Detergent compositions, essentially free of chlorine bleach compounds, containing a surfactant, builder, enzyme, peroxygen bleach and from about 0.001 % to about 5 % by weight polyethyleneimine (PEI) or salts thereof are disclosed. These compositions exhibit controlled and improved bleaching action on stains as well as improved storage stability, fabric safety and whitening/brightening characteristics.

DETERGENT COMPOSITIONS CONTAINING
POLYETHYLENEIMINES FOR ENHANCED PEROXYGEN BLEACH
STABILITY

FIELD OF THE INVENTION

The present invention relates to improved detergent compositions. Specifically, it relates to laundry detergent compositions, substantially free of chlorine bleach compounds, containing polyethyleneimine (PEI) sequestrants or salts thereof, which have improved peroxoxygen bleach stability resulting in controlled bleaching action on stains. PEI can be used as a replacement for all or part of the phosphonate chelants currently used in many existing laundry products, thereby yielding detergent formulations having reduced phosphorus content.

BACKGROUND OF THE INVENTION

Recently, in some geographical areas, there has been a growing concern regarding the use of phosphorus-containing compounds in laundry detergent compositions because of some evidence that links such compounds to the eutrophication of lakes and streams. While it is not clear whether or not this link is really significant, some governmental bodies have begun to restrict the phosphorus content of detergent compositions, necessitating the formulation of laundry detergents containing chelants less effective than the conventionally-used phosphonates or polyphosphonates. These requirements have complicated the formulation of effective and appropriately priced laundry detergent compositions. It would, therefore, be highly desirable to be able to formulate detergent compositions substantially free of chlorine bleach compounds which contain reduced levels of
phosphorous-containing components, but still exhibit excellent stain removal performance due to improved stabilized peroxxygen bleaching action.

Accordingly, it is an object of the present invention to provide novel detergent compositions which exhibit improved stain removal characteristics due to improved stabilized peroxxygen bleaching action useful for cleaning fabrics, hard surfaces and the like.

It is another object of the present invention to provide novel laundry detergent compositions substantially free of chlorine bleach compounds which exhibit excellent stain removal performance due to improved stabilized peroxxygen bleaching action.

It is another object of the present invention to provide novel laundry detergent compositions substantially free of chlorine bleach compounds which exhibit improved, peroxxygen bleach stability, particularly under harsh water conditions and elevated wash water temperatures.

It is yet another object of the present invention to provide novel detergent compositions which exhibit controlled and stabilized bleaching action resulting in improved fabric safety.

It is yet another object of the present invention to provide novel detergent compositions which exhibit improved storage stability.

Still, it is another object of the present invention to provide novel detergent compositions which exhibit improved inhibition of odor.

Still, it is another object of the present invention to provide novel detergent compositions which exhibit improved biocidal activity ensuring that fabrics remain substantially free of bacteria, mold and fungus.
Still, it is another object of the present invention to provide novel detergent compositions which exhibit improved whitening and brightening characteristics, particularly on white fabrics.

It is a final object of the present invention to provide novel methods of stabilizing laundry detergent compositions comprising peroxygen bleach compounds which contain PEI's, as nil-phosphorous chelants.

These and other objects of the invention will be more readily apparent in the description that follows.

The use of PEI sequestrants in various compositions are generally disclosed in the art.

U.S. Patent No. 3,033,746 to Moyle et al. discloses compositions comprising PEI for use in coating, oil/latex paint and cellulosic applications. The compositions are said to have improved antimicrobial properties by combining halophenol compounds with PEI.

WO 94/27621 to Mandeville discloses a method of reducing iron absorption from the gastrointestinal tract by orally administering a therapeutic amount of PEI.

U.S. Patent No. 4,085,060 to Vassileff discloses sequestering compositions for industrial applications comprising polycarboxylate polymers and PEI which have excellent sequestering properties for metals.

U.S. Patent No. 3,636,213 to Gerstein discloses a method for solubilizing heavy metal salts of 1-hydroxy-2-pyridinemethione in cosmetic formulations where PEI functions as a solubilizing agent. No builders, enzymes or peroxygen bleaching agents are present in such compositions.
U.S. Patent No. 3,400,198 to Lang discloses wave set retention shampoo compositions containing PEI. The compositions are said to precipitate on the hair fiber when diluted with water in the course of usage. Upon drying, PEI improves the wave retention of the hair as well as improving hair manageability. No builders, enzymes or peroxygen bleaching agents are present in such compositions.

U.S. Patent No. 3,740,422 to Hewitt and U.S. Patent No. 3,769,398 to Hewitt disclose aqueous and aqueous alcoholic scalp rinses containing solubilized PEI. It is said that PEI is effective against *Pityrosporum ovale*, the fungus believed to be associated with dandruff and therefore PEI serves as an anti-dandruff agent. No builders, enzymes or peroxygen bleaching agents would be present in such compositions.

British Patent No. 1,524,966 (to Reckitt and Colman Products) and British Patent No. 1,559,823 (to Reckitt and Colman Products) disclose anti-dandruff shampoo compositions comprising PEI as a conditioning agent for hair and as an antimicrobial agent. Again, no detergency builders, enzymes or peroxygen bleaching agents would be present in such compositions.

U.S. Patent No. 5,360,581 to Rizvi et al. and U.S. Patent No. 5,417,965 to Janchitraponvej et al. disclose conditioning shampoo compositions containing PEI. It is said that protonated PEI's with cationic polyquaternium 32 provide improved stability and conditioning benefits. No detergency builders, enzymes or peroxygen bleaching agents would be present in such compositions.

U.S. Patent No. 5,259,984 to Hull discloses a rinse free cleaner composition for hands, upholstery and carpet containing PEI. No enzymes or peroxygen bleaching agents would be present in such compositions.

thereof. It is suggested that PEI's can be broadly used in various applications such as oil well treatment, asphalt applications, textile applications and the like.

U.S. Patent No. 3,844,952 to Booth discloses detergent and fabric softener compositions containing alkylated and alkanoylated PEI's as antistatic agents. The alkylated or alkanoylated polyethyleneimines disclosed by Booth differ structurally from the polyethyleneimines and polyethyleneimine salts (or mixtures) of the invention which are not derivatized.

Furthermore, there are numerous patents that describe various alkoxyalted derivatives of PEI (similar to those described by Booth) which are also structurally different and are otherwise unrelated to the present invention. See for example, U.S. Patent Nos. 2,792,372, 4,171,278, 4,341,716, 4,597,898, 4,561,991, 4,664,848, 4,689,167 and 4,891,160.

Finally, perhaps the most relevant references that do disclose the use of polyethyleneimines in detergent compositions are as follows:

U.S. Patent No. 3,489,686 to Parran, for example, discloses detergent compositions containing certain PEI's which serve to enhance deposition and retention of particulate substances an surfaces washed with such compositions.

There is no teaching or suggestion that polyethyleneimines be used in compositions comprising enzymes. Further, the polyethyleneimines are cationic in nature and are used at a level of about 0.1% to about 10.0% by weight of the composition. The polyethyleneimines of the present invention can be cationic in nature, however are preferably nonionic in nature as "free" amines.
AU Patent No. 17813/95 (to Procter & Gamble) and JP 08,053,698 (to Procter & Gamble) disclose detergent compositions containing 0.01% to 10% PEI substantially free of tertiary amino groups having a specific molecular weight of 100-600 as a polymeric chlorine scavenger. The compositions are said to minimize fading of fabric colors sensitive to chlorine which may be present in the composition or in the wash or rinse water. The compositions optionally contain peroxygen or chlorine bleaching agents.

Once again compositions of the subject invention are free of chlorine bleach compounds, include builders, enzymes and peroxygen bleaching agents and provide excellent cleansing and stain removal characteristics due to improved stabilized peroxygen bleaching action, even under harsh wash water conditions and elevated wash water temperatures.

Accordingly, none of the above patents or applications disclose the improved compositions of the present invention or recognize the unique peroxygen bleach stabilization properties and benefits of PEI or PEI salts (or mixtures thereof) in the context of laundry detergent compositions substantially free of chlorine bleach.

**SUMMARY OF THE INVENTION**

The present invention provides a detergent composition comprising:

(a) from about 1% to about 75% by weight of a detergent surfactant selected from anionic surfactants, nonionic surfactants, zwitterionic surfactants, ampholytic surfactants, cationic surfactants, and mixtures thereof;

(b) from about 5% to about 80% by weight of a detergency builder;

(c) from about 0.001% to about 5% by weight of an enzyme;
(d) from about 0.001% to about 5% by weight of polyethyleneimine, polyethyleneimine salt, or mixtures thereof; and

(e) from about 0.01 to about 60% by weight of a peroxxygen bleach compound,

wherein the composition is substantially free of chlorine bleach compounds.

Remainder of composition is water and additional optional detersive ingredients.

Accordingly, it is an object of the present invention to provide improved novel laundry detergent compositions containing PEI as nil-phosphorus chelant which possess improved peroxxygen bleach stabilization characteristics and are substantially free of chlorine bleaching agents.

This and other objects as well as additional advantages will appear as the description proceeds.

DETAILED DESCRIPTION OF THE INVENTION

This invention relates to detergent bleaching compositions comprising active peroxxygen (oxygen releasing) agents and a zero-phosphorus stabilizing agent polyethyleneimine (PEI), wherein PEI permits controlled and improved bleaching and cleaning of stains. PEI also provides improved storage stability of peroxxygen bleaching agents in detergent compositions.

The use of peroxxygen bleaching agents for the purpose of bleaching various substrates are well known in the art. Peroxxygen bleaching agents are defined mainly as hydrogen peroxide or any of its other forms which include, but are not limited to inorganic perhydrate salts, such as perborates and percarbonates as well as organic peroxyacids such as diperoxydodecanedioc acid and the like. Perborate salts are
well known in the art and are useful as components of detergent compositions, such as in laundry detergents, automatic dishwashing detergents and the like.

In the method of the invention, which involves stabilized bleaching, it is desirable that the peroxxygen bleaching agents be released in a controlled manner. The use of PEI minimizes the rapid decomposition of peroxxygen bleaching agents and results in effective cleansing and stain removal. In contrast, uncontrolled decomposition of peroxxygen bleaching agents do not provide effective cleansing or stain removal performance and in some cases may be harmful.

For example, it is known that cellulosic materials (e.g., cotton shirts) that are in uncontrolled, strongly alkaline peroxxygen solutions are attacked by oxygen from the rapid decomposition of peroxxygen bleaching agents resulting in the loss of tensile strength and increased fabric damage and fabric fading.

It is highly desirable, under today's laundering and dishwashing conditions, for bleach stabilizing agents to be effective in alkaline solutions under relatively high temperatures. Furthermore, the bleach stabilizing agent should be compatible with other components, which may be present in the detergent compositions. PEI is such a stabilizing agent. It is well known that the presence of certain heavy metal ions may catalyze peroxxygen bleach decomposition. Such ions are inevitably present and arise from a variety of sources such as soil, tap water, washing machine parts, pipes, certain fabric dyes and the like.

While not wishing to be bound by theory, it is believed that PEI acts as a metal sequestering agent which controls the levels of free heavy metal ions in aqueous detergent solutions and thus prevents metal ion catalyzed decomposition of peroxxygen bleaches, hence enhanced and controlled bleach stabilization.
Organic phosphonate and amino alkylene (polyalkylene phosphonates) as well as amino alkylene (polyalkylene carboxylates) are known as bleach stabilizing agents and are described in U.S. Patent Nos. 3,860,391 and 4,239,643.

Phosphorous-containing compounds have been linked to undesirable eutrophication effects in lakes and rivers, and this has led to a dramatic reduction in the use of phosphorous-containing ingredients in detergent compositions in certain parts of the world.

It has now been discovered that the use of low levels of PEI, at specific PEI: peroxynitrogen bleach ratios, provides excellent stabilization of peroxynitrogen bleach agents in aqueous wash liquor solutions, even in the presence of high levels of hardness and heavy metal ions (harsh water conditions).

The stabilization is of particular importance at elevated wash liquor temperature (>40°C). Surprisingly, PEI provides comparable or significantly better bleach stabilization than other commercially available chelants such as Dequest\textsuperscript(R) 2066, EDTA and [S,S]-EDDS. Furthermore, it has been found that incorporation of PEI into a peroxynitrogen bleach composition provides improved storage stability of that composition. Such stabilized compositions exhibit improved stain removal characteristics and biocidal activity as well as enhanced whitening and brightening characteristics. These findings are unexpected and have not been disclosed in the art.

The detergent compositions of the invention may be used in essentially any bleaching process. According to one aspect of the present invention the bleaching process will employ an aqueous alkaline solution of the bleaching composition, with a preferred pH range for said solution lying in the range from 7.5-12.5, more preferably from 8-12, most preferably from 8.5 to 11.5.
The essential and less essential components of the present invention are described in detail below.

(a) **The Detergent Surfactant:**

The amount of detergent surfactant included in the detergent compositions of the present invention can vary from about 1% to about 75% by weight of the composition depending upon the particular surfactant(s) used, the type of composition to be formulated (e.g., granular, liquid, etc.) and the effects desired. Preferably, the detergent surfactant(s) comprises from about 5% to about 60% by weight of the composition. The detergent surfactant can be nonionic, anionic, ampholytic, zwitterionic, or cationic. Mixtures of these surfactants can also be used.

1. **Nonionic Surfactants:**

Suitable nonionic surfactants are generally disclosed in U.S. Patent No. 3,929,678, Laughlin et al., issued December 30, 1975, at column 13, line 14 through column 16, line 6, incorporated herein by reference. Classes of useful nonionic surfactants include:

1. The polyethylene oxide condensates of alkyl phenols. These compounds include the condensation products of alkyl phenols having an alkyl group containing from about 6 to 12 carbon atoms in either a straight chain or branched chain configuration with ethylene oxide, the ethylene oxide being present in an amount equal to from about 5 to about 25 moles of ethylene oxide per mole of alkyl phenol. Examples of compounds of this type include nonyl phenol condensate with about 9.5 moles of ethylene oxide per mole of phenol; dodecyl phenol condensed with about 12 moles of ethylene oxide per mole of phenol; dinonyl phenol condensed with about 15 moles of ethylene oxide per mole of phenol; and diisoctyl phenol
condensed with about 15 moles of ethylene oxide per mole of phenol. Commercially available nonionic surfactants of this type include Igepal CO-630, marketed by the GAF Corporation; and Triton X-45, X-114, X-100, and X-102, all marketed by the Rohm & Haas Company.

2. The condensation products of aliphatic alcohols with from about 1 to 25 moles of ethylene oxide. The alkyl chain of the aliphatic alcohol can either be straight or branched, primary or secondary, and generally contains from about 8 to about 22 carbon atoms. Particularly preferred are the condensation products of alcohols having an alkyl group containing from about 10 to about 20 carbon atoms with from about 4 to about 10 moles of ethylene oxide per mole of alcohol. Examples of such ethoxylated alcohols include the condensation product of myristyl alcohol with about 10 moles of ethylene oxide per mole of alcohol; and the condensation product of coconut alcohol (a mixture of fatty alcohols with alkyl chains varying in length from 10 to 14 carbon atoms) with about 9 moles of ethylene oxide. Examples of commercially available nonionic surfactants of this type include Tergitol 15-S-9 (the condensation product of C_{11}-C_{15} linear alcohol with 9 moles ethylene oxide), marketed by Union Carbide Corporation; Neodol 45-9 (the condensation product of C_{14}-C_{15} linear alcohol with 9 moles of ethylene oxide, Neodol 23-6.5 (the condensation product of C_{12}-C_{13} linear alcohol with 6.5 moles of ethylene oxide), Neodol 45-7 (the condensation product of C_{14}-C_{15} linear alcohol with 7 moles of ethylene oxide), and Neodol 45-4 (the condensation product of C_{14}-C_{15} linear alcohol with 4 moles of ethylene oxide), marketed by Shell Chemical Company.

3. The condensation products of ethylene oxide with a hydrophobic base formed by the condensation of propylene oxide with propylene glycol. The hydrophobic portion of these compounds has a molecular weight of from about 1500 to about 1800 and exhibits water insolvability. The addition of polyoxyethylene moieties to this hydrophobic portion tends to increase the water solubility of the molecule as a whole, and the liquid character of the product is retained up to the point where the polyoxyethylene content is about 50% of the total weight of the
condensation product, which corresponds to condensation with up to about 40 moles of ethylene oxide. Examples of compounds of this type include certain of the commercially available Pluronic surfactants, marketed by Wyandotte Chemical Corporation.

4. The condensation products of ethylene oxide with the product resulting from the reaction of propylene oxide and ethylenediamine. The hydrophobic moiety of these products consists of the reaction product of ethylenediamine and excess propylene oxide, and generally has a molecular weight of from about 2500 to about 3000. This hydrophobic moiety is condensed with ethylene oxide to the extent that the condensation product contains from about 40% to about 80% by weight of polyoxyethylene and has a molecular weight of from about 5,000 to about 11,000. Examples of this type of nonionic surfactant include certain of the commercially available Tetronic compounds, marketed by Wyandotte Chemical Corporation.
5. Semi-polar nonionic surfactants which include water-soluble amine oxides containing one alkyl moiety of from about 10 to about 18 carbon atoms and 2 moieties selected from the group consisting of alkyl groups and hydroxyalkyl groups containing from about 1 to about 3 carbon atoms; water-soluble phosphine oxides containing one alkyl moiety of from about 10 to about 18 carbon atoms and 2 moieties selected from the group consisting of alkyl groups and hydroxyalkyl groups containing from about 1 to about 3 carbon atoms; and water-soluble sulfoxides containing one alkyl moiety of from about 10 to 18 carbon atoms and a moiety selected from the group consisting of alkyl and hydroxyalkyl moieties of from about 1 to 3 carbon atoms.

