Abridged/Abstract:
The objective of the present invention is to provide a vinyl chloride resin composition that is for powder molding and that provides a molded article having superior flexibility at low-temperatures. The vinyl chloride resin composition for powder molding comprises (a) vinyl chloride resin particles, (b) a plasticizer, and (c) vinyl chloride resin microparticles having an average degree of polymerization of 1000-5000 inclusive.
ABSTRACT

Provided is a vinyl chloride resin composition for powder molding that can provide a molded product having superior flexibility at low temperatures. The vinyl chloride resin composition for powder molding includes (a) vinyl chloride resin particles, (b) a plasticizer, and (c) vinyl chloride resin fine particles having an average degree of polymerization of at least 1,000 and no greater than 5,000.
VINYL CHLORIDE RESIN COMPOSITION FOR POWDER MOLDING,
VINYL CHLORIDE RESIN MOLDED ARTICLE, AND LAMINATE

TECHNICAL FIELD

[0001] The present disclosure relates to a vinyl chloride resin composition for powder molding that can provide a molded product having superior flexibility at low temperatures, a vinyl chloride resin molded product formed through powder molding of the vinyl chloride resin composition for powder molding, and a laminate including the vinyl chloride resin molded product and a foamed polyurethane molded product.

BACKGROUND

[0002] An automobile instrument panel has a structure in which a foamed polyurethane layer is disposed between a substrate and a surface skin formed from a vinyl chloride resin. Over time, the surface skin formed from the vinyl chloride resin discolors and experiences a reduction in heat aging resistance. One main cause of discoloration and so forth of the surface skin is a chemical reaction that occurs as a result of a tertiary amine used as a catalyst in formation of the foamed polyurethane layer migrating to the surface skin formed from the vinyl chloride resin. In order to prevent surface skin discoloring, a urethane integrated foamed molded product has been considered in which a granular catcher agent that captures volatile organic compounds produced in a foamed polyurethane layer and that is coated with an open cell foam sheet is provided near locations at which the edges of the foamed polyurethane layer are sealed by a surface skin and a substrate (for example, refer to PTL 1). However, there are sections where the surface skin and the foamed polyurethane layer are in contact in this urethane integrated foamed molded product and, as a result, surface skin discoloration due to the aforementioned chemical reaction cannot be prevented over a long period and heat aging resistance of the surface skin decreases.

On the other hand, a laminate has been considered in which a synthetic resin foamed layer is provided that joins a core material and a surface skin and in which the core material includes gas release holes for releasing gas produced in the foamed layer (for example, refer to PTL 2). However, the
synthetic resin foamed layer and the surface skin are in contact in this laminate and, as a result, surface skin discoloration due to the aforementioned chemical reaction cannot be prevented over a long period and heat aging resistance of the surface skin decreases.

Furthermore, a molded product has been considered that includes a polyurethane molded product, a surface skin containing a vinyl chloride resin that covers at least one surface of the urethane molded product, and an amine catcher layer disposed between the polyurethane molded product and the surface skin (for example, refer to PTL 3). However, it is not possible to prevent migration of a tertiary amine to the surface skin formed from the vinyl chloride resin over a long period due to volatility of the amine catcher. Therefore, surface skin discoloration due to the aforementioned chemical reaction cannot be prevented over a long period and heat aging resistance of the surface skin decreases in this molded product.

On the other hand, a vinyl chloride resin composition for powder molding that includes a prescribed trimellitate plasticizer has been considered as a raw material for a surface skin of an automobile interior material (for example, refer to PTL 4). However, it is necessary to increase the blended amount of the plasticizer in order to improve heat aging resistance of a surface skin material that is obtained through powder molding of the vinyl chloride resin composition, which results in the surface skin material feeling sticky due to the plasticizer. A vinyl chloride resin composition for powder molding has also been considered that includes 100 parts by mass of vinyl chloride resin particles made from a vinyl chloride resin having an average degree of polymerization of at least 1,500 and 110 parts by mass to 150 parts by mass of a prescribed trimellitate plasticizer (for example, refer to PTL 5).

SUMMARY

(Technical Problem)

[0005] In order that fragments of a surface skin of an automobile instrument panel that is laminated with a foamed polyurethane layer are not scattered when the surface skin breaks as designed at low temperatures upon expansion of an air bag, there has been demand in recent years for an automobile instrument panel including a surface skin having superior flexibility at low temperatures. However, it has not been possible to achieve an automobile instrument panel including a surface skin such as described above.

[0006] The present disclosure aims to solve a problem of provision of a vinyl chloride resin composition for powder molding that can provide a molded product having superior flexibility at low temperatures. Another problem that the present disclosure aims to solve is provision of a vinyl chloride resin molded product that is formed through powder molding of the vinyl chloride resin composition for powder molding described above and that has superior flexibility at low temperatures, and provision of a laminate including the vinyl chloride resin molded product and a foamed polyurethane molded product.

(Solution to Problem)

[0007] As a result of diligent investigation in order to solve the problems described above, the present inventor discovered that a vinyl chloride resin composition for powder molding including (a) vinyl chloride resin particles, (b) a plasticizer, and (c) vinyl chloride resin fine particles having a specific average degree of polymerization can provide a molded product having particularly superior flexibility at low temperatures. This discovery led to the present disclosure.

[0008] A presently disclosed vinyl chloride resin composition for powder molding includes (a) vinyl chloride resin particles, (b) a plasticizer, and (c) vinyl chloride resin fine particles having an average degree of polymerization of at least 1,000 and no greater than 5,000.

[0009] In the presently disclosed vinyl chloride resin composition for powder molding, (b) the plasticizer is preferably at least one plasticizer selected from the group consisting of trimellitate plasticizers and pyromellitate plasticizers.

[0010] In the presently disclosed vinyl chloride resin composition for powder
molding, a vinyl chloride resin forming (a) the vinyl chloride resin particles preferably has an average degree of polymerization of at least 1,000 and no greater than 5,000.

[0011] In the presently disclosed vinyl chloride resin composition for powder molding, (a) the vinyl chloride resin particles preferably have an average particle diameter of at least 50 µm and no greater than 500 µm, and (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000 preferably have an average particle diameter of at least 0.1 µm and no greater than 10 µm.

[0012] In the presently disclosed vinyl chloride resin composition for powder molding, an amount of (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000 relative to a total amount of (a) the vinyl chloride resin particles and (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000 is preferably at least 5 mass% and no greater than 35 mass%.

[0013] In the presently disclosed vinyl chloride resin composition for powder molding, an amount of (b) the plasticizer per 100 parts by mass in total of (a) the vinyl chloride resin particles and (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000 is preferably at least 70 parts by mass and no greater than 200 parts by mass.

[0014] The presently disclosed vinyl chloride resin composition for powder molding preferably further includes (d) vinyl chloride resin fine particles having an average degree of polymerization of less than 1,000.

[0015] In the presently disclosed vinyl chloride resin composition for powder molding, (a) the vinyl chloride resin particles preferably have an average particle diameter of at least 50 µm and no greater than 500 µm, (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000 preferably have an average particle diameter of at least 0.1 µm and no greater than 10 µm, and (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000 preferably have an average particle diameter of at least 0.1 µm and no greater than 10 µm.
[0016] In the presently disclosed vinyl chloride resin composition for powder molding, an amount of (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000 relative to a total amount of (a) the vinyl chloride resin particles, (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000, and (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000 is preferably at least 3 mass% and no greater than 20 mass%, and an amount of (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000 relative to the total amount of (a) the vinyl chloride resin particles, (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000, and (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000 is preferably at least 2 mass% and no greater than 15 mass%.

