AN AQUEOUS ALKALINE HAND DISHWASH LIQUID DETERGENT FORMULATION

An aqueous alkaline hand dishwash liquid detergent formulation comprising: i) 9 to 20 wt% of a surfactant system; wherein 2 to 5 wt% of the surfactant system comprises a linear alkyl benzene sulfonate; and 7 to 17 wt% of the surfactant system comprises an alkyl ether sulfate; and wherein less than 1 wt% of the surfactant system comprises non-ionic surfactant; and wherein the weight ratio of linear alkyl benzene sulfonate (as LAS acid) to alkyl ether sulfate is lower than or equal to 1 : 2.2; and ii) wherein the pH of the formulation is in the range of 9.1 to 11; iii) wherein the formulation further comprises a pH adjustment, buffering and thickening system which comprises at least 5 wt% of the total formulation, wherein the system comprises one or more components selected from the group consisting of sodium carbonate, sodium hydrogen carbonate, potassium carbonate and potassium hydrogen carbonate; and iv) wherein the formulation has a viscosity in the range of from 1.5 to 6.0 Pa.s when measured at a shear rate of 21 s⁻¹ at 25 °C.
AN AQUEOUS ALKALINE HAND DISHWASH LIQUID DETERGENT FORMULATION

Technical Field of the Invention

This present invention relates to an improved aqueous alkaline hand dishwash liquid detergent formulation comprising a surfactant system which includes a linear alkyl benzene sulfonate and an alkyl ether sulfate, and a buffering and thickening system, which provides enhanced cleaning power, particularly against resistant dried-on and burnt-on soil. The aqueous alkaline hand dishwash liquid detergent formulation is also isotropic and is an un-built hand dishwash liquid detergent formulation.

Background of the Invention

Hand dish-wash liquid detergent formulations suitable for washing dishes are well known. However, it is essential that the formulations are able to deliver excellent grease and soil removal at a competitive price. Unfortunately, changing the components and parameters of hand-dish wash formulations often changes the viscosity of the formulations leading to the requirement of more expensive components to balance the effect. Therefore balancing the components of hand dish wash liquid detergent formulations against cleaning performance poses difficulties for hand dish-wash formulators.

For example, in GB833444 there is described both 'built' and 'un-built' foaming detergent compositions. This patent teaches that foaming light-duty detergent compositions may be prepared by formulating an anionic alkyl aryl sulfonate and a non-ionic, surface active polyoxyethylene ether of a multi-branched primary aliphatic alcohol or by formulating an anionic sulfate ester of a polyoxyethylene derivative and an anionic alkyl aryl sulfonate, to create a composition at neutral pH.

US 3332877 discloses a neutral synergistic ternary detergent composition for light duty dishwashing liquids containing at least 30 weight % surfactant derived from two anionic surfactants and a zwitterionic surfactant but does not include the use of a linear alkyl benzene sulfonate.
WO 93/14183 discloses stable colourless detergent compositions and is particularly interested in soaps, and shampoos comprising from 9 to 95% anionic or non-ionic surfactant. Whilst this document does also mentions hand dish wash formulations, these formulations are also pH neutral and do not comprise a linear alkyl benzene sulfonate.

US 6225272 discloses a pourable, storage-stable manual dishwashing detergent which contains various surfactants, an electrolyte, optionally a solvent, and at least 45% percent sodium bicarbonate with a mean particle diameter of at least 150 micrometers and provides good pouring properties and cleaning performance. However, the formulation does not include a linear alkyl benzene sulfonate.

WO 2010/105816 discloses the use of carbamide or a derivative thereof in various detergent compositions such as for example dishwasher detergents, laundry detergents and cleansers. The compositions may contain up to 40% by weight of surfactants and electrolytes. However, only one example of a hand dish wash formulation is included which comprises a pH of 5.4.

WO 2013/064356 and WO 2013/064357 disclose structured detergents or cleaning agent compositions comprising a mixture of anionic and non-ionic surfactants as well as inorganic salts and co-surfactants at a pH slightly above neutral.

