH=CFCHF₂. The process involves contacting CCl₃CF₂CF₃ and optionally CCl₂FCF₂CCIF₂ with H₂ in the presence of a catalyst including a catalytically effective amount of palladium supported on a support of alumina, fluorided alumina and/or aluminum fluoride, to produce a product mixture including CH₂=CFCF₃ (and when CCl₂FCF₂CCIF₂ is present, CHF=CFCHF₂); recovering CH₂=CFCF₃ or a mixture thereof with CHF=CFCHF₂ from the product mixture; and optionally, separating at least a portion of any CHF=CFCHF₂ in the product mixture from the CH₂=CFCF₃ in the product mixture. The mole ratio of H₂ to the total of CCl₃CF₂CF₃ and CCl₂FCF₂CCIF₂ fed to the reaction zone is between about 1:1 and about 5:1. The present invention also provides another process for making CH₂=CFCF₃ or mixtures thereof with CHF=CFCHF₂. This process involves (a) reacting CCl₃CF₂CF₃ and optionally CCl₂FCF₂CCIF₂ with H₂ in the presence of a catalytically effective amount of a hydrogenation catalyst to form CH₂=CFCF₃ (and when CCl₂FCF₂CCIF₂ is present, CH₂=CFCF₃(CHF₂)); (b) dehydrofluorinating CH₂=CFCF₃ and optionally any CH₂=CFCF₃(CHF₂) from (a) to form a product mixture including CH₂=CFCF₃, and if CH₂=CFCF₃(CHF₂) is present, CHF=CFCHF₂; (c) recovering CH₂=CFCF₃ or a mixture thereof with CHF=CFCHF₂ from the product mixture formed in (b); and optionally (d) separating at least a portion of any CHF=CFCHF₂ in the product mixture formed in (b) from the CH₂=CFCF₃ in the product mixture formed in (b).

The present invention also provides compositions involving CH₂=CFCF₃ and/or CHF=CFCHF₂ including compositions useful as refrigerants, foam blowing agents, cleaning agents and aerosols and azeotropic compositions involving (a) CF₃HCF=CFH and (b) HF.
PROCESS FOR PRODUCING AND COMPOSITIONS COMPRISING 2,3,3,3-TETRAFLUOROPROPENE AND/OR 1,2,3,3-TETRAFLUOROPROPENE

CROSS REFERENCE TO RELATED APPLICATIONS

FIELD OF THE INVENTION

[0002] The present invention relates to processes that involve the production of halogenated hydrocarbon products comprising 2,3,3,3-tetrafluoropropene and/or 1,2,3,3-tetrafluoropropene and compositions comprising 2,3,3,3-tetrafluoropropene and/or 1,2,3,3-tetrafluoropropene.

BACKGROUND OF THE INVENTION

[0003] A result of the Montreal Protocol phasing out ozone depleting chlorofluorocarbons (CFCs) and hydrochlorofluorocarbons (HCFCs), industry has been working for the past few decades to find replacement refrigerants. The solution for most refrigerant producers has been the commercialization of hydrofluorocarbon (HFC) refrigerants. The new hydrofluorocarbon refrigerants, HFC-134a (CF₃CH₂F) being the most widely used at this time, have zero ozone depletion potential and thus are not affected by the current regulatory phase out as a result of the Montreal Protocol. The production of other hydrofluorocarbons for use in applications such as solvents, blowing agents, cleaning agents, aerosol propellants, heat transfer media, dielectrics, fire extinguishants and power cycle working fluids has also been the subject of considerable interest.

[0004] There is also considerable interest in developing new refrigerants with reduced global warming potential for the mobile air-conditioning market.

[0005] 2,3,3,3-Tetrafluoropropene (CF₃CF₂CF₃, HFC-1234yf) and 1,2,3,3-tetrafluoropropene (CF₂-CFCHF₂, HFC-1234yze), both having zero ozone depletion and low global warming potential, have been identified as potential components in refrigerant blends (see PCTg application published as WO 2006/094303). HFC-1234yf has been prepared by reaction of CH₂Cl₂, CF₃CF₂F, and CH₂I₂ in a closed vessel at 150°C for 12 days (Hashedin and Steele, Journal of the Chemical Society, pages 2193-2197 (1957)). HFC-1234yf has been prepared as a by-product in the vapor phase fluorination of 3-chloro-1,1,2,2-tetrafluoroethylene over a chromium catalysts as disclosed by Yasuhara, et. al. in U.S. Pat. No. 5,629,461. There is a need for new manufacturing processes for the production of HFC-1234yf and HFC-1234ye.