[0017] In the presently disclosed vinyl chloride resin composition for powder molding, an amount of (b) the plasticizer per 100 parts by mass in total of (a) the vinyl chloride resin particles, (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000, and (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000 is preferably at least 70 parts by mass and no greater than 200 parts by mass.

[0018] The presently disclosed vinyl chloride resin composition for powder molding is preferably used for powder slush molding.

[0019] A presently disclosed vinyl chloride resin molded product is obtainable through powder molding of the vinyl chloride resin composition for powder molding described above.

The vinyl chloride resin molded product is preferably used as a surface skin of an automobile instrument panel.

[0020] A presently disclosed laminate includes a foamed polyurethane molded product and the vinyl chloride resin molded product described above. The laminate is preferably used as a laminate of an automobile instrument panel.

(Advantageous Effect)
The presently disclosed vinyl chloride resin composition for powder molding can provide a molded product having superior flexibility at low temperatures.

DETAILED DESCRIPTION

(Vinyl chloride resin composition for powder molding)

As presently disclosed vinyl chloride resin composition for powder molding includes (a) vinyl chloride resin particles, (b) a plasticizer, and (c) vinyl chloride resin fine particles having an average degree of polymerization of at least 1,000 and no greater than 5,000, and may optionally include (d) vinyl chloride resin fine particles having an average degree of polymerization of less than 1,000 and additives.

A vinyl chloride resin forming (a) the vinyl chloride resin particles, (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000, and (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000 may for example be a homopolymer of vinyl chloride or a copolymer preferably including at least 50 mass% of vinyl chloride units and more preferably at least 70 mass% of vinyl chloride units. Specific examples of comonomers of vinyl chloride copolymers include: olefins such as ethylene and propylene; halogenated olefins such as allyl chloride, vinylidene chloride, vinyl fluoride, and trifluorochloroethylene; carboxylic acid vinyl esters such as vinyl acetate and vinyl propionate; vinyl ethers such as isobutyl vinyl ether and cetyl vinyl ether; allyl ethers such as allyl-3-chloro-2-oxy propyl ether and allyl glycidyl ether; unsaturated carboxylic acids, esters of unsaturated carboxylic acids, and acid anhydrides of unsaturated carboxylic acids such as acrylic acid, maleic acid, itaconic acid, acrylic acid-2-hydroxyethyl, methyl methacrylate, monomethyl maleate, diethyl maleate, and maleic anhydride; unsaturated nitriles such as acrylonitrile and methacrylonitrile; acrylamides such as acrylamide, N-methylolacrylamide, acrylamido-2-methylpropane sulfonic acid, and (meth)acrylamidopropyltrimethylammonium chloride; and allyl amines and derivatives thereof such as allylamine benzoate and diallyldimethylammonium chloride. The above examples of monomers are
merely some of the monomers (comonomers) that are copolymerizable with vinyl chloride. Further examples of various types of monomers that can be used as comonomers are provided in pages 75-104 of “Polyvinyl chloride” edited by the Vinyl Section of the Kinki Chemical Society Japan and published by Nikkan Kogyo Shim bun, Ltd. (1988). Any one of these monomers or any two or more of these monomers may be used. Moreover, the vinyl chloride resin forming (a) the vinyl chloride resin particles, (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000, and (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000 may include a resin formed by graft polymerization of (1) vinyl chloride or (2) vinyl chloride and a copolymerizable comonomer such as described above with a resin such as an ethylene-vinyl acetate copolymer, an ethylene-methyl methacrylate copolymer, an ethylene-ethyl acrylate copolymer, or a chlorinated polyethylene.

The present description uses the term “(meth)acryl” to refer to either or both of acryl and methacryl.

[0024] Conventionally known production methods such as suspension polymerization, emulsion polymerization, solution polymerization, and bulk polymerization can be used to produce the vinyl chloride resin.

[0025] In the vinyl chloride resin composition for powder molding, (a) the vinyl chloride resin particles function as a matrix resin. Moreover, (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000 and (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000 function as a dusting agent (powder fluidity modifier) described further below. It is preferable that (a) the vinyl chloride resin particles are produced by suspension polymerization. Moreover, it is preferable that (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000 and (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000 are produced by emulsion polymerization.

[0026] <Vinyl chloride resin particles>

An average degree of polymerization of a vinyl chloride resin forming
(a) the vinyl chloride resin particles is preferably at least 1,000 and no greater than 5,000, more preferably at least 1,500 and no greater than 5,000, further preferably greater than 2,000 and no greater than 5,000, even further preferably greater than 2,000 and no greater than 4,000, particularly preferably greater than 2,000 and no greater than 3,500, and most preferably greater than 2,000 and no greater than 3,000. As a result of the average degree of polymerization of the vinyl chloride resin forming (a) the vinyl chloride resin particles being in the range described above, favorable fluidity and meltability can be obtained during powder molding of the vinyl chloride resin composition for powder molding and a vinyl chloride resin molded product formed through powder molding of the vinyl chloride resin composition for powder molding can be provided with favorable heat aging resistance. Note that the average degree of polymerization is measured in accordance with JIS K6720-2.

[0027] No specific limitations are placed on the average particle diameter of (a) the vinyl chloride resin particles. The average particle diameter is preferably at least 50 µm and no greater than 500 µm, more preferably at least 50 µm and no greater than 250 µm, and particularly preferably at least 100 µm and no greater than 200 µm. As a result of the average particle diameter of (a) the vinyl chloride resin particles being in the range described above, powder fluidity of the vinyl chloride resin composition for powder molding and smoothness of a vinyl chloride resin molded product formed through powder molding of the vinyl chloride resin composition for powder molding are improved. The average particle diameter of (a) the vinyl chloride resin particles is measured by a laser diffraction method in accordance with JIS Z8825 using, for example, a SALD-2300 produced by Shimadzu Corporation.

Note that (a) the vinyl chloride resin particles normally have a particle diameter of at least 30 µm.

[0028] <Vinyl chloride resin fine particles having average degree of polymerization of at least 1,000 and no greater than 5,000>

(c) The vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000 function as a dusting agent for improving powder fluidity of the vinyl chloride resin composition for powder molding, and are distinct from (a) the vinyl chloride
resin particles. It is actually possible to visually confirm the difference in fluidity of (a) the vinyl chloride resin particles and (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000.

5 **[0029]** The average particle diameter of (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000 is preferably at least 0.1 μm and no greater than 10 μm.

Furthermore, (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000 normally have a particle diameter of less than 30 μm.

The average particle diameter of (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000 is measured by a laser diffraction method in accordance with JIS Z8825 using, for example, a SALD-2300 produced by Shimadzu Corporation.

**[0030]** The average degree of polymerization of a vinyl chloride resin forming (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000 is preferably at least 1,200 and no greater than 5,000, more preferably greater than 1,500 and no greater than 5,000, further preferably greater than 1,500 and no greater than 4,000, even further preferably greater than 1,500 and no greater than 3,000, particularly preferably greater than 2,000 and no greater than 3,000, and most preferably greater than 2,000 and no greater than 2,500. As a result of the average degree of polymerization of the vinyl chloride resin forming (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000 being in the range described above, flexibility at low temperatures and heat aging resistance (tensile properties after heating) of a vinyl chloride resin molded product obtained through powder molding of the vinyl chloride resin composition for powder molding are improved.

**[0031]** <Vinyl chloride resin fine particles having average degree of polymerization of less than 1,000>

The presently disclosed vinyl chloride resin composition for powder molding preferably further includes (d) the vinyl chloride resin fine particles
having the average degree of polymerization of less than 1,000. (d) The vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000 function as a dusting agent for improving powder fluidity of the vinyl chloride resin composition for powder molding and are distinct from (a) the vinyl chloride resin particles and (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000.

