Witnesses:

Inventor:

Fritz Feser
To all whom it may concern:

Be it known that I, Fritz Feser, a citizen of the German Republic, and residing at 10 Neue Mainzerstrasse, Frankfort-on-the-Main, Germany, have invented certain new and useful Improvements in Means for Preventing Bagging at the Knees of Men's Trousers, of which the following is a specification, reference being had therein to the accompanying drawing.

My invention relates to men's trousers with pieces or patches of web-like fabric, preferably lining-batiste, stitched inside the trouser leg at the knee of the trouser to prevent the bagging at the knees of the latter, and consists in having these pieces or patches fully stretched and extended lengthwise before being sewn at the knee portion of the trousers. The effect of this is, that when the knee is flexed, the patch, incapable of further longitudinal extension, is spread transversely and draws up the trouser material, yet only for the time the knee is bent, returning to its normal state, when the trouser knee is straightened again.

My invention is illustrated in the accompanying drawing, in which—

Figure 1 shows a pair of men's trousers with the insertion indicated by a broken line.

Figure 2 is an elevation of the piece or patch of web-like fabric sewn to the inside of the trouser material along the crease.

Figure 3 shows the piece or patch of web-like fabric before it is stretched and sewn to the garment.

In the drawing, Figure 1, is the trouser leg at the knee of the trouser to prevent the bagging at the knees of the latter, said pieces or patches being extended diagonally to the cross of the threads up to the limit of their capacity in this direction and being elastic only transversely and connected immovably with the trouser material by stitches along the edges and the crease, thereby preventing the stretching or bagging of the latter.

In testimony whereof, I have affixed my signature.

FRITZ FESER.
