PYRIDAZINONE COMPOUNDS AND THEIR USE AS DAAO INHIBITORS

The present invention relates to pyridazinone derivatives, processes for their preparation, pharmaceutical compositions containing them and their use in therapy, particularly in the treatment or prevention of conditions having an association with the D-amino acid oxidase enzyme (DAAO).

The hyper-dopaminergic theory has driven schizophrenia drug discovery for decades and has produced notable drugs such as clozapine and olanzapine. Although these medicaments can be highly efficacious against the positive symptoms of schizophrenia and have significantly benefited many patients they are not the complete answer, with fewer or no effects against the negative and cognitive aspects of the disease and with undesired side effect profiles in some cases. Amongst alternative hypotheses the hyper-glutamatergic theory has much merit with the first real evidence coming from the use of PCP (phencyclidine), MK801 or ketamine, direct N-methyl-D-aspartate (NMDA)-receptor antagonists that are able to produce schizophrenia-like symptomatology in healthy human volunteers or exacerbate the clinical signs in schizophrenia patients. However, direct modulation of the NMDA receptor using agonists has not proved successful with excitotoxicity (excessive stimulation by the neurotransmitter) leading to undesirable side effects. An alternative approach is to target the co-agonists required for NMDA receptor activation. These are glycine and serine (D-SER). Attempts to enhance NMDA receptor activity through the use of glycine transporter inhibitors have produced clinical compounds (but no marketed drugs to-date). D-SER is a co-agonist with even greater potency than glycine and so modulation of D-SER may represent an alternative strategy. One way to increase levels of D-SER is to reduce the activity of DAAO, the enzyme which removes it from the synaptic cleft.

DAAO enzyme inhibitors are known in the art. For example, Adage et al., European Neuropsychopharmacology 2008, 18, 200-2 14 have described AS-057278, a small molecule DAAO enzyme inhibitor. Likewise, Sparey et al, Bioorganic & Medicinal Chemistry Letters, 2008, 18, 3386-3391 have demonstrated that molecules containing small heterocyclic rings furnished with a carboxylic acid group can inhibit the DAAO enzyme. DAAO inhibitors which avoid the carboxylic acid group have been described

We have now discovered a new class of compounds that are DAAO enzyme inhibitors which have desirable activity profiles. The compounds of this invention have beneficial potency, selectivity and/or pharmacokinetic properties.

In accordance with the present invention, there is therefore provided a compound of formula (I)

In the definition of R³, the saturated or unsaturated 3- to 10-membered carbocyclic or heterocyclic ring system may have alicyclic or aromatic properties as too will the 4- to 6-membered saturated or unsaturated heterocyclic ring substituent. An unsaturated ring system will be partially or fully unsaturated.

For the avoidance of doubt, when R³ represents an optionally substituted 3- to 10-membered saturated or unsaturated carbocyclic or heterocyclic ring system, then it should be understood that the invention does not encompass any unstable ring structures or any O-O, O-S or S-S bonds and that a substituent, if present, may be attached to any suitable ring atom. The R³ moiety may be attached at any heteroatom or carbon
atom which results in the creation of a stable structure. Similar comments apply with respect to the optional 4- to 6-membered saturated or unsaturated heterocyclic ring substituent on the \( R^3 \) ring system.

When any chemical moiety or group in formula (I) is described as being optionally substituted, it will be appreciated that the moiety or group may be either unsubstituted or substituted by one or more of the specified substituents. It will be appreciated that the number and nature of substituents will be selected so as to avoid sterically undesirable combinations.

and optionally thereafter carrying out one or more of the following procedures:

- converting a compound of formula (I) into another compound of formula (I)
- removing any protecting groups
- forming a pharmaceutically acceptable salt.

Process (i) may conveniently be carried out in an organic solvent, such as toluene, in the presence of a palladium catalyst, e.g. tris(dibenzylideneacetone)dipalladium(0) (Pd\(^2\)(DBA)\(^3\)) and an organophosphorous compound such as 4,5-bis(diphenylphosphino)-9,9-dimethylxanthene (Xantphos).

Processes (ii) and (iii) may conveniently be carried out in an organic solvent, such as dichloromethane, using a suitable amount of an oxidising agent such as meta-chloroperoxybenzoic acid.