CN 102492574 discloses a tableware detergent comprising by weight percent: N-fatty acyl glutamate (0.1 to 10), sulfonate anionic surfactant (1 to 25), non-ionic surfactant (1 to 25) and optionally, amphoterics, polyol wetting agents, electrolytes, pH regulators, antimicrobial agents, essence and water to produce a detergent with a neutral pH.

However, none of the formulations proposed in the prior art disclose or contemplate high-performance, dermatologically compatible, temperature-stable and storage-stable, pourable hand dishwashing formulations capable of removing obstinate soil and which comprise specific anionic surfactants at high pH. The reason for this may be because the use of, for example, sodium carbonate makes a composition suitably alkaline, but the present inventors have also found that the use of sodium carbonate alone leads to the requirement of other more expensive materials, such as citric acid, at high levels to achieve acceptable formulations. In addition, the use of amino based counter-ions such
As, for example, triethanolamine (TEA) with linear alkyl benzene sulfonates (LAS), produces compositions which are unacceptably thin and expensive.

The object of the present invention is therefore to deliver control of cleaning performance, rheology, and appearance in a hand dish wash concentrate composition at an acceptable cost.

To meet these objectives, the inventors have now discovered that an alkaline formulation with a specified range of anionic surfactants in combination with a pH adjustment, buffering and thickening system, is able to meet the demanding performance requirements of hand dish wash formulations if provided with a sufficient buffering capacity to maintain the alkaline pH during the cleaning process.

By pH adjustment, buffering and thickening system is meant a material which is able to maintain the pH of a formulation and generate the required viscosity. A particular example is sodium carbonate.

In addition, a builder is able to sequester calcium and magnesium ions. A buffer may not necessarily be a builder. This depends on whether or not the functional group is able to sequester calcium and/or magnesium ions. For example, carboxylic acid or phosphonate based buffers are also builders whereas amine based buffers are not builders.

Therefore in accordance with the present invention there is provided an aqueous alkaline hand dishwasher liquid detergent formulation comprising:

i) 9 to 20 wt% of a surfactant system;

wherein 2 to 5 wt% of the surfactant system comprises a linear alkyl benzene sulfonate; and 7 to 17 wt% of the surfactant system comprise an alkyl ether sulfate; and wherein less than 1 wt% of the surfactant system comprises non-ionic surfactant; and wherein the weight ratio of linear alkyl benzene sulfonate to alkyl ether sulfate is lower than or equal to 1 : 2.2; and

ii) wherein the pH of the formulation is in the range 9.1 to 11;

iii) wherein the formulation further comprises a pH adjustment, buffering and thickening system which comprises at least 5 wt% of the total formulation,
wherein the system comprises one or more components selected from the group consisting of sodium carbonate, sodium hydrogen carbonate, potassium carbonate and potassium hydrogen carbonate; and

iv) wherein the formulation has a viscosity in the range of from 1.5 to 6.0 Pa.s when measured at a shear rate of 215 at 25 °C.

It is preferred that in the aqueous alkaline hand dishwasher liquid detergent formulation according to the present invention, the linear alkyl benzene sulfonate has between 6 to 20 carbon atoms in its alkyl group. It is also preferred that the linear alkyl benzene sulfonate is sodium linear alkyl benzene sulfonate.

It is also preferred that the alkyl ether sulfate has between 8 and 22 carbon atoms in its alkyl group. More preferably the alkyl ether sulfate is sodium alkyl ether sulfate. Even more preferably the sodium alkyl ether sulfate is sodium alkyl ether sulfate (SLES) 1EO.

The pH of the formulation is preferably in the range 9.2 to 10.8. More preferably the pH of the formulation is in the range 9.2 to 10.5. Even more preferably, the pH of the formulation is in the range 9.2 to 9.8.

The pH adjustment, buffering and thickening system comprises one or more of the components selected from the group consisting of: sodium carbonate, sodium hydrogen carbonate, potassium carbonate, potassium hydrogen carbonate. Most preferably, the pH adjustment, buffering and thickening system comprises a mixture of sodium carbonate and sodium hydrogen carbonate.