SUMMARY OF THE INVENTION

[0006] The present invention provides a process for making HFC-1234yf or mixtures thereof with HFC-1234ye. The process comprises contacting CCl₃CF₂CF₃ (CFC-215cb), and optionally CCl₃CF₂CCl₂F (CFC-215ca), with hydrogen (H₂) in a reaction zone in the presence of a catalyst comprising a catalytically effective amount of palladium supported on a support selected from the group consisting of alumina, fluorided alumina, aluminum fluoride and mixtures thereof, to produce a product mixture comprising HFC-1234yf and, when CFC-215ca is present, HFC-1234ye, wherein the mole ratio of H₂ to the total of CFC-215cb and CFC-215ca fed to the reaction zone is between about 1:1 and about 5:1; recovering HFC-1234yf, or a mixture thereof with HFC-1234ye, from the product mixture; and optionally separating at least a portion of any HFC-1234ye in the product mixture from the HFC-1234yf in the product mixture.

[0007] The present invention also provides another process for making HFC-1234yf or mixtures thereof with HFC-1234ye. This process comprises (a) reacting CFC-215cb and optionally CFC-215ca with H₂ in the presence of a catalytically effective amount of a hydrogenation catalyst to form CH₃CF₂CF₃ (HFC-245cb) and, when CFC-215ca is present, CH₃CF₂CF₂CHF₂ (HFC-245ca); (b) dehydrofluorinating HFC-245cb, and optionally any HFC-245ca, from (a) to form a product mixture comprising HFC-1234yf and, if HFC-245ca is present, HFC-1234ye; and (c) recovering HFC-1234yf, or a mixture thereof with HFC-1234ye, from the product mixture formed in (b); and optionally (d) separating at least a portion of any HFC-1234ye in the product mixture formed in (b) from the HFC-1234yf in the product mixture formed in (b).

DETAILED DESCRIPTION

[0009] The present invention provides a process for making HFC-1234yf or mixtures thereof with 1234ye by reacting at least one compound selected from the group consisting of CFC-215cb and CFC-215ca with hydrogen in a reaction zone over a suitable catalyst. HFC-1234ye may exist as one of two configurational isomers, E or Z. HFC-1234ye as used herein refers to either E-HFC-1234ye (CAS Reg. No. [115781-19-6]) or Z-HFC-1234ye (CAS Reg. No. [730993-62-1]), as well as any combination or mixture of such isomers.

[0010] Note of are embodiments wherein the C₂Cl₃F₃ component (that is, the total of CFC-215cb and CFC-215ca) reacted with hydrogen is primarily CFC-215cb. Of particular note are embodiments where the C₂Cl₃F₃ reacted with hydrogen is essentially free of CFC-215ca.

[0011] CFC-215cb and CFC-215ca can be prepared from a variety of starting materials. For example, a mixture of CFC-215cb and CFC-215ca can be prepared by the reaction of trichlorofluoromethane (CF₃CCl₂F) with tetrafluoroethylene (TFE) in the presence of aluminum chloride as reported by Paleta, et. al. in Collections of Czechoslovakia Chemical Communications, Vol. 36, pages 1867 to 1875 (1971). However, the boiling points of CFC-215cb and CFC-215ca are within about one degree Celsius of each other making separation by conventional distillation very difficult. In one embodiment of the present invention, it is possible to prepare CFC-215cb essentially free of CFC-215ca by reacting TFE with CFC-11 in the presence of aluminum chloride in a mole ratio of at least 1:1. Under these conditions CFC-215ca formed as a co-product with CFC-215cb reacts with additional TFE to form CC₂F₂CCl₂CF₃ (CFC-4191ca) (see Example No. 1). When the mole ratio of TFE to CFC-11 is less than one, a substantial amount of CFC-215ca is present in the reaction product (see Example No. 2). The boiling point of CFC-
4191ca is substantially higher than CFC-215cb which permits easy separation of CFC-215cb by conventional distillation.

[0012] Catalysts suitable for carrying out the process of making HFC-1234yf in accordance with this invention (that is, HFC-1234yf and optionally HFC-1234ye) from C₂Cl₃F₇, starting material palladium and may optionally comprise additional Group VIII metals (e.g., Pt, Ru, Rh or Ni). The palladium is supported on alumina, fluoridized alumina, aluminum fluoride or a mixture thereof. The palladium-containing precursor used to prepare the catalyst is preferably a palladium salt (e.g., palladium chloride). Other metals, when used, may be added to the support during the preparation of the catalyst.

[0013] The supported metal catalysts may be prepared by conventional methods known in the art such as by impregnation of the carrier with a soluble salt of the catalytic metal (e.g., palladium chloride or rhodium nitrate) as described by Satterfield on page 95 of Heterogenous Catalysis in Industrial Practice, 2nd edition (McGraw-Hill, New York, 1991). Palladium supported on alumina is available commercially. Another suitable procedure for preparing a catalyst containing palladium on fluoridized alumina is described in U.S. Patent No. 4,873,381, which is incorporated herein by reference.