Process (iv) may conveniently be carried out in an organic solvent, such as toluene, in the presence of a copper (I) iodide catalyst at elevated temperature (e.g. 30°C to 150°C).

The first step of process (v) may conveniently be carried out in an organic solvent, such as diethyl ether, at low temperature (e.g. -78°C) in the presence of a reagent such as butyllithium. A suitable activating agent to use in the second step would be a compound such as N,0-dimethylhydroxylamine hydrochloride which is commercially available, e.g. from the Sigma-Aldrich Corporation, to form a 'Weinreb amide' which is then reacted with the compound of formula (Va) to form the appropriate compound of formula (I).

Process (vi) may conveniently be carried out in an organic solvent using a suitable amide coupling reagent. Various amide coupling reagents are known in the art such as dicyclohexylcarbodiimide (DCC), diisopropylcarbodiimide (DIC), 0-(benzotriazol-1-
(yl)-N,N,N\textsubscript{N} Metramethyluronium hexafluorophosphate (HBTU) and 0-(benzotriazol-1-yl)- N,N,N',N'-tetramethyluronium tetrafluoroborate (TBTU).

The first step of process (vii) may conveniently be carried out in an organic solvent, such as diethyl ether, at low temperature (e.g. -78°C) in the presence of a reagent such as isopropylmagnesium chloride. A suitable oxidising-chlorinating agent to use in the second step would be sulphuryl chloride and the subsequent reaction with a compound of formula (VIII) may be carried out in accordance with known sulphonamide coupling procedures in the art.

The animation reaction in process (viii) may conveniently be carried out in an organic solvent, such as toluene, in the presence of (1) a palladium catalyst such as tris(dibenzylideneacetone)dipalladium(0) (Pd\textsubscript{2}(DBA)\textsubscript{3}), (2) a base such as sodium t-butoxide and (3) an organophosphorous compound such as 4,5-bis(diphenylphosphino)-9,9-dimethylxanthene (Xantphos).

Processes (ix) and (x) may conveniently be carried out in an organic solvent, such as diethyl ether, at low temperature (e.g. -78°C) in the presence of a reagent such as butyllithium.

The hydrogenation reaction in process (x) and process (xi) may be carried out according to techniques known in the art, e.g. in the presence of an organic solvent, such as ethanol, using hydrogen gas and a palladium on carbon catalyst, under acid catalysed conditions as required.

Process (xii) is analogous to a Horner-Wadsworth-Emmons reaction as known, for example, from Wadsworth, W. Org. React. 1977, 25, 73. Suitable reaction conditions for carrying out this type of reaction are known in the art.

Processes (xiii) and (xiv) are analogous to the Simmons-Smith cyclopropanation reaction of alkenes, for example, as described by Howard H. Simmons, Ronald D.
Compounds of formula (IV) in which $P_1$ represents a protecting group such as -CH$_2$CH$_2$C(0)OCH$_3$ may be prepared by reacting a compound of formula (II) as defined above with methyl 3-sulfanylpropanoate.

Compounds of formula (VII) may be prepared by reacting a compound of formula (II) as defined above with carbon dioxide in an organic solvent such as diethyl ether at low temperature (e.g. -78°C) in the presence of a reagent such as butyllithium.

Compounds of formula (X) in which the $CR^4$ groups are linked by a carbon-carbon double bond may be prepared by processes analogous to process (xii) above.

Compounds of formula (X) in which the $CR^4$ groups are linked by a carbon-carbon triple bond, each $R^4$ represents a hydrogen atom and $R^3$ represents an optionally substituted heterocyclic ring system may be prepared according to the following reaction scheme:
Step 1 is carried out by reacting the pyridazine compound (in which $R^1$ is as hereinbefore defined) with ethynyltrimethylsilane in an organic solvent such as tetrahydrofuran.

Step 2 is carried out using potassium carbonate in a polar solvent such as methanol.

Step 3 is carried out using a compound of formula $R^3$-Br where $R^3$ represents an optionally substituted heterocyclic ring system as hereinbefore defined, in the presence of copper(I) iodide and a suitable palladium catalyst.