It is preferred that the pH adjustment, buffering and thickening system comprises a maximum of 10 wt% of the total formulation. More preferably, however, the buffering and thickening system comprises between 5 and 7 wt% of the total formulation.

The formulation preferably comprises at least 65 wt% water. More preferably, the formulation comprises at least 68 wt% water.
The formulation preferably comprises a ratio of linear alkyl benzene sulfonate to alkyl ether sulfate in the range of 1 : 2.2 to 1 : 5.5 by weight. More preferably, the formulation comprises a ratio of linear alkyl benzene sulfonate to alkyl ether sulfate in the range of 1 : 2.2 to 1 : 5.0 by weight. Even more preferably the formulation comprises a ratio of linear alkyl benzene sulfonate to alkyl ether sulfate in the range of 1 : 2.2 to 1 : 1.40 by weight. Most preferably, however, the formulation comprises a ratio of linear alkyl benzene sulfonate to alkyl ether sulfate in the range of 1 : 2.2 to 1 : 3.5 by weight or even 1 : 2.2 to 1 : 3.0 by weight.

10 **Detailed Description of the Invention**

In the present invention, the term 'dish' means a hard surface, as is intended to be cleaned using a hand dish-wash formulation and includes: dishes, glasses, pots, pans, baking dishes and flatware made from any material or a combination of hard surface materials commonly used in the making of articles used for eating and/or cooking.

All amounts are by weight of the total composition, i.e. the aqueous alkaline hand dishwash liquid detergent formulation, unless otherwise specified.

20 **Surfactants**

In the present invention, the surfactant system is comprised of a mixture of a linear alkyl benzene sulfonate and alkyl ether sulfate with less than 1 wt% of the surfactant system comprising non-ionic surfactant.

The linear alkyl benzene sulfonate is preferably present in the hand dish wash formulation is an amount of 2 to 5.0 wt%. More preferably the linear alkyl benzene sulfonate is preferably present in the hand dish wash formulation in an amount of from 3 to 5 wt%. More preferably, the linear alkyl benzene sulfonate is preferably present in the hand dish wash formulation is an amount of from 3.25 to 4.95 wt%.

It is also preferred that the linear alkyl benzene sulfonate present in the hand dish wash formulation is in the form of a sodium salt. However, it will be appreciated, that other
counter-ions to the linear alkyi benzene sulfonate may be present, such as for example, potassium. The preferred length of the alkyi group is C8 to C18.

The alkyi ether sulfate is preferably present in the hand dish wash formulation in an amount of from 6 to 17 wt%. More preferably, the alkyi ether sulfate is present in the hand dish wash formulation in an amount of from 9 to 15 wt%.

It is also preferred that the alkyi ether sulfate present in the hand dish wash formulation is in the form of a sodium salt. However, it will be appreciated, that other counter-ions to the alkyi ether sulfate may be present, such as for example, potassium. The preferred length of the alkyi ether group is C8 to C18 alkyi with 1 to 3 ethoxylate (EO) groups. Most preferably the length of the alkyi ether group is C8 to C18 alkyi with 1 or 2 ethoxylate groups (EO).

In addition to the presence of linear alkyi benzene sulfonate and alkyi ether sulfate, additional surfactant may be present in the formulation. Additional surfactants (or detergent actives) may be chosen from, for example, other anionic and/or nonionic detergent actives. The cleaning formulation may further, or alternatively, comprise cationic, amphoteric and zwitterionic surfactants. However, in the formulation of the present invention the surfactant system comprises less than 1 wt% non-ionic surfactant.

In addition, in the formulation of the present invention the surfactant system preferably comprises less than 1 wt% cationic surfactants, less than 1 wt% amphoteric surfactants and less than 1 wt% zwitterionic surfactants.

Suitable synthetic (non-soap) anionic surfactants are water-soluble salts of organic sulphuric acid mono-esters and sulfonic acids which have in the molecular structure a branched or straight chain alkyi group containing from 6 to 22 carbon atoms in the alkyi part.