Preferred semi-polar nonionic detergent surfactants are the amine oxide surfactants having the formula:

\[
\begin{align*}
&\text{O} \\
&\text{R}^3(\text{OR}^4)_x\text{NR}^5_2
\end{align*}
\]

wherein \(R^3\) is an alkyl, hydroxyalkyl, or alkyl phenyl group or mixtures thereof containing from about 8 to about 22 carbon atoms; \(R^4\) is an alkylene or hydroxyalkylene group containing from about 2 to about 3 carbon atoms or mixtures thereof; \(x\) is from 0 to about 3; and each \(R^5\) is an alkyl or hydroxyalkyl group containing from about 1 to about 3 carbon atoms or a polyethylene oxide group containing from about 1 to about 3 ethylene oxide groups. \(R^5\) groups can be attached to each other, e.g., through an oxygen or nitrogen atom, to form a ring structure.

Preferred amine oxide surfactants are \(C_{10-18}\) alkylidimethylamine oxides and \(C_6-C_{12}\) alkoxyethyldihydroxyethylene oxides.
6. Alkylpolysaccharides disclosed in U.S. Patent No. 4,565,647, Lienado, issued January 21, 1986, having a hydrophobic group containing from about 6 to about 30 carbon atoms, preferably from about 10 to about 16 carbon atoms and a polysaccharide, e.g., a polyglycoside, hydrophilic group containing from about 1½ to about 10, preferably from about 1½ to about 3, most preferably from about 1.6 to about 2.7 saccharide units. Any reducing saccharide containing 5 or 6 carbon atoms can be used, e.g., glucose, galactose, and galactosyl moieties can be substituted for the glucosyl moieties. (Optionally the hydrophobic group is attached at the 2-, 3-, 4-, etc. positions thus giving a glucose or galactose as opposed to a glucoside or galactoside). The intersaccharide bonds can be, e.g., between the one position of the additional saccharide units and the 2-, 3-, 4-, and/or 6- positions on the preceding saccharide units.

Optionally, and less desirably, there can be a polyalkylene oxide chain joining the hydrophobic moiety and the polysaccharide moiety. The preferred alkyleneoxide is ethylene oxide. Typical hydrophobic groups include alkyl groups, either saturated or unsaturated, branched or unbranched containing from about 8 to about 18, preferably from about 10 to about 16, carbon atoms. Preferably, the alkyl group is a straight chain saturated alkyl group. The alkyl group can contain up to 3 hydroxy groups and/or the polyalkylene oxide chain can contain up to about 10, preferably less than 5, alkyleneoxide moieties. Suitable alkyl polysaccharides are octyl, nonyldecyl, undecyldodecyl, tridecyl, tetradecyl, pentadecyl, hexadecyl, heptadecyl, and octadecyl, di-, tri-, tetra-, penta-, and hexaglucosides, galactosides, lactosides, glucoses, fructoses, fructoses and/or galactoses. Suitable mixtures include coconut alkyl, di-, tri-, tetra-, and penta-glucosides and tallow alkyl tetra-, penta-, and hexaglycosides. The preferred alkylpolyglycosides have the formula:

\[ R^2O(C_nH_{2n}O)_{x}(glycosyl)_x \]
wherein R² is selected from the group consisting of alkyl, alkyphenyl, hydroxyalkyl, hydroxyalkylphenyl, and mixtures thereof in which the alkyl groups contain from about 10 to about 18, preferably from about 12 to about 14, carbon atoms; n is 2 or 3, preferably 2; t is from 0 to about 10, preferably 0; and x is from about 1½ to about 10, preferably from about 1½ to about 3, most preferably from about 1.6 to about 2.7. The glycosyl is preferably derived from glucose. To prepare these compounds, the alcohol or alkylpolyethoxy alcohol is formed first and then reacted with glucose, or a source of glucose, to form the glucoside (attachment at the 1-position). The additional glycosyl units can then be attached between their 1-position and the preceding glycosyl units 2-, 3-, 4- and/or 6-position, preferably predominately the 2-position.

7. The fatty acid amide surfactants having the formula:

```
O
R⁸ — C — NR²₂
```

wherein R⁸ is an alkyl group containing from about 7 to about 21 (preferably from about 9 to about 17) carbon atoms and each, R⁷ is selected from the group consisting of hydrogen, C₁-C₄ alkyl, C₁-C₄ hydroxyalkyl, and - (C₂H₄O)ₓH where x varies from about 1 to about 3.

Preferred amides are C₆-C₂₅ ammonia amides, monoethanolamides, diethanolamides, and isopropanolamides.

8. The polyhydroxy fatty acid amide surfactants (alkyl glycamides) having the formula:

```
O  R¹
R² — C — N — Z
```
wherein: \( R^1 \) is H, \( C_1-C_4 \) hydrocarbyl, 2-hydroxyethyl, 2-hydroxypropyl, or a mixture thereof, preferably \( C_1-C_4 \) alkyl, more preferably \( C_1 \) or \( C_2 \) alkyl, most preferably \( C_1 \) alkyl (i.e., methyl); and \( R^2 \) is a \( C_5-C_31 \) hydrocarbyl, preferably straight chain \( C_7-C_{19} \) alkyl or alkenyl, more preferably straight chain \( C_9-C_{17} \) alkyl or alkenyl, most preferably straight chain \( C_{11}-C_{15} \) alkyl or alkenyl, or mixtures thereof; and \( Z \) is a polyhydroxyhydrocarbyl having a linear hydrocarbyl chain with at least 3 hydroxyl groups directly connected to the chain, or an alkoxylated derivative (preferably ethoxylated or propoxylated) thereof. \( Z \) preferably will be derived from a reducing sugar in a reductive amination reaction; more preferably \( Z \) will be a glycitin. Suitable reducing sugars include glucose, fructose, maltose, lactose, galactose, mannose, and xylose. As for raw materials, high dextrose corn syrup, high fructose corn syrup, and high maltose corn syrup can be utilized as well as the individual sugars listed above. These corn syrups may yield a mixture of sugar components for \( Z \). It should be understood that it is by no means intended to exclude other suitable raw materials. \( Z \) preferably will be selected from the group consisting of \( -CH_2-(CHOH)_n-CH_2OH \), \( -CH(CH_2OH)-(CHOH)_n-CH_2OH \), \( -CH_2-(CHOH)_2(CHOR')-CHOH)-CH_2OH \), and alkoxylated derivatives thereof, where \( n \) is an integer from 3 to 5, (inclusive) and \( R' \) is H or a cyclic or aliphatic monosaccharide. Most preferred are glycitins wherein \( n \) is 4, particularly \( -CH_2-(CHOH)_4-CH_2OH \).

In the above formula \( R' \) can be, for example, N-methyl, N-ethyl, N-propyl, N-isopropyl, N-butyl, N-2-hydroxyethyl, or N-2-hydroxypropyl.

\( R^2-CO-N< \) can be, for example, cocamide, stearamide, oleamide, lauramide, myristamide, capricamide, palmitamide, tallowamide, etc.

\( Z \) can be 1-deoxyglucityl, 2-deoxyfructityl, 1-deoxymaltityl, 1-deoxylactityl, 1-deoxygalactityl, 1-deoxymannityl, 1-deoxymaltotriolityl, etc.
9. The N-alkoxy and N-aryloxy polyhydroxy fatty acid amide surfactants (alkyl glycamides) having the formula:

```
O    R¹  O    R²
\|    \|    \|
R  C  N  Z
```

wherein R is C_7-C_21 hydrocarbyl, preferably C_9-C_17 hydrocarbyl, including straight-chain (preferred), branched-chain alkyl and alkenyl, as well as substituted alkyl and alkenyl, e.g., 12-hydroxy oleic, or mixtures thereof; R¹ is C_2-C_8 hydrocarbyl including straight-chain, branched-chain and cyclic (including aryl), and is preferably C_2-C_4 alkylene, i.e., -CH_2CH_2-, -CH_2CH_2CH_2- and -CH_2(CH_2)_2CH_2-; and R² is C_1-C_8 straight-chain, branched-chain and cyclic hydrocarbyl including aryl and oxy-hydrocarbyl, and is preferably C_1-C_4 alkyl or phenyl; and Z is a polyluberoxidhydrocarbyl moiety having a linear hydrocarbyl chain with at least 2 (in the case of glyceraldehyde) or at least 3 hydroxyls (in the case of other reducing sugars) directly connected to the chain, or an alkoxyalted derivative (preferably ethoxylated or propoxyalted) thereof. Z preferably will be derived from a reducing sugar in a reductive amination reaction; more preferably Z is a glycycyl moiety. Suitable reducing sugars include glucose, fructose, maltose, lactose, galactose, mannose, and xylose, as well as glyceraldehyde. As for raw materials, high dextrose corn syrup, high fructose corn syrup, and high maltose corn syrup can be utilized as well as the individual sugars listed above. These corn syrups may yield a mix of sugar components for Z. It should be understood that it is by no means intended to exclude other suitable raw materials. Z preferably will be selected from the group consisting of -CH_2-(CHOH)_(n-1)-CH_2OH, -CH(CH_2OH)-(CHOH)_(n-1)-CH_2OH, -CH_2-(CHOH)_(2)(CHOR')-(CHOH)-CH_2OH, where n is an integer from 1 to 5, inclusive, and R' is H or a cyclic mono- or polysaccharide, and alkoxyalted derivatives thereof. Most preferred are glycityls wherein n is 4, particularly -CH_2-(CHOH)_(4)-CH_2OH.
In compounds of the above formula, nonlimiting examples of the amine substituents group -R'1-O-R'2 can be, for example: 2-methoxyethyl-, 3-methoxypropyl-, 4-methoxybutyl-, 5-methoxypentyl-, 6-methoxyhexyl-, 2-ethoxyethyl-, 3-ethoxypropyl-, 2-methoxypropyl, methoxybenzyl-, 2-isopropoxyethyl-, 3-isopropoxypropyl-, 2-(t-butoxy)ethyl-, 3-(t-butoxy)propyl-, 2-(isobutoxy)ethyl-, 3-(isobutoxy)propyl-, 3-butoxypropyl, 2-butoxyethyl, 2-phenoxyethyl-, methoxycyclohexyl-, methoxycyclohexylmethyl-, tetrahydrofururyl-, tetrahydropyranylxyethyl-, 3-[2-methoxyethoxy]propyl-, 2-[2-methoxyethoxy]ethyl-, 3-[3-methoxypropoxy]propyl-, 2-[3-methoxypropoxy]ethyl-, 3-[methoxypolyethyleneoxy]propyl-, 3-[4-methoxybutoxy]propyl-, 3-[2-methoxyisopropoxy]propyl-, CH₃O-CH₂CH(CH₃)- and CH₃-OCH₂CH(CH₃)CH₂-O-(CH₂)₃-

R-CO-N< can be, for example, cocamide, stearamide, oleamide, lauramide, myristamide, capricamide, palmitamide, tallowamide, ricinolamide, etc.

Z can be 1-deoxyglucityl, 2-deoxyfructityl, 1-deoxymaltityl, 1-deoxylactityl, 1-deoxygalactityl, 1-deoxymannityl, 1-deoxymaltotriityl, etc.

10. The aldonamides and aldobionamides disclosed in U.S. Patent Nos. 5,296,588; 5,336,765; 5,386,018; 5,389,279; 5,401,426 and 5,401,839 as well as WO 94/12511 which are all incorporated herein by reference.

Aldobionamides are defined as the amide of an aldobionic acid (or aldobionolactone) and an aldobionic acid is a sugar substance (e.g., any cyclic sugar comprising at least two saccharide units) wherein the aldehyde group (generally found at the C₁ position of the sugar) has been replaced by a carboxylic acid, which upon drying cyclizes do an aldonolactone.

An aldobionamide may be based on compounds comprising two saccharide units (e.g., lactobionamides or maltobionamides, etc.) or they may be based on compounds comprising more than two saccharide units (e.g., maltotrinamides), as
long as the terminal sugar in the polysaccharide has an aldehyde group. By definition an aldobionamide must have at least two saccharide units and cannot be linear. Disaccharide compounds such as lactobionamides or maltobionamides are preferred compounds. Other examples of aldobionamides (disaccharides) which may be used include cellobionamides, melibionamides and gentiobionamides.

A specific example of an aldobionamide which may be used for purposes of the invention is the disaccharide lactobionamide set forth below:

\[
\begin{align*}
\text{HO} & \quad \text{OH} \\
\text{OH} & \quad \text{O} \\
\text{O} & \quad \text{NR}_1 \text{R}_2 \\
\text{OH} & \quad \text{O} \\
\text{HO} & \quad \text{OH} \\
\text{OH} & \quad \text{O}
\end{align*}
\]

wherein \( R_1 \) and \( R_2 \) are the same or different and are selected from the group consisting of hydrogen; an aliphatic hydrocarbon radical (e.g., alkyl groups and alkene groups which groups may contain heteroatoms such as N, O or S or alkoxyalted alkyl chains such as ethoxylated or propoxylated alkyl groups, preferably an alkyl group having 6 to 24, preferably 8 to 18 carbons; an aromatic radical (including substituted or unsubstituted aryl groups and arenes); a cycloaliphatic radical; an amino acid ester, ether amines and mixtures thereof. It should be noted that \( R_1 \) and \( R_2 \) cannot be hydrogen at the same time.
II. Anionic Surfactants:

Anionic surfactants suitable for use in the present invention are generally disclosed in U.S. Patent No. 3,929,678, Laughlin et al., issued December 30, 1975, at column 23, line 58 through column 29, line 23, incorporated herein by reference. Classes of useful anionic surfactants include:

1. Ordinary alkali metal soaps, such as the sodium, potassium, ammonium and alkylolammonium salts of higher fatty acids containing from about 8 to about 24 carbon atoms, preferably from about 10 to about 20 carbon atoms. Preferred alkali metal soaps are sodium laurate, sodium cocoate, sodium stearate, sodium oleate and potassium palmitate as well as fatty alcohol ether methylcarboxylates and their salts.

2. Water-soluble salts, preferably the alkali metal, ammonium and alkylolammonium salts, of organic sulfuric reaction products having in their molecular structure an alkyl group containing from about 10 to about 20 carbon atoms and a sulfonic acid or sulfuric acid ester group. (Included in the term "alkyl" is the alkyl portion of acyl groups).

Examples of this group of anionic surfactants are the sodium and potassium alkyl sulfates, especially those obtained by sulfating the higher alcohol (C₈-C₁₈ carbon atoms) such as those produced by reducing the glycerides of tallow or coconut oil; and the sodium and potassium alkylbenzene sulfonates in which the alkyl group contains from about 9 to about 15 carbon atoms, in straight chain or branched chain configuration, e.g., those of the type described in U.S. Patent No. 2,220,099, Guenther et al., issued November 5, 1940, and U.S. Patent No. 2,477,383, Lewis, issued December 26, 1946. Especially useful are linear straight chain alkylbenzene sulfonates in which the average number of carbon atoms in the alkyl group is from about 11 to about 13, abbreviated as C₁₁-C₁₃ LAS.
Another group of preferred anionic surfactants of this type are the alkyl polyalkoxylate sulfates, particularly those in which the alkyl group contains from about 8 to about 22, preferably from about 12 to about 18 carbon atoms, and wherein the polyalkoxylate chain contains from about 1 to about 15 ethoxylate and/or propoxylate moieties, preferably from about 1 to about 3 ethoxylate moieties. These anionic detergent surfactants are particularly desirable for formulating heavy-duty liquid laundry detergent compositions.

Other anionic surfactants of this type include sodium alkyl glyceryl ether sulfonates, especially those ethers of higher alcohols derived from tallow and coconut oil; sodium coconut oil fatty acid monoglyceride sulfonates and sulfates; sodium or potassium salts of alkyl phenol ethylene oxide ether sulfates containing from about 1 to about 10 units of ethylene oxide per molecule and wherein the alkyl groups contain from about 8 to about 12 carbon atoms; and sodium or potassium salts of alkyl ethylene oxide ether sulfates containing about 1 to about 15 units of ethylene oxide per molecule and wherein the alkyl group contains from about 8 to about 22 carbon atoms.

Also included are water-soluble salts of esters of alpha sulfonated fatty acids containing from about 6 to about 20 carbon atoms in the fatty acid group and from about 1 to about 10 carbon atoms in the ester group; water-soluble salts of 2-acyloxyalkane-1-sulfonic acids containing from about 2 to about 9 carbon atoms in the acyl group and from about 9 to about 23 carbon atoms in the alkane moiety; water-soluble salts of olefin sulfonates containing from about 12 to about 24 carbon atoms; and beta alkylxy alkane sulfonates containing from about 1 to about 3 carbon atoms in the alkyl group and from about 8 to about 20 carbon atoms in the alkane moiety as well as primary alkane sulfonates, secondary alkane sulfonates, α-sulfo fatty acid esters, sulfosuccinic acid alkyl esters, acylaminoalkane sulfonates (Taurides), sarcosinates and sulfated alkyl glycamides, sulfated sugar surfactants and sulfonated sugar surfactants.
Particularly preferred surfactants for use herein include alkyl benzene sulphonates, alkyl sulfates, alkyl polyethoxy sulfates and mixtures thereof. Mixtures of these anionic surfactants with a nonionic surfactant selected from the group consisting of C₁₀⁻C₂₀ alcohols ethoxylated with an average of from about 4 to about 10 moles of ethylene oxide per mole of alcohol are particularly preferred.

3. Anionic phosphate surfactants such as the alkyl phosphates and alkyl ether phosphates.

4. N-alkyl substituted succinamates.

III. Ampholytic Surfactants:

Ampholytic surfactants can be broadly described as aliphatic derivatives of secondary or tertiary amines, or aliphatic derivatives of heterocyclic secondary and tertiary amines in which the aliphatic radical can be straight or branched chain and wherein one of the aliphatic substituents contains from about 8 to about 18 carbon atoms and at least one of the aliphatic substituents contains an anionic water-solubilizing group, e.g., carboxy, sulphonate or sulfate. See U.S. Patent No. 3,929,678, Laughlin et al., issued December 30, 1975, column 19, line 38 through column 22, line 48, incorporated herein by reference, for examples of ampholytic surfactants useful herein.

