TRICYCLIC THROMBIN RECEPTOR ANTAGONISTS

5 The present application claims priority under 35 USC section 119(e) of United States Provisional application Serial No. 60/373,072, filed April 16, 2002, the complete text, claims and figures of which are incorporated by reference herein as if fully set forth.

BACKGROUND OF THE INVENTION

10 The present invention relates to substituted tricyclic thrombin receptor antagonists, pharmaceutical compositions containing them and their use in the treatment of diseases associated with thrombosis, atherosclerosis, restenosis, hypertension, angina pectoris, arrhythmia, heart failure, cerebral ischemia, stroke, inflammatory disorders, neurodegenerative diseases and cancer. The invention also relates to the combination of novel compounds of the invention and other cardiovascular agents.

Thrombin is known to have a variety of activities in different cell types and thrombin receptors are known to be present in such cell types as human platelets, vascular smooth muscle cells, endothelial cells and fibroblasts. It is therefore possible that thrombin receptor antagonists, also known as protease activated receptor (PAR) antagonists will be useful in the treatment of thrombotic, inflammatory, atherosclerotic and fibroproliferative disorders, as well as other disorders in which thrombin and its receptor play a pathological role.

Thrombin receptor antagonists peptides have been identified based on structure-activity studies involving substitutions of amino acids on thrombin receptors. In Bernatowicz et al, J. Med. Chem., vol. 39, pp. 4879-4887 (1996), tetra- and pentapeptides are disclosed as being potent thrombin receptor antagonists, for example N-trans-cinnamoyl-p-fluorophenylglycinophenylalanine-leucine-arginine-NH$_2$ and N-trans-cinnamoyl-p-fluorophenylglycinophenylalanine-leucine-arginine-arginine-NH$_2$.

30 Peptide thrombin receptor antagonists are also disclosed in WO 94/03479, published February 17, 1994.

Substituted tricyclic thrombin receptor antagonists are disclosed in US 6,063,847, US 6,326,380 and U.S. Serial Nos. 09/880222 (WO 01/96330) and 10/271715.

As used above, and throughout the specification, the following terms, unless otherwise indicated, shall be understood to have the following meanings:

"Subject" includes both mammals and non-mammalian animals.

"Mammal" includes humans and other mammalian animals.

The term "optionally substituted" means optional substitution with the specified groups, radicals or moieties. It should be noted that any atom with unsatisfied valences in the text, schemes, examples and tables herein is assumed to have the hydrogen atom(s) to satisfy the valences.

The following definitions apply regardless of whether a term is used by itself or in combination with other terms, unless otherwise indicated. Therefore, the definition of "alkyl" applies to "alkyl" as well as the "alkyl" portions of "hydroxyalkyl", "haloalkyl", "alkoxy", etc.

As used herein, the term "alkyl" means an aliphatic hydrocarbon group that can be straight or branched and comprises 1 to about 20 carbon atoms in the chain. Preferred alkyl groups comprise 1 to about 12 carbon atoms in the chain. More preferred alkyl groups comprise 1 to about 6 carbon atoms in the chain. "Branched" means that one or more lower alkyl groups such as methyl, ethyl or propyl, are attached to a linear alkyl chain. The alkyl can be substituted by one or more substituents independently selected from the group consisting of halo, aryl, cycloalkyl, cyano, hydroxy, alkoxy, alkylthio, amino, -NH(alkyl), -NH(cycloalkyl), -N(alkyl)$_2$ (which alkyls can be the same or different), carboxy and -C(O)O-alkyl. Non-limiting examples of suitable alkoxy groups include methoxy, ethoxy and isopropoxy. The alkyl group of the alkoxy is linked to an adjacent moiety through the ether oxygen.

"Alkynyl" means an aliphatic hydrocarbon group comprising at least one carbon-carbon triple bond and which may be straight or branched and comprising about 2 to about 15 carbon atoms in the chain. Preferred alkynyl groups have about 2 to about 12 carbon atoms in the chain; and more preferably about 2 to about 4 carbon atoms in the chain. Branched means that one or more lower alkyl groups such as methyl, ethyl or propyl, are attached to a linear alkynyl chain. Non-limiting examples of suitable alkynyl groups include ethynyl, propynyl, 2-butynyl, 3-methylbutynyl, n-pentynyl, and decynyl. "Halogen" or "halo" refers to fluorine, chlorine, bromine or iodine radicals. Preferred are fluoro, chloro or bromo, and more preferred are fluoro and chloro.

"Heteroaryl" means a single ring, bicyclic or benzofused heteroaryl group of 5 to 14 ring atoms, preferably about 5 to 10 ring atoms, comprised of 1 to 13 carbon atoms and 1 to 4 heteroatoms independently selected from the group consisting of N, O and S, provided that the rings do not include adjacent oxygen and/or sulfur atoms. N-oxides of the ring nitrogens are also included, as well as compounds wherein a ring nitrogen is substituted by a (C₁-C₄)alkyl group to form a quaternary amine. Examples of single-ring heteroaryl groups are pyridyl, oxazolyl, isoxazolyl, oxadiazolyl, furanyl, pyrrolyl, thienyl, imidazolyl, pyrazolyl, tetrazolyl, thiazolyl, isothiazolyl, thiadiazolyl, pyrazinyl, pyrimidyl, pyridazinyl and triazolyl. Examples of bicyclic heteroaryl groups are naphthyridyl (e.g., 1, 5 or 1,7), imidazopyridyl, pyrido[2,3]imidazolyl, pyridopyrimidinyl and 7-azaindolyl. Examples
of benzofused heteroaryl groups are indolyl, quinolyl, isoquinolyl, phthalazinyl, benzothienyl (i.e., thionaphthenyl), benzimidazolyl, benzofuranyl, benzoxazolyl and benzofurazanyl. All positional isomers are contemplated, e.g., 2-pyridyl, 3-pyridyl and 4-pyridyl.