[0014] By a catalytically effective amount is meant the concentration of catalysts on the support that is sufficient to carry out the catalytic reaction. The concentration of palladium on the support is typically in the range of from about 0.1% to about 10% by weight based on the total weight of the catalyst and is preferably in the range of about 0.1% to about 5% by weight based on the total weight of the catalyst. The concentration of the additional Group VIII metal, when used, is about 3% by weight, or less, based on the total weight of the catalyst; but palladium is ordinarily at least 50% by weight based on the weight of the total metals present on the support, and preferably at least 80% by weight based on the weight of the total metals present on the support.

[0015] The relative amount of hydrogen fed during contact of C₂Cl₃F₇ in a reaction zone containing the palladium-containing catalyst is from about 1 mole of H₂ per mole of C₂Cl₃F₇ to about 5 moles of H₂ per mole of C₂Cl₃F₇. Preferably from about 1 mole of H₂ per mole of C₂Cl₃F₇ to about 4 moles of H₂ per mole of C₂Cl₃F₇, and more preferably from about 1 mole of H₂ per mole of C₂Cl₃F₇ to about 2 moles H₂ per mole of C₂Cl₃F₇.

[0016] The reaction zone temperature for the catalytic hydrogenation of C₂Cl₃F₇ is typically in the range of from about 100°C to about 400°C, and preferably is in the range of from about 125°C to about 350°C. The contact time is typically in the range of from about 2 to 1000 seconds, and preferably is in the range of from about 10 to about 120 seconds. The reactions are typically conducted near atmospheric pressure.

[0017] The effluent from the reaction zone typically includes HCl, unreacted hydrogen, HFC₃⁻CF⁻CF₂⁻CH₃ (HFC-245cb), higher boiling products and intermediates typically including one or more of CF₂CF⁻CF₂CF₃ (FCF-1214ya), CF₃CF⁻CF₂CF₃ (HFC-225ca), CH₃CFCF⁻CF₂CF₃ (HFC-235ca), CF₂CHFCHF₂, (HFC-236ca), CF₂CHFCHF₂ (HFC-246ca), and any unconverted CFC-215cb. When CFC-215ca is present as a starting material, the effluent from the reaction zone may also include one or more of CFC-1214yb (CCF⁻CF₂CF₂), CCF⁻CF₂CF₂ (HFC-1224yb), CF₂⁻CFCHCF₃ (HFC-1224yc), CHF₂CF₂CF₂ (HFC-225eb), CHF₂CF₂CF₃ (HFC-235ca), CH₂F₂CF₂CH₃ (HFC-246ca), CH₂F₂CF₂HFC₃ (HFC-254ca), and any unconverted HFC-215ca.

[0018] Of note are embodiments where HFC-1234yf is a desired product, and is recovered from the product mixture. The HFC-1234yf present in the effluent from the reaction zone may be separated from the other components of the product mixture and unreacted starting materials by conventional means (e.g., distillation). When HF is present in the effluent, this separation can also include isolation of azeotrope or near azeotropic composition of HFC-1234yf and HFC further processing to produce HF-free HFC-1234yf by using procedures similar to that disclosed in U.S. Patent Application No. 2006/0106263, which is incorporated herein by reference.

[0019] The present invention also provides a process for making HFC-1234 that comprises (a) reacting C₂Cl₃F₇ with H₂ in a reaction zone in the presence of a catalytically effective amount of hydrogenation catalyst to form C₃H₃F₃ (that is, the total of HFC-245cb and any HFC-245ca); and (b) dehydrofluorinating C₃H₃F₃ from (a) to form HFC-1234. In step (a) of this process of the invention, C₂Cl₃F₇ is reacted with hydrogen in the presence of a hydrogenation catalyst. Hydrogenation catalysts suitable for use in this invention include catalysts comprising at least one catalytic metal component selected from the group consisting of iron, cobalt, rhodium, nickel, palladium, and platinum. Said catalytic metal component is typically supported on a carbonaceous carrier such as activated carbon or graphite or an aluminum-based support such as alumina, fluoridized alumina, aluminum fluoride, or mixtures thereof. Note are carbon-supported catalysts in which the carbon support has been washed with acid and has an ash content below about 0.1% by weight. Hydrogenation catalysts supported on low ash carbon are described in U.S. Patent No. 5,136,113, the teachings of which are incorporated herein by reference. Of particular note are palladium catalysts supported on carbon (see, e.g., U.S. Patent No. 5,523,501, the teachings of which are incorporated herein by reference). Also of particular note are palladium catalysts supported on three-dimensional matrix porous carbonaceous materials. Preparation of such three-dimensional matrix porous carbonaceous materials is disclosed in U.S. Patent No. 4,978,649, incorporated herein by reference. Also of note are platinum catalysts supported on alumina, fluoridized alumina, aluminum fluoride or a mixture thereof.

[0020] Also of note is use of palladium supported on alumina, fluoridized alumina, aluminum fluoride or a mixture thereof in step (a) where HFC-1234yf is produced in both step (a) and step (b).