The average particle diameter of (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000 is preferably at least 0.1 μm and no greater than 10 μm.

Furthermore, (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000 normally have a particle diameter of less than 30 μm.

The average particle diameter of (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000 is measured by a laser diffraction method in accordance with JIS Z8825 using, for example, a SALD-2300 produced by Shimadzu Corporation.

The average degree of polymerization of a vinyl chloride resin forming (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000 is preferably at least 300 and less than 1,000, more preferably at least 500 and no greater than 950, and particularly preferably at least 600 and no greater than 900. As a result of the average degree of polymerization of the vinyl chloride resin forming (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000 being in the range described above, powder fluidity of the vinyl chloride resin composition for powder molding and meltability of the composition in a molding process can be improved.

<Content ratio of vinyl chloride resin particles and vinyl chloride resin fine particles>

Herein, in a situation in which the presently disclosed vinyl chloride resin composition for powder molding does not include (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000, the amount of (a) the vinyl chloride resin particles relative to the total amount (100 mass%) of (a) the vinyl chloride resin particles and (c) the vinyl
chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000 is preferably at least 65 mass% and no greater than 95 mass%, more preferably at least 70 mass% and no greater than 92 mass%, and particularly preferably at least 72 mass% and no greater than 88 mass%. As a result of the amount of (a) the vinyl chloride resin particles being in the range described above, powder fluidity of the vinyl chloride resin composition for powder molding can be improved, and flexibility at low temperatures and heat aging resistance (tensile properties after heating) of a vinyl chloride resin molded product obtained through powder molding of the vinyl chloride resin composition for powder molding can be improved.

[0035] Furthermore, in the situation in which the presently disclosed vinyl chloride resin composition for powder molding does not include (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000, the amount of (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000 relative to the total amount (100 mass%) of (a) the vinyl chloride resin particles and (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000 is preferably at least 5 mass% and no greater than 35 mass%, more preferably at least 8 mass% and no greater than 30 mass%, and particularly preferably at least 12 mass% and no greater than 28 mass%. As a result of the amount of (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000 being in the range described above, powder fluidity of the vinyl chloride resin composition for powder molding can be improved, and flexibility at low temperatures and heat aging resistance (tensile properties after heating) of a vinyl chloride resin molded product obtained through powder molding of the vinyl chloride resin composition for powder molding can be improved.

[0036] On the other hand, in a situation in which the presently disclosed vinyl chloride resin composition for powder molding includes (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000, the amount of (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000 relative to the total amount (100 mass%) of (a) the vinyl chloride resin particles, (c) the vinyl...
chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000, and (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000 is preferably at least 2 mass% and no greater than 15 mass%, more preferably at least 3 mass% and no greater than 12 mass%, and particularly preferably at least 4 mass% and no greater than 11 mass%. As a result of the amount of (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000 being in the range described above, powder fluidity of the vinyl chloride resin composition for powder molding and meltability of the composition in a molding process can be improved. Moreover, a vinyl chloride resin molded product obtained through powder molding of the vinyl chloride resin composition for powder molding has a superior balance of flexibility at low temperatures and heat aging resistance (tensile properties after heating).

[0037] In the situation in which the presently disclosed vinyl chloride resin composition for powder molding includes (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000, the amount of (a) the vinyl chloride resin particles relative to the total amount (100 mass%) of (a) the vinyl chloride resin particles, (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000, and (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000 is preferably at least 65 mass% and no greater than 95 mass%, more preferably at least 70 mass% and no greater than 92 mass%, and particularly preferably at least 72 mass% and no greater than 88 mass%. As a result of the amount of (a) the vinyl chloride resin particles being in the range described above, powder fluidity of the vinyl chloride resin composition for powder molding can be improved, and flexibility at low temperatures and heat aging resistance (tensile properties after heating) of a vinyl chloride resin molded product obtained through powder molding of the vinyl chloride resin composition for powder molding can be improved.

[0038] Furthermore, in the situation in which the presently disclosed vinyl chloride resin composition for powder molding includes (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than
1,000, the amount of (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000 relative to the total amount (100 mass%) of (a) the vinyl chloride resin particles, (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000, and (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000 is preferably at least 3 mass% and no greater than 20 mass%, more preferably at least 5 mass% and no greater than 18 mass%, and particularly preferably at least 8 mass% and no greater than 17 mass%. As a result of the amount of (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000 being in the range described above, powder fluidity of the vinyl chloride resin composition for powder molding and meltability of the composition in a molding process can be improved.

[0039] <Plasticizer>

No specific limitations are placed on (b) the plasticizer included in the presently disclosed vinyl chloride resin composition for powder molding which may for example be a trimellitate plasticizer, a pyromellitate plasticizer, or another plasticizer. Among such plasticizers, (b) the plasticizer is preferably at least one plasticizer selected from the group consisting of trimellitate plasticizers and pyromellitate plasticizers. A preferable example of a trimellitate plasticizer is an ester compound of trimellitic acid and a monohydric alcohol, and a preferable example of a pyromellitate plasticizer is an ester compound of pyromellitic acid and a monohydric alcohol.

[0040] [Trimellitate plasticizer]

Specific examples of trimellitate plasticizers that may be used include tri-n-hexyl trimellitate, tri-n-heptyl trimellitate, tri-n-octyl trimellitate, tri(2-ethylhexyl) trimellitate, tri-n-nonyl trimellitate, tri-n-decyl trimellitate, triisodecyl trimellitate, tri-n-undecyl trimellitate, tri-n-dodecyl trimellitate, and tri-n-alkyl trimellitates (esters including two or more types of alkyl groups having differing carbon numbers of 6-12 in molecules thereof).

[0041] One specific preferable example of a trimellitate plasticizer is a compound represented by formula (1) shown below.

[CHEM. 1]
In formula (1), $R^1$, $R^2$, and $R^3$ are alkyl groups that may be the same or different.

[0042] A straight chain ratio of each of $R^1$, $R^2$, and $R^3$ is preferably at least 90 mol% and more preferably at least 95 mol%. The proportion of alkyl groups having a carbon number of no greater than 7 relative to all alkyl groups $R^1$, $R^2$, and $R^3$ is preferably at least 0 mol% and no greater than 10 mol%. The proportion of alkyl groups having a carbon number of 8 or 9 relative to all alkyl groups $R^1$, $R^2$, and $R^3$ is preferably at least 5 mol% and no greater than 100 mol%, more preferably at least 40 mol% and no greater than 95 mol%, and particularly preferably at least 75 mol% and no greater than 95 mol%. The proportion of alkyl groups having a carbon number of 10 relative to all alkyl groups $R^1$, $R^2$, and $R^3$ is preferably at least 0 mol% and no greater than 95 mol%, more preferably at least 5 mol% and no greater than 60 mol%, and particularly preferably at least 5 mol% and no greater than 25 mol%. The proportion of alkyl groups having a carbon number of at least 11 relative to all alkyl groups $R^1$, $R^2$, and $R^3$ is preferably at least 0 mol% and no greater than 10 mol%. Note that the straight chain ratios of $R^1$, $R^2$, and $R^3$ are the proportions of straight chain alkyl groups relative to all alkyl groups for $R^1$, $R^2$, and $R^3$ respectively.