IV. Zwitterionic Surfactants:

Zwitterionic surfactants can be broadly described as derivatives of secondary and tertiary amines, derivatives of heterocyclic secondary and tertiary amines, or derivatives of quaternary ammonium, quaternary phosphonium or tertiary sultonium compounds. See U.S. Patent No. 3,929,678, Laughlin et al., issued December 30, 1975, column 19, line 38 through column 22, line 48, incorporated herein by reference, for examples of zwitterionic surfactants useful herein.
V. **Cationic Surfactants:**

Cationic surfactants can also be included in detergent compositions of the present invention. Cationic surfactants comprise a wide variety of compounds characterized by one or more organic hydrophobic groups in the cation and generally by a quaternary nitrogen associated with an acid radical. Pentavalent nitrogen ring compounds are also considered quaternary nitrogen compounds. Suitable anions are halides, methyl sulfate and hydroxide. Tertiary amines can have characteristics similar to cationic surfactants at washing solutions pH values less than about 8.5.

Suitable cationic surfactants include the quaternary ammonium surfactants having the formula:

\[ [R^2(OR^3)_y][R^4(OR^3)_y]_2R^5N^+X^- \]

wherein \( R^2 \) is an alkyl or alkyl benzyl group having from about 8 to about 18 carbon atoms in the alkyl chain; each \( R^3 \) is independently selected from the group consisting of - \( \text{CH}_2\text{CH}_2^- \), - \( \text{CH}_2\text{CH} (\text{CH}_3)^- \), - \( \text{CH}_2\text{CH} (\text{CH}_2\text{OH})^- \), and - \( \text{CH}_2\text{CH}_2\text{CH}_2^- \); each \( R^4 \) is independently selected from the group consisting of \( \text{C}_1\text{C}_4 \) alkyl, \( \text{C}_1\text{C}_4 \) hydroxyalkyl, benzyl, ring structures formed by joining the two \( R^4 \) groups, - \( \text{CH}_2\text{CHOHCHOHCOR}^6\text{CHOHCH}_2\text{OH} \) wherein \( R^6 \) is any hexose or hexose polymer having a molecular weight less than about 1000, and hydrogen when \( y \) is not 0; \( R^5 \) is the same as \( R^4 \) or is an alkyl chain wherein the total number of carbon atoms of \( R^2 \) plus \( R^5 \) is not more than about 18, each \( y \) is from 0 to about 10 and the sum of the \( y \) values is from 0 to about 15; and \( X \) is any compatible anion.

Preferred examples of the above compounds are the alkyl quaternary ammonium surfactants, especially the mono long chain alkyl surfactants described in
the above formula when $R^5$ is selected from the same groups as $R^4$. The most preferred quaternary ammonium surfactants are the chloride, bromide, and methylsulfate $C_8$-$C_{16}$ alkyl trimethylammonium salts, $C_8$-$C_{16}$ alkyl di(hydroxy-ethyl)methylammonium salts, the $C_8$-$C_{16}$ alkyl oxypropyltrimethylammonium salts. Of the above, decyl trimethylammonium methylsulfate, lauryl trimethylammonium chloride, myristyl trimethylammonium bromide and coconut trimethylammonium chloride and methylsulfate are particularly preferred.

A more complete disclosure of cationic surfactants useful herein can be found in U.S. Patent No. 4,228,044, Cambre, issued October 14, 1980, incorporated herein by reference.

(b) **Detergent Builders:**

Detergent compositions of the present invention contain inorganic and/or organic detergent builders to assist in mineral hardness control. These builders comprise from about 5% to about 80% by weight of the compositions. Built liquid formulations preferably comprise from about 7% to about 30% by weight of detergent builder, while built granular formulations preferably comprise from about 10% to about 50% by weight of detergent builder.

Suitable detergent builders include crystalline aluminosilicate ion exchange materials having the formula:

$$\text{Na}_y[(\text{AlO}_2)_z(\text{SiO}_2)]\times\text{H}_2\text{O}$$

wherein $z$ and $y$ are at least about 6, the mole ratio of $z$ to $y$ is from about 1.0 to about 0.5; and $x$ is from about 10 to about 264. Amorphous hydrated aluminosilicate materials useful herein have the empirical formula

$$M_y(\text{zAlO}_2\text{ySiO}_2)$$
wherein M is sodium, potassium, ammonium, or substituted ammonium, z is from about 0.5 to about 2; and y is 1; this material having a magnesium ion exchange capacity of at least about 50 milligram equivalents of CaCO$_3$ hardness per gram of anhydrous aluminosilicate.

The aluminosilicate ion exchange builder materials are in hydrated form and contain from about 10% to about 28% of water by weight if crystalline, and potentially even higher amounts of water if amorphous. Highly preferred crystalline aluminosilicate ion exchange materials contain from about 18% to about 22% water in their crystal matrix. The preferred crystalline aluminosilicate ion exchange materials are further characterized by a particle size diameter of from about 0.1 μm to about 10 μm. Amorphous materials are often smaller, e.g., down to less than about 0.01 μm. More preferred ion exchange materials have a particle size diameter of from about 0.2 μm to about 4 μm. The term "particle size diameter" represents the average particle size diameter of a given ion exchange material as determined by conventional analytical techniques such as, for example, microscopic determination utilizing a scanning electron microscope. The crystalline aluminosilicate ion exchange materials are usually further characterized by their calcium ion exchange capacity, which is at least about 200 mg. equivalent of CaCO$_3$ water hardness/g of aluminosilicate, calculated on an anhydrous basis, and which generally is in the range of from about 300 mg eq/g to about 352 mg eq/g. The aluminosilicate ion exchange materials are still further characterized by their calcium ion exchange rate which is at least about 2 grains Ca++/gallon/minute/gram/gallon of aluminosilicate (anhydrous basis), and generally lies within the range of from about 2 grains/gallon/minute/gram/gallon to about 6/grains/gallon/minute/gram/ gallon, based on calcium ion hardness. Optimum aluminosilicates for builder purposes exhibit a calcium ion exchange rate of at least about 4 grains/gallon/ minute/gram/gallon.

The amorphous aluminosilicate ion exchange materials usually have a Mg++ exchange capacity of at least about 50 mg eq CaCo$_3$/g (12mg Mg++/g) and a Mg++ exchange rate of at least about 1 grain/gallon/minute/gram/gallon. Amorphous
materials do not exhibit an observable diffraction pattern when examined by Cu radiation (1.54 Angstrom Units).

Useful aluminosilicate ion exchange materials are commercially available. These aluminosilicates can be crystalline or amorphous in structure and can be naturally-occurring aluminosilicates or synthetically derived. A method for producing aluminosilicate ion exchange materials is disclosed in U.S. Patent No. 3,985,669, Krummel et al., issued October 12, 1976, incorporated herein by reference. Preferred synthetic crystalline aluminosilicate ion exchange materials useful herein are available under the designations Zeolite A, Zeolite P (B), and Zeolite X. In an especially preferred embodiment, the crystalline aluminosilicate ion exchange material has the formula:

$$Na_{12}[(AlO_2)_{12}(SiO_2)_{12}]xH_2O$$

wherein $x$ is from about 20 to about 30, especially about 27.

Other detergency builders useful in the present invention include the alkali metal silicates, alkali metal carbonates, phosphates, polyphosphates, phosphonates, polyphosphonic acids, C_{10-18} alkyl monocarboxylic acids, polycarboxylic acids, alkali metal ammonium or substituted ammonium salts thereof and mixtures thereof. Preferred are the alkali metal, especially sodium, salts of the above.

Specific examples of inorganic phosphate builders are sodium and potassium tripolyphosphate, pyrophosphate, polymeric metaphosphate having a degree of polymerization of from about 6 to about 21, and orthophosphate. Examples of polyphosphonate builders are the sodium and potassium salts of ethylene-1,1,1-triphasphonic acid, the sodium and potassium salts of ethane 1-hydroxy-1,1-diphasphonic acid and the sodium and potassium salts of ethane 1,1,2-triphosphonic acid. Other suitable phosphorus builder compounds are disclosed in U.S. Patent No. 3,159,571, Diehl, issued December 1, 1964; U.S. Patent No. 3,213,030, Diehl,
issued October 19, 1965; U.S. Patent No. 3,400,148, Quimby, issued September 3, 1968; U.S. Patent No. 3,400,176, Quimby, issued September 3, 1968; U.S. Patent No. 3,422,021, Roy, issued January 14, 1969; and U.S. Patent No. 3,422,137, Quimby, issued September 3, 1968; all herein incorporated by reference. However, while suitable for use in compositions of the invention, one of the advantages of the present invention is that effective detergent compositions can be formulated using minimum levels or in the complete absence of phosphonates and phosphates.

The PEI sequestrants will provide improved stain and soil removal benefits in the presence and absence of phosphonate and/or phosphate builders or chelants.

Examples of nonphosphorus, inorganic builders are sodium and potassium carbonate, bicarbonate, sesquicarbonate, tetraborate decahydrate, and silicate having a mole ratio of SiO₂ to alkali metal oxide of from about 0.5 to about 4.0, preferably from about 1.0 to about 2.4.

Useful water-soluble, nonphosphorus organic builders include the various alkali metal, ammonium and substituted ammonium polyacetates, carboxylates, polycarboxylates and polyhydroxysulfonates. Examples of polyacetate and polycarboxylate builders are the sodium, potassium, lithium, ammonium and substituted ammonium salts of ethylenediamine tetraacetic acid, nitrilotriacetic acid, oxydisuccinic acid, mellitic acid, benzene polycarboxylic acids, and citric acid. For purposes of defining the invention, the organic detergent builder component which may be used herein does not comprise diaminoalkyl di(sulfosuccinate) (DDSS) or salts thereof.

Highly preferred polycarboxylate builders are disclosed in U.S. Patent No. 3,308,067, Diehl, issued March 7, 1967, incorporated herein by reference. Such materials include the water-soluble salts of homo- and copolymers of aliphatic carboxylic acids such as maleic acid, itaconic acid, mesaconic acid, fumaric acid, aconitic acid, citraconic acid and methylenemalonic acid.

A class of useful phosphorus-free detergent builder materials have been found to be ether polycarboxylates. A number of ether polycarboxylates have been disclosed for use as detergent builders. Examples of useful ether polycarboxylates include oxydisuccinate, as disclosed in Berg, U.S. Patent No, 3,128,287, issued April 7, 1964, and Lamberti et al., U.S. Patent No. 3,635,830, issued January 18, 1972, both of which are incorporated herein by reference.

A specific type of ether polycarboxylates useful as builders in the present invention are those having the general formula:

\[
\begin{array}{c}
A \quad \text{CH} \quad \text{CH} \quad \text{O} \quad \text{CH} \quad \text{CH} \quad \text{B} \\
\text{COO} \quad \text{X} \quad \text{COO} \quad \text{X} \\
\end{array}
\]

wherein A is H or OH; B is H or

\[
\begin{array}{c}
\text{O} \quad \text{CH} \quad \text{CH}_2 \\
\text{COO} \quad \text{X} \quad \text{COO} \quad \text{X} \\
\end{array}
\]

and X is H or a salt-forming cation. For example, if in the above general formula A and B are both H, then the compound is oxydisuccinic acid and its water-soluble salts. If A is OH and B is H, then the compound is tartrate monosuccinic acid (TMS) and its water soluble salts. If A is H and B is
then the compound is tartrate disuccinic acid (TDS) and its water-soluble salts. Mixtures of these builders are especially preferred for use herein. Particularly preferred are mixtures of TMS and TDS in a weight ratio of TMS to TDS of from about 97:3 to about 20:80.

Suitable ether polycarboxylates also include cyclic compounds, particularly alicyclic compounds, such as those described in U.S. Patent Nos. 3,923,679; 3,835,163; 4,158,635; 4,120,874 and 4,102,903, all of which are incorporated herein by reference.

Other useful detergency builders include the ether hydroxypolycarboxylates represented by the structure:

![Chemical Structure]

wherein M is hydrogen or a cation wherein the resultant salt is water soluble, preferably an alkali metal, ammonium or substituted ammonium cation, n is from about 2 to about 15 (preferably n is from about 2 to about 10, more preferably n averages from about 2 to about 4) and each R is the same or different and selected from hydrogen, C_{1-4} alkyl or C_{1-4} substituted alkyl (preferably R is hydrogen).
Also suitable in the detergent compositions of the present invention are the 3,3-dicarboxy-4-oxa-1,6-hexanedioates and the related compounds disclosed in U.S. Patent No. 4,566,984, Bush, issued January 28, 1986, incorporated herein by reference. Other useful builders include the C₅-C₂₀ alkyl succinic acids and salts thereof. A particularly preferred compound of this type is dodecenylsuccinic acid.

Useful builders also include sodium and potassium carboxymethylxymalate, carboxymethylxysuccinate, cis-cyclohexanehexacarboxylate, cis-cyclopentanetetracarboxylate, phloroglucinol trisulfonate, water soluble poly-acrylates (having molecular weights of from about 2,000 to about 200,000, for example), and the copolymers of maleic anhydride with vinyl methyl ether or ethylene.

Other suitable polycarboxylates are the polyacetal carboxylates disclosed in U.S. Patent No. 4,144,226, Crutchfield et al., issued March 13, 1979, incorporated herein by reference. These polyacetal carboxylates can be prepared by bringing together, under polymerization conditions, an ester of glyoxylic acid and a polymerization initiator. The resulting polyacetal carboxylate ester is then attached to chemically stable end groups to stabilize the polyacetal carboxylate against rapid depolymerization in alkaline solution, converted to the corresponding salt, and added to a surfactant.

Especially useful detergency builders include the C₁₀-C₁₈ alkyl monocarboxylic (fatty) acids and salts thereof. These fatty acids can be derived from animal and vegetable fats and oils, such as tallow, coconut oil and palm oil. Suitable saturated fatty acids can also be synthetically prepared (e.g., via the oxidation of petroleum or by hydrogenation of carbon monoxide via the Fisher-Tropsch process). Particularly preferred C₁₀-C₁₈ alkyl monocarboxylic acids are saturated coconut fatty acids, palm kernel fatty acids, and mixtures thereof.
Other useful detergency builder materials are the "seeded builder" compositions disclosed in Belgian Patent No. 798,836, published October 29, 1973, incorporated herein by reference. Specific examples of such seeded builder mixtures are 3:1 wt. mixtures of sodium carbonate and calcium carbonate having 5 μm particle diameter; 2.7:1 wt. mixtures of sodium sesquicarbonate and calcium carbonate having a particle diameter of 0.5 μm; 20:1 wt. mixtures of sodium sesquicarbonate and calcium hydroxide having a particle diameter of 0.01 μm; and a 3:3:1 wt. mixture of sodium carbonate, sodium aluminate and calcium oxide having a particle diameter of 5μm.

(c) **Enzymes**

Enzymes can be included in the formulations herein for a wide variety of fabric laundering purposes, including removal of protein-based, carbohydrate-based, or triglyceride-based stains, for examples, and for the prevention of refugee dye transfer, and for fabric restoration. The enzymes to be incorporated include proteases, amylases, lipases, cellulases, and peroxidases, as well as mixtures thereof. Other types of enzymes may also be included. They may be of any suitable origin, such as vegetable, animal, bacterial, fungal and yeast origin. However, their choice is governed by several factors such as pH-activity and/or stability optima, thermostability, stability versus active detergents, builders and so on. In this respect bacterial or fungal enzymes are preferred, such as bacterial amylases and proteases, and fungal cellulases.

Enzymes are normally incorporated at levels sufficient to provide up to about 5 mg by weight, more typically about 0.01 mg to about 3 mg, of active enzyme per gram of the composition. Stated otherwise, the compositions herein will typically comprise from about 0.001% to about 5%, preferably 0.01% - 1%, by weight of a commercial enzyme preparation. Protease enzymes are usually present in such commercial preparations at levels sufficient to provide from 0.005 to 0.1 Anson units (AU) of activity per gram of composition.
Suitable examples of proteases are the subtilisins which are obtained from particular strains of B. subtilis and B. licheniforms. Another suitable protease is obtained from a strain of Bacillus, having maximum activity throughout the pH range of 8-12, developed and sold by Novo Industries A/S under the registered trade name ESPERASE. The preparation of this enzyme and analogous enzymes is described in British Patent Specification No. 1,243,784 of Novo. Proteolytic enzymes suitable for removing protein-based stains that are commercially available include those sold under the tradenames ALCALASE and SAVINASE by Novo Industries A/S (Denmark) and MAXATASE by International Bio-Synthetics, Inc. (The Netherlands). Other proteases include Protease A (See European Patent Application No. 130 756 published January 9, 1985) and Protease B (See European Patent Application Serial No. 87303761.8 filed April 28, 1987, and European Patent Application No. 130 756, Bott et al., published January 9, 1985).

Amylases include, for example, a-amylases described in British Patent Specification No. 1,296,839 (Novo), RAPIDASE, Internation Bio-Synthetics, Inc. and TERMAMYL, Novo Industries.

The cellulases usable in the present invention include both bacterial or fungal cellulase. Preferably, they will have a pH optimum of between 5 and 9.5. Suitable cellulases are disclosed in U.S. Patent No. 4,435,307, Barbesgaard et al., issued March 6, 1984, which discloses fungal cellulase produced from Humicola insolens and Humicola strain DSM1800 or a cellulase 212-producing fungus belonging to the genus Aeromonas, and cellulase extracted from the hepatopancreas of a marine mollusk (Dolabella Auricula Solander). Suitable cellulases are also disclosed in GB A-2.075.028; GB A-2.095.275 and DE-OS-2.247.832.

Suitable lipase enzymes for detergent usage include those produced by microorganisms of the Pseudomonas group, such as Pseudomonas stutzeri ATCC 19.154, as disclosed in British Patent 1,372,034. See also lipases in
Japanese Patent Application 53-20487, laid open to public inspection on February 24, 1978. This lipase is available from Amano Pharmaceutical Co. Ltd., Nagoya, Japan, under the tradename Lipase P "Amano", hereinafter referred to as "Amano-P". Other commercial lipases include Amano-CES, lipases ex Chromobacter viscosum, e.g., Chromobacter viscosum var, lipolyticum NRRLB 3673, commercially available from Toyo Jozo Co., Tagata, Japan; and further Chromobacter viscosum lipases from U.S. Biochemical Corp., USA and Disoynth Co., The Netherlands, and lipases ex Pseudomonas gladioli. The LIPOLASE enzyme derived from Humicola lanuginosa and commercially available from Novo (See also EPO 341,947) is a preferred lipase for use herein.

