United States Patent Office.

E. H. CRAIGE, OF BROOKLYN, NEW YORK.

Letters Patent No. 84,172, dated November 17, 1868.

IMPROVEMENT IN PAPER-FILES.

The Schedule referred to in these Letters Patent and making part of the same.

To all whom it may concern:

Be it known that I, E. H. CRAIGE, of Brooklyn, in the county of Kings, and State of New York, have invented a new and improved Paper-File; and I do hereby declare that the following is a full, clear, and exact description thereof, which will enable those skilled in the art to make and use the same, reference being had to the accompanying drawing, forming part of this specification, in which—

Figure 1 is a sectional view of my invention, showing the manner of using it on a desk or table.

Figure 2 is a similar view, showing the manner of using it suspended in an upright position.

Similar letters of reference indicate corresponding parts.

The object of this invention is to provide a simple and effective paper-file, which combines the advantageous features of a weight and hook, or wire point.

It consists, in general terms, of a plate, A, bearing a pointed wire, *a*, for penetrating the papers to be filed, in combination with a weight, C, having one or more holes in it for the reception of the said wire, *a*, so that the weight may rest on the papers, and be retained in place thereon by the wire.

The base-plate may consist of any flat plate, as the part A, but an additional advantage is obtained by forming the base, A, with an extension, B, which forms an obtuse angle with the base-plate, as shown.

The part B is provided with a hole, or loop, or other device, for suspending it from a nail, as shown.

This construction enables the file to be used upon the wall, or any upright part of a desk, as shown at fig. 2, while it does not impair its availability for use horizontally on a desk or table, as shown in fig. 1.

The papers are represented in red color.

The weight C may be formed with a number of holes arranged close together, so that it may be placed down at random upon the pointed wire *a*, thus obviating the necessity of using care or judgment in order to accomplish the insertion of the wire in one particular hole.

I claim as new, and desire to secure by Letters Patent—

1. The combination of a base-plate, A, having an upright pin or pointed wire, *a*, with a weight, C, having one or more holes, *b*, the whole constituting a paper-file, substantially as and for the purpose herein shown and described, as a new article of manufacture.

2. The angular base-plate A B, having a pin or pointed wire, *a*, in combination with a weight, C, having one or more holes, *b*, the whole constituting a paper-file substantially as and for the purpose herein shown and described, as a new article of manufacture.

The above specification of my invention signed by me, this 19th day of October, 1868.

E. H. CRAIGE.