[0043] Specific examples of straight chain alkyl groups that can form $R^1$, $R^2$, and $R^3$ in formula (1) include a methyl group, an ethyl group, an n-propyl
group, an n-butyl group, an n-pentyl group, an n-hexyl group, an n-heptyl group, an n-octyl group, an n-nonyl group, an n-decyl group, an n-undecyl group, an n-dodecyl group, an n-tridecyl group, an n-pentadecyl group, an n-hexadecyl group, an n-heptadecyl group, and an n-stearyl group. Specific examples of branched alkyl group that can form $R_1$, $R_2$, and $R_3$ in formula (1) include an i-propyl group, an i-butyl group, an i-pentyl group, an i-hexyl group, an i-heptyl group, an i-octyl group, an i-nonyl group, an i-decyl group, an i-undecyl group, an i-dodecyl group, an i-tridecyl group, an i-pentadecyl group, an i-hexadecyl group, an i-heptadecyl group, an i-octadecyl group, a t-butyl group, a t-pentyl group, a t-hexyl group, a t-heptyl group, a t-octyl group, a t-nonyl group, a t-decyl group, a t-undecyl group, a t-dodecyl group, a t-tridecyl group, a t-pentadecyl group, a t-hexadecyl group, a t-heptadecyl group, a t-octadecyl group, and a 2-ethylhexyl group.

[0044] The trimellitate plasticizer may be a single compound or may be a mixture.

[0045] [Pyromellitate plasticizer]

Specific examples of pyromellitate plasticizers that may be used include tetraalkyl pyromellitates such as tetra-n-hexyl pyromellitate, tetra-n-octyl pyromellitate, tetra(2-ethylhexyl) pyromellitate, tetra-n-decyl pyromellitate, tetra-i-decyl pyromellitate, and tetra-n-alkyl pyromellitates (esters including two or more types of alkyl groups having differing carbon numbers of 6-12, and preferably 7-10, in molecules thereof). Among the above examples, tetraalkyl pyromellitates in which the ester groups each have a carbon number of 6-10 are preferable, tetraalkyl pyromellitates in which the ester groups each have a carbon number of 8-10, such as tetra-n-octyl pyromellitate, tetra(2-ethylhexyl) pyromellitate, and tetra-n-decyl pyromellitate, are more preferable, and tetraalkyl pyromellitates in which the ester groups each have a carbon number of 8, such as tetra-n-octyl pyromellitate and tetra(2-ethylhexyl) pyromellitate, are particularly preferable.

[0046] The pyromellitate plasticizer may be a single compound or may be a mixture.

[0047] [Other plasticizers]

Examples of other plasticizers besides the trimellitate plasticizer and...
the pyromellitate plasticizer that may be used include primary plasticizers and secondary plasticizers listed below.

[0048] Examples of so-called primary plasticizers include:

- epoxidized vegetable oils such as epoxidized soybean oil and epoxidized linseed oil;
- phthalic acid derivatives such as dimethyl phthalate, diethyl phthalate, di-n-butyl phthalate, diisobutyl phthalate, di-n-heptyl phthalate, di(2-ethylhexyl) phthalate, di-n-octyl phthalate, di-n-nonyl phthalate, di-n-decyl phthalate, diisodecyl phthalate, di-n-undecyl phthalate, di-n-dodecyl phthalate, di-n-tridecyl phthalate, dicyclohexyl phthalate, diphenyl phthalate, dibenzyl phthalate, and n-butylbenzyl phthalate;
- isophthalic acid derivatives such as dimethyl isophthalate, di(2-ethylhexyl) isophthalate, and diisooctyl isophthalate;
- tetrahydrophthalic acid derivatives such as di(2-ethylhexyl)tetrahydrophthalate, di-n-octyl tetrahydrophthalate, and diisodecyl tetrahydrophthalate;
- adipic acid derivatives such as di-n-butyl adipate, di(2-ethylhexyl)adipate, diisononyl adipate, and diisodecyl adipate;
- azelaic acid derivatives such as di(2-ethylhexyl)azelate, diisooctyl azelate, and di-n-hexyl azelate;
- sebacic acid derivatives such as di-n-butyl sebacate, di(2-ethylhexyl)sebacate, diisodecyl sebacate, and di(2-butoxyctyl)sebacate;
- maleic acid derivatives such as dimethyl maleate, diethyl maleate, di-n-butyln maleate, and di(2-ethylhexyl)maleate;
- fumaric acid derivatives such as di-n-butyl fumarate and di(2-ethylhexyl)fumarate;
- citric acid derivatives such as triethyl citrate, tri-n-butyl citrate, acetyltriethyl citrate, and acetyltri(2-ethylhexyl) citrate;
- itaconic acid derivatives such as monomethyl itaconate, mono-n-butyl itaconate, dimethyl itaconate, diethyl itaconate, di-n-butyl itaconate, and di(2-ethylhexyl)itaconate;
- oleic acid derivatives such as butyl oleate, glyceryl monooleate, and diethylene glycol monooleate;
- ricinoleic acid derivatives such as methylacetyl ricinoleate,
n-butylacetyl ricinoleate, glyceryl monoricinoleate, and diethylene glycol monoricinoleate;

stearic acid derivatives such as n-butyl stearate and diethylene glycol distearate;

other fatty acid derivatives such as diethylene glycol monolaurate, diethylene glycol dipelargonate, and pentaerythritol fatty acid esters;

phosphoric acid derivatives such as triethyl phosphate, tri-n-butyl phosphate, tri(2-ethylhexyl) phosphate, tri-n-butoxyethyl phosphate, triphenyl phosphate, cresyl diphenyl phosphate, tricresyl phosphate, tritylenyl phosphate, and tris(chloroethyl) phosphate;

glycol derivatives such as diethylene glycol dibenzoate, dipropylene glycol dibenzoate, triethylene glycol dibenzoate, triethylene glycol di(2-ethylbutyrate), triethylene glycol di(2-ethylhexoate), and dibutyl methylenebis(thioglycolate);

glycerin derivatives such as glycerol monoacetate, glycerol triacetate, and glycerol tributyrate;

epoxy derivatives such as epoxy hexahydro diisodecyl phthalate, epoxy triglyceride, epoxidized octyl oleate, and epoxidized decyl oleate; and polyester plasticizers such as adipic acid polyesters, sebacic acid polyesters, and phthalic acid polyesters.

[0049] Examples of so-called secondary plasticizers include chlorinated paraffin, fatty acid esters of glycol such as triethylene glycol dicaprylate, n-butyl epoxy stearate, phenyl oleate, and methyl dihydroabietate.

[0050] Any one or any two or more of these other plasticizers may be used in the presently disclosed vinyl chloride resin composition for powder molding. In a situation in which a secondary plasticizer is used, a primary plasticizer of equivalent or greater mass is preferably used in combination with the secondary plasticizer.

[0051] Among the other plasticizers listed above, epoxidized plant oils are preferable, and epoxidized soybean oil is more preferable.

[0052] The amount of (b) the plasticizer per 100 parts by mass in total of (a) the vinyl chloride resin particles, (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000, and (d) the vinyl chloride resin fine particles having the average
degree of polymerization of less than 1,000, which are added as required, is preferably at least 70 parts by mass and no greater than 200 parts by mass, more preferably at least 80 parts by mass and no greater than 180 parts by mass, further preferably at least 90 parts by mass and no greater than 160 parts by mass, particularly preferably at least 100 parts by mass and no greater than 150 parts by mass, and most preferably at least 115 parts by mass and no greater than 125 parts by mass. As a result of the amount of (b) the plasticizer being in the range described above, a vinyl chloride resin molded product obtained through powder molding of the vinyl chloride resin composition for powder molding has better heat aging resistance, and powder molding properties of the vinyl chloride resin composition for powder molding are improved due to good absorption of (b) the plasticizer by (a) the vinyl chloride resin particles.