[0021] The relative amount of hydrogen contacted with C₂Cl₃F₇ is typically from about 1 mole of hydrogen per mole of C₂Cl₃F₇ to about 15 moles of H₂ per mole of the C₂Cl₃F₇ starting material. Suitable reaction temperatures are typically from about 100°C to about 350°C, preferably from about 125°C to about 300°C. The contact time is typically from about 1 to about 450 seconds, preferably from about 10 to about 120 seconds. The reactions are typically conducted at atmospheric or superatmospheric pressures.

[0022] The effluent from the reaction zone in this process of the invention typically includes HCl, unreacted hydrogen, HFC-245cb, and one or more of CFC-215ca, CFC-1214ya, HFC-235ca, and HFPC-225ca. If CFC-215ca is present as...
a starting material, the effluent from the reaction zone typically also includes HFC-245ca and one or more of CFC-215ca, HCFC-225cb, CCl₂F₆CHF₂ (HCFC-225 cc), CH₂₂CH₂₂F₃ (HCFC-235 cc), HFC-235ca, and CFC-1214yb. In one embodiment of the invention, the HFC-245cb is isolated by separation processes known in the art such as distillation; and the isolated HFC-245cb is then used for step (b) of the process.

[0023] Unreacted C₂Cl₂F₄ and intermediate products such as C₂Cl₃F₅ and C₂H₂Cl₂F₂ isomers may be recycled to step (a) of the process. Reaction by-products such as C₂Cl₂F₄ isomers may be recovered and converted to HFC-1234 in the reaction zone of step (a) of the process or separately by contact with hydrogen in the presence of a hydrogenation catalyst.

[0024] In another embodiment of the invention, the C₂Cl₂F₄ is reacted with hydrogen in the presence of catalyst in a molar ratio of H₂ to C₂Cl₂F₄ of from about 1:1 to about 10:1; and, after separation of hydrogen chloride and any hydrogen, the remaining effluent from the reaction zone is then sent directly to step (b) of the process.

[0025] In step (b) of the process of the invention, the C₂H₂Cl₂F₂ produced in step (a) is contacted with a dehydrofluorination catalyst in a reaction zone for time sufficient to convert at least a portion of the C₂H₂Cl₂F₂ to HFC-1234 and, if HFC-245ca is fed to the reaction zone, HFC-1234. The dehydrofluorination reaction may be conducted in a tubular reactor in the vapor phase at temperatures of from about 200°C to about 500°C and preferably from about 300°C to about 450°C. The contact time is typically from about 1 to about 450 seconds, preferably from about 10 to about 120 seconds.

[0026] The reaction pressure can be subatmospheric, atmospheric or superatmospheric. Generally, near atmospheric pressures are preferred. However, the dehydrofluorination of C₂H₂Cl₂F₂ can be beneficially run under reduced pressure (i.e., pressures less than one atmosphere).

[0027] The catalytic dehydrofluorination can optionally be carried out in the presence of an inert gas such as nitrogen, helium or argon. The addition of an inert gas can be used to increase the extent of dehydrofluorination. Of note are processes where the mole ratio of inert gas to C₂H₂Cl₂F₂ is from about 5:1 to 1:1. Nitrogen is the preferred inert gas.

[0028] Typical dehydrofluorination reaction conditions and dehydrofluorination catalysts are disclosed in U.S. Pat. No. 5,396,000, which is herein incorporated by reference in its entirety. Preferably, the dehydrofluorination catalyst comprises at least one catalyst selected from the group consisting of carbon, aluminum fluoride, fluorided alumina, and trivalent chromium oxide.

[0029] Other dehydrofluorination catalysts useful for converting C₂H₂Cl₂F₂ from step (a) to HFC-1234 products are described in U.S. Pat. No. 6,093,859; the teachings of this disclosure are incorporated herein by reference in its entirety. Still other dehydrofluorination catalysts suitable for use in step (b) are described in U.S. Pat. No. 6,369,284; the teachings of this disclosure are incorporated herein by reference in its entirety.

[0030] The products from the step (b) reaction zone typically include HF, HFC-1234yf, and when HFC-245ca is present, the E- and Z-forms of HFC-1234yf. Unconverted C₂H₂Cl₂F₂ may be recovered and recycled back to the dehydrofluorination reactor to produce additional quantities of HFC-1234.

[0031] The separation steps involving recovery of HFC-1234yf and/or HFC-1234ye, such as steps (c) and (d) above, can be carried out using conventional separation technology such as distillation.

[0032] The HFC-1234 products produced by the processes of this invention can be recovered individually and/or as mixtures thereof. Of note are processes wherein in step (a) the C₂Cl₂F₄, contacted with H₂, includes CFC-215ca; wherein the C₂H₂Cl₂F₂ dehydrofluorinated in (b) includes HFC-245ca; and wherein the product mixture from in (b) includes HFC-1234yf. Included are processes wherein HFC-1234yf essentially free of HFC-1234ye is recovered and/or HFC-1234ye essentially free of HFC-1234yf is recovered.