Examples of such anionic surfactants are (primary) long chain (e.g. 6-22 C-atoms) alcohol sulfates (hereinafter referred to as PAS), especially those obtained by sulphating the fatty alcohols produced by reducing the glycerides of tallow or coconut oil; secondary alkanesulfonates; and mixtures thereof.
Also suitable are the salts of alkylglyceryl ether sulfates, especially the ethers of fatty alcohols derived from tallow and coconut oil; fatty acid monoglyceride sulfates; sulfates of ethoxylated aliphatic alcohols containing 1-12 ethyleneoxy groups; alkylphenol ethyleneoxy-ether sulfates with from 1 to 8 ethyleneoxy units per molecule and in which the alkyl groups contain from 4 to 14 carbon atoms; the reaction product of fatty acids esterified with isethionic acid and neutralised with alkali, and mixtures thereof.

Nonionic surfactants tend to reduce the foam produced on use of the composition. Consumers frequently associate high foam with powerful cleaning so it is desirable to either avoid the use of nonionic surfactant altogether, or to use less than 1 wt%. For compositions which do include a nonionic surfactant, suitable nonionic surfactants may be broadly described as compounds produced by the condensation of simple alkylen oxide, which are hydrophilic in nature, with an aliphatic or alkyl-aromatic hydrophobic compound having a reactive hydrogen atom. The length of the hydrophilic or polyoxyalkylene chain which is attached to any particular hydrophobic group may be readily adjusted to yield a compound having the desired balance between hydrophilic and hydrophobic elements. This enables the choice of nonionic surfactants with the right HLB value to be selected. The HLB value is a measure of the hydrophilic/lipophilic balance of such a surfactant.

Particular examples of preferred nonionic surfactants include: the condensation products of aliphatic alcohols having from 8 to 22 carbon atoms in either straight or branched chain configuration with ethylene oxide, such as a coconut alcohol/ethylene oxide condensate having from 2 to 15 moles of ethylene oxide per mole of coconut alcohol; condensates of alkylphenols having C6-C15 alkyl groups with 5 to 25 moles of ethylene oxide per mole of alkylphenol; and condensates of the reaction product of ethylene-diamine and propylene oxide with ethylene oxide, the condensates containing from 40 to 80 wt% of ethyleneoxy groups and having a molecular weight of from 5,000 to 11,000.

Other classes of nonionic surfactants include for example: tertiary amine oxides of structure R1R2R3N-O, where R1 is an alkyl group of 8 to 20 carbon atoms and R2 and R3 are each alkyl or hydroxyalkyl groups of 1 to 3 carbon atoms, e.g. dimethylidodecylamine oxide; tertiary phosphine oxides of structure R1R2R3P-O, where R1 is an alkyl group of 8 to 20 carbon atoms and R2 and R3 are each alkyl or hydroxyalkyl groups of 1 to 3 carbon atoms.
atoms, for instance dimethyl-dodecylphosphine oxide; dialkyl sulphoxides of structure \( R_i R_2 S = 0 \), where \( R_i \) is an alkyl group of from 10 to 18 carbon atoms and \( R_2 \) is methyl or ethyl, for instance methyl-tetradecyl sulphoxide; fatty acid alkylolamides, such as the ethanol amides; alkylene oxide condensates of fatty acid alkylolamides; and alkyl mercaptans.

If one or more nonionic surfactants are to be employed the amount present in the cleaning compositions of the invention will generally be at least 0.1 wt%. Preferably the amount of nonionic surfactant will be in the region of 0.5 wt%.

Suitable amphoteric surfactants are derivatives of aliphatic secondary and tertiary amines containing an alkyl group of 8 to 20 carbon atoms and an aliphatic group substituted by an anionic water-solubilising group, for instance sodium 3-dodecylamino-propionate, sodium 3-dodecylaminopropane-sulfonate and sodium N-2-hydroxy-dodecyl-N-methyltaurate.