Peroxidase enzymes are used in combination with oxygen sources, e.g., percarbonate, perborate, persulfate, hydrogen peroxide, etc. They are used for "solution bleaching", i.e., to prevent transfer of dyes or pigments removed from substrates during wash operations to other substrates in the wash solution.

Peroxidase enzymes are known in the art, and include, for examples, horseradish peroxidase, ligninase, and haloperoxidase such as chloro- and bromoperoxidase. Peroxidase-containing detergent compositions are disclosed, for example, in PCT International Application WO 89/099813, published October 19, 1989 by O. Kirk, assigned to Novo Industries A/S.

A wide range of enzyme materials and means for their incorporation into synthetic detergent granules are also disclosed in U.S. Patent No. 3,553,139, issued January 5, 1971, to McCarty et al. Enzymes are further disclosed in U.S. Patent No. 4,101,457, Place et al., issued July 18, 1978, and in U.S. Patent No. 4,507,219, Hughes, issued March 26, 1985, both. Enzyme materials useful for detergent formulations, and their incorporation into such formulations, are disclosed in U.S. Patent No. 4,261,868, Hora et al., issued April 14, 1981. Enzymes for use in detergents can be stabilized by various techniques. Enzyme stabilization techniques are disclosed and exemplified in U.S. Patent No. 4,261,868 issued April 14, 1981, to Horn et al., U.S. Patent No. 3,600,319 issued August 17, 1971 to Gedge et al., and
European Patent Application No. 0 199 405, Application No. 86200586.6, published October 29, 1986, Venegas. Enzyme stabilization systems are also described for example, in U.S. Patents 4,261,868; 3,600,319 and 3,519,570. For example, the enzymes employed herein can be stabilized by the presence of water-soluble sources of calcium and/or magnesium ions in the finished compositions which provide such ions to the enzymes. (Calcium ions are generally somewhat more effective than magnesium ions and are preferred herein if only one type of cation is being used). Additional stability can be provided by the presence of various other art-disclosed stabilizers, especially borate species: See Severson, U.S. 4,537,706, cited above. Typical detergents, especially liquids, will comprise from about 1 to about 30, preferably from about 2 to about 20, more preferably from about 5 to about 15, and most preferably from about 8 to about 12, millimoles of calcium ion per kilo of finished composition. This can vary somewhat, depending on the amount of enzyme present and its response to the calcium or magnesium ions. The level of calcium or magnesium ions should be selected so that there is always some minimum level available for the enzyme, after allowing for complexation with builders, fatty acids, etc., in the composition. Any water-soluble calcium or magnesium salt can be used as the source of calcium or magnesium ions, including, but not limited to, calcium chloride, calcium sulfate, calcium malate, calcium maleate, calcium hydroxide, calcium formate, and calcium acetate, and the corresponding magnesium salts. A small amount of calcium ion, generally from about 0.05 to about 0.4 millimoles per kilo, is often also present in the composition due to calcium in the enzyme slurry and formula water. In granular detergent compositions, the formulation may include a sufficient quantity of a water-soluble calcium ion source to provide such amounts in the laundry liquor. In the alternative, natural water hardness may suffice.

It is to be understood that the foregoing levels of calcium and/or magnesium ions are sufficient to provide enzyme stability. More calcium and/or magnesium ions can be added to the compositions to provide an additional measure of grease removal performance. Accordingly, the compositions herein may comprise from
about 0.05% to about 2% by weight of a water-soluble source of calcium or magnesium ions, or both. The amount can vary, of course, with the amount and type of enzyme employed in the composition.

The compositions herein may also optionally, but preferably, contain various additional stabilizers, especially borate-type stabilizers. Typically, such stabilizers will be used at levels in the compositions from about 0.25% to about 10%, preferably from about 0.5% to about 5%, more preferably from about 0.75% to about 3%, by weight of boric acid or other borate compound capable of forming boric acid in the composition (calculated on the basis of boric acid). Boric acid is preferred, although other compounds such as boric oxide, borax and other alkali metal borates (e.g., sodium ortho-, meta- and pyroborate, and sodium pentaborate) are suitable. Substituted boric acids (e.g., phenylboronic acid, butane boronic acid, and p-bromo phenylboronic acid) can also be used in place of boric acid.

(d) Polyethyleneimines (PEI's):

The polyethyleneimines (PEI's) suitable for use in the detergent compositions of the present invention can have the general formula, although the actual formula is not exactly known: 
\[-\text{NHCH}_2\text{CH}_2\text{N}(-\text{CH}_2\text{CH}_2\text{NH}_2\text{CH}_2\text{CH}_2\text{N})_x\]

wherein \(x\) is an integer from about 1 to about 120,000, preferably from about 2 to about 60,000, more preferably from about 3 to about 24,000 and \(y\) is an integer from about 1 to about 60,000, preferably from about 2 to about 30,000, more preferably from about 3 to about 12,000. Specific examples of polyethyleneimines are PEI-3, PEI-7, PEI-15, PEI-30, PEI-45, PEI-100, PEI-300, PEI-500, PEI 600, PEI 700, PEI-800, PEI-1000, PEI-1500, PEI-1800, PEI-2000, PEI-2500, PEI-5000, PEI-10,000, PEI-25,000, PEI 50,000, PEI-70,000, PEI-500,000, PEI-5,000,000 and the like, wherein the integer represents the average molecular weight of the polymer. PEI's which are designated as such are available through Aldrich.
PEI's are usually highly branched polyamines characterized by the empirical formula \((C_2H_5N)_n\) with a repeating molecular mass of 43.07. They are commercially prepared by acid-catalyzed ring opening of ethyleneimine, also known as aziridine. (The latter, ethyleneimine, is prepared through the sulfuric acid esterification of ethanolamine). The reaction scheme is shown below:

\[
\begin{align*}
(i) & \quad \text{HOCH}_2\text{CH}_2\text{NH}_2 \xrightarrow{\text{H}_2\text{SO}_4} \quad \text{O}_3\text{SOCH}_2\text{CH}_2\text{NH}_3^+ + \text{H}_2\text{O} \\
(ii) & \quad \text{O}_3\text{SOCH}_2\text{CH}_2\text{NH}_3^+ + 2\text{NaOH} \xrightarrow{} \quad \text{CH}_2-\text{CH}_2 + \text{Na}_2\text{SO}_4 + 2\text{H}_2\text{O} \\
(iii) & \quad \text{X} \quad \text{PEI's}
\end{align*}
\]

Polyethyleneimines can have an average molecular weight of about 100 to about 5,000,000 or even higher. Any polyethyleneimine is suitable for use in the present invention, however the preferred polyethyleneimines are branched and have a typical average molecular weight of up to about 3,000,000, preferably from about 300 to about 2,500,000, more preferably from about 400 to about 1,000,000.

PEI's are commercially available from the BASF Corporation under the trade name Lupasol\textsuperscript{(R)} (also sold as Polymix\textsuperscript{(R)}). These compounds can be prepared as a wide range of molecular weights and product activities. Examples of commercial PEI's sold by BASF suitable for use in the present invention include, but are not limited to, Lupasol FG\textsuperscript{(R)}, Lupasol G-35\textsuperscript{(R)}, Lupasol-P\textsuperscript{(R)}, Lupasol-PS\textsuperscript{(R)}, Lupasol-(Water-Free)\textsuperscript{(R)} and the like.
PEI's are also commercially available from Polymer Enterprises or Nippon Soda (of Japan) under the trade name Epomin\(^{(R)}\). Examples of commercial PEI's sold by Polymer Enterprises or Nippon Soda suitable for use in the present invention include, but are not limited to Epomin SP012\(^{(R)}\), Epomin P1050\(^{(R)}\), Epomin SP103\(^{(R)}\), Epomin SP003\(^{(R)}\), Epomin SP006\(^{(R)}\) and the like.

Other frequently used commercial trade names for PEI suitable for use in the present invention include, but are not limited to Polyazinidine\(^{(R)}\), Corcat\(^{(R)}\), Montek\(^{(R)}\), Polymin P\(^{(R)}\) and the like.

The amine groups of PEI exist mainly as a mixture of primary, secondary and tertiary groups in the ratio of about 1:1:1 to about 1:2:1 with branching every 3 to 3.5 nitrogen atoms along a chain segment. Because of the presence of amine groups, PEI can be protonated with acids to form a PEI salt from the surrounding medium resulting in a product that is partially or fully ionized depending on pH. For example, about 73% of PEI is protonated at pH 2, about 50% of PEI is protonated at pH 4, about 33% of PEI is protonated at pH 5, about 25% of PEI is protonated at pH 8 and about 4% of PEI is protonated at pH 10. Therefore, since the detergent compositions of the present invention are buffered at a pH of about 6 to about 11, this suggests that PEI is about 4-30% protonated and about 70-96% unprotonated.

In general, PEI's can be purchased as their protonated or unprotonated form with and without water. When protonated PEI's are formulated in the compositions of the present invention they are deprotonated to a certain extent by adding a sufficient amount of suitable base. The deprotonated form of PEI is the preferred form, however moderate amounts of protonated PEI can be used and do not significantly detract from the present invention.

An example of a segment of a branched protonated polyethyleneimine (PEI salt) is shown below:
The counterion of each protonated nitrogen center is balanced with an anion of an acid obtained during neutralization.

Examples of protonated PEI salts include, but are not limited to, PEI-hydrochloride salt, PEI-sulfuric acid salt, PEI-nitric acid salt, PEI-acetic acid salt PEI fatty acid salt and the like. In fact, any acid can be used to protonate PEI's resulting in the formation of the corresponding PEI salt compound.

It has now been found, according to the present invention, that polyethyleneimines should not be used in amounts greater than 5% by weight of detergent formulation since they interfere with anionic ingredients in the detergent formulation and/or wash water. Without being bound by theory, it is believed that in an anionic ingredient system, pairing of PEI with anionic ingredients (anionic surfactants) as well as soaps (carboxylates) or other charged species (polycarboxylates) tends to lower the solubility and activity of PEI as well as reduce the activity of the anionic ingredient system. This of course can be completely prevented by formulating in the absence of such anionic ingredients, for example in the presence of an all nonionic ingredient system.

It should be noted that linear polyethyleneimines as well as mixtures of linear and branched polyethyleneimines are useful in the compositions of the present invention. Linear PEI's are obtained by cationic polymerization of oxazoline and oxazine derivatives. Methods for preparing linear PEI (as well as branched PEI) are
more fully described in Advances in Polymer Science, Vol. 102, pgs. 171-188, 1992 (references 6-31) which is incorporated in its entirety herein by reference.

The level of PEI used in the compositions of the present invention is from about 0.001% to about 5%, preferably from about 0.005% to about 4.5%, more preferably from about 0.01% to about 4%. The addition of PEI to the detergent compositions of the present invention unexpectedly provide excellent cleaning and stain removal characteristics due to the improved stabilized peroxide bleaching action, even under harsh wash water conditions, such as in the presence of high levels of hardness/transition metal ions, (Ca^{2+}, Mg^{2+}, Fe^{3+}, Cu^{2+}, Zn^{2+}, Mn^{2+} and the like) and elevated wash water temperatures. Furthermore, it was surprising to find that the detergent compositions of the present invention also provides fabric safety, storage stability, inhibition of odor, biocidal activity as well as improved whitening and brightening characteristics. These findings are unexpected and have not been disclosed in the art.

(e) Peroxygen Bleaching Agents

An essential component of the detergent compositions of the invention is a peroxide bleaching agent which may be useful for detergent or bleaching compositions in textile cleaning, hard surface cleaning, or the cleaning purposes that are now known or become known. The peroxygen bleaching agent may be hydrogen peroxyde, the addition compounds of hydrogen peroxyde, organic peroxyacids, or mixtures thereof. By addition compounds of hydrogen peroxyde it is meant compounds which are formed by the addition of hydrogen peroxyde to a second chemical compound, which may be for example an inorganic salt, urea or organic carboxylate, to provide the corresponding addition compound. Examples of the addition compounds of hydrogen peroxyde include inorganic perhydrate salts, organic percarboxylates, perureas, and compounds in which hydrogen peroxyde is clathrated.
Examples of inorganic perhydride salts include, but are not limited to perborate, percarbonate, perphosphate, persulfate, persilicate salts and mixtures thereof. The inorganic perhydride salts are normally the alkali metal salts. Salts in which hydrogen peroxide is clathrated are described in GB-A-1,494,953 which is incorporated herein by reference.

Sodium percarbonate is a preferred inorganic perhydride for inclusion in granular bleaching compositions in accordance with the invention. This may be incorporated as either the monohydrate or tetrahydrate of the empirical formula:

$$\text{NaBO}_2 \cdot \text{H}_2\text{O}_2 \text{ or NaBO}_2 \cdot \text{H}_2\text{O}_2 \cdot 3\text{H}_2\text{O}$$

The detergent compositions of the invention can be any composition used for cleaning and can be of any physical form such as a solid (powders, bars and granules), or fluid (liquids, gels and pastes). When the peroxxygen compound is hydrogen peroxide however, the detergent composition will generally comprise a concentrated solution of the hydrogen peroxide together with the PEI. When the peroxxygen bleaching agent is an inorganic perhydride salt the detergent composition will generally be a solid, preferably granular in nature. The inorganic perhydride salt may be included in such a granular composition as the crystalline solid without additional protection. For certain perhydride salts however, the preferred executions of such granular compositions utilize a coated form of the material which provides better storage stability for the perhydride salt in the granular product.

Sodium percarbonate, which is a highly preferred perhydride for inclusion in granular bleaching compositions in accordance with the invention, is an addition compound having a formula corresponding to $2\text{Na}_2\text{CO}_3 \cdot 3\text{H}_2\text{O}_2$, or $\text{Na}_2\text{CO}_3 \cdot 15\text{H}_2\text{O}_2$, and is available commercially as a crystalline solid.

Sodium percarbonate may comprise dry particles having an average particle size in the range from about 500 micrometers to about 1,000 micrometers, not more
than about 10% by weight of said particles being smaller than about 200 micrometers and not more than about 10% by weight of said particles being larger than about 1,250 micrometers.

The percarbonate may be incorporated in coated form. The most preferred coating material comprises a mixed salt of an alkali metal sulphate and carbonate. Such coatings together with coating processes have previously been described in GB 1,466,799, granted to Interox on 9th March 1977 which is incorporated herein by reference. The weight ratio of the mixed salt coating material to percarbonate lies in the range from 1:200 to 1:4, more preferably from 1:99 to 1:9, and most preferably from 1:49 to 1:19. Preferably, the mixed salt is of sodium sulphate and sodium carbonate which has the general formula \( \text{Na}_2\text{SO}_4 \cdot n \cdot \text{Na}_2\text{CO}_3 \) wherein \( n \) is from 0.1 to 3, preferably \( n \) is from 0.3 to 1.0 and most preferably \( n \) is from 0.2 to 0.5.

Another suitable coating material is sodium silicate of \( \text{SiO}_2: \text{Na}_2\text{O} \) ratio from 1.6:1 to 3.4:1, preferably 2.8:1, applied as an aqueous solution to give a level of from 2% to 10% (normally from 3% to 5%) of silicate solids by weight of the percarbonate. Magnesium silicate can also be included in the coating. Other suitable coating materials include the alkali and alkaline earth metal sulphates and carbonates. Sodium pyrophosphate peroxhydrate, urea peroxhydrate, sodium peroxide, Oxone\(^{\text{R}}\) sold by DuPont (per sulfate) are further examples of inorganic perhydrate salts suitable for use in the present invention.

Potassium peroxymonopersulfate is another inorganic perhydrate salt of particular usefulness in detergent compositions. The corresponding organic peroxycacid, namely peroxymonopersulfuric acid is also useful.

Where the bleaching processes utilizing the detergent compositions of the invention are carried out at least in part at temperatures lower than about \( 60^\circ\text{C} \) the detergent compositions of the invention will also preferably contain additional
bleaching agents more suited to low temperature bleaching. These will include, for example peroxycyanic acid bleach precursor.

While the principal advantage of the presence of PEI in the detergent compositions of the invention lies in its ability to stabilize peroxycyanic acid bleaching agents, particularly when used under high temperature (>40°C) bleaching processes, PEI still acts as an effective chelant at lower solution temperatures. Thus, the heavy metal ion chelation provided by PEI may also stabilize any organic peroxycyanic acid bleach components which are present as active bleaching agents at these lower solution temperatures.

PEI also provides improved storage stability characteristics when incorporated into bleach containing detergent compositions. Such improved storage stability characteristics are particularly observed when the bleach-containing compositions are formulated as alkaline detergent compositions.

As used herein, bleaching agents also comprise preformed organic percarboxylic acids. Such bleaching agents that can be used without restriction encompass percarboxylic acid bleaching agents and salts thereof. Suitable examples of this class of agents include magnesium monopersulfathalate hexahydrate (INTEROX), the magnesium salt of metachloroperbenzoic acid, 4-nonylamino-4-oxoperoxybutyric acid and diperoxypentadecanoic acid. Such bleaching agents are disclosed in U.S. Patent No. 4,483,781, Hartman, issued November 20, 1984, U.S. Patent Application Serial No. 740,446, Burns et al., filed June 3, 1985, European Patent Application 0,133,354, Banks et al., published February 20, 1985, and U.S. Patent No. 4,412,934, Chung et al., issued November 1, 1983, all of which are incorporated herein by reference. Highly preferred bleaching agents also include 6-nonylamino-6-oxperoxycaproic acid (NAPAA) as described in U.S. Patent No. 4,634,551, issued January 6, 1987 to Burns et al. which is incorporated herein by reference.
Such materials normally have a general formula:

\[ \text{HO-O-C(O)-R-Y} \]

wherein \( R \) is an alkylene or substituted alkylene group containing from 1 to about 22 carbon atoms or a phenylene or substituted phenylene group, and \( Y \) is hydrogen, halogen, alkyl, aryl or

\[-\text{C(O)}-\text{OH}\]

or

\[-\text{C(O)}-\text{O- OH}\]

The organic percarboxylic acids usable in the present invention can contain either one or two peroxy groups and can be either aliphatic or aromatic. When the organic percarboxylic acid is aliphatic, the unsubstituted acid has the general formula:

\[ \text{HO-O-C(O)}-(\text{CH}_2)_n-Y \]

where \( Y \) can be, for example, H, \( \text{CH}_3 \), \( \text{CH}_2\text{Cl} \), COOH, or COOOH; and \( n \) is an integer from 1 to 20.