[0033] The consideration of a process for the separation of HFC-1234yf from the product mixture by distillation includes the azeotropic combination thereof with HF.

[0034] As noted above, the present invention also provides azeotropic compositions comprising an effective amount of hydrogen fluoride combined with HFC-1234yf.

[0035] By effective amount is meant an amount, which, when combined with HFC-1234yf, results in the formation of azeotrope mixture. As recognized in the art, an azeotrope composition is a constant boiling liquid admixture of two or more different substances, wherein the admixture distills without substantial composition change and behaves as a constant boiling composition. Constant boiling compositions, which are characterized as azeotropic, exhibit either a maximum or a minimum boiling point, as compared with that of the non-azeotrope mixtures of the same substances. Azeotropic compositions as used herein include homogeneous azeotropes, which are liquid admixtures of two or more substances that behave as a single substance, in that the vapor, produced by partial evaporation or distillation of the liquid, has the same composition as the liquid. Azeotropic compositions as used herein also includes heterogeneous azeotropes where the liquid phase splits into two or more liquid phases. In these embodiments, at the azeotropic point, the vapor phase is in equilibrium with two liquid phases and all three phases have different compositions. If the two equilibrium liquid phases of a heterogeneous azeotrope are combined and the composition of the overall liquid phase calculated, this would be identical to the composition of the vapor phase.

[0036] Accordingly, the essential features of an azeotrope composition are that at a given pressure, the boiling point of the liquid composition is fixed and that the composition of the vapor above the boiling composition is essentially that of the boiling liquid composition (i.e., no fractionation of the components of the liquid composition takes place). It is also recognized in the art that both the boiling point and the weight percentages of each component of the azeotrope composition may change when the azeotrope composition is subjected to boiling at different pressures. Thus, an azeotrope composition may be defined in terms of the unique relationship that exists among the components or in terms of the compositional ranges of the components or in terms of exact weight percentages of each component of the composition characterized by a fixed boiling point at a specified pressure. It is also recognized in the art that various azeotrope compositions (including their boiling points at particular pressures) may be calculated (see, e.g., W. Schotte Ind. Eng. Chem. Process Des. Dev. (1980) 19, 432-439). Experimental identification of azeotropic compositions involving the same components may be
used to confirm the accuracy of such calculations and/or to modify the calculations at the same or other temperatures and pressures.

[0037] In accordance with this invention, compositions are provided which comprise the HFC-1234ye and HF, wherein the HF is present in an effective amount to form an azeotropic combination with the HFC-1234ye. According to calculations, these include compositions comprising from about 80 mole percent to about 60 mole percent HF and from about 20 mole percent to about 40 mole percent HFC-1234ye (which form azeotropes boiling at a temperature of from between about 0°C and about 100°C).

[0038] Compositions may be formed that consist essentially of azeotropic combinations of hydrogen fluoride with HFC-1234ye. These include compositions calculated to consist essentially of from about 80 mole percent to about 60 mole percent HF and from about 20 mole percent to about 40 mole percent HFC-1234ye (which forms an aze trope boiling at a temperature from between about 0°C and about 100°C).

[0039] Azeotropic compositions of HF and HFC-1234ye are useful as sources of HF in fluorination reactions. For example by combining the aze trope of HF and HFC-1234ye with fluorination precursor compounds it is possible to obtain HF-free HFC-1234ye and a fluorinated product (see for example, U.S. Pat. No. 6,624,781).

[0040] The reactor, distillation columns, and their associated feed lines, effluent lines, and associated units used in applying the process of this invention should be constructed of materials resistant to hydrogen fluoride and hydrogen chloride. Typical materials of construction, well-known to the fluorination art, include stainless steels, in particular of the austenitic type, the well-known high nickel alloys, such as Monel™ nickel-copper alloys, Hastelloy™ nickel-based alloys and Inconel™ nickel-chromium alloys, and copper clad steel.

[0041] The HFC-1234yf, the Z isomer of HFC-1234ye, and the E isomer of HFC-1234ye are all useful (both individually and as mixtures thereof) as components of refrigerant compositions, blowing agent compositions, sterlant compositions, aerosol propellant compositions, and cleaning compositions. Of note are compositions comprising HFC-1234yf, HFC-1234ye, and at least one flame retardant compound. Included are compositions wherein the flame retardant component comprises at least one compound selected from the group consisting of hydrofluorocarbons, hydrochlorofluorocarbons, perfluorocarbons, perfluoroketones, perfluorosulfones, hydrofluorosulfones, bromofluorosulfones, hydrofluoropolymers, hydrofluoropolymers, hydrofluoroethers, chlorofluorocarbons, bromofluorocarbons, bromochlorofluorocarbons, bromochlorofluorocarbons, and bromodichlorofluorocarbons. This group includes both saturated and unsaturated compounds. For example, the term "bromofluorocarbon" includes bromo difluoroalkanes as well as bromofluoroolesins and the term "hydrofluorocarbon" includes hydrofluoralkanes as well as hydrofluorocarbons. Of note are compositions wherein the flame-retarding component comprises HFC-1225ye (CF₃CF=C=CF₂), HFC-125 (CF₃CH₂F), HFC-23 (CHF₃), HFC-227ea (CF₃CHFCF₃), HFC-236fa (CF₃CH₂CF₃), CF₃I and/or CF₃CBr=CH₂.