Examples of suitable cationic surfactants may be selected from quaternary ammonium salts having one or two alkyl or aralkyl groups of from 8 to 20 carbon atoms and two or three small aliphatic (for example, methyl) groups, for instance cetyltrimethylammonium chloride.

A specific group of surfactants are the tertiary amines obtained by condensation of ethylene and/or propylene oxide with long chain aliphatic amines. The compounds behave like nonionic surfactants in alkaline medium and like cationic surfactants in acid medium.

Examples of suitable zwitterionic surfactants may be selected from derivatives of aliphatic quaternary ammonium, sulfonium and phosphonium compounds having an aliphatic group of from 8 to 18 carbon atoms and an aliphatic group substituted by an anionic water-solubilising group, for instance betaine and betaine derivatives such as alkyl betaine, in particular C\(_{12-16}\) alkyl betaine, 3-(N,N-dimethyl-N-hexadecylammonium)-propane 1-sulfonate betaine, 3-(dodecylmethyl-sulfonium)-propane 1-sulfonate betaine, 3-(cetylmethyl-phosphonium)-propane-1-sulfonate betaine and N,N-dimethyl-N-dodecyl-
glycine. Other well known betaines are the alkylamidopropyl betaines for example, those wherein the alkylamido group is derived from coconut oil fatty acids.

pH adjustment, buffering and thickening system

The formulation comprises at least 5 wt% of a pH adjustment, buffering and thickening system. Preferably, the pH adjustment, buffering and thickening system preferably comprises no more than 10 wt% of the total formulation. Most preferably the amount of pH adjustment, buffering and thickening system comprises 5 to 7 wt% of the total formulation.

The components of the pH adjustment, buffering and thickening system are selected from the group consisting of sodium carbonate, sodium hydrogen carbonate, potassium carbonate, potassium hydrogen carbonate.

Most preferably, however, the pH adjustment, buffering and thickening system comprises a mixture of sodium carbonate and sodium hydrogen carbonate.

In the present invention the pH adjustment, buffering and thickening system provides a formulation with a viscosity level of between 1.8 and 6.0 Pa.s over the preferred pH range of 9.2 to 11. More preferably, the pH adjustment, buffering and thickening system provides a formulation with the required viscosity level of between 1.85 and 6.0 Pa.s over the preferred pH range of 9.2 to 10.8. Even more preferably, the pH adjustment, buffering and thickening system provides a formulation with the required viscosity level of between 1.85 and 6.0 Pa.s over the preferred pH range of 9.2 to 10.5.
Perfumes

Preferably the formulation comprises a perfume. The perfume is preferably present in the range from 0.001 to 3 wt%, most preferably 0.1 to 1 wt%. Suitable examples of perfumes are provided in the CTFA (Cosmetic, Toiletry and Fragrance Association) 1992 International Buyers Guide, published by CFTA Publications and OPD 1993 Chemicals Buyers Directory 80th Annual Edition, published by Schnell Publishing Co.

Optional Ingredients

The formulation may include optional ingredients, such as, abrasive particles and additional ingredients which aid formulation properties, stability and cleaning performance as well as one or more optional ingredients conventionally included in liquid hand dish wash formulations such as, for example: perfume carriers, fluorescers, colourants, hydrotropes, anti-redeposition agents, polyelectrolytes, enzymes, pearlescers, anti-spotting agents, germicides, fungicides, anti-corrosion agents, anti-static agents, crystal growth inhibitors, anti-oxidants, anti-reducing agents, dyes, and water activity modifiers such as sugars, salts, proteins and water soluble homo- and co-polymers.

The inclusion of a preservative is also desirable in the formulation of the present invention, for example a mixture of biocides CIT and MIT (5-Chloro-2-methyl-4-isothiazolinon-3-one / 2-Methyl-4-isothiazolin-3-one). BIT (1,2-Benzisothiazol-3(2H)-one) may also be used. The level of preservative will vary according to the expected storage temperature and the quality of raw materials. A value of from 0.0001 to 0.1 wt % is typical.