Compounds of formula (X) in which the $CR^4$ groups are linked by a carbon-carbon triple bond, each $R^4$ represents a hydrogen atom and $R^3$ represents an optionally substituted carbocyclic ring system may be prepared according to the following reaction scheme:

```
        HO
     O--N
      \  /
       \|
  R^1--Cl
```

(II)  (X)

Step 4 is carried out by reacting the compound of formula (II) as hereinbefore defined with a compound of formula, $HC\text{C}-R^3$, where $R^3$ represents an optionally substituted carbocyclic ring system as hereinbefore defined, in the presence of copper(I) iodide and a suitable palladium catalyst.

Compounds of formula (XI) may be prepared by reacting a compound of formula (II) as defined above with dimethylformamide in an organic solvent, such as diethyl ether, at low temperature (e.g. -78°C) in the presence of a reagent such as butyllithium, optionally followed by an alkylation reaction.

\end{align*}
\]

Step a is carried out using, for example, copper cyanide. The compound of formula (II) is as hereinbefore defined.

Step b is carried out using a Grignard reagent of formula \( R^3 \cdot [Y] \cdot \text{MgBr} \) where 1. Y and \( R^3 \) are as defined in formula (XIII).

Step c is carried out using Tebbe reagent solution (bis(cyclopentadienyl)^-chloro-(dimethylaluminum)^-methylene)tinium).
Compounds of formulae (II), (III), (V), (Va), (VI), (VIII), (IX), (IXa) and (IXb) are either commercially available, are well known in the literature or may be prepared using known techniques.

The present invention further provides certain novel intermediates, e.g. intermediates of formula (XXX),

$\text{XXX}$

wherein $P^1$ and $P^2$ each independently represent a protecting group (e.g. benzyl), $R^{20}$ represents a hydrogen atom or a leaving group (e.g. trimethylsilane, Si(C$_3$H$_7$)$_3$) and $R^1$ is as defined in formula (I) above.

It will be appreciated by those skilled in the art that in the processes of the present invention certain functional groups such as phenol, hydroxyl or amino groups in the reagents may need to be protected by protecting groups. Thus, the preparation of the compounds of formula (I) may involve, at an appropriate stage, the removal of one or more protecting groups.

The compounds of formula (I) above may be converted to a pharmaceutically acceptable salt thereof, preferably an acid addition salt such as a hydrochloride, hydrobromide, benzenesulphonate (besylate), saccharin (e.g. monosaccharin), trifluoroacetate, sulphate, nitrate, phosphate, acetate, fumarate, maleate, tartrate, lactate, citrate, pyruvate, succinate, valerate, propanoate, butanoate, malonate, oxalate, 1-hydroxy-2-napthoate (xinafoate), methanesulphonate or p-toluenesulphonate salt.
In one aspect of the invention, compounds of formula (I) may bear one or more radiolabels. Such radiolabels may be introduced by using radiolabel-containing reagents in the synthesis of the compounds of formula (I), or may be introduced by coupling the compounds of formula (I) to chelating moieties capable of binding to a radioactive metal atom. Such radiolabeled versions of the compounds may be used, for example, in diagnostic imaging studies.

Compounds of formula (I) and their salts may be in the form of hydrates or solvates which form an aspect of the present invention. Such solvates may be formed with common organic solvents, including but not limited to, alcoholic solvents e.g. methanol, ethanol or isopropanol.

Compounds of formula (I) are capable of existing in stereoisomeric forms. It will be understood that the invention encompasses the use of all geometric and optical isomers (including atropisomers) of the compounds of formula (I) and mixtures thereof including racemates. The use of tautomers and mixtures thereof also form an aspect of the present invention. Enantiomerically pure forms are particularly desired.

The compounds of formula (I) and their pharmaceutically acceptable salts have activity as pharmaceuticals, in particular as D-amino acid oxidase enzyme (DAAO) inhibitors, and thus may be used in the treatment of schizophrenia and other psychotic disorders (e.g., psychotic disorder, psychosis), dementia and other cognitive disorders, anxiety disorders (e.g., generalized anxiety disorder), mood disorders (e.g., depressive disorders, major depressive disorders, bipolar disorders including bipolar I and II, bipolar mania, bipolar depression), sleep disorders, disorders usually first diagnosed in infancy, childhood, or adolescence (e.g., attention-deficit disorder and disruptive behaviour disorders), pain (e.g. neuropathic pain) and neurodegenerative disorders (e.g. Parkinson's or Alzheimer's disease).