[0053] In a situation in which (b) the plasticizer includes both a trimellitate plasticizer and a pyromellitate plasticizer, no specific limitations are placed on the content ratio of the trimellitate plasticizer and the pyromellitate plasticizer. The content ratio of the trimellitate plasticizer and the pyromellitate plasticizer in (b) the plasticizer (trimellitate plasticizer/pyromellitate plasticizer), as a mass ratio, is preferably from 10/1 to 1/10, more preferably from 8/1 to 1/8, further preferably from 4/1 to 1/4, and particularly preferably from 4/1 to 1/1.

[0054] In a situation in which (b) the plasticizer includes any of the other plasticizers described above, the amount of the other plasticizers in (b) the plasticizer is preferably no greater than 10 mass%, more preferably at least 1 mass% and no greater than 10 mass%, and particularly preferably at least 2 mass% and no greater than 5 mass%.

[0055] <Additives>

Besides (a) the vinyl chloride resin particles, (b) the plasticizer, (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000, and (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000, the presently disclosed vinyl chloride resin composition for powder molding may further include various additives. Although no specific limitations are placed on these additives, examples of additives that may be
used include perchloric acid-treated hydrotalcite, zeolite, fatty acid metal salts, dusting agents (powder fluidity modifiers) other than (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000 and (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000 (hereinafter also referred to as "other dusting agents"), and other additives.

[0056] [Perchloric acid-treated hydrotalcite]

The perchloric acid-treated hydrotalcite that may be included in the presently disclosed vinyl chloride resin composition for powder molding can be easily produced by, for example, addition and stirring of hydrotalcite with a dilute aqueous solution of perchloric acid, followed by filtration, dehydration, and drying as required. Through this process, at least some of the carbonate anions (CO$_3^{2-}$) in the hydrotalcite are substituted with perchlorate anions (ClO$_4^-$) (note that 2 mol of perchlorate anions are substituted per 1 mol of carbonate anions). The molar ratio of hydrotalcite and perchloric acid may be freely set, although a ratio of from 0.1 mol to 2 mol of perchloric acid relative to 1 mol of hydrotalcite is typical.

[0057] The substitution ratio of carbonate anions in the untreated (unsubstituted) hydrotalcite by perchlorate anions is preferably at least 50 mol%, more preferably at least 70 mol%, and particularly preferably at least 85 mol%. Moreover, the substitution ratio of carbonate anions in the untreated (unsubstituted) hydrotalcite by perchlorate anions is preferably no greater than 95 mol%. As a result of the substitution ratio of carbonate anions in the untreated (unsubstituted) hydrotalcite by perchlorate anions being in the range described above, a vinyl chloride resin molded product formed through powder molding of the vinyl chloride resin composition for powder molding can be provided with favorable flexibility at low temperatures.

[0058] Hydrotalcite is a non-stoichiometric compound represented by a general formula: [Mg$_{1-x}$Al$_x$(OH)$_2$]$^+$[(CO$_3$)$_{y/2}$·mH$_2$O]$^{n-}$, and is an inorganic substance having a layered crystal structure formed by a positively charged basic layer of [Mg$_{1-x}$Al$_x$(OH)$_2$]$^+$ and a negatively charged intermediate layer of [(CO$_3$)$_{y/2}$·mH$_2$O]$^{n-}$. In the general formula shown above, x represents a number that is greater than 0 and no greater than 0.33. Natural hydrotalcite is represented by Mg$_6$Al$_2$(OH)$_{16}$CO$_3$·4H$_2$O. On the other hand, a synthetic
hydrotalcite represented by Mg₄.₅Al₂(OH)₁₅CO₃·3.₅H₂O is commercially available. Synthetic hydrotalcite can for example be synthesized by a method described in JP S61-174270 B.

[0059] The amount of the perchloric acid-treated hydrotalcite per 100 parts by mass in total of (a) the vinyl chloride resin particles, (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000, and (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000, which are added as required, is preferably at least 0.5 parts by mass and no greater than 7 parts by mass, more preferably at least 1 part by mass and no greater than 6 parts by mass, and particularly preferably at least 1.5 parts by mass and no greater than 5.5 parts by mass. As a result of the amount of the perchloric acid-treated hydrotalcite being in the range described above, a vinyl chloride resin molded product formed through powder molding of the vinyl chloride resin composition for powder molding can be provided with favorable flexibility at low temperatures.

[0060] [Zeolite]

The presently disclosed vinyl chloride resin composition for powder molding may include a zeolite as a stabilizer. A zeolite is a compound represented by a general formula: Mₓ/n[(AlO₂)ₓ·(SiO₂)ₙ]·zH₂O (in the general formula, M is a metal ion of valency n, x + y is the number of tetrahedra per unit cell, and z is the number of moles of water). Examples of M in the general formula include monovalent and divalent metals such as Na, Li, Ca, Mg, and Zn, and mixtures thereof.

[0061] No specific limitations are placed on the amount of the zeolite that is included. The amount of the zeolite per 100 parts by mass in total of (a) the vinyl chloride resin particles, (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000, and (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000, which are added as required, is preferably at least 0.1 parts by mass and no greater than 5 parts by mass.

[0062] [Fatty acid metal salt]

The fatty acid metal salt that may be included in the presently disclosed vinyl chloride resin composition for powder molding is preferably a
metal salt of a monobasic fatty acid, more preferably a metal salt of a monobasic fatty acid having a carbon number of at least 12 and no greater than 24, and particularly preferably a metal salt of a monobasic fatty acid having a carbon number of at least 15 and no greater than 21. Specific examples of the fatty acid metal salt include lithium stearate, magnesium stearate, aluminum stearate, calcium stearate, strontium stearate, barium stearate, zinc stearate, calcium laurate, barium laurate, zinc laurate, barium 2-ethylhexanoate, zinc 2-ethylhexanoate, barium ricinoleate, and zinc ricinoleate. The metal in the fatty acid metal salt is preferably a metal that can produce polyvalent cations, more preferably a metal that can produce divalent cations, further preferably a metal from periods 3-6 of the periodic table that can produce divalent cations, and particularly preferably a metal from period 4 of the periodic table that can produce divalent cations. The fatty acid metal salt is most preferably zinc stearate.

[0063] The amount of the fatty acid metal salt per 100 parts by mass in total of (a) the vinyl chloride resin particles, (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000, and (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000, which are added as required, is preferably at least 0.05 parts by mass and no greater than 5 parts by mass, more preferably at least 0.1 parts by mass and no greater than 1 part by mass, and particularly preferably at least 0.1 parts by mass and no greater than 0.5 parts by mass. As a result of the amount of the fatty acid metal salt being in the range described above, a vinyl chloride resin molded product formed through powder molding of the vinyl chloride resin composition for powder molding can be provided with favorable flexibility at low temperatures and a color difference value thereof can be reduced.

[0064] [Other dusting agents]

Examples of other dusting agents (powder fluidity modifiers) besides (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000 and (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000 that may be included in the presently disclosed vinyl chloride resin composition for powder molding include: inorganic fine particles such
as calcium carbonate, talc, and aluminum oxide; and organic fine particles such as polyacrylonitrile resin fine particles, poly(meth)acrylate resin fine particles, polystyrene resin fine particles, polyethylene resin fine particles, polypropylene resin fine particles, polyester resin fine particles, and polyamide resin fine particles. Among these examples, inorganic fine particles having an average particle diameter of at least 10 nm and no greater than 100 nm are preferable.