Sodium EDTA chelant may also be advantageously included in the formulation at a level of 0.01 to 0.5 wt%. DMDMH (glydant) may also be included into the compositions at level of from 0.005 to 1 wt%.

The formulation may comprise detergent builders in an amount of from 0.1 to 25 wt%. Suitable inorganic and organic builders are well known to those skilled in the art. For example, citric acid is a preferred buffer/builder and may suitably be included at a level of from 0.01 to 0.5 wt%.
The formulation may also comprise ingredients such as but not limited to: colorants, whiteners, optical brighteners, soil suspending agents, detergents enzymes, compatible bleaching agents (particularly peroxide compounds and active chlorine releasing compounds), solvents, co-solvents, gel-control agents, freeze-thaw stabilisers, bactericides, preservatives, hydrotropes, polymers and perfumes.

Examples of optional enzymes include amylase, lipase, cellulase, protease, mannanase, and pectate lyase.

**Viscosity**

The alkaline hand dishwash aqueous liquid formulation has a viscosity in the range of from 1.5 to 6.0 Pa.s when measured at a shear rate of 21 s\(^{-1}\) at 25 °C. More preferably the formulation has a viscosity in the range of from 1.75 to 5.5 Pa.s when measured at a shear rate of 21 s\(^{-1}\) at 25 °C. Even more preferably the formulation has a viscosity in the range of from 2.0 to 5.5 Pa.s when measured at a shear rate of 21 s\(^{-1}\) at 25 °C. Still even more preferably the formulation has a viscosity in the range of from 2.5 to 4.5 Pa.s, when measured at a shear rate of 21 s\(^{-1}\) at 25 °C.

A preferred formulation with a ratio of linear alkyl benzene sulfonate (LAS) to sodium dodecyl benzene sulfonate (SLES) of 1:2.2 to 1:3.5, preferably has a viscosity in the range of from 2.5 to 6.0 Pa.s over the pH range of 9.2 to 10.5, when measured at a shear rate of 21 s\(^{-1}\) at 25 °C.

For the purpose of the present invention the viscosity is measured using an Anton Paar Physica - DSR 301 measuring head Automated Sample Changer (ASC), geometry - CC27, DIN concentric cylinder.

**Packaging**

The formulation may be packaged in any suitable form of container. Preferably the formulation is packaged in a plastic bottle with a detachable closure or pouring spout. The bottle may be rigid or deformable and may optionally comprise a dosing device to
deliver set amounts of liquids when in use. A deformable bottle offers the advantage that it allows the bottle to be squeezed to aid dispensing of the liquid formulation. If clear bottles are used, they may be formed from Polyethylene terephthalate (PET). Polyethylene or clarified polypropylene may also be used. Preferably the container is clear enough so that the liquid formulation with any visual cues therein, is visible from the outside. The bottle may also be provided with one or more labels. In addition, the bottle may be provided with a shrink wrap sleeve which is desirably at least partially transparent, for example, at least 50% of the area of the sleeve is transparent. The adhesive used to secure any transparent label to the bottle should preferably not adversely affect the transparency of the bottle.

The invention will now be further described with reference to the following non-limiting examples.

Abbreviations

The abbreviated names used in these examples have the following meanings:

- **Water** is Demineralised water.
- **NaOH** is sodium hydroxide base.
- **LAS acid** is linear alkyl benzene sulfonic acid (anionic surfactant).
- **NaHCOs** is sodium hydrogen carbonate (also called sodium bicarbonate)
- **Na₂CO₃** is sodium carbonate
- **SLES (1EO)** is sodium dodecyl benzene sulfonate (SLES) 1EO (anionic surfactant), (Texapon®, N701, ex BASF).
- **DMDMH** preservative, Glydant™ ex Lonza
- **Preservative** antimicrobial preservative, solution of chloromethylisothiazolin-3-one (CMIT) and methylisothiazolin-3-one (MIT) in water ex Dow chemical and ex Arch Chemicals
- **EDTA** ethylene diamine tetra acetic acid, sequestrant
- **Perfume** is free oil perfume, lime juice, green lime
- **Lutensol** is non-ionic surfactant ex BASF
Unless otherwise specified, the amounts and proportions used in the methods and formulations are by weight.