Thus, the present invention provides a compound of formula (I) or a pharmaceutically acceptable salt thereof as hereinbefore defined for use in therapy, in particular for the treatment of conditions whose development or symptoms are linked to DAAO enzyme activity.
The present invention also provides the use of a compound of formula (I) or a pharmaceutically acceptable salt thereof as hereinbefore defined for the preparation of a medicament for the treatment of conditions whose development or symptoms are linked to DAAO enzyme activity.

In the context of the present specification, the term "therapy" also includes "prophylaxis" unless there are specific indications to the contrary. The terms "therapeutic" and "therapeutically" should be construed accordingly.

Prophylaxis is expected to be particularly relevant to the treatment of persons who have suffered a previous episode of, or are otherwise considered to be at increased risk of, the disorder or condition in question. Persons at risk of developing a particular disorder or condition generally include those having a family history of the disorder or condition, or those who have been identified by genetic testing or screening to be particularly susceptible to developing the disorder or condition or those in the prodromal phase of a disorder.

In particular, the compounds of the invention (including pharmaceutically acceptable salts) may be used in the treatment of the positive symptoms of schizophrenia, schizophreniform disorder or schizoaffective disorder (e.g. voices or hallucinations), cognitive disorders (such as dementia and impaired learning) and also pain (such as neuropathic pain).

The invention also provides a method of treating at least one symptom or condition associated with schizophrenia, schizophreniform disorder, schizoaffective disorder and other psychotic disorders (e.g., psychotic disorder, psychosis), dementia and other cognitive disorders, anxiety disorders (e.g., generalized anxiety disorder), mood disorders (e.g., depressive disorders, major depressive disorders, bipolar disorders including bipolar I and II, bipolar mania, bipolar depression), sleep disorders, disorders usually first diagnosed in infancy, childhood, or adolescence (e.g., attention-deficit disorder, autistic spectrum disorders and disruptive behaviour disorders), pain (e.g. neuropathic pain) and neurodegenerative disorders (e.g. Parkinson's or Alzheimer's...
disease) which comprises administering to a patient in need thereof a therapeutically
effective amount of a compound of formula (I) or a pharmaceutically acceptable salt
thereof as hereinbefore defined.

Such symptoms and conditions include, but are not limited to, anxiety, agitation,
hostility, panic, an eating disorder, an affective symptom, a mood symptom, a negative
and positive psychotic symptom commonly associated with psychosis and
neurodegenerative disorder.

For the above-mentioned therapeutic uses the dosage administered will, of course, vary
with the compound employed, the mode of administration, the treatment desired and the
disorder indicated. For example, the daily dosage of the compound of the invention, if
inhaled, may be in the range from 0.05 micrograms per kilogram body weight (μg/kg) to
100 micrograms per kilogram body weight (μg/kg). Alternatively, if the compound is
administered orally, then the daily dosage of the compound of the invention may be in
the range from 0.01 micrograms per kilogram body weight (μg/kg) to 100 milligrams
per kilogram body weight (mg/kg).

The compounds of formula (I) and pharmaceutically acceptable salts thereof may be
used on their own but will generally be administered in the form of a pharmaceutical
composition in which the formula (I) compound/salt (active ingredient) is in association
with a pharmaceutically acceptable adjuvant, diluent or carrier.

Therefore the present invention further provides a pharmaceutical composition
comprising a compound of formula (I) or a pharmaceutically acceptable salt thereof as
hereinbefore defined, in association with a pharmaceutically acceptable adjuvant, diluent or carrier.

The invention still further provides a process for the preparation of a pharmaceutical
composition of the invention which comprises mixing a compound of formula (I) or a
pharmaceutically acceptable salt thereof as hereinbefore defined with a
pharmaceutically acceptable adjuvant, diluent or carrier.
Conventional procedures for the selection and preparation of suitable pharmaceutical formulations are described in, for example, "Pharmaceutics - The Science of Dosage Form Design", M. E. Aulton, Churchill Livingstone, 1988.