[0065] The amount of other dusting agents that are included is not limited to a specific range. The amount of other dusting agents per 100 parts by mass in total of (a) the vinyl chloride resin particles, (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000, and (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000, which are added as required, is preferably no greater than 20 parts by mass, and more preferably no greater than 10 parts by mass.

[0066] [Other additives]

Examples of other additives that may be included in the presently disclosed vinyl chloride resin composition for powder molding include colorants, impact modifiers, perchloric acid compounds other than perchloric acid-treated hydrotalcite (for example, sodium perchlorate and potassium perchlorate), antioxidants, fungicides, flame retardants, antistatic agents, fillers, light stabilizers, foaming agents, β-diketones, and mold release agents.

[0067] Specific examples of colorants include quinacridone pigments, perylene pigments, condensed polyazo pigments, isoindolinone pigments, copper phthalocyanine pigments, titanium white, and carbon black. Any one of these pigments or any two or more of these pigments may be used.

A quinacridone pigment is obtained through concentrated sulfuric acid treatment of a p-phenylene dianthranilic acid and has a hue from yellowish red to reddish purple. Specific examples of quinacridone pigments include quinacridone red, quinacridone magenta, and quinacridone violet.

A perylene pigment is obtained through a condensation reaction of perylene-3,4,9,10-tetracarboxylic anhydride and an aromatic primary amine and has a hue from red to red-purple/brown. Specific examples of perylene pigments include perylene red, perylene orange, perylene maroon, perylene
vermilion, and perylene bordeaux.

A condensed azo pigment is obtained through condensation of an azo pigment in a solvent to achieve a high molecular weight and has a hue of a yellow or red pigment. Specific examples of condensed azo pigments include polyazo red, polyazo yellow, chromophthal orange, chromophthal red, and chromophthal scarlet.

An isoindolinone pigment is obtained through a condensation reaction of 4,5,6,7-tetrachloroisoiindolinone and an aromatic primary diamine and has a hue from greenish yellow to red/brown. A specific example of an isoindolinone pigment is isoindolinone yellow.

A copper phthalocyanine pigment is a pigment in which copper is coordinated with a phthalocyanine and has a hue from yellowish green to bright blue. Specific examples of copper phthalocyanine pigments include phthalocyanine green and phthalocyanine blue.

Titanium white is a white pigment made from titanium dioxide. Titanium white has high opacity and exists in anatase form and rutile form.

Carbon black is a black pigment having carbon as a main component and also including oxygen, hydrogen, and nitrogen. Specific examples of carbon black include thermal black, acetylene black, channel black, furnace black, lamp black, and bone black.

Specific examples of impact modifiers include an acrylonitrile-butadiene-styrene copolymer, a methyl methacrylate-butadiene-styrene copolymer, a chlorinated polyethylene, an ethylene-vinyl acetate copolymer, and a chlorosulfonated polyethylene. One impact modifier or two or more impact modifiers may be used in the presently disclosed vinyl chloride resin composition for powder molding. Note that the impact modifier is dispersed as a heterogeneous phase of fine elastic particles in the vinyl chloride resin composition for powder molding. In the vinyl chloride resin composition for powder molding, polar groups and chains grafted polymerized with the elastic particles are compatible with (a) the vinyl chloride resin particles and improve impact resistance of the vinyl chloride resin composition for powder molding.

Specific examples of antioxidants include phenolic antioxidants, sulfuric antioxidants, phosphoric antioxidants, and phosphite antioxidants.
Specific examples of fungicides include aliphatic ester fungicides, hydrocarbon fungicides, organic nitrogen fungicides, and organic nitrogen sulfur fungicides.

Specific examples of flame retardants include halogen-containing flame retardants such as chlorinated paraffin, phosphoric flame retardants such as phosphate esters, and inorganic hydroxides such as magnesium hydroxide and aluminum hydroxide.

Specific examples of antistatic agents include: anionic antistatic agents such as fatty acid salts, higher alcohol sulfuric acid esters, and sulfonic acid salts; cationic antistatic agents such as aliphatic amine salts and quaternary ammonium salts; and non-ionic antistatic agents such as polyoxyethylene alkyl ethers and polyoxyethylene alkyl phenol ethers.

Specific examples of fillers include silica, talc, mica, calcium carbonate, and clay.

Specific examples of light stabilizers include ultraviolet absorbers based on benzotriazoles, benzophenone, and nickel chelate, and hindered amine light stabilizers.

Specific examples of foaming agents include: organic foaming agents such as azo compounds (for example, azodicarbonamides and azobisisobutyronitrile), nitroso compounds (for example, N,N'-dinitrosopentamethylenetetramine), and sulfonyl hydrazide compounds (for example p-toluenesulfonyl hydrazide and p,p-oxybis(benzenesulfonyl hydrazide)); and gaseous foaming agents such as chlorofluorocarbons, carbon dioxide gas, water, and volatile hydrocarbons (for example pentane), and microcapsules containing any of these gaseous foaming agents.

A β-diketone can be used to more effectively suppress variation in initial color of a vinyl chloride resin molded product obtained through powder molding of the presently disclosed vinyl chloride resin composition for powder molding. Specific examples of β-diketones include dibenzoylmethane, stearoylbenzoylmethane, and palmitoylbenzoylmethane. Any one of these β-diketones may be used alone or a combination of any two or more of these β-diketones may be used.

No specific limitations are placed on the amount of the β-diketone that is included. The amount of the β-diketone per 100 parts by mass in total of (a)
the vinyl chloride resin particles, (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000, and (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000, which are added as required, is preferably at least 0.1 parts by mass or no greater than 5 parts by mass.

[0077] Specific examples of mold release agents include hydroxy group-containing saturated fatty acids such as hydroxystearic acid, hydroxymyristic acid, and hydroxylauric acid. Any one of these mold release agents may be used alone or a combination of any two or more of these mold release agents may be used. No specific limitations are placed on the amount of the mold release agent that is included. The amount of the mold release agent per 100 parts by mass in total of (a) the vinyl chloride resin particles, (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000, and (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000, which are added as required, is preferably at least 0.1 parts by mass and no greater than 3 parts by mass.

[0078] <Production method of vinyl chloride resin composition for powder molding>

The presently disclosed vinyl chloride resin composition for powder molding can be produced by mixing the components described above.

No specific limitations are placed on the method used to mix (a) the vinyl chloride resin particles, (b) the plasticizer, (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000, and also, as required, (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000 and other additives. One example of a preferable mixing method involves mixing all of the components with the exception of the plasticizer and the dusting agent (including (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000 and (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000) by dry blending and subsequently mixing in the plasticizer and the dusting agent in order. The dry blending is preferably carried out using a Henschel mixer. The temperature during dry
blending is preferably at least 50°C and no greater than 100°C, and more preferably at least 70°C and no greater than 80°C.

[0079] (Vinyl chloride resin molded product)

A presently disclosed vinyl chloride resin molded product is obtained through powder molding, and preferably through powder slush molding, of the presently disclosed vinyl chloride resin composition for powder molding described above. The mold temperature during powder slush molding is preferably at least 200°C and no greater than 300°C, and more preferably at least 220°C and no greater than 280°C.

[0080] In production of the presently disclosed vinyl chloride resin molded product, the presently disclosed vinyl chloride resin composition for powder molding is for example sprinkled onto a mold having a temperature in the aforementioned range. The vinyl chloride resin composition for powder molding is initially left for at least 5 seconds and no greater than 30 seconds and, after shaking off any excess vinyl chloride resin composition for powder molding, is then further left for at least 30 seconds and no greater than 3 minutes. The mold is subsequently cooled to at least 10°C and no greater than 60°C and the presently disclosed vinyl chloride resin molded product obtained thereby is removed from the mold.