When the organic percarboxylic acid is aromatic, the unsubstituted acid has the general formula:

\[ \text{HO-O-C(O)}-\text{C}_6\text{H}_4-Y \]

where \( Y \) is hydrogen, alkyl, alkylhalogen, halogen, or COOH or COOOH.
Typical monoperoxypercarboxylic acids useful herein include alkyl percarboxylic acids and aryl percarboxylic acids such as:

(i) peroxybenzoic acid and ring-substituted peroxybenzoic acids, e.g., peroxy-o-naphtoic acid;

(ii) aliphatic, substituted aliphatic and arylalkyl monoperoxy acids, e.g., peroxylauric acid, peroxystearic acid, and N,N-phthaloylaminoperoxycapeic acid (PAP).

Typical diperoxy percarboxylic acids useful herein include alkyl diperoxy acids and aryl diperoxy acids, such as:

(iii) 1,12-diperoxydodecanedioic acid;

(iv) 1,9-diperoxyazelaic acid;

(v) diperoxybrassylic acid; diperoxysebacic acid and diperoxyisophthalic acid;

(vi) 2-decylidiperoxybutane-1,4-dioic acid;

(vii) 4,4'-sulfonybisperoxybenzoic acid.

The compositions of the invention may also contain organic amide substituted peroxyacids of the general formulas:

\[
\begin{align*}
R^1 & - C - N \cdot R^2 - C - OOH \text{ or } R^1 & - N - C \cdot R^2 - C - OOH \\
\| & \| & \| \\
O & R^5 & O & R^5 & \| & \|
\end{align*}
\]
wherein \( R^1 \) is an alkyl, aryl, or alkaryl group containing from about 1 to about 14 carbon atoms, \( R^2 \) is an alkyylene, arylene or alkarylene group containing from about 1 to about 14 carbon atoms, and \( R^5 \) is H or an alkyl, aryl, or alkaryl group containing from about 1 to about 10 carbon atoms.

Other organic peroxyacids include the diacyl peroxides and dialkyl peroxides. Suitable are diperoxydecanedioc acid, diperoxytetradecanedioc acid, diperoxyhexadecanedioc acid, mixtures of mono- and diperazelaic acid, mixtures of mono- and diperbrassylic acid, and their salts as disclosed in, for example, EP-A-0,341,947 which is incorporated herein by reference.

When incorporated as components of liquid, particularly liquid, bleaching compositions, the peroxygen bleaching agent, and in particular any organic peroxyacids, may be dissolved or dispersed or be incorporated as emulsions or suspensions.

The weight ratio of said peroxygen bleaching agent to PEI preferably lies in the range from 400:1 to 20:1, more preferably from 200:1 to 40:1, and most preferably from 150:1 to 50:1.

Of all the peroxygen bleaching agents described, the perborates, the percarbonates, are preferably combined with bleach activators, which lead to the in situ production in aqueous solution (i.e., during the Washing process) of the percarboxylic acid corresponding to the bleach activator.

Bleach activators are known and are described in literature such as in the GB Patents 836,988; 864,798; 907,356; 1,003,310 and 1,519,351; German Patent 3,337,921; EP-A-0,185,522; EP-1-1,174,132; EP-1-0,120,591; and U.S. Patent Numbers 1,246,339; 3,332,882; 4,128,494; 4,412,934 and 4,675,393, all of which are incorporated herein by reference.

2-(N,N,N-trimethylammonium)ethyl-4-sulphophenyl carbonate-(SPCC);
N-octyl,N,N-dimethyl-N-10-carbophenoxydecylammonium chloride-(ODC);
3(N,N,N-trimethylammonium)propyl sodium-4-sulphophenylcarboxylate; and
N,N,N-trimethylammoniumtoluoyloxybenzene sulphonate.

Other activators include sodium-4-benzoyloxybenzene sulphonate; N,N,N',N'-tetracetylethlenediamine; sodium-1-methyl-2-benzyloxybenzene-4-sulphonate; sodium-4-methyl-3-benzoyloxybenzoate; sodium nonanoyloxybenzene sulphonate; sodium 3,5,5,-trimethyl hexanoyloxybenzene sulphonate; glucose pentaacetate and tetraacetyl xylose.

Various nonlimiting examples of additional activators which may comprise the bleach compositions disclosed herein include those in U.S. patent No. 4,915,854, issued April 10, 1990 to Mao et al., and U.S. patent No. 4,412,934 which are incorporated herein by reference. The nonanoyloxybenzene sulphonate (NOBS) and tetraacetylethlenediamine (TAED) activators are typical, and mixtures thereof can also be used. See also U.S. Patent No. 4,634,551 for other typical bleaches and activators useful herein.

Bleach activators also useful in the present invention are the amide substituted compounds of the following general formula:

\[
R^1 - C - N - R^2 - C - L \quad \text{or} \quad R^1 - N - C - R^2 - C - L
\]

\[
\begin{array}{c}
\mid \quad \mid \\
O & R^5 & O \\
\end{array} \quad \begin{array}{c}
\mid \quad \mid \\
R^5 & O & O \\
\end{array}
\]
wherein \( R^1 \) is an aryl or alkaryl group with from about 1 to about 14 carbon atoms, \( R^2 \) is an alkylene, arylene, or alkarylene group containing from about 1 to 14 carbon atoms, and \( R^5 \) is \( H \) or an alkyl, aryl, or alkaryl group containing 1 to 10 carbon atoms and \( L \) can be essentially any leaving group. \( R^1 \) preferably contains from about 6 to 12 carbon atoms. \( R^2 \) preferably contains from about 4 to 8 carbon atoms. \( R^1 \) may be straight chain or branched alkyl, substituted aryl or alkylaryl containing branching, substitution, or both and may be sourced from either synthetic sources or natural sources including for example, tallow fat. Analogous structural variations are permissible for \( R^2 \). The substitution can include alkyl, aryl, halogen, nitrogen, sulphur and other typical substituent groups or organic compounds. \( R^5 \) is preferably \( H \) or methyl. \( R^1 \) and \( R^5 \) should not contain more than 18 carbon atoms total.

\( L \) can be essentially any suitable leaving group. A leaving group is any group that is displaced from the bleaching activator as a consequence of the nucleophilic attack on the bleach activator by the perhydroxide anion. This, the perhydrolysis reaction, results in the formation of the peroxycarboxylic acid. Generally, for a group to be a suitable leaving group it must exert an electron attracting effect. It should also form a stable entity so that the rate of the back reaction is negligible. This facilitates the nucleophilic attack by the perhydroxide anion.

The \( L \) group must be sufficiently reactive for the reaction to occur within the optimum time frame (e.g., a wash cycle). However, if \( L \) is too reactive, this activator will be difficult to stabilize for use in a bleaching composition. These characteristics are generally paralleled by the pKa of the conjugate acid of the leaving group, although exceptions to this convention are known. Ordinarily, leaving groups that exhibit such behavior are those in which their conjugate acid has a pKa in the range of from about 4 to about 13, preferably from about 6 to about 11 and most preferably from about 8 to about 11.
Preferred bleach activators are those of the above general formula wherein $R^1$, $R^2$ and $R^5$ are as defined for the peroxycacid and $L$ is selected from the group consisting of:

$$
\begin{align*}
\text{Y} \quad \text{O} \quad \text{Y} \\
\text{O} \quad \text{Y} \\
\text{O} \quad \text{Y}
\end{align*}
$$

$$
\begin{align*}
\text{Y} \quad \text{O} \quad \text{Y} \\
\text{O} \quad \text{Y} \\
\text{O} \quad \text{Y}
\end{align*}
$$

$$
\begin{align*}
\text{N} \quad \text{C} \quad \text{O} \\
\text{R}^1 \quad \text{N} \quad \text{C} \quad \text{CH} \quad \text{R}^4 \\
\text{R}^3 \quad \text{Y} \\
\text{Y}
\end{align*}
$$

$$
\begin{align*}
\text{O} \quad \text{C} \quad \text{R}^1 \quad \text{O} \\
\text{CH}_2 \quad \text{N} \quad \text{R}^4 \quad \text{C} \quad \text{N} \quad \text{R}^4 \\
\text{O} \quad \text{C} \quad \text{R}^1 \quad \text{O} \\
\text{N} \quad \text{S} \quad \text{C} \quad \text{R}^4 \\
\text{R}^3 \quad \text{O} \quad \text{Y} \\
\end{align*}
$$
and mixtures thereof, wherein R³ is an alkyl, aryl, or alkaryl group containing from about 1 to about 14 carbon atoms, R⁴ is an alkyl chain containing from 1 to about 8 carbon atoms, R⁴ is H or R³, and Y is H or a solubilizing group.

The preferred solubilizing groups are -SO₃⁻M⁺, -CO₂⁻M⁺, -SO₄⁻M⁺, -N⁺(R³)₃X⁻ and O⁻N(R³)₃ and most preferably -SO₃⁻M⁺ and CO₂⁻M⁺ wherein R³ is an alkyl chain containing from about 1 to about 4 carbon atoms, M is a cation which provides solubility to the bleach activator and X is a union which provides solubility to the bleach activator. Preferably, M is an alkali metal, ammonium or substituted ammonium cation, with sodium and potassium being most preferred, and X is a halide, hydroxide, methylsulfate or acetate anion. It should be noted that bleach activators with a leaving group that does not contain a solubilizing group should be well dispersed in the bleaching solution in order to assist in their dissolution. Preferred bleach activators are those of the above general formula wherein L is selected from the group consisting of

\[
\begin{align*}
\text{Y} & \quad \text{O} \quad \text{Y}, \\
\text{R³} & \quad \text{O} \quad \text{Y}, \quad \text{and} \\
\text{R²Y} & \quad \text{O} \quad \text{Y}
\end{align*}
\]

wherein R³ is as defined above and Y is -SO₃⁻M⁺ or -CO₂⁻M⁺ wherein M is as defined above.
Preferred examples of bleach activators of the above formulae include (6-octanamidocaproyl)oxybenzenesulfone, (6-nonanamidocaproyl)oxybenzenesulfonate, (6-decanamidocaproyl)oxybenzenesulfonate, and mixtures thereof.

Another important class of bleach activators provide organic peracids as described herein by ring opening as a consequence of the nucleophilic attack on the carbonyl carbon of the cyclic ring by the perhydroxide anion. For instance, this ring opening reaction in certain activators involves attack at the lactate ring carbonyl by hydrogen peroxide or its anion. Since attack of an acyl lactate by hydrogen peroxide or its anion occurs preferably at the exocyclic carbonyl, obtaining a significant fraction of ring opening may require a catalyst. Another example of ring opening bleach activators can be found in other activators, such as those disclosed in U.S. patent No. 4,966,723, Hoge et al., issued October 30, 1990 which is incorporated herein by reference.

Such activator compounds disclosed by Hodge include the activators of the benzoxazin-type, having the formula:

![Chemical structure]

including the substituted benzoxazins of the type
wherein \( R_1 \) is H, alkyl, alkaryl, aryl, arylalkyl, and wherein \( R_2, R_3, R_4, \) and \( R_5 \) may be the same or different substituents selected from H, halogen, alkyl, alkenyl, aryl, hydroxyl, alkoxy, amino, alkyl amino, COOR \( R^6 \) (wherein \( R^6 \) is H or an alkyl group) and carbonyl functions.

A preferred activator of the benzoxazin-type is

When the activators are used, optimum surface bleaching performance is obtained with washing solutions wherein the pH of such solution is between about 8.5 and 10.5 and preferably between 9.5 and 10.5 in order to facilitate the perhydrolysis reaction. Such pH can be obtained with substances commonly known as buffering agents, which are optional components of the bleaching systems herein.

Still another class of preferred bleach activators includes the acyl lactam activators, especially acyl caprolactams and acyl valerolactams of the formula:
wherein $R^6$ is H, an alkyl, aryl, alkoxyaryl, or alkaryl group containing from 1 to about 12 carbon atoms, or a substituted phenyl group containing from about 6 to about 18 carbons. See also U.S. Patent No. 4,545,784, issued to Sanderson, October 8, 1985, incorporated herein by reference, which discloses acyl carprolactams, including benzoyl caprolactam, adsorbed into sodium perborate.

The superior bleaching/cleaning action of the present compositions is also preferably achieved with safety to natural rubber machine parts and other natural rubber articles, including fabrics containing natural rubber and natural rubber elastic materials. The bleaching mechanism and, in particular, the surface bleaching mechanism are not completely understood. However, it is generally believed that the bleach activator undergoes nucleophilic attack by a perhydroxide anion, which is generated from the hydrogen peroxide evolved by the peroxygen bleach, to form a peroxycarboxylic acid. This reaction is commonly referred to as perhydrolysis.

Such bleach activators may contain one or more N- or O- acyl groups, which activators can be selected from a wide range of classes. Suitable classes include anhydrides, esters, amides and acylated derivatives of imidazoles and oximes, and examples of useful materials within these classes are disclosed in GB-A-1,586,789 which is incorporated herein by reference. The most preferred classes are esters such as are disclosed in GB-A-836,988, 884,798, 1,147,871 and 2,143,231 and imides such as are disclosed in GB-A-855,735 and 1,246,338 which are all incorporated herein by reference.

Particularly preferred bleach activators are the $N,N,N',N'$-tetraacetylated compounds of the formula:
wherein x can be 0 or an integer between 1 and 6.

Examples include tetraacetylmethylenediamine (TAMD) in which x = 1, tetraacetylenediamine (TAED) in which x = 2 and tetraacetylhexylenediamine (TAHD) in which x = 6. These and analogous compounds are described in GB-A-907,356 which is incorporated herein by reference. The most preferred peroxycacid bleach precursor is TAED.

The amido-derived and lactam bleach activators herein can also be used in combination with preferably rubber-safe, enzyme-safe, hydrophilic activators such as TAED, typically at weight ratios of amido-derived or caprolactam activators-TAED in the range of 1:5 to 5:1, preferably about 1:1.

Still other examples of bleach activators are metal containing bleach catalysts.

One type of bleach catalyst useful herein is a catalyst system comprising a heavy metal cation of defined bleach catalytic activity, such as copper, iron or manganese cations, an auxiliary metal cation having little or no bleach catalytic activity, such as zinc or aluminum cations, and a sequestrant having defined stability constants for the catalytic and auxiliary metal cations, particularly ethylenediaminetetraacetic acid, ethylenediaminetetra(methyleneephosphonic acid) and water-soluble salts thereof. Such catalysts are disclosed in U.S. Patent No. 4,430,243.
Other types of bleach catalyst include the manganese-based complexes disclosed in U.S. Patent No. 5,246,621 and U.S. Patent No. 5,244,594.

Still another type of bleach catalyst, as disclosed in U.S. patent No. 5,114,606, is a water-soluble complex of manganese (II), (III), and/or (IV) with a ligand which is a noncarboxylate polyhydroxy compound having at least three consecutive C-OH groups. Preferred ligands include sorbitol, iditol, dulcisitol, mannotol, xylitol, arabitol, adonitol, meso-erythritol, meso-inositol, lactose, and mixtures thereof.

U.S. Patent No. 5,114,611 hereby incorporated by reference, teaches a bleach catalyst comprising a complex of transition metals, including Mn, Co, Fe, or Cu, with a non-(macro)-cyclic ligand.

The bleach catalysts of the present invention may also be prepared by combining a water soluble ligand with a water soluble manganese salt in aqueous media and concentrating the resulting mixture by evaporation. Any convenient water soluble salt of manganese can be used herein. Manganese (II), (III), (IV) and/or (V) is readily available on a commercial scale. In some instances, sufficient manganese may be present in the wash liquor, but, in general, it is preferred to add Mn cations in the compositions to ensure its presence in catalytically effective amounts. Thus, the sodium salt of the ligand and a member selected from the group consisting of MnSO₄, Mn(ClO₄)₂ or MnCl₂ (least preferred) are dissolved in water at molar ratios of ligand: Mn salt in the range of about 1:4 to 4:1 at neutral or slightly alkaline pH. The water may first be de-oxygenated by boiling and cooled by sparging with nitrogen. The resulting solution is evaporated (under N₂, if desired) and resulting solids are used in the bleaching and detergent compositions herein without further purification.

In an alternate mode, the water-soluble manganese source, such as MnSO₄, is added to the bleach/cleaning composition or to the aqueous bleaching/cleaning bath which comprises the ligand. Some type of complex is apparently formed in
situ, and improved bleach performance is secured. In such an in situ process, it is convenient to use a considerable molar excess of the ligand over the manganese, and mole ratios of ligand:Mn typically are 3:1 to 15:1. The additional ligand also serves to scavenge vagrant metal ions such as iron and copper, thereby protecting the bleach from decomposition. One possible such system is described in European patent application, publication No. 549,271.

While the structures of the bleach-catalyzing manganese complexes of the present invention have not been elucidated, it may be speculated that they comprise chelates or other hydrated coordination complexes which result from the interaction of the carboxyl and nitrogen atoms of the ligand with the manganese cation. Likewise, the oxidation state of the manganese cation during the catalytic process is not known with certainty, and may beg the (+II), (+III), (+IV) or (+V) valence state. Due to the ligands' possible six points of attachment to the manganese cation, it may be reasonably speculated that multi-nuclear species and/or “cage” structures may exist in the aqueous bleaching media. Whatever the form of the active Mn-ligand species which actually exists, it functions in an apparently catalytic manner to provide improved bleaching performances on stubborn stains such as tea, ketchup, coffee, blood, and the like.

manganese cations and non-catalytic metal cations), and U.S. Patent No. 4,728,455 (manganese gluconate catalysts).