Pharmaceutically acceptable adjuvants, diluents or carriers that may be used in the pharmaceutical compositions of the invention are those conventionally employed in the field of pharmaceutical formulation, and include, but are not limited to, sugars, sugar alcohols, starches, ion exchangers, alumina, aluminium stearate, lecithin, serum proteins, such as human serum albumin, buffer substances such as phosphates, glycerine, sorbic acid, potassium sorbate, partial glyceride mixtures of saturated vegetable fatty acids, water, salts or electrolytes, such as protamine sulphate, disodium hydrogen phosphate, potassium hydrogen phosphate, sodium chloride, zinc salts, colloidal silica, magnesium trisilicate, polyvinyl pyrrolidone, cellulose-based substances, polyethylene glycol, sodium carboxymethylcellulose, polyacrylates, waxes, polyethylene- polyoxypropylene-block polymers, polyethylene glycol and wool fat.

The pharmaceutical compositions of the present invention may be administered orally, parenterally, by inhalation spray, rectally, nasally, buccally, vaginally or via an implanted reservoir. Oral administration is preferred. The pharmaceutical compositions of the invention may contain any conventional non-toxic pharmaceutically acceptable adjuvants, diluents or carriers. The term parenteral as used herein includes subcutaneous, intracutaneous, intravenous, intramuscular, intra-articular, intrasynovial, intrasternal, intrathecal, intralesional and intracranial injection or infusion techniques.

The pharmaceutical compositions may be in the form of a sterile injectable preparation, for example, as a sterile injectable aqueous or oleaginous suspension. The suspension may be formulated according to techniques known in the art using suitable dispersing or wetting agents (such as, for example, Tween 80) and suspending agents. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally acceptable diluent or solvent, for example, as a solution in 1,3-butanol. Among the acceptable diluents and solvents that may be employed are mannitol, water, Ringer's solution and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For
this purpose, any bland fixed oil may be employed including synthetic mono- or diglycerides. Fatty acids, such as oleic acid and its glyceride derivatives are useful in the preparation of injectables, as are natural pharmaceutically acceptable oils, such as olive oil or castor oil, especially in their polyoxyethylated versions. These oil solutions or suspensions may also contain a long-chain alcohol diluent or dispersant such as that described in Ph. Helv. or a similar alcohol.

The pharmaceutical compositions of this invention may be orally administered in any orally acceptable dosage form including, but not limited to, capsules, tablets, powders, granules, and aqueous suspensions and solutions. These dosage forms are prepared according to techniques well-known in the art of pharmaceutical formulation. In the case of tablets for oral use, carriers which are commonly used include lactose and corn starch. Lubricating agents, such as magnesium stearate, are also typically added. For oral administration in a capsule form, useful diluents include lactose and dried corn starch. When aqueous suspensions are administered orally, the active ingredient is combined with emulsifying and suspending agents. If desired, certain sweetening and/or flavouring and/or colouring agents may be added.

The pharmaceutical compositions of the invention may also be administered in the form of suppositories for rectal administration. These compositions can be prepared by mixing the active ingredient with a suitable non-irritating excipient which is solid at room temperature but liquid at the rectal temperature and therefore will melt in the rectum to release the active ingredient. Such materials include, but are not limited to, cocoa butter, beeswax and polyethylene glycols.

The pharmaceutical compositions of this invention may be administered by nasal aerosol or inhalation. Such compositions are prepared according to techniques well-known in the art of pharmaceutical formulation and may be prepared as solutions in saline, employing benzyl alcohol or other suitable preservatives, absorption promoters to enhance bioavailability, fluorocarbons, and/or other solubilising or dispersing agents known in the art.
Depending on the mode of administration, the pharmaceutical composition will preferably comprise from 0.05 to 99% w (per cent by weight), more preferably from 0.05 to 80% w, still more preferably from 0.10 to 70% w, and even more preferably from 0.10 to 50% w, of active ingredient, all percentages by weight being based on total composition.