[0081] The presently disclosed vinyl chloride resin molded product is highly suitable for use as a surface skin of an automobile interior material such as an instrument panel or a door trim.

[0082] (Laminate)

A presently disclosed laminate is obtainable by stacking the presently disclosed vinyl chloride resin molded product with a foamed polyurethane molded product. Examples of stacking methods that can be adopted include: a method in which the vinyl chloride resin molded product and the foamed polyurethane molded product are prepared separately and are subsequently joined together by, for example, thermal fusion bonding, thermal adhesion, or using a commonly known adhesive; and a method in which raw materials of the foamed polyurethane molded product such as an isocyanate and a polyol are caused to react on the vinyl chloride resin molded product so as to polymerize while carrying out polyurethane foaming by a commonly known method to directly form the foamed polyurethane molded product on the vinyl
chloride resin molded product. The latter of these methods is more suitable because it involves a simple process and enables laminates of various different shapes to be obtained while ensuring reliable adhesion of the vinyl chloride resin molded product and the foamed polyurethane molded product.

[0083] The presently disclosed laminate is highly suitable for use as an automobile interior material such as an instrument panel or a door trim.

EXAMPLES

[0084] The present disclosure is described in more detail through the following examples but is not limited to these examples.

Note that in the following examples, the average degree of polymerization of vinyl chloride resin particles or vinyl chloride resin fine particles was calculated in accordance with JIS K6720-2 by dissolving the vinyl chloride resin particles or vinyl chloride resin fine particles in nitrobenzene and measuring the viscosity.

Furthermore, the average particle diameter (volume average particle diameter) of vinyl chloride resin particles or vinyl chloride resin fine particles was calculated by dispersing the vinyl chloride resin particles or vinyl chloride resin fine particles in a water tank, measuring and analyzing a light diffraction/scattering intensity distribution using a device shown below, and thereby measuring particles diameters and a volume-basis particle diameter distribution.

Device: Laser diffraction particle size analyzer (SALD-2300 produced by Shimadzu Corporation)

Measurement method: Laser diffraction and scattering
Measurement range: 0.017 μm to 2,500 μm
Light source: Semiconductor laser (wavelength 680 nm, output 3 mW)

[0085] (Examples 1-14 and Comparative Example 1)

Ingredients shown in Tables 1 and 2 with the exception of the plasticizer (trimellitate plasticizer and epoxidized soybean oil) and the dusting agent were added into a Henschel mixer and mixed. The plasticizer was added to the mixture after increasing the temperature of the mixture to 80°C and the mixture was dried up (i.e., the aforementioned mixture changed to a dry state through absorption of the plasticizers by vinyl chloride resin
particles). Thereafter, once the dried-up mixture had been cooled to 70°C or lower, vinyl chloride resin fine particles used as the dusting agent were added to the mixture to produce a vinyl chloride resin composition for powder molding.

The resultant vinyl chloride resin composition for powder molding was sprinkled onto a textured mold that was heated to 250°C and after being left to melt for a time adjusted to give a vinyl chloride resin molded sheet thickness of 1 mm (specifically, from 14 seconds to 17 seconds), excess vinyl chloride resin composition for powder molding was shaken off. Next, the mold was placed in an oven set to 200°C and was cooled with cooling water once 60 seconds had passed. Once the mold had cooled to 40°C, a vinyl chloride resin molded sheet of 145 mm × 175 mm × 1 mm was removed from the mold. Various properties of the resultant vinyl chloride resin molded sheet were measured by the methods described below. The results are shown in

[0086] The measurement methods of the various properties were as follows.

(1) Initial tensile test

The vinyl chloride resin molded sheet was punched with a No. 1 dumbbell prescribed by JIS K6251, and tensile stress and tensile elongation thereof were measured in accordance with JIS K7113 at a tension rate of 200 mm/minute and a temperature of −35°C. Note that a high tensile elongation at −35°C indicates that a vinyl chloride resin molded sheet has superior flexibility at low temperatures.

(2) Post-heating tensile test

A measurement sample was prepared as follows. Two obtained vinyl chloride resin molded sheets were placed in a mold having dimensions of 200 mm × 300 mm × 10 mm with a textured surface below the molded sheets such that the molded sheets did not overlap one another. A mixed solution was prepared by mixing polymethylene polyphenylene polyisocyanate (polymeric MDI) with a polyl mixture in a ratio determined to give an isocyanate index of 98. The polyl mixture was composed of 50 parts by mass of a propylene glycol PO (propylene oxide)/EO (ethylene oxide) block adduct (hydroxyl value 28, terminal EO unit content 10%, internal EO unit content 4%), 50 parts by mass of a glycerin PO/EO block adduct (hydroxyl value 21, terminal
EO unit content 14%), 2.5 parts by mass of water, 0.2 parts by mass of an ethylene glycol solution of triethylenediamine (product name: TEDA-L33, produced by Tosoh Corporation), 1.2 parts by mass of triethanolamine, 0.5 parts by mass of triethylamine, and 0.5 parts by mass of a foam stabilizer (product name: F-122, produced by Shin-Etsu Chemical Co., Ltd.). Thereafter, the resultant mixed solution was poured onto the two vinyl chloride resin molded sheets and the mold was covered with an aluminum plate of 348 mm \times 255 mm \times 10 mm to seal the mold. After 5 minutes, a sample (laminate) was formed, in the mold, of a surface skin formed by a vinyl chloride resin molded sheet having a thickness of 1 mm lined with a foamed polyurethane molded product having a thickness of 9 mm and a density of 0.18 g/cm³. The resultant sample was removed from the mold.

Thereafter, the resultant sample was placed in an oven and after the sample was heated for 250 hours at 130°C, the foamed polyurethane layer was peeled from the sample. Tensile stress and tensile elongation of the sample were measured at −35°C in the same way as in the initial tensile test described above in section (1). Note that a high tensile elongation at −35°C indicates that a vinyl chloride resin molded sheet has superior flexibility at low temperatures.

[0090] Molded products (vinyl chloride resin molded sheets) obtained through powder slush molding of the vinyl chloride resin compositions for powder molding in Examples 1-14 had superior tensile properties at low temperatures, both initially and post-heating.

Among these examples, molded products (vinyl chloride resin molded sheets) obtained through powder slush molding of the vinyl chloride resin compositions for powder molding in Examples 5 and 11-14 had particularly superior flexibility at low temperatures.

[0091] On the other hand, in the case of a molded product (vinyl chloride
resin molded sheet) obtained through powder slush molding of the vinyl chloride resin composition for powder molding in Comparative Example 1, which did not include vinyl chloride resin fine particles having an average degree of polymerization of at least 1,000 and no greater than 5,000, the molded product had low tensile elongation at low temperatures post-heating and had poor flexibility at low temperatures.

[0092] (Examples 15-17 and Comparative Example 2)

Ingredients shown in Table 3 with the exception of the plasticizer (trimellitate plasticizer, pyromellitate plasticizer, and epoxidized soybean oil) and the dusting agent were added into a Henschel mixer and mixed. The plasticizer was added to the mixture after increasing the temperature of the mixture to 80°C and the mixture was dried up (i.e., the aforementioned mixture changed to a dry state through absorption of the plasticizers by vinyl chloride resin particles). Thereafter, once the dried-up mixture had been cooled to 70°C or lower, vinyl chloride resin fine particles used as the dusting agent were added to the mixture to produce a vinyl chloride resin composition for powder molding.