The bleach catalyst is used in a catalytically effective amount in the compositions and processes herein. By "catalytically effective amount" is meant an amount which is sufficient, under whatever comparative test conditions are employed, to enhance bleaching and removal of the stain or stains of interest from the target substrate. Thus, in a fabric laundering operation, the target substrate will typically be a fabric stained with, for example, various food stains. The test conditions will vary, depending on the type of washing appliance used and the habits of the user. Thus, front-loading laundry washing machines of the type employed in Europe generally use less water and higher detergent concentrations than do top-loading U.S. style machines. Some machines have considerably longer wash cycles than others. Some users elect to use very hot water, others use warm or even cold water in fabric laundering operations. Of course, the catalytic performance of the bleach catalyst will be affected by such considerations, and the levels of bleach catalyst used in fully-formulated detergent and bleach compositions can be appropriately adjusted.

As a practical matter, and not by way of limitation, the compositions and processes herein can be adjusted to provide on the order of at least one part per ten million of the active bleach catalyst species in the aqueous washing liquid, and will preferably provide from about 0.1 ppm to about 1700 ppm, more preferably from about 1 ppm to about 500 ppm, of the catalyst species in the laundry liquor. To illustrate this point further, on the order of 3 micromolar manganese catalyst is effective at 40°C, pH 10 under European conditions using perborate and a bleach activator (e.g., benzoyl caprolactam). An increase in concentration of 3-5 fold may be required under U.S. conditions to achieve the same results. Conversely, use of a bleach activator and the manganese catalyst with perborate may allow the formulator to achieve equivalent bleaching at lower perborate usage levels than products without the manganese catalyst.
The composition herein will therefore typically comprise from about 1 ppm to about 1200 ppm of the metal-containing bleach catalyst, preferably from about 5 ppm to about 800 ppm, and more preferably from about 10 ppm to about 600 ppm. Most preferred compositions comprise the bleach catalyst $\text{Mn}^{IV}_2(\text{u-O})_3(1,4,7$-trimethyl-1,4,7-triazacyclononate)$_2(\text{PF}_6)_2$ in concentration of from about 30 ppm to about 1000 ppm, preferably from about 50 ppm to about 650 ppm, more preferably from about 50 ppm to about 500 ppm, and most preferably from about 120 ppm to about 400 ppm.

The peroxygen bleaching agent is preferably present at a level of from 0.01% to 60%, more preferably from 1% to 40%, most preferably from 1% to 25% by weight of the bleaching composition.

Bleaching agents other than oxygen bleaching agents are also known in the art and can be utilized herein. One type of non-oxygen bleaching agent of particular interest includes photoactivated bleaching agents such as the sulfonated zinc and/or aluminum phthalocyanines. These materials can be deposited upon the substrate during the washing process. Upon irradiation with light, in the presence of oxygen, such as by hanging clothes out to dry in the daylight, the sulfonated zinc phthalocyanine is activated and, consequently, the substrate is bleached. Preferred zinc phthalocyanine and a photoactivated bleaching process are described in U.S. Patent No. 4,033,718, issued July 5, 1977 to Holcombe et al., incorporated herein by reference. Typically detergent compositions can contain about 0.01% to about 1.3% by weight of sulfonated zinc phthalocyanine.

(f) **Optional Detergent Ingredients:**

The compositions herein can optionally include one or more additional detersive materials or other ingredients for assisting or enhancing cleaning performance, treatment of the substrate to be cleaned, or to modify the aesthetics of
the detergent composition (e.g., perfumes, colorants, dyes, etc.). The following are illustrative examples of such materials.

**Polymeric Soil Release Agent**

Any polymeric soil release agent known to those skilled in the art can optionally be employed in the compositions and processes of this invention. Polymeric soil release agents are characterized by having both hydrophilic segments, to hydrophilize the surface of hydrophobic fibers, such as polyester and nylon, and hydrophobic segments, to deposit upon hydrophobic fibers and remain adhered thereto through completion of washing and rinsing cycles and, thus, serve as an anchor for the hydrophilic segments. This can enable stains occurring subsequent to treatment with the soil release agent to be more easily cleaned in later washing procedures.

The polymeric soil release agents useful herein especially include those soil release agents having: (a) one or more nonionic hydrophilic components consisting essentially of (i) polyoxyethylene segments with a degree of polymerization of at least 2, or (ii) oxypropylene or polyoxypropylene segments with a degree of polymerization of from 2 to 10, wherein said hydrophilic segments does not encompass any oxypropylene unit unless it is bonded to adjacent moieties at each end by ether linkages, or (iii) a mixture of oxyalkylene units comprising oxyethylene and from 1 to about 30 oxypropylene units wherein said mixture contains a sufficient amount of oxyethylene units such that the hydrophilic component has hydrophilicity great enough to increase the hydrophilicity of conventional polyester synthetic fiber surfaces upon deposit of the soil release agent on such surface, said hydrophilic segments preferably comprising at least about 25% oxyethylene units and more preferably, especially for such components having about 20 to 30 oxypropylene units, at least about 50% oxyethylene units; or (b) one or more hydrophobe components comprising (i) C₃ oxyalkylene terephthalate segments, wherein, if said hydrophobe components also comprise oxyethylene terephthalate, the ratio of
oxyethylene terephthalate:C₃ oxyalkylene terephthalate units is about 2:1 or lower, (ii) C₄-C₆ alkylene or oxy C₄-C₆ alkylene segments, or mixtures thereof, (iii) poly (vinyl ester) segments, preferably poly(vinyl acetate), having a degree of polymerization of at least 2 or (iv) C₁-C₄ alkyl ether or C₄ hydroxyalkyl ether substituents, or mixtures thereof, wherein said substituents are present in the form of C₁-C₄ alkyl ether or C₄ hydroxyalkyl ether cellulose derivatives, or mixture therein, and such cellulose derivatives are amphiphilic, whereby they have a sufficient level of C₁-C₄ alkyl ether and/or C₄ hydroxyalkyl ether units to deposit upon conventional polyester synthetic fiber surfaces and retain a sufficient level of hydroxyls, once adhered to such conventional synthetic fiber surface, to increase fiber surface hydrophilicity, or a combination of (a) and (b).

Typically, the polyoxyethylene segments of (a)(i) will have a degree of polymerization of from 2 to about 200, although higher levels can be used, preferably from 3 to about 150, more preferably from 6 to about 100. Suitable oxy C₄-C₆ alkylene hydrophobe segments include, but are not limited to, end-caps of polymeric soil release agents such as MO₃S(CH₂)ₙOCH₂CH₂O⁻, where M is sodium and n is an integer from 4-6, as disclosed in U.S. Patent No. 4,721,580, issued January 26, 1988, to Gosselin.

Polymeric soil release agents useful in the present invention also include cellulosic derivatives such as hydroxyether cellulosic polymers, copolymeric blocks of ethylene terephthalate or propylene terephthalate with polyethylene oxide or polypropylene oxide terephthalate, and the like. Such agents are commercially available and include hydroxyethers of cellulose such as METHOCEL (Dow). Cellulosic soil release agents for use herein also include those selected from the group consisting of C₁-C₄ alkyl and C₄ hydroxyalkyl cellulose; See U.S. Patent No. 4,000,093, issued December 28, 1976, to Nicol et al.

Soil release agents characterized by poly(vinyl ester) hydrophobe segments include graft copolymers of poly(vinyl ester), e.g., C₁-C₆ vinyl esters, preferably
poly(vinyl acetate) grafted onto polyalkylene oxide backbones, such as polyethylene oxide backbones. See European Patent Application No. 0 219 048 published April 22, 1987 by Kud et al. Commercially available soil release agents of this kind include the SOKALAN type of material, e.g., SOKALAN HP-22, available from BASF (West Germany).

One type of soil release agent is a copolymer having random blocks of ethylene terephthalate and polyethylene oxide (PEO) terephthalate. The molecular weight of this polymeric soil release agent is in the range of from about 25,000 to about 55,000. See U.S. Patent No. 3,959,230 to Hays, issued May 25, 1976, and U.S. Patent No. 3,893,929 to Basadur issued July 8, 1975.

Another polymeric soil release agent is a polyester with repeat units of ethylene terephthalate units containing 10-15% by weight of ethylene terephthalate units together with 90-80% by weight of polyoxyethylene terephthalate units, derived from a polyoxyethylene glycol of average molecular weight 300-5,000. Examples of this polymer include the commercially available material ZELCON 5126 (from Dupont) and MILEASE T (from ICI). See also, U.S. Patent No. 4,702,857, issued October 27, 1987 to Gosselin.

Another polymeric soil release agent is a sulfonated product of a substantially linear ester oligomer comprised of an oligomeric ester backbone of terephthaloyl and oxyalkyleneoxy repeat units and terminal moieties covalently attached to the backbone. These soil release agents are described fully in U.S. Patent No. 4,968,451, issued November 6, 1990 to J. J. Scheibel and E. P. Gosselink.

Still other polymeric soil release agents also include the soil release agents of U.S. Patent No. 4,877,896, issued October 31, 1989 to Maldonado et al., which discloses anionic, especially sulfoaroyl, end-capped terephthalate esters.

If utilized, soil release agents will generally comprise from about 0.01% to about 10.0% by weight, of the detergent compositions herein, typically from about 0.1% to about 5%, preferably from about 0.2% to about 3.0%.

**Co-chelating Agents**

The detergent compositions herein may also optionally contain one or more iron and/or manganese co-chelating agents. Such chelating agents can be selected from the group consisting of amino carboxylates, amino phosphonates, polyfunctionally-substituted aromatic chelating agents and mixtures therein, all as hereinafter defined. Without intending to be bound by theory, it is believed that the benefit of these materials is due in part to their exceptional ability to remove iron and manganese ions from washing solutions by formation of soluble chelates.

Amino carboxylates useful as optional chelating agents include ethylenediaminetetraacetates, N-Hydroxyethyl-ethylenediaminetriacetates, nitrilotriacetates, ethylenediamine tetrapropionates, triethylenetetraaminehexaacetates, diethylenetriaminepentaaacetates, ethylenediaminedisuccinate, diaminoalkyl di(sulfo succinates) and ethanoldiglycines, alkali metal, ammonium, and substituted ammonium salts therein and mixtures thereof.

Amino phosphonates are also suitable for use as chelating agents in the compositions of the invention when at least low levels of total phosphorus are permitted in detergent compositions, and include ethylenediaminetetraakis (methylene phosphonates), nitrilotris (methylene phosphonates) and diethylene-triaminepentakis (methylene phosphonates) as DEQUEST. Preferably, these amino
phosphonates do not contain alkyl or alkenyl groups with more than about 6 carbon atoms.

Polyfunctionally-substituted aromatic chelating agents are also useful in the compositions herein. See U.S. Patent No. 3,812,044, issued May 21, 1974, to Connor et al. Preferred compounds of this type in acid form are dihydroxydisulfobenzenes such as 1,2-dihydroxy-3,5-disulfobenzene.

If utilized, these chelating agents will generally comprise from about 0.1% to about 10% by weight of the detergent compositions herein. More preferably, if utilized, the chelating agents will comprise from about 0.1% to about 3.0% by weight of such composition.

**Clay Soil Removal/Anti-Redeposition Agents**

The compositions of the present invention can also optionally contain water-soluble ethoxylated amines having clay soil removal and anti-redeposition properties. Granular detergent compositions which contain these compounds typically contain from about 0.01% to about 10.0% by weight of the water-soluble ethoxylated amines.

The most preferred soil release and anti-redeposition agent is ethoxylated tetraethylenepentamine. Exemplary ethoxylated amines are further described in U.S. Patent No. 4,597,898, VanderMeer, issued July 1, 1986. Another group of preferred clay soil removal/antiredeposition agents are the cationic compounds disclosed in European Patent Application 111 965, Oh and Gosselin, published June 27, 1984. Other clay soil removal/antiredeposition agents which can be used include the ethoxylated amine polymers disclosed in European Patent Application 111 984, Gosselin, published June 27, 1984; the zwitterionic polymers disclosed in European Patent Application 112 592, Gosselin, published July 4, 1984; and the amine oxides disclosed in U.S. Patent No. 4,548,744, Connor, issued October 22, 1985. Other clay soil removal and/or antiredeposition agents known in the art can
also be utilized in the compositions herein. Another type of preferred antiredeposition agent includes the carboxymethyl cellulose (CMC) materials. These materials are well known in the art.

**Polymeric Dispersing Agents**

Polymeric dispersing agents can advantageously be utilized at levels from about 0.1% to about 7%, by weight in the compositions herein, especially in the presence of zeolite and/or layered silicate builders. Suitable polymeric dispersing agents include polymeric polycarboxylates and polyethylene glycols, although others known in the art can also be used. It is believed, though it is not intended to be limited by theory, that polymeric dispersing agents enhance overall detergent builder performance, when used in combination with other builders (including lower molecular weight polycarboxylates) by crystal growth inhibition, particulate soil release peptization, and anti-redeposition.

Polymeric polycarboxylate materials can be prepared by polymerizing or copolymerizing suitable unsaturated monomers, preferably in their acid form. Unsaturated monomeric acids that can be polymerized to form suitable polymeric polycarboxylates include acrylic acid, maleic acid (or maleic anhydride), fumaric acid, itaconic acid, aconitic acid, mesaconic acid, citraconic acid and methylenemalonic acid. The presence in the polymeric polycarboxylates herein of monomeric segments, containing no carboxylate radicals such as vinyl methyl ether, styrene, ethylene, etc., is suitable provided that such segments do not constitute more than about 40% by weight.

Particularly suitable polymeric polycarboxylates can be derived from acrylic acid. Such acrylic acid-based polymers which are useful herein are the watersoluble salts of polymerized acrylic acid. The average molecular weight of such polymers in the acid form preferably ranges from about 2,000 to 10,000, more preferably from about 4,000 to 7,000 and most preferably from about 4,000 to 5,000.
Water-soluble salts of such acrylic acid polymers can include, for example, the alkali metal, ammonium and substituted ammonium salts. Soluble polymers of this type are known materials. Use of polyacrylates of this type in detergent compositions has been disclosed, for example, in Diehl, U.S. Patent No. 3,308,067, issued March 7, 1967.

Acrylic/maleic-based copolymers may also be used as a preferred component of the dispersing/anti-redeposition agent. Such materials include the water-soluble salts of copolymers of acrylic acid and maleic acid. The average molecular weight of such copolymers in the acid form preferably ranges from about 2,000 to 100,000, more preferably from about 5,000 to 75,000, most preferably from about 7,000 to 65,000. The ratio of acrylate to maleate segments in such copolymers will generally range from about 30:1 to about 1:1, more preferably from about 10:1 to 2:1. Water-soluble salts of such acrylic acid/maleic acid copolymers can include, for example, the alkali metal, ammonium and substituted ammonium salts. Soluble acrylate/maleate copolymers of this type are known materials which are described in European Patent Application No. 66 915, published December 15, 1982.

Another polymeric material which can be included is polyethylene glycol (PEG). This agent PEG, can exhibit dispersing agent performance as well as act as a clay soil removal/antiredeposition agent. Typical molecular weight ranges for these purposes range from about 500 to about 100,000, preferably from about 1,000 to about 50,000, more preferably from about 1,500 to about 10,000.

Polyaspartate and polyglutamate dispersing agents may also be used, especially in conjunction with zeolite builders.

**Brightener**

Any optical brighteners or other brightening or whitening agents known in the art can be incorporated at levels typically from about 0.05% to about 1.2% by weight,
into the detergent compositions herein. Commercial optical brighteners which may be useful in the present invention can be classified into subgroups which include, but are not necessarily limited to, derivatives of stilbene, pyrazoline, coumarin, carboxylic acid, methinecyanines, dibenzo-thiophene-5,5-dioxide, azoles, 5- and 6-membered-ring heterocycles, and other miscellaneous agents. Examples of such brighteners are disclosed in "The Production and Application of Fluorescent Brightening Agents", M. Zahradnik, Published by John Wiley & Sons, New York (1982).

Specific examples of optical brighteners which are useful in the present compositions are those identified in U.S. Patent 4,790,856, issued to Wixson on December 13, 1988. These brighteners include the PHORWHITE series of brighteners from Verona. Other brighteners disclosed in this reference include: Tinopal UNPA, Tinopal CBS and Tinopal 5BM; available from Ciba-Geigy; Arctic White CC and Arctic White CWD, available from Hilton-Davis, located in Italy; the 2-(4-styrylphenyl)-2H-naphthol[1,2-d]triazoles; 4,4'-bis(1,2,3-triazol-2-yl)stilbenes; 4,4'-bis(styryl)bisphenyls; and the aminocoumarins. Specific examples of these brighteners include 4-methyl-7-diethylaminocoumarin; 1,2-bis(benzimidazol-2-yl)-ethylene; 1,3-diphenylphrazolines; 2,5-bis(benzoxazol-2-yl)thiophene; 2-styrylnaphthaldehyde[1,2-d]oxazole; and 2-(stilbene-4-yl)-2H-naphtho[1,2-d]triazole. See also U.S. Patent No. 3,646,015, issued February 29, 1972, to Hamilton which is incorporated herein by reference.