[0042] Also of note are compositions wherein the flame-retarding component comprises carbon dioxide and the carbon dioxide is at least about 20 weight percent of the composition. Of note are such compositions wherein the HFC-1234ye therein consists essentially of the Z isomer. Also of note are such compositions wherein the HFC-1234ye therein consists essentially of the E isomer.

[0043] This invention provides certain refrigerant compositions comprising HFC-1234ye. In one embodiment, the refrigerant compositions comprise Z-HFC-1234ye. In another embodiment, the refrigerant compositions comprise E-HFC-1234ye. These compositions may further comprise other components as described for example in PCT application published as WO2006/094303, which is hereby incorporated by reference in its entirety. Of particular note are refrigerant compositions comprising Z-HFC-1234ye and CF₃I. These compositions may also comprise E-HFC-1234ye. Of note are refrigerant compositions wherein the HFC-1234ye therein consists essentially of the Z isomer. Also of note are refrigerant compositions wherein the HFC-1234ye therein consists essentially of the E isomer.

[0044] This invention also provides certain blowing agent compositions comprising HFC-1234yf and HFC-1234ye. Certain of these compositions may be used for example in methods to produce foams of thermostet and thermoplastic resins. These compositions may further comprise other components as described for example in U.S. Pat. Nos. 5,147,896 and 5,164,419, both of which are hereby incorporated by reference in their entirety. In one embodiment, a blowing agent composition is provided that comprises Z-HFC-1234ye. In another embodiment, a blowing agent composition is provided that comprises E-HFC-1234ye. In yet another embodiment, a blowing agent composition is provided that comprises HFC-1234ye, HFC-1234yf and at least one compound selected from the group consisting of HFC-152a (CH₂FCH₂F), HFC-134 (CHF₂CH₂F), HFC-134a (CF₃CH₂F), HFC-143a (CF₃CH₂F), HFC-245fa (CF₃CH₂CHF₂), HFC-1336mzz (CF₃CH=CHCF₃), HFC-1225ye (CF₃CF=C=CHF), HFC-1243zf (CF₃CF=CH₂), propane, n-butane, and dimethyl ether. Of note are blowing agent compositions wherein the HFC-1234ye therein consists essentially of the Z isomer. Also of note are blowing agent compositions wherein the HFC-1234yf therein consists essentially of the E isomer.

[0045] This invention provides cleaning compositions. In one embodiment, a cleaning composition is provided that comprises Z-HFC-1234ye. In another embodiment, a cleaning composition is provided that comprises E-HFC-1234ye.

[0046] In yet another embodiment, a cleaning composition is provided that comprises HFC-1234yf and at least one compound selected from the group consisting of CH₂Cl₂ (methylene chloride); CH₃CCl₂ (1,1,1-trichloroethane); CH₂ClCH₂Cl (1,2-dichloroethane); E- or Z-CHCl=CHCl (cis or trans-1,2-dichloroethylene); trichloroethene; perchloroethylene; n-propyl bromide; methanol; ethanol; isopropanol; n-propanol; methyl-1-butyl ether; tetrahydrofuran; dioxane; ethylene glycol dimethyl ether; acetone; methyl ethyl ketone; butyl ethyl ketone; methyl acetate; ethyl acetate; hexamethyldisiloxane; pentanes; hexanes; heptanes; octanes; hexenes; heptenes; CF₃CH₂CF₂CH₃ (HFC-365mf); CF₃CHFCHFCF₃ (HFC-43-10mec); cyclo-CF₃CF₃C(CHF₂CH₂CF₃) (HFC-447fee); CF₃OCH₃ (HFE-7100); CF₃OC(O)H₂ (HFE-7200). These cleaning compositions may further comprise other components as described for example in U.S. Pat. No. 6,852,684, which is hereby incorporated by reference in its entirety. Of note are cleaning compositions wherein the HFC-1234ye therein con-
sists essentially of the Z isomer. Also of note are such compositions wherein the HFC-1234ye therein consists essentially of the E isomer.

