BRUSH AND COMB COMBINATION FOR PACKETS

Stella Meyers Fiegel, Marshall, Tex.

Application November 1, 1934, Serial No. 751,037

2 Claims. (Cl. 132—86)

This invention relates to a novel package or packet of toilet articles.

A prime object of this invention is to provide a flat pocket size packet of a brush and comb combination.

Other objects of the invention will appear from the following detailed description of the invention, and as disclosed in the single sheet of drawing which is made a part of this application.

In the drawing,

Fig. 1 is a perspective view showing the brush and comb in pivoted relationship and adapted for the package.

Fig. 2 is a rear edge view of Fig. 1.

Fig. 3 is a sectional view along 3—3 of Fig. 3.

Fig. 4 is a perspective view of the packet.

Fig. 5 is a perspective view of a modified form of brush for the package.

Fig. 6 is a perspective view of a modification of the package contents.

Fig. 7 is a sectional view of Fig. 6.

In the form of the invention or portion thereof, disclosed in Fig. 1 of the package article, numeral 1 designates a comb of substantially flat dimensions, made of any suitable material and provided with teeth 3, and adapted to be pivoted at 5 to a narrow brush holder 2 having bristles 4 consisting of some substantial brush material, and arranged in one or more rows as may be deemed desirable within the holder 2 in such a manner that when the comb 1 and brush 2 are folded together a flat compact package article will be formed.

Figs. 5 and 6 represent other forms of brush and comb construction adapted for this package or packet invention. The brush in Fig. 5 calls for a narrow holder 6 having a bristle portion 7 extending therefrom, and constructed of material similar to that described for the article disclosed in Fig. 1. The comb for cooperating with the form of brush 6, within the packet may be of any suitable type such as that disclosed at 3 in Fig. 3.

Fig. 4 discloses the flat, thin packet having the members thereof arranged in operative assembled form, wherein numeral 8 designates the packet covering made of any suitable material and provided with a flap portion 9.

The form of the invention disclosed in Fig. 6 calls for a comparatively thin bar 10, made of a suitable pliable material adapted to have affixed thereto a plurality of bristles 11 for forming a brush portion. The bar 10 is bent or otherwise formed at 12 to provide a slot adapted to receive in operative and folded relationship the comb base section 14 and teeth 15. The free ends of the bar 10 are arranged in pivoted relationship to the comb portion 14 as at 13. The bristles 11 are affixed to the bar 10 in such a manner that when the bar 10 is bent into a U shape for forming a receiving slot, a portion of the bristles 11 will fall opposite and on each side thereof, as clearly disclosed in Fig. 7, thereby providing a brush of narrow dimensions having substantial and durable characteristics.

This invention provides a novel flat pocket size packet including a brush and comb combination as above described in detail.

It is to be understood that changes, variations and modifications may be made within the scope of the following claims without departing from the spirit of the invention.

The pocket comb and brush may be attached or unattached. The case may be opened or closed, and perforated if considered desirable, to allow for proper ventilation. The bristles in the brush may be arranged in one or more rows or otherwise.

What I claim is,

1. A brush arranged in pivoted relationship to a comb in such a manner that it may be easily removed from a packet cover, the brush comprising a bar member provided with bristles, the bar member being bent into the form of a U, thereby providing a slot for receiving the comb in folded relationship therein.

2. A narrow brush and comb combination arranged to be easily removed from a packet cover, the brush comprising a bar member provided with bristles, and bent into the form of a U, thereby providing a slot for receiving the comb in pivotal relationship therein, the bristles being arranged along one edge of the bar member in such a manner that a portion thereof will fall opposite and on each side of the slot, thereby providing a narrow and durable brush.

STELLA MEYERS FIEGEL.