Example 1

Aqueous alkaline hand dishwash liquid detergent formulations were prepared using the components listed in Table 1 over a range of pH concentrations by mixing the ingredients listed therein. The components were diluted further with demineralised water to give the concentration levels indicated in Table 1.

</table>

The components in the aqueous alkaline hand dishwash liquid detergent formulations were added in the order set out in Table 1 in which the amounts given define the amount of reagent required in the final formulation based on 100% reagent supplied.
Cleaning test experiments

The efficiency and cleaning power of the five aqueous alkaline hand dishwash liquid detergent formulations listed in Table 1 was investigated.

A 25% solution by weight of each aqueous alkaline hand dishwash liquid detergent formulation listed in Table 1 was prepared using a 3 : 1 weight ratio of water : detergent.

Soiled brushed stainless steel tiles were prepared by coating the tiles with a three way soil monitor, that is a mixture of fat, protein, and starch and then baked at 100 °C for 1 hour. A number of tiles were then soaked in each of the five aqueous alkaline hand dishwash liquid detergent formulations before cleaning.

Cleaning was carried out using a custom Martindale Abrasion rig called a WIRA. A piece of ballerina cloth was affixed to the cleaning head which was placed in contact with a tile specially designed to simulate a dish surface and to give highly repeatable cleaning results. Cleaning was achieved by moving the cleaning head in a lissajous motion. The soak time prior to the cleaning process was measured using a count-down timer before starting the abrasion rig. Cleaned tiles were rinsed with demineralised water and left to dry overnight before investigating the results of the cleaning process.

Gravimetric measurements were recorded by weighing the tiles with and without soil before and after washing to determine the cleaning efficiency of the different aqueous alkaline hand dishwash liquid detergent formulations in Table 1.

Multiple repeat tiles were cleaned per aqueous alkaline hand dishwash liquid detergent formulation. In Table 2 the average % soil removal values for each formulation are reported. The entire test was carried out at a temperature of approximately 21 °C. The clean stainless steel tiles used in Experiment 1 were supplied by Mersey Metals and possess low in-batch variability. The results of the cleaning test experiments are provided in Table 2.
It can be seen from Table 2 that increasing the pH using a pH adjustment, buffering and thickening system (for example a mixture of sodium carbonate and sodium hydrogen carbonate) in the aqueous alkaline hand dishwash liquid detergent formulation provides an increase in the cleaning performance of the formulation moving from neutral to alkaline pH. For each pH a minimum of four experiments were performed.

In addition, the increase in pH of the aqueous alkaline hand dishwash liquid detergent formulation created by introducing a mixture of carbonate and hydrogen carbonate enabled a formulation to be achieved with a pH above 9, sufficient for un-built hand dishwash formulations. For hand dish wash formulations a viscosity of at least 1.5 Pa.s is preferred.

These compositions therefore provide an aqueous alkaline hand dishwash liquid detergent formulation which is able to meet the cleaning requirements of obstinate soiling and which still provides the required rheology parameters required of hand dish wash formulations using pH adjustment, buffering and thickening system in the form of a combination of sodium carbonate and sodium hydrogen carbonate.

**Example 2**

Aqueous alkaline hand dishwash liquid detergent formulations were prepared using the components listed in Table 3 over a range of ratios of linear alkyl benzene sulfonate (LAS Acid) to sodium dodecyl benzene sulfonate, at pH 9.5, by mixing the ingredients listed.
therein. The components were diluted further with demineralised water to give the concentration levels indicated in Table 3.