**Suds Suppressors**

Compounds for reducing or suppressing the formation of suds can be incorporated into the compositions of the present invention. Suds suppression can be of particular importance under conditions such as those found in European-style front loading laundry washing machines, or in the concentrated detergency process of U.S. Patent Nos. 4,489,455 and 4,478,574, or when the detergent compositions herein optionally include a relatively high sudsing adjunct surfactant.
A wide variety of materials may be used as suds suppressors, and suds suppressors are well known to those skilled in the art. See, for example, Kirk Othmer Encyclopedia of Chemical Technology, Third Edition, Volume 7, pages 430-447 (John Wiley & Sons, Inc., 1979). One category of suds suppressor of particular interest encompasses monocarboxylic fatty acids and soluble salts therein. See U.S. Patent No. 2,954,347, issued September 27, 1960 to Wayne St. John. The monocarboxylic fatty acids and salts thereof used as suds suppressor typically have hydrocarbyl chains of 10 to about 24 carbon atoms, preferably 12 to 18 carbon atoms. Suitable salts include the alkali metal salts such as sodium, potassium, and lithium salts, and ammonium and alkanolammonium salts.

The detergent compositions herein may also contain non-surfactant suds suppressors. These include, for example: high molecular weight hydrocarbons such as paraffin, fatty acid esters (e.g., fatty acid triglycerides), fatty acid esters of monovalent alcohols, aliphatic C_{18}-C_{40} ketones (e.g., stearone), etc. Other suds inhibitors include N-alkylated amino triazines such as tri- to hexaalkylmelamines or di- to tetraalkylidiamine chlorotriazines formed as products of cyanuric chloride with two or three moles of a primary or secondary amine containing 1 to 24 carbon atoms, propylene oxide, and monostearoyl phosphates such as monostearoyl alcohol phosphate ester and monostearoyl di-alkali metal (e.g., K, Na, and Li) phosphates and phosphate esters. The hydrocarbons such as paraffin and haloparaffin can be utilized in liquid form. The liquid hydrocarbons will be liquid at room temperature and atmospheric pressure, and will have a pour point in the range of about -40°C and about 5°C, and a minimum boiling point not less than about 110°C (atmospheric pressure). It is also known to utilize waxy hydrocarbons, preferably having a melting point below about 100°C. The hydrocarbons constitute a preferred category of suds suppressor for detergent compositions. Hydrocarbon suds suppressors are described, for example, in U.S. Patent No. 4,265,779, issued May 5, 1981 to Gandolfo et al. The hydrocarbons, thus, include aliphatic, alicyclic, aromatic, and heterocyclic saturated or unsaturated hydrocarbons having from about 12 to about
70 carbon atoms. The term "paraffin", as used in this suds suppressor discussion, is intended to include mixtures of true paraffins and cyclic hydrocarbons.

Another preferred category of non-surfactant suds suppressors comprises silicone suds suppressors. This category includes the use of polyorganosiloxane oils, such as polydimethylsiloxane, dispersions or emulsions of polyorganosiloxane oils or resins, and combinations of polyorganosiloxane with silica particles wherein the polyorganosiloxane is chemisorbed or fused onto the silica. Silicone suds suppressors are well known in the art and are, for example, disclosed in U.S. Patent No. 4,265,779, issued May 5, 1981 to Gandolfo et al. and European Patent Application No. 89307851.9, published February 7, 1990 by Starch, M.S.

Other silicone suds suppressors are disclosed in U.S. Patent 3,455,839 which relates to compositions and processes for defoaming aqueous solutions by incorporating therein small amounts of polydimethylsiloxane fluids.

Mixtures of silicone and silanated silica are described, for instance, in German Patent Application DOS 2,124,526. Silicone defoamers and suds controlling agents in granular detergent compositions are disclosed in U.S. Patent No. 3,933,672, Bartolotta et al., and in U.S. Patent No. 4,652,392, Baginski et al., issued March 24, 1987.

An exemplary silicone based suds suppressor for use herein is a suds suppressing amount of a suds controlling agent consisting essentially of:

(i) polydimethylsiloxane fluid having a viscosity of from about 20 cs. to about 1500 cs at 25°C;

(ii) from about 5 to about 50 parts per 100 parts by weight of (i) of siloxane resin composed of \((\text{CH}_3)_3\text{SiO}_x\) units of \(\text{SiO}_2\) units in a ratio of from
(CH₃)₃SiO₅ units and to SiO₂ units of from about 0.6:1 to about 1.2:1; and

(iii) from about 1 to about 20 parts per 100 parts by weight of (i) of a solid silica gel.

In the preferred silicone suds suppressor used herein, the solvent for a continuous phase is made up of certain polyethylene glycols or polyethylene-polypropylene glycol copolymers or mixtures thereof (preferred), and not polypropylene glycol. The primary silicone suds suppressor is branched/crosslinked and not linear.

To illustrate this point further, typical laundry detergent compositions with controlled suds will optionally comprise from about 0.001 to about 1, preferably from about 0.01 to about 0.7, most preferably from about 0.05 to about 0.5 weight % of said silicone suds suppressor, which comprises (1) a nonaqueous emulsion of a primary antifoam agent which is a mixture of (a) a polyorganosiloxane, (b) a resinous siloxane or a silicone resin-producing silicone compound, (c) a finely divided filler material, and (d), to form silanolates; (2) at least one nonionic silicone surfactant; and (3) polyethylene glycol or a copolymer of polyethylene-polypropylene glycol having a solubility in water at room temperature of more than about 2 weight %; and without polypropylene glycol. Similar amounts can be used in granular compositions, gels, etc. See also U.S. Patent Nos. 4,978,471, Starch, issued December 18, 1990; and 4,983,316, Starch, issued January 8, 1991; and U.S. Patent Nos. 4,639,489 and 4,749,740, Aizawa et al. at column 1, line 46 through column 4, line 35.

The silicone suds suppressor herein preferably comprises polyethylene glycol and a copolymer of polyethylene glycol/polypropylene glycol, all having an average molecular weight of less than about 1,000, preferably between about 100 and 800. The polyethylene glycol and polyethylene/polypropylene copolymers herein have a
solubility in water at room temperature of more than about 2 weight %, preferably more than about 5 weight %.

The preferred solvent herein is polyethylene glycol having an average molecular weight of less than about 1,000, more preferably between about 100 and 800, most preferably between 200 and 400, and a copolymer of polyethylene glycol/polypropylene glycol, preferably PPG 200/PEG 300. Preferred is a weight ratio of between about 1:1 and 1:10, most preferably between 1:3 and 1:6, of polyethylene glycol:copolymer of polyethylene-polypropylene glycol.

The preferred silicone suds suppressors used herein do not contain polypropylene glycol, particularly of 4,000 molecular weight. They also preferably do not contain block copolymers of ethylene oxide and propylene oxide, like PLURONIC L101.

Other suds suppressors useful herein comprise the secondary alcohols (e.g., 2-alkyl alkanols) and mixtures of such alcohols with silicone oils, such as the silicones disclosed in U.S. 4,798,679; 4,075,118 and EP 150 872. The secondary alcohols include the C₆⁻C₁₆ alkyl alcohols having a C₁⁻C₁₆ chain. A preferred alcohol is 2-butyl octanol, which is available from Condea under the trademark ISOFOL 12. Mixtures of secondary alcohols are available under the trademark ISALCHEM 123 from Enichem. Mixed suds suppressors typically comprise mixtures of alcohol + silicone at a weight ratio of 1:5 to 5:1.

For any detergent compositions to be used in automatic laundry washing machines, suds should not form to the extent that they overflow the washing machine. Suds suppressors, when utilized, are preferably present in a "suds suppressing amount". By "suds suppressing amount" is meant that the formulator of the composition can select an amount of this suds controlling agent that will sufficiently control the suds to result in a low-sudsing laundry detergent for use in automatic laundry washing machines.
The compositions herein will generally comprise from 0% to about 5% of suds suppressor. When utilized as suds suppressors, monocarboxylic fatty acids, and salts therein, will be present typically in amounts up to about 5%, by weight, of the detergent composition. Preferably, from about 0.5% to about 3% of fatty monocarboxylate suds suppressor is utilized. Silicone suds suppressors are typically utilized in amounts up to about 2.0%, by weight, of the detergent composition, although higher amounts may be used. This upper limit is practical in nature, due primarily to concern with keeping costs minimized and effectiveness of lower amounts for effectively controlling sudsing. Preferably from about 0.01% to about 1% of silicone suds suppressor is used, more preferably from about 0.25% to about 0.5%. As used herein, these weight percentage values include any silica that may be utilized in combination with polyorganosiloxane, as well as any adjunct materials that may be utilized. Monostearyl phosphate suds suppressors are generally utilized in amounts ranging from about 0.1% to about 2% by weight of the composition. Hydrocarbon suds suppressors are typically utilized in amounts ranging from about 0.01% to about 5.0%, although higher levels can be used. The alcohol suds suppressors are typically used at 0.2%-3% by weight of the finished compositions.

In addition to the foregoing ingredients, the compositions herein can also be used with a variety of other adjunct ingredients which provide still other benefits in various compositions within the scope of this invention. The following illustrates a variety of such adjunct ingredients, but is not intended to be limiting therein.

**Fabric Softeners**

Various through-the-wash fabric softeners, especially the impalpable smectite clays of U.S. Patent No. 4,062,647, Storm and Nirschl, issued December 13, 1977, as well as other softener clays known in the art, can optionally be used typically at levels of from about 0.5% to about 10% by weight in the present compositions to
provide fabric softener benefits concurrently with the fabric cleaning. Clay softeners can be used in combination with amine and cationic softeners, as disclosed, for example, in U.S. Patent No. 4,375,416, Crisp et al., March 1, 1983, and U.S. Patent No. 4,291,071, Harris et al., issued September 22, 1981. Mixtures of cellulase enzymes (e.g., CAREZYME, Novo) and clays are also useful as high-performance fabric softeners. Various nonionic and cationic materials can be added to enhance static control such as C₈-C₁₈ dimethylamino propyl glucamide, C₆-C₁₈ trimethylamino propyl glucamide ammonium chloride and the like.

**Dye Transfer Inhibiting Agents**

The compositions of the present invention may also include one or more materials effective for inhibiting the transfer of dyes from one fabric to another during the cleaning process. Generally, such dye transfer inhibiting agents include polyvinyl pyrrolidone polymers, polyamine N-oxide polymers, copolymers of N-vinylpyrrolidone and N-vinylimidazole, manganese phthalocyanine, peroxidases, and mixtures thereof. If used, these agents typically comprise from about 0.01% to about 10% by weight of the composition, preferably from about 0.01% to about 5%, and more preferably from about 0.05% to about 2%.

More specifically, the polyamine N-oxide polymers preferred for use herein contain units having the following structural formula: R-Aₓ-P; wherein P is a polymerizable unit to which an N-O group can be attached or the N-O group can form part of the polymerizable unit or the N-O group can be attached to both units; A is one of the following structure: -NC(O)-, -C(O)O-, -S-, -O-, -N=; x is 0 or 1; and R is aliphatic, ethoxylated aliphatics, aromatics, heterocyclic or alicyclic groups or any combination thereof to which the nitrogen of the N-O group can be attached or the N-O group is part of these groups. Preferred polyamine N-oxides are those wherein R is a heterocyclic group such as pyridine, pyrrole, imidazole, pyrrolidine, piperidine and derivatives thereof.
The N-O group can be represented by the following general structures:

\[
\begin{align*}
\text{O} \\
(R_1)_x \text{N} \quad (R_2)_y \\
(R_3)_z \\
\end{align*}
\]

\[
\begin{align*}
\text{O} \\
\text{N} \quad (R_1)_x \\
\end{align*}
\]

wherein \( R_1, R_2, R_3 \) are aliphatic, aromatic, heterocyclic or alicyclic groups or combinations thereof; \( x, y \) and \( z \) are 0 or 1; and the nitrogen of the N-O group can be attached or form part of any of the aforementioned groups. The amine oxide unit of the polyamine N-oxides has a pKa < 10, preferably pKa < 7, more preferred pKa < 6.

Any polymer backbone can be used as long as the amine oxide polymer formed is water-soluble and has dye transfer inhibiting properties. Examples of suitable polymeric backbones are polyvinyls, polyalkylenes, polyesters, polyethers, polyamide, polyimidies, polyacrylates and mixtures thereof. These polymers include random or block copolymers where one monomer type is an amine N-oxide and the other monomer type is an N-oxide. The amine N-oxide polymers typically have a ratio of amine to the amine N-oxide of 10:1 to 1:1,000,000. However, the number of amine oxide groups present in the polyamine oxide polymer can be varied by appropriate copolymerization or by an appropriate degree of N-oxidation. The polyamine oxides can be obtained in almost any degree of polymerization. Typically, the average molecular weight is within the range of 500 to 1,000,000; more preferred 1,000 to 500,000; most preferred 5,000 to 100,000. This preferred class of materials can be referred to as "PVNO".

The most preferred polyamine N-oxide useful in the detergent compositions herein is poly(4-vinylpyridine-N-oxide) which has an average molecular weight of about 50,000 and an amine to amine N-oxide ratio of about 1:4.
Copolymers of N-vinylpyrrolidone and N-vinylimidazole polymers (referred to as a class as "PVPVI") are also preferred for use herein. Preferably the PVPVI has an average molecular weight range from 5,000 to 1,000,000, more preferably from 5,000 to 200,000, and most preferably from 10,000 to 20,000. (The average molecular weight range is determined by light scattering as described in Barth et al., Chemical Analysis, Vol. 113, "Modern Methods of Polymer Characterization", the disclosures of which are incorporated herein by reference). The PVPVI copolymers typically have a molar ratio of N-vinylimidazole to N-vinylpyrrolidone from 1:1 to 0.2:1, more preferably from 0.8:1 to 0.3:1, most preferably from 0.6:1 to 0.4:1. These copolymers can be either linear or branched.

The present invention compositions also may employ a polyvinylpyrrolidone ("PVP") having an average molecular weight of from about 5,000 to about 400,000, preferably from about 5,000 to about 200,000, and more preferably from about 5,000 to about 50,000. PVP's are known to persons skilled in the detergent field; see, for example, EP-A-262,897 and EP-A-256,696, incorporated herein by reference. Compositions containing PVP can also contain polyethylene glycol (PEG) having an average molecular weight from about 500 to about 100,000, preferably from about 1,000 to about 10,000. Preferably, the ratio of PEG to PVP on a ppm basis delivered in wash solutions is from about 2:1 to about 50:1, and more preferably from about 3:1 to about 10:1.

The detergent compositions herein may also optionally contain from about 0.005% to 5% by weight of certain types of hydrophilic optical brighteners which also provide a dye transfer inhibition action. If used, the compositions herein will preferably comprise from about 0.01% to 1% by weight of such optical brighteners.
The hydrophilic optical brighteners useful in the present invention are those having the structural formula:

wherein \( R_1 \) is selected from anilino, N-2-bis-hydroxyethyl and NH-2-hydroxyethyl; \( R_2 \) is selected from N-2-bis-hydroxyethyl, N-2-hydroxyethyl-N-methylamino, morphilino, chloro and amino; and \( M \) is a salt-forming cation such as sodium or potassium.

When in the above formula, \( R_1 \) is anilino, \( R_2 \) is N-2-bis-hydroxyethyl and \( M \) is a cation such as sodium, the brightener is 4,4',-bis[(4-anilino-6-(N-2-bis-hydroxyethyl)-s-triazine-2-yl)amino]-2,2'-stilbenedisulfonic acid and disodium salt. This particular brightener species is commercially marketed under the tradename Tinopal-UNPA-GX by Ciba-Geigy Corporation. Tinopal-UNPA-GX is the preferred hydrophilic optical brightener useful in the detergent compositions herein.

When in the above formula, \( R_1 \) is anilino, \( R_2 \) is N-2-hydroxyethyl-N-2-methylamino and \( M \) is a cation such as sodium, the brightener is 4,4',-bis[(4-anilino-6-(N-2-hydroxyethyl-N-methylamino)-s-triazine-2-yl)amino]-2,2'-stilbenedisulfonic acid disodium salt. This particular brightener species is commercially marketed under the tradename Tinopal 5BM-GX by Ciba-Geigy Corporation.

When in the above formula, \( R_1 \) is anilino, \( R_2 \) is morphilino and \( M \) is a cation such as sodium, the brightener is 4,4'-bis[(4-anilino-6-morphilino-s-triazine-2-yl)amino]-2,2'-stilbenedisulfonic acid, sodium salt. This particular brightener species
is commercially marketed under the tradename Tinopal AMS-GX by Ciba-Geigy Corporation.

The specific optical brightener species selected for use in the present invention provide especially effective dye transfer inhibition performance benefits when used in combination with the selected polymeric dye transfer inhibiting agents hereinbefore described. The combination of such selected polymeric materials (e.g., PVNO and/or PVPVI) with such selected optical brighteners (e.g., Tinopal UNPA-GX, Tinopal 5BM-GX and/or Tinopal AMS-GX) provides significantly better dye transfer inhibition in aqueous wash solutions than does either of these two detergent composition components when used alone.

**Other Ingredients:**

Other additional optional ingredients which are known or become known which can be present in detergent compositions of the invention (in their conventional art-established levels for use generally from 0.001% to about 50% by weight of the detergent composition), include bleach activating inorganic/organic catalysts, solvents, hydrotropes, solubilizing agents, processing aids, soil-suspending agents, corrosion inhibitors, dyes, fillers, carriers, germicides, pH-adjusting agents, perfumes, static control agents, thickening agents, abrasive agents, viscosity control agents, solubilizing/clarifying agents, sunscreens/UV absorbers, phase regulants, foam boosting/stabilizing agents, bleach catalysts, antioxidants, metal ions, buffering agents, color speckles, encapsulation agents, deflocculating polymers, skin protective agents, color care agents and the like.

Various detergents ingredients employed in the present compositions optionally can be further stabilized by absorbing said ingredients onto a porous hydrophobic substrate, then coating said substrate with a hydrophobic coating. Preferably, the detergents ingredient is admixed with a surfactant before being absorbed into the
porous substrate. In use, the detersive ingredient is released from the substrate into the aqueous washing liquor, where it performs its intended detressive function.