This invention also provides aerosol compositions comprising HFC-1234yf of. Of particular note are aerosol cleaning compositions comprising: (i) HFC-1234yf as an aerosol propellant; (ii) at least one solvent selected from the group consisting of (a) halogenated compounds selected from the group consisting of saturated chlorocarbons, unsaturated chlorocarbons and saturated bromocarbons, (b) oxygen-containing compounds selected from the group consisting of alcohols, ethers, ketones, esters, and siloxanes and (c) hydrocarbons of the formula C₅H₈n₊ₑ and hydrocarbons of the formula C₆H₆m where n and m are integers from 4 to 8; and (iii) at least one fluorinated compound selected from the group consisting of saturated hydrofluorocarbons, unsaturated hydrofluorocarbons, saturated hydrofluoroethers, unsaturated hydrofluoroethers and unsaturated halohydrocarbons.

Examples of component (ii) include CH₂Cl₂, (methylene chloride); CH₃CCl₂ (1,1,1-trichloroethane); CH₂CICH₂Cl (1,2-dichloroethane); E- and/or Z-CHCl—CHCl (cis and/or trans-1,2-dichloroethylene); trichloroethylene; perchloroethylene; n-propyl bromide; methanol; ethanol; isopropanol; n-propanol; methyl-1-butyl ether; tetrahydrofuran; dioxane; ethylene glycol dimethyl ether; acetone; methyl ethyl ketone; butyl ethyl ketone; methylacetate; ethylacetate; hexamethyldisiloxane; pentanes; hexanes; heptanes; octanes; and heptenes.

Examples of component (iii) include HFC-1234ye, HFC-43-10mee, HFC-365mf, HFC-245fa, HFC-447feca, CF₃CF₂CH—CHCF₂CF₂CF₂CF₃ (F24E), HFE-7100, and HFE-7200 and others as described in for example U.S. Pat. No. 6,852,684, and U.S. Provisional Patent Application No. 60/732,771. Of note are aerosol cleaning compositions that comprise at least one compound selected from the group consisting of HFC-1234ye, HFC-43-10mee, HFC-365mf, HFC-447feca, CF₃CF₂CH—CHCF₂CF₂CF₂CF₃ (F24E), HFE-7100, and HFE-7200.

The following specific Examples are to be construed as merely illustrative, and do not constrain the remainder of the disclosure in any way whatsoever.

EXAMPLES

Example 1
Reaction of CFC-11 with TFE

A 400 mL Hastelloy C shaker tube was charged with aluminum chlorofluoride (7 g) and CFC-11 (69.5, 0.50 mole). The aluminum chlorofluoride was prepared according to the procedure in U.S. Pat. No. 5,157,171. The tube was cooled in dry ice, evacuated, and purged three times with nitrogen. The cold tube was placed in the barricade, charged with 20 g of TFE (0.20 mole), and heated to 41°C. Another 30 g of TFE (0.30 mole total) was added; the maximum pressure was 58 psig. The tube was held at 37-41°C for 4 h; the final pressure was 8 inches of vacuum. The product was discharged to give 124 g of a clear supernatant over a brown solid. Analysis of the product by ¹³C NMR is given in the Table below.

Example 2
Reaction of CFC-11 with TFE

A suspension of aluminum chlorofluoride (15 g) in CFC-11 (600 g, 4.37 moles) was drawn into an evacuated, 1 L stirred autoclave. The reactor already contained spent catalyst from the previous similar run. d-Limonene-inhibited TFE was fed to the reactor beginning at a temperature of 15.4°C and a pressure of 6.3 psig. A total of 410.6 g of TFE (4.11 moles) were added to the autoclave over the course of about 0.72 h. The reaction exotherm brought the temperature in the reactor to 40.2°C. The reaction was then cooled and the products discharged to afford 906.9 g of crude product which was analyzed by ¹³C NMR with the results given below.

Example 3
Synthesis of CF₃CF—CH₂ by Dehydrofluorination with Fluoridated Alumina Catalyst

A Hastelloy TM tube reactor (2.54 cm OD×2.17 cm ID×24.1 cm L) was filled with 25 cc of gamma-alumina ground to 12-20 mesh (0.84 to 1.68 mm). The catalyst was activated by heating at 200°C for 15 minutes under a nitrogen purge and then reacted with a HF/N₂ mixture heated up to 425°C to yield 16.7 g of activated fluoridated alumina.

At a temperature of 350°C, 10 secmin of nitrogen (1.7×10⁻⁷ m³/min) and 15 secmin (2.5×10⁻⁷ m³/min) of CF₃CF₂CH₂ were mixed and flowed through the reactor. The temperature was then raised to 400°C, the flow rates held constant. The effluent for both temperatures was sampled and analyzed by
Additionally, the effluent was analyzed by GC to determine concentrations as listed in Table 1.

**Example 4**

Synthesis of CF₂CF₂CH₂ with Carbon Catalyst

Following the procedure of Example 3, a mixture of 10 sccm (1.7x10⁻⁷ m³/s) of nitrogen and 15 sccm (2.5x10⁻⁷ m³/s) of CF₂CF₂CH₂ were passed through the reactor giving a contact time of 60 seconds. The flows were reduced to 5 sccm (8.3x10⁻⁸ m³/s) of nitrogen and 7.5 sccm (1.3x10⁻⁷ m³/s) of CF₂CF₂CH₂ giving a contact time of 120 seconds. The effluent was sampled under both sets of conditions and analyzed by ¹⁹F NMR. The effluent compositions as determined by GC are listed in Table 2.

