(54) **Device for fastening an electrical plug at an inaccessible position, in particular in a motor vehicle**

(57) In a device for fastening electric plugs (40) at an inaccessible position it is nevertheless important to make it possible to connect the mating connectors (50) conveniently. For this purpose, a two-part fastening device is proposed consisting of a fixed rail part (20) and of a sliding carriage part (30) longitudinally displaceable thereon which carries fittings (32) for the electric plugs (40). In addition the sliding carriage part (30) is provided with a sprung handle (35). The sliding carriage part (30) can be displaced between two positions on the rail part (20), it being possible in a first run-out position to connect the mating connectors (50) especially conveniently to the plugs (40). In the other retracted position on the other hand the plugs (40) and mating connectors (50) connected to one another are at the inaccessible positions (15) in the vehicle. Both these positions are fixed by means of stopping and opposing stopping members and can be rendered inoperative by means of the handle (35) provided on the sliding carriage part (30).