The compounds of the invention (that is, compounds of formula (I) and pharmaceutically acceptable salts thereof) may also be administered in conjunction with other compounds used for the treatment of the above conditions and/or with serine. The invention therefore further relates to combination therapies wherein a compound of the invention or a pharmaceutical composition or formulation comprising a compound of the invention is administered with another therapeutic agent or agents and/or with serine, for the treatment of one or more of the conditions previously indicated. Such therapeutic agents may be selected from the following:

Nuclear magnetic resonance (NMR) spectra were recorded at 400MHz; the chemical shifts (δ) are reported in parts per million. Spectra were recorded using a Bruker 400 Avance instrument fitted with a 5mm BBFO probe or DUL probe. Instrument control was by Bruker TopSpin 2.1 software, unless stated otherwise.

Purity was assessed using UPLC with UV (photodiode array) detection over a wide range of wavelengths, normally 220-450nm, using a Waters Acquity UPLC system equipped with Acquity UPLC BEH or HSS C18 columns (2.1mm id x 50mm long) operated at 50 or 60°C. Mobile phases typically consisted of acetonitrile or methanol mixed with water containing either 0.05% formic acid or 0.025% ammonia.

Mass spectra were recorded with a Waters SQD single quadrupole mass spectrometer using atmospheric pressure ionisation, unless stated otherwise.

Compounds were purified using normal phase chromatography on silica or alumina, or by reverse phase chromatographic methods, using Biotage or Isolute KPNH Cartridge, SCX cartridge and SCX-2 solid phase extraction cartridges.

Preparative High Performance Liquid Chromatography (HPLC) was performed using an Agilent Technologies 1100 Series system typically using Waters 19mm id x 100mm long C18 columns such as XBridge or SunFire 5µm materials at 20 mL/min. Mobile phases typically consisted of acetonitrile or methanol mixed with water containing either 0.1% formic acid or 0.1% ammonia, unless stated otherwise.

CAS number 6082-66-2

Intermediate 1: 3,4-bis(Benzyloxy)-6-chloropyridazine
Phenylmethanol (6.72 g, 62.2 mmol) was added dropwise to a suspension of sodium hydride (60% suspension in mineral oil; 2.486 g, 62.2 mmol) in tetrahydrofuran (total volume: 100 ml) at room temperature. The resulting mixture was stirred for 1 hour and then cooled to 0 °C before 3,4,6-trichloropyridazine (5.7 g, 31.1 mmol) was added portionwise over 10 minutes. To a solution of 3,4-bis(benzyloxy)-6-chloropyridazine (Intermediate 1: 0.22 g, 0.67 mmol) in tetrahydrofuran (6 ml) and water (0.6 ml) was added cesium carbonate (0.66 g, 2.01 mmol) and [1,r-bis(diphenylphosphino)ferrocene]dichloropalladium(II) (0.049 g, 0.067 mmol). The reaction was then purged and evacuated with nitrogen several times before 9-benzyl-9-borabicyclo[3.3.1]nonane (9-BBN; 4.02 ml, 2.01 mmol) was added. The reaction vessel was then sealed and heated to 60 °C for 1 hour. The organics portion was dried (MgSO$_4$), filtered and concentrated to give an orange oil. The crude oil was purified by silica chromatography (eluting with 0-80% ethyl acetate in petrol) to yield 6-benzyl-3,4-bis(benzyloxy)pyridazine as a colourless oil (yield = 64%).

4,4,5,5-Tetramethyl-2-(l-(3-(trifluoromethyl)phenyl)ethenyl)-1,3,2-dioxaborolane was prepared as follows:

A flask was charged with (l,3-bis(2,6-diisopropylphenyl)-2,3-dihydro-lH-imidazol-2-yl)copper(II) chloride (0.675 g, 1.38 mmol), sodium tert-butoxide (0.133 g, 1.38 mmol) and THF (100 ml) and stirred under nitrogen for 10 minutes. Bis(pinacolato)diborane (7.72 g, 30.4 mmol) was added to the solution and the mixture was stirred at room temperature for 30 minutes. The mixture was cooled to -78°C and a solution of 1-ethynyl-3-(trifluoromethyl)benzene (4.7 g, 27.6 mmol) in THF (20 ml) and MeOH (1.23 ml, 30.4 mmol) were added via syringe. The flask was then stirred at -40°C (Acetonitrile/CCl3 bath) overnight. Reaction was at room temperature in the morning.