**Example 5**

Synthesis of CF₂CF₂CH₂ from CF₂CF₂CH₃F

A 0.375 inch (0.95 cm) O. D. Hastelloy™ nickel alloy tube was charged with 7.0 grams (10 cc) of gamma-alumina ground to 12/20 mesh (0.84 to 1.68 mm). The tube was purged with nitrogen (50 sccm, 8.3x10⁻⁷ m³/s) for twenty minutes as the temperature was raised from 40°C to 175°C. The nitrogen flow was continued as anhydrous hydrogen fluoride (50 sccm, 8.3x10⁻⁷ m³/s) was added to the reactor for about 1.5 hours. The nitrogen flow was then reduced to 20 sccm (3.3x10⁻⁷ m³/s) and the hydrogen fluoride flow increased to 80 sccm (1.3x10⁻⁶ m³/s) as the temperature in the tube was increased from 174°C to 373°C over the course of 3.7 hours. The nitrogen flow was then reduced to 10 sccm (1.7x10⁻⁷ m³/s) and the hydrogen fluoride flow was maintained at 80 sccm (1.3x10⁻⁶ m³/s) for one hour at 400°C. The reactor temperature was then adjusted to 290°C and the reactor purged with nitrogen.

**Example 6**

Hydrodechlorination of CFC-215cb over Fluorided Pd/Al₂O₃ Catalyst

A commercial palladium on aluminum oxide catalyst (0.5% Pd/Al₂O₃, 10 cc, 14.45 g, 12-20 mesh (1.68-0.84 mm)) was placed in a 30.5 cm x 1.27 cm o.d. Hastelloy B tube. The tube was connected to a reactor system and surrounded with an electrically-heated furnace. The catalyst was first dried for three hours under a nitrogen purge (25 sccm, 4.2x10⁻⁷ m³/s) as the temperature of the furnace was raised to 300°C. The reactor was then cooled to 150°C, and then hydrogen gas (20 sccm, 3.3x10⁻⁷ m³/s) was passed through the reactor for three hours as the temperature in the reactor was increased to 300°C. The reactor was cooled again to 150°C under a flow of nitrogen (20 sccm, 3.3x10⁻⁷ m³/s). The catalyst was then fluorinated with a mixture of nitrogen and hydrogen fluoride according to the following sequence: 2 hours with N₂ flow of 7.5x10⁻⁷ m³/s, and HF flow of 8.3x10⁻⁸ m³/s at 150°C; 2 hours with N₂ flow of 6.6x10⁻⁷ m³/s, and HF flow of 1.7x10⁻⁷ m³/s at 150°C; 2 hours with N₂ flow of 6.6x10⁻⁷ m³/s, and HF flow of 1.7x10⁻⁷ m³/s at 250°C; and 2 hours with N₂ flow of 4.2x10⁻⁷ m³/s and HF flow of 4.2x10⁻⁷ m³/s at 250°C. The flow of hydrogen fluoride was then stopped and the reactor was purged with nitrogen.

**Example 7**

A mixture of hydrogen, CF₂CF₂CCl₃ (CFC-215cb), and hydrogen fluoride in a 1:1:2 molar ratio was fed to the above catalyst at 350°C with a contact time of 25 seconds. The analysis of the reactor effluent as determined by GC-MS is given in Table 4.

Example 8
Hydrodechlorination of CFC-215cb over Fluorided Pt/Al₂O₃ Catalyst

[0062] A commercial platinum on aluminum oxide catalyst (5% Pt/Al₂O₃, 10 cc, 9.42 g, 12-20 mesh (1.68-0.84 mm)) was placed in a 30.5 cm x 1.27 cm o.d. Hastelloy® tube. The tube was connected to a reactor system and surrounded with an electrically-heated furnace. The catalyst was first dried, reduced, and fluorinated as described in Example 6.

[0063] A mixture of hydrogen and CF₃CF₂CCl₃ (CFC-215cb) in a 4:1 molar ratio was fed to the above catalyst at 250⁰C. with a contact time of 30 seconds. The analysis of the reactor effluent as determined by GC-MS is given in TABLE 5.

What is claimed is:
1. A composition comprising:
   (a) CF₃HCF=CFH and
   (b) HF; wherein the HF is present in an effective amount to form an azeotropic combination with CF₃HCF=CFH.
2. The azeotropic composition of claim 1, comprising from about 20 mole percent to about 40 mole percent of CHF=CFCHF₂ and HF.
3. The azeotropic composition of claim 1, consisting essentially of from about 20 mole percent to about 40 mole percent of CHF=CFCHF₂ and hydrogen fluoride.