</table>

Therefore it can be seen that as the ratio of linear alkyl benzene sulfonate (LAS Acid) to SLES increases, the viscosity of the formulation increases with a preferred level of viscosity for the hand dish wash formulation being obtained with a ratio of 1:2.2.
CLAIMS

1. An aqueous alkaline hand dishwash liquid detergent formulation comprising:

   i) 9 to 20 wt% of a surfactant system;
   wherein 2 to 5 wt% of the surfactant system comprises a linear alkyl benzene sulfonate; and 7 to 17 wt% of the surfactant system comprise an alkyl ether sulfate; and wherein less than 1 wt% of the surfactant system comprises non-ionic surfactant; and wherein the weight ratio of linear alkyl benzene sulfonate (as LAS acid) to alkyl ether sulfate is lower than or equal to 1 : 2.2; and

   ii) wherein the pH of the formulation is in the range 9.1 to 11;

   iii) wherein the formulation further comprises a pH adjustment, buffering and thickening system which comprises at least 5 wt% of the total formulation, wherein the system comprises one or more components selected from the group consisting of sodium carbonate, sodium hydrogen carbonate, potassium carbonate and potassium hydrogen carbonate; and

   iv) wherein the formulation has a viscosity in the range of from 1.5 to 6.0 Pa.s when measured at a shear rate of 21 s⁻¹ at 25 °C.

2. An aqueous alkaline hand dishwash liquid detergent formulation according to claim 1 wherein the linear alkyl benzene sulfonate has between 6 to 20 carbon atoms in its alkyl group.

3. An aqueous alkaline hand dishwash liquid detergent formulation according to claim 1 or 2 wherein the linear alkyl benzene sulfonate is sodium linear alkyl benzene sulfonate.

4. An aqueous alkaline hand dishwash liquid detergent formulation according to any one of claims 1 to 3 wherein the alkyl ether sulfate has between 8 and 22 carbon atoms in its alkyl group.

5. An aqueous alkaline hand dishwash liquid detergent formulation according to any one of claims 1 to 4 wherein the alkyl ether sulfate is sodium alkyl ether sulfate, most preferably, SLES 1EO.
6. An aqueous alkaline hand dishwash liquid detergent formulation according to any one of claims 1 to 5 wherein the pH is in the range 9.2 to 10.8.

7. An aqueous alkaline hand dishwash liquid detergent formulation according to any one of claims 1 to 6 wherein the pH of the formulation is in the range 9.2 to 9.8.

8. An aqueous alkaline hand dishwash liquid detergent formulation according to any one of claims 1 to 7 wherein the pH adjustment, buffering and thickening system consists of a mixture of sodium carbonate and sodium hydrogen carbonate.

9. An aqueous alkaline hand dishwash liquid detergent formulation according to any one of claims 1 to 8 wherein the pH adjustment, buffering and thickening system comprises a maximum of 10 wt% of the total formulation.

10. An aqueous alkaline hand dishwash liquid detergent formulation according to any one of claims 1 to 8 wherein the pH adjustment, buffering and thickening system comprises between 5 and 7 wt% of the total formulation.

11. An aqueous alkaline hand dishwash liquid detergent formulation according to any one of claims 1 to 10 wherein the formulation comprises at least 65 wt% water.

12. An aqueous alkaline hand dishwash liquid detergent formulation according to any one of claims 1 to 11 wherein the formulation has a weight ratio of linear alkyl benzene sulfonate to alkyl ether sulfate in the range of 1 : 2.2 to 1 : 5.0.

13. An aqueous alkaline hand dishwash liquid detergent formulation according to any of claims 1 to 12 wherein the formulation has a weight ratio of linear alkyl benzene sulfonate to alkyl ether sulfate in the range of 1 : 2.2 to 1 : 4.0, more preferably the formulation comprises a weight ratio of linear alkyl benzene sulfonate to alkyl ether sulfate in the range of 1 : 2.2 to 1 : 3.5.
14. An aqueous alkaline hand dishwash liquid detergent formulation according to any one of claims 1 to 13 wherein the formulation has a viscosity in the range of from 1.75 to 5.5 Pa.s, preferably from 2.0 to 5.5 Pa.s and more preferably from 2.5 to 4.5 Pa.s.