The reaction was cooled to -78°C and then filtered through a pad of silica and diatomaceous earth (sold under the trade mark "Celite") to give a brown solution which was concentrated and the residue was purified by silica chromatography eluting with 0-5% Et2O/Petrol to yield 4,4,5,5-tetramethyl-2-(1-(3-(trifluoromethyl)phenyl)ethenyl)-1,3,2-dioxaborolane (2.15g, 26%)

**In Vitro DAAO Enzyme Assay**

The functional activity of compounds inhibiting the DAAO enzyme was determined by utilizing the co-product of the catalysis of D-Serine, H$_2$O$_2$ which can be quantitatively measured using the 'Amplex' (trade mark) Red (Invitrogen) detection. 'Amplex' Red reagent is a colorless substrate that reacts with hydrogen peroxide (H$_2$O$_2$) with a 1:1 stoichiometry in the presence of hydrogen peroxide to produce highly fluorescent resorufin (excitation/emission maxima=570/585 nm). The changes in fluorescence were monitored by a fluorescence plate reader, Envision (Perkin Elmer) and increases in DAAO activity were readily detected upon addition of D-Serine and suppression of this response observed with the application of test compounds.
Human DAAO enzyme was supplied by the Takeda Pharmaceutical Company (Osaka) and each batch was tested and used at concentrations giving comparable levels of activity. The $K_m$ of D-Serine was measured for each enzyme batch to maintain consistency; this $K_m$ was used in subsequent assays.

On the day of the assay compounds were serially diluted in DMSO before being diluted 1:20 with assay buffer (20mM Tris pH 7.4). A 5µl portion of assay buffer was added to the wells of a 384 clear base black-walled plate (Corning), 5µl of diluted compound was then added via automated plate to plate transfer using the Bravo liquid handler (Agilent technologies) followed by 5µl of human DAAO enzyme and then 5µl D-Serine 50mM was added to all but the negative control wells (final concentration of 10mM). Finally 5µl 'Amplex' red reagent (Invitrogen) was added to all wells as per manufacturer’s protocol. The plate was incubated for 60 minutes in the dark at 25 °C and the fluorescence in each well was measured in the Envision plate reader.

The IC50 values for compounds were determined from ten point half log scale dose-response studies and represent the concentration of compound required to prevent 50% inhibition of DAAO activity in the presence of 10mM D-Serine. Concentration response curves were generated using the average of duplicate wells for each data point and analyzed using non-linear regression and four parameter curve fit.

These results indicate that compounds of the invention have potent inhibitory activity against the DAAO enzyme. The compounds tested above exhibit IC₅₀ values significantly less than 5 µM, with the most potent compounds showing activity at the DAAO enzyme with IC₅₀ values < 250 nM. Accordingly, the compounds of the invention are expected to have usefulness in the prevention or treatment of conditions, such as those discussed above, in which DAAO enzyme activity is implicated.

In addition, the compounds of the present invention possess variously advantageous pharmacological and/or toxicological profiles, when tested in a variety of standard tests for such parameters. For example, the compounds of the invention exhibit one or more potentially useful properties for in vivo use, when characterised by pharmacological and/or toxicological tests including: hERG interaction (which is an indication of potential cardiotoxicity, and measures the effects of the compounds on the human ether-a-go-go-related gene, using for example the PatchXpress 7000A platform); CypP₄₅₀ interactions (which may be measured in accordance with the FDA draft guidelines for
drug interaction studies (study design, data analysis and implications for dosing and labeling) (Sep. 2006), see www.fda.gov; phototoxicity (for example using a protocol in accordance with assay details outlined in the OECD guidelines for testing of chemicals: 432 In Vitro 3T3 Neutral Red Uptake phototoxicity test, April 2004); determination of pharmacokinetic parameters (for example following in vivo dosing via multiple routes, with plasma concentrations of compounds being determined from venous blood samples using an LC-MS/MS protocol); and in vivo receptor occupancy (determined, for example, using protocols based on Medhurst et al., *Journal of Pharmacology and Experimental Therapeutics*, 2007, *321*, 1032). These standard tests for the characterisation of drug molecules are well known to the skilled person.