To illustrate this technique in more detail, a porous hydrophobic silica (trademark SIPERNAT D10, Degussa) is admixed with a proteolytic enzyme solution containing 3%-5% of C_{13,15} ethoxylated alcohol EO(7) nonionic surfactant. Typically, the enzyme/surfactant solution is 2.5 X the weight of silica. The resulting powder is dispersed with stirring in silicone oil (various silicone oil viscosities in the range of 500-12,500 can be used). The resulting silicone oil dispersion is emulsified or otherwise added to the final detergent matrix. By this means, ingredients such as the aforementioned enzymes, photoactivators, dyes, fluorescers, fabric conditioners and hydrolyzable surfactants can be "protected" for use in detergents, including liquid laundry detergent compositions.

A detergent composition might contain the following by weight:

(1) 1-75% detergent surfactant system;
(2) 5-80% builder;
(3) 0-30% buffer salt;
(4) 0-30% sulfate;
(5) 0.01-60% peroxo bleach;
(6) 0.001-5% enzyme;
(7) 0.001-5% PEI;
(8) water and additional optional ingredients to 100%.

A preferred detergent composition might contain the following by weight:

(1) 5-60% detergent surfactant system;
(2) 10-50% builder;
(3) 0-28% buffer salt;
(4) 0-28% sulfate;
(5) 1-25% peroxygen bleach;
(6) 0.001-3.5% enzyme;
(7) 0.01-4% PEI;
(8) water and additional optional ingredients to 100%.

**Home Application and Use:**

The PEI chelants/sequestrants and their salts of the present invention are useful in a variety of detergent, personal product, cosmetic, oral hygiene, food, pharmacological and industrial compositions which are available in many types and forms. Preferred compositions, however, are detergent compositions.

A classification according to detergent type would consist of heavy-duty detergent powders, heavy-duty detergent liquids, light-duty liquids (dishwashing liquids), machine dishwashing detergents, institutional detergents, specialty detergent powders, specialty detergent liquids, laundry aids, pretreatment aids, after treatment aids, presoaking products, hard surface cleaners, carpet cleansers, carwash products and the like.

A classification according to personal product type would consist of hair care products, bath products, cleansing products, skin care products, shaving products and deodorant/antiperspirant products.
Examples of hair care products include, but are not limited to rinses, conditioners, shampoos, conditioning shampoos, antidandruff shampoos, antilice shampoos, coloring shampoos, curl maintenance shampoos, baby shampoos, herbal shampoos, hair loss prevention shampoos, hair growth/promoting/ stimulating shampoos, hairwave neutralizing shampoos, hair setting products, hair sprays, hair styling products, permanent wave products, hair straightening/relaxing products, mousses, hair lotions, hair tonics, hair pomade products, brilliantsines and the like.

Examples of bath products include, but are not limited to bath oils, foam or bubble bathes, therapeutic bathes, after bath products, after bath splash products and the like.

Examples of cleansing products include, but are not limited to shower cleansers, shower gels, body shampoos, hand/body/facial cleansers, abrasive scrub cleansing products, astringent cleansers, makeup cleansers, liquid soaps, toilet soap bars, synthetic detergent bars and the like.

Examples of skin care products include, but are not limited to hand/body/facial lotions, sunscreen products, tanning products, self-tanning products, aftersun products, masking products, lipsticks, lip gloss products, rejuvenating products, antiaging products, antiwrinkle products, anticellulite products, antiacne products and the like.

Examples of shaving products include, but are not limited to shaving creams, aftershave products, preshave products and the like.

Examples of deodorant/antiperspirant products include, but are not limited to deodorant products, antiperspirant products and the like.

A classification according to oral hygiene type would consist of, but is not limited to mouthwashes, pre-brushing dental rinses, post-brushing rinses, dental
sprays, dental creams, toothpastes, toothpaste gels, tooth powders, dental cleansers, dental flosses, chewing gums, lozenges and the like.

The PEI chelant/sequestrant of the present invention are also useful in softening compositions such as liquid fabric softeners, fabric softening rinses, fabric softening sheets, tissue papers, paper towels, facial tissues, sanitary tissues, toilet paper and the like.

A classification according to composition form would consist of aerosols, liquids, gels, creams, lotions, sprays, pastes, roll-on, stick, tablet, powdered and bar form.

**Industrial Application and Use:**

The PEI chelants/sequestrants and their ammonium salts of the present invention are useful in a variety of other compositions as above. More specifically, PEI is useful as chelants of heavy metal and hardness ions (builders), scale inhibiting agents, corrosion inhibiting agents, deflocculating/dispensing agents, stain removal agents, bleach stabilizing agents, protecting agents of peroxide labile ingredients, photobleaching enhancing agents, thickener/viscosity modifying agents, crystal growth modification agents, sludge modification agents, surface modification agents, processing aids, electrolyte, hydrolytic stability agents, alkalinity agents and the like. The PEI chelant/sequestrant and its salts of the present invention are also useful for certain industrial applications such as acid cleaners, aluminum etching, boiler cleaning, water treatment, bottle washing, cement modification, dairy cleaners, desalination, electrochemical machining, electroplating, metal finishing, paper mill evaporations, oil field water treatment, paper pulp bleaching, pigment dispersion, trace metal carrier for fertilizers, irrigation, circuit cleaning and the like.
Detergent Formulations:

Granular detergent compositions embodying the present invention can be formed by conventional techniques, i.e., by slurrying the individual components in water and then atomizing and spray-drying the resultant mixtures, or by pan or drum agglomeration of the ingredients. Granular formulations preferably comprise from about 5% to about 60% of detergent surfactant selected from the group consisting of anionic surfactants, nonionic surfactants, and mixtures thereof.

Liquid compositions of the present invention can contain water and other solvents. Lower molecular weight primary or secondary alcohols, exemplified by methanol, ethanol, propanol, and isopropanol, are suitable. Monohydrate alcohols are preferred for solubilizing the surfactant, but polyols containing from about 2 to about 6 carbon atoms and from about 2 to about 6 hydroxy groups can be used and can provide improved enzyme stability (if enzymes are included in the composition). Examples of polyols include propylene glycol, ethylene glycol, glycerine and 1,2-propanediol. Ethanol is a particularly preferred alcohol.

The liquid compositions preferably comprise from about 5% to about 60% of detergent surfactant, about 7% to about 30% of builder and about 0.001% to about 5% PEI or salts thereof.

Useful detergency builders in liquid compositions include the alkali metal silicates, alkali metal carbonates, polyphosphonic acids, C_{10}-C_{18} alkyl monocarboxylic acids, polycarboxylic acids, alkali metal, ammonium or substituted ammonium salts thereof, and mixtures thereof. In preferred liquid compositions, from about 8% to about 28% of the detergency builders are selected from the group consisting of C_{10}-C_{18} alkyl monocarboxylic acids, polycarboxylic acids and mixtures thereof.
Particularly, preferred liquid compositions contain from about 8% to about 18% of a C_{10}-C_{18} monocarboxylic (fatty) acid and from about 0.2% to about 10% of a polycarboxylic acid, preferably citric acid, and provide a solution pH of from about 6 to about 10 at 1.0% concentration in water.

Preferred liquid compositions are substantially free of inorganic phosphates or phosphonates. As used in this context "substantially free" means that the liquid compositions contain less than about 0.5% by weight of an inorganic phosphate- or phosphonate-containing compound.

The detergent compositions of the invention are particularly suitable for laundry use, but are also suitable for the cleaning of hard surfaces and for dishwashing.

In a laundry method aspect of the invention, typical laundry wash water solutions comprise from about 0.01% to about 5% by weight of the detergent compositions of the invention. Fabrics to be laundered are agitated in these solutions to effect cleaning and stain removal.

The detergent compositions of the present invention may be in any of the usual physical forms, such as powders, beads, flakes, bars, tablets, noodles, liquids, pastes and the like. The detergent compositions are prepared and utilized in the conventional manner. The wash solutions thereof desirably have a pH from about 6 to about 12, preferably from about 7 to about 11, more preferably from about 7.5 to about 10.

The following examples further describe and demonstrate the preferred embodiments that are within the scope of the invention. The examples are given solely for the purpose of illustration and are not to be construed as being limiting to the present invention since many variations are possible without departing from the spirit and scope of the invention.
EXAMPLES 1-3

The following Examples 1-3 represent the frame formulations of the present invention. These examples are not intended to be limiting to the present invention, but rather to simply further illustrate the additional aspects of the present technology which may be considered by the formulator when manufacturing a wide variety of detergent compositions comprising PEI chelants/sequestrants. Numerous modifications and variations are possible without departing from the spirit and scope of the present frame formulations. Unless otherwise indicated, all percentages herein are by weight.

EXAMPLES 4-7

In order to demonstrate the improved peroxxygen bleach stability characteristics of detergent compositions containing PEI, three detergent compositions were prepared containing PEI and compared to identical compositions with ethylenetriamine pentaacetic acid hexasodium salt (Dequest 2066, D2066), ethylenediaminetetraacetic acid tetrasodium salt (EDTA) and [S,S]-ethylenediamine-N,N'-dissuccinic acid tetrasodium salt [S,S]-(EDDS). The structure of the sequestrants are as follows:
\[
\text{NaOOCCH}_2\text{NCH}_2\text{CH}_2\text{NCH}_2\text{CH}_2\text{COO}Na
\]
\[
\text{CHCOONa}
\]
\[
\text{CHCOONa}
\]
\[
\text{CHCOONa}
\]

Dequest 2066 (Comparative)

\[
\text{NaOOCCH}_2\text{NCH}_2\text{CH}_2\text{NCH}_2\text{COO}Na
\]
\[
\text{CHCOONa}
\]
\[
\text{CHCOONa}
\]

EDTA (Comparative)

\[
\text{NaOOCCH}_2\text{CHNHCH}_2\text{CH}_2\text{NHCHCH}_2\text{COO}Na
\]
\[
\text{COONa}
\]
\[
\text{COONa}
\]

[S,S] - EDDS (Comparative)

\[
(\text{NHCH}_2\text{CH}_2\text{)}_x \left(\text{N(CH}_2\text{CH}_2\text{NH}_2\text{)}\text{CH}_2\text{CH}_2\text{)}_y
\]

PEI (The Invention)
Below is a list of PEI's that were evaluated at concentrations of 0.38% to 0.65% by weight of various detergent formulations (1, 2 or 3) and compared to identical formulations with Dequest 2066, EDTA and [S,S]-EDDS.

Procedure for the Determination of Peroxygen Bleach Stability

A 2,000 ml Erlenmeyer flask containing 1,000 ml of water composed of 24° French Hardness (4:1 Ca:Mg), 2.3 ppm Zn^{2+}, 2 ppm Fe^{3+}, 1.1 ppm Cu^{2+} and 0.12 ppm Mn^{2+} was heated to 40°C. To the flask was added 6.08 g of Formulation 1 or 3.3g of Formulation 2, or 25 g of Formulation 3 which were allowed to mix for 2 minutes at 40°C. Aliquots (50.4g) of detergent solution were removed from the flask at fixed time intervals (0-50 min.) and placed into 20% sulfuric acid (50 ml). The % H$_2$O$_2$ remaining (from perborate) was determined by titrating with 0.1N potassium permanganate (KMnO$_4$).

\[
\begin{align*}
\% \text{ H}_2\text{O}_2 &= \frac{\text{Volume of KMnO}_4 \text{ (ml)} \times 0.1 \text{ N} \times \text{Milliequivalent weight}}{\text{Weight of Perborate (g)}} \times 100 \\
\% \text{ H}_2\text{O}_2 \text{ Remaining} &= \frac{\text{% H}_2\text{O}_2 \text{ at Time X}}{\text{% H}_2\text{O}_2 \text{ at Time 0}} \times 100
\end{align*}
\]

wherein X = 5-5- minutes.
In Examples 4-6, the following abbreviations have the corresponding meanings.

</table>

From the above table it can be seen that during the first 5 minutes, most PEI sequestrants exhibit comparative peroxygen bleach stability, however, at 10 minutes or greater, all PEI sequestrants exhibit better peroxygen bleach stability than EDTA and EDDS.

This invention has been described with respect to certain preferred embodiments and various modifications and variations in the light thereof will be suggested to persons skilled in the art and are to be included within the spirit and purview of this application and the scope of the appended claims.
CLAIMS:

1. A detergent composition comprising:
   
   (a) from about 1% to about 75% by weight of a detergent surfactant selected from anionic surfactants, nonionic surfactants, zwitterionic surfactants, ampholytic surfactants, cationic surfactants, and mixtures thereof;
   
   (b) from about 5% to about 80% by weight of a detergency builder;
   
   (c) from about 0.001% to about 5% by weight of an enzyme;
   
   (d) from about 0.001% to about 5% by weight of polyethyleneimine, polyethyleneimine salt, or mixtures thereof; and
   
   (e) from about 0.01 to about 60% by weight of a peroxygen bleach compound,
   
   wherein the composition is substantially free of chlorine bleach compounds.

2. A composition according to claim 1, wherein the composition further comprises about 0.01% to about 1.3% by weight of a non-oxygen photoactivating bleaching agent selected from zinc phthalocyanine, aluminium phthalocyanine and mixtures thereof.

3. A composition according to claim 1 or claim 2, wherein the detergency builder component is selected from zeolites; alkali metal silicates; alkali metal carbonates; alkali metal phosphates; alkali metal polyphosphates; alkali metal phosphonates; alkali metal polyphosphonic acids; C₈₋C₆ eight alkyl monocarboxylic acids, polycarboxylic acids, and alkali metal, ammonium or substituted ammonium salts thereof; and mixtures thereof.

4. A composition according to any preceding claim, wherein the polyethyleneimine component is in the non-protonated, non-salt form.
5. A composition according to any preceding claim, wherein the peroxide
bleach compound is selected from hydrogen peroxide, sodium percarbonate, sodium
perborate monohydrate, sodium perborate tetrahydrate, peroxylauric acid,
peroxynonamic acid, peroxybenzoic acid, N,N-phthaloylaminoperoxycaproic acid,
and mixtures thereof.

6. A composition according to any of claims 1 to 4, wherein the peroxide
bleach compound is a peroxyacid bleach activator selected from tetraacetyl
ethylenediamine, tetraacetyldihexylenediamine, tetraacetylmethylene diamine, sodium
nonanoyloxybenzene sulfonate, glucose pentaacetate, benzoyl caprolactam, and
mixtures thereof.

7. A granular laundry detergent composition comprising:

(a) from about 5% to about 60% by weight of a detergent surfactant
selected from anionic surfactants, nonionic surfactants, and mixtures
thereof;

(b) from about 10% to about 50% by weight of a detergency builder
selected from zeolites; alkali metal silicates, alkali metal carbonates,
alkali metal phosphates, alkali metal polyphosphates, alkali metal
phosphonates, alkali metal polyphosphonic acids; C₈-C₁₈ alkyl
monocarboxylic acids, polycarboxylic acids, and alkali metal,
ammonium or substituted ammonium salts thereof; and mixtures
thereof;

(c) from about 0.001% to about 5% by weight of an enzyme;

(d) from about 0.001% to about 5% by weight of polyethyleneimine,
polyethyleneimine salt or mixtures thereof; and

(e) from about 0.01% to about 60% by weight of a peroxide bleach
compound,

wherein the composition is substantially free of chlorine bleach compounds.
8. A composition according to claim 7, wherein the surfactant component is 
selected from alkylbenzene sulfonates, alkyl sulfates, alkyl polyethoxy sulfates, α-
olefin sulfonates, and mixtures thereof.

9. A composition according to any preceding claim wherein component (d) 
comprises from 0.005% to about 4.5% of the polyethyleneimine, polyethyleneimine 
salt, or mixture thereof.

10. A composition according to any preceding claim, wherein each of the 
polyethyleneimines or salts thereof has a molecular weight of about 300 to about 
2,500,000.

11. A composition according to any preceding claim, wherein the surfactant 
component comprises a nonionic surfactant selected from C_{10}-C_{20} alcohols 
ethoxylated with an average of from about 4 to about 10 moles of ethylene oxide per 
mole of alcohol, alkyl polyglycosides, alkyl aldonamides, alkyl aldobionamides, alkyl 
glycamides, and mixtures thereof.

12. A method for laundering fabrics comprising agitating the fabrics in an aqueous 
solution containing from about 0.01% to about 5% by weight of a composition as 
defined in any of claims 1 to 11.

13. A method for improving the stability of peroxxygen bleach in a detergent 
composition as defined by components (a), (b), (c) and (e) of claim 1 and 
substantially free of chlorine bleach compounds, which comprises adding from about 
0.001% to about 5% by weight of polyethyleneimine, polyethyleneimine salt, or 
mixtures thereof, based on the total composition.

</table>
| X        | AU 17813 95 A (PROCTOR & GAMBLE) 21 December 1995  
see page 3, line 12 - line 16  
see page 14, paragraph 2 - page 16,  
paragraph 3  
see page 27, line 1 - page 28, line 10  
see claims 1-9; example C | 1,2,8-13 |
| P,X      | DE 196 11 977 A (BASF AG) 2 October 1997  
see claims; examples 4-6; tables | 1,3-6, 9-13 |
| X        | WO 91 17234 A (PROCTOR & GAMBLE) 14 November 1991  
see page 5, line 13 - line 15; claims  
1,4,7; examples I,II | 1,3-5, 7-13 |

X Further documents are listed in the continuation of box C.  
P Patent family members are listed in annex.

- Special categories of cited documents:
  - "A" document defining the general state of the art which is not considered to be of particular relevance.
  - "E" earlier document but published on or after the international filing date.
  - "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another document or to determine special reason (as specified).
  - "O" document referring to an oral disclosure, use, exhibition or other means.
  - "P" document published prior to the international filing date but later than the priority date claimed.

- "T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention.
- "X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone.
- "Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
- "&" document member of the same patent family.

Date of the actual completion of the international search  
6 November 1998

Date of mailing of the international search report  

Name and mailing address of the ISA  
European Patent Office, P.B. 5818 Patentlaan 2  
NL-2280 HV Rijswijk  
Tel. (+31-70) 340-2040, Tx. 31 651 spn nl,  
Fax: (+31-70) 340-3016

Authorized officer  
Loiselet-Taisne, S

Form PCT/ISA/210 (second sheet) (July 1999)