The resultant vinyl chloride resin composition for powder molding was sprinkled onto a textured mold that was heated to 250°C and after being left to melt for a time adjusted to give a vinyl chloride resin molded sheet thickness of 1 mm (specifically, from 14 seconds to 17 seconds), excess vinyl chloride resin composition for powder molding was shaken off. Next, the mold was placed in an oven set to 200°C and was cooled with cooling water once 60 seconds had passed. Once the mold had cooled to 40°C, a vinyl chloride resin molded sheet of 145 mm × 175 mm × 1 mm was removed from the mold. Various properties of the resultant vinyl chloride resin molded sheet were measured by the methods described below. The results are shown in Table 3.

[0093] (3) Initial tensile test

The vinyl chloride resin molded sheet was punched with a No. 1 dumbbell prescribed by JIS K6251, and tensile stress and tensile elongation thereof were measured in accordance with JIS K7113 at a tension rate of 200 mm/minute and a temperature of −35°C. Note that a high tensile elongation at −35°C indicates that a vinyl chloride resin molded sheet has superior
flexibility at low temperatures.

(4) Post-heating tensile test

A measurement sample was prepared as follows. Two obtained vinyl chloride resin molded sheets were placed in a mold having dimensions of 200 mm × 300 mm × 10 mm with a textured surface below the molded sheets such that the molded sheets did not overlap one another. A mixed solution was prepared by mixing polymethylene polyphenylene polyisocyanate (polymeric MDI) with a polyl mixture in a ratio determined to give an isocyanate index of 98. The polyl mixture was composed of 50 parts by mass of a propylene glycol PO (propylene oxide)/EO (ethylene oxide) block adduct (hydroxyl value 28, terminal EO unit content 10%, internal EO unit content 4%), 50 parts by mass of a glycerin PO/EO block adduct (hydroxyl value 21, terminal EO unit content 14%), 2.5 parts by mass of water, 0.2 parts by mass of an ethylene glycol solution of triethylenediamine (product name: TEDA-L33, produced by Tosoh Corporation), 1.2 parts by mass of triethanolamine, 0.5 parts by mass of triethylamine, and 0.5 parts by mass of a foam stabilizer (product name: F-122, produced by Shin-Etsu Chemical Co., Ltd.). Thereafter, the resultant mixed solution was poured onto the two vinyl chloride resin molded sheets and the mold was covered with an aluminum plate of 348 mm × 255 mm × 10 mm to seal the mold. After 5 minutes, a sample (laminate) was formed, in the mold, of a surface skin formed by a vinyl chloride resin molded sheet having a thickness of 1 mm lined with a foamed polyurethane molded product having a thickness of 9 mm and a density of 0.18 g/cm³. The resultant sample was removed from the mold.

Thereafter, the resultant sample was placed in an oven and after the sample was heated for 250 hours at 130°C, the foamed polyurethane layer was peeled from the sample. Tensile stress and tensile elongation of the sample were measured at −35°C in the same way as in the initial tensile test described above in section (3). Note that a high tensile elongation at −35°C indicates that a vinyl chloride resin molded sheet has superior flexibility at low temperatures.

Another obtained sample was placed in an oven and after the sample was heated for 600 hours at 130°C, the foamed polyurethane layer was peeled from the sample. Tensile stress and tensile elongation of the sample were
measured at −35°C in the same way as in the initial tensile test described above in section (3). Note that a high tensile elongation at −35°C indicates that a vinyl chloride resin molded sheet has superior flexibility at low temperatures.

[0096] Molded products (vinyl chloride resin molded sheets) obtained through powder slush molding of the vinyl chloride resin compositions for powder molding in Examples 15-17 had superior tensile properties at low temperatures, both initially and post-heating.

[0097] On the other hand, in the case of a molded product (vinyl chloride resin molded sheet) obtained through powder slush molding of the vinyl chloride resin composition for powder molding in Comparative Example 2, which did not include vinyl chloride resin fine particles having an average degree of polymerization of at least 1,000 and no greater than 5,000, and pyromellitate plasticizers, the molded product had low tensile elongation at low temperatures post-heating and had poor flexibility at low temperatures post-heating.

25 INDUSTRIAL APPLICABILITY

[0098] The presently disclosed vinyl chloride resin composition for powder molding is highly suitable as, for example, a molding material for a surface skin of an automobile interior material such as an instrument panel or a door trim.
CLAIMS

1. A vinyl chloride resin composition for powder molding comprising:
   (a) vinyl chloride resin particles;
   (b) a plasticizer; and
   (c) vinyl chloride resin fine particles having an average degree of
   polymerization of at least 1,000 and no greater than 5,000.

2. The vinyl chloride resin composition for powder molding of claim 1,
   wherein
   (b) the plasticizer is at least one plasticizer selected from the group
   consisting of trimellitate plasticizers and pyromellitate plasticizers.

3. The vinyl chloride resin composition for powder molding of claim 1
   or 2, wherein
   a vinyl chloride resin forming (a) the vinyl chloride resin particles has
   an average degree of polymerization of at least 1,000 and no greater than
   5,000.

4. The vinyl chloride resin composition for powder molding of any
   one of claims 1-3, wherein
   (a) the vinyl chloride resin particles have an average particle diameter
   of at least 50 μm and no greater than 500 μm, and
   (c) the vinyl chloride resin fine particles having the average degree of
   polymerization of at least 1,000 and no greater than 5,000 have an average
   particle diameter of at least 0.1 μm and no greater than 10 μm.

5. The vinyl chloride resin composition for powder molding of any
   one of claims 1-4, wherein
   an amount of (c) the vinyl chloride resin fine particles having the
   average degree of polymerization of at least 1,000 and no greater than 5,000
   relative to a total amount of (a) the vinyl chloride resin particles and (c) the
   vinyl chloride resin fine particles having the average degree of polymerization
   of at least 1,000 and no greater than 5,000 is at least 5 mass% and no greater
than 35 mass%.

6. The vinyl chloride resin composition for powder molding of any one of claims 1-5, wherein

an amount of (b) the plasticizer per 100 parts by mass in total of (a) the vinyl chloride resin particles and (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000 is at least 70 parts by mass and no greater than 200 parts by mass.

7. The vinyl chloride resin composition for powder molding of any one of claims 1-6, further comprising
(d) vinyl chloride resin fine particles having an average degree of polymerization of less than 1,000.

8. The vinyl chloride resin composition for powder molding of claim 7, wherein
(a) the vinyl chloride resin particles have an average particle diameter of at least 50 μm and no greater than 500 μm,
(c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000 have an average particle diameter of at least 0.1 μm and no greater than 10 μm, and
(d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000 have an average particle diameter of at least 0.1 μm and no greater than 10 μm.

9. The vinyl chloride resin composition for powder molding of claim 7 or 8, wherein

an amount of (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000 relative to a total amount of (a) the vinyl chloride resin particles, (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000, and (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000 is at least 3 mass% and no greater than 20 mass%, and
an amount of (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000 relative to the total amount of (a) the vinyl chloride resin particles, (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000, and (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000 is at least 2 mass% and no greater than 15 mass%.

10. The vinyl chloride resin composition for powder molding of any one of claims 7-9, wherein

an amount of (b) the plasticizer per 100 parts by mass in total of (a) the vinyl chloride resin particles, (c) the vinyl chloride resin fine particles having the average degree of polymerization of at least 1,000 and no greater than 5,000, and (d) the vinyl chloride resin fine particles having the average degree of polymerization of less than 1,000 is at least 70 parts by mass and no greater than 200 parts by mass.

11. The vinyl chloride resin composition for powder molding of any one of claims 1-10 used in powder slush molding.