The term "Het" is exemplified by the single ring, bicyclic and benzofused heteroaryl groups as defined immediately above. Het groups are joined to group B by a carbon ring member, e.g., Het is 2-pyridyl, 3-pyridyl or 2-quinolyl. The Het ring can be substituted on any available ring carbon by a group W; 1 to 4 W substituents can be present on a Het ring.

"Heterocycloalkyl" means a 4 to 6 membered saturated ring containing 3 to 5 carbon atoms and 1 or 2 heteroatoms selected from the group consisting of N, S and O, provided that the heteroatoms are not adjacent. Examples of heterocycloalkyl rings are pyrrolidinyl, piperidinyl, piperazinyl, morpholinyl, thiomorpholinyl, thiazolidinyl, 1,3-dioxolanyli, 1,4-dioxanyl, tetrahydrofuranyl, tetrahydrothiophenyl and tetrahydrothiopyranyl.

The term "heterospiroyclic" refers to a spirocyclic structure containing 3 to 5 carbon atoms and 1 or 2 heteroatoms selected from the group consisting of N, S and O, provided that the heteroatoms are not adjacent.

The term "optional single bond" refers to the bond shown by the dotted line between X and the carbon to which Y and R15 are attached in the structure of Formula I. The optional double bond represented by \( \overset{\text{\textbullet \textbullet \textbullet \textbullet \textbullet}}{} \) means that at least a single bond must be present, but that a double bond can be present; when the double bond is present, R10 is absent.

When R4 and R5 join to form a ring with the nitrogen to which they are attached, the rings formed are 1-pyrrolidinyl, 1-piperidinyl and 1-piperazinyl, wherein the piperazinyl ring may also be substituted at the 4-position nitrogen by a group R7.

The above statements, wherein, for example, R4 and R5 are said to be independently selected from a group of substituents, means that R4 and R5 are independently selected when attached to the same nitrogen, but also that where an R4 or R5 variable occurs more than once in a molecule, those occurrences are independently selected. Similarly, each occurrence of R13 or R14 is independent of
any other $R^{13}$ or $R^{14}$ in the same Q ring. Those skilled in the art will recognize that the size and nature of the substituent(s) will affect the number of substituents which can be present.

Compounds of the invention have at least one asymmetrical carbon atom and therefore all isomers, including enantiomers, stereoisomers, rotamers, tautomers and racemates of the compounds of Formula (I) (where they exist) are contemplated as being part of this invention. The invention includes d and l isomers in both pure form and in admixture, including racemic mixtures. Isomers can be prepared using conventional techniques, either by reacting optically pure or optically enriched starting materials or by separating isomers of a compound of Formula I. Isomers may also include geometric isomers, e.g., when a double bond is present. Polymorphous forms of the compounds of Formula (I), whether crystalline or amorphous, also are contemplated as being part of this invention.

Those skilled in the art will appreciate that for some of the compounds of Formula I, one isomer will show greater pharmacological activity than other isomers.

![Chemical structure]

with compounds having that absolute stereochemistry being more preferred.

Also included are salts formed with pharmaceutically acceptable amines such as ammonia, alkyl amines, hydroxyalkylamines, N-methylglucamine and the like.

"Solvate" means a physical association of a compound of this invention with one or more solvent molecules. This physical association involves varying degrees of ionic and covalent bonding, including hydrogen bonding. In certain instances the solvate will be capable of isolation, for example when one or more solvent molecules are incorporated in the crystal lattice of the crystalline solid. "Solvate" encompasses both solution-phase and isolatable solvates. Non-limiting examples of suitable solvates include ethanolates, methanolates, and the like. "Hydrate" is a solvate wherein the solvent molecule is H₂O.

**Example 69**

**Step 1:**

Compound 17 (100 mg, 0.239 mmol), prepared as described in US 6,063,847 was stirred with ammonium acetate (1.84 g, 23.9 mmol) and NaCNBH$_3$ (24 mg, 0.38 mmol) in CH$_3$OH (7 ml) at rt under N$_2$ for 16 h. The mixture was treated with NH$_4$OH (10 ml, 29% aqueous), diluted with CH$_2$Cl$_2$ (75 ml), and washed with NaHCO$_3$ (sat.). The organic layer was dried (MgSO$_4$) and concentrated in vacuo. PTLC separation of the residue with 2.0 M NH$_3$/CH$_3$OH–CH$_2$Cl$_2$ (5–95) as eluent gave 18A (43 mg, 43%, lower $R_f$), MS (ESI) m/z 421 (MH$^+$), and 18B (17 mg, 17%, higher $R_f$), MS (ESI) m/z 421 (MH$^+$).

**Step 2:**

Compound 18A (0.100 g, 0.238 mmol) was stirred with ethyl chloroformate (0.195 ml, 2.38 mmol) and Et$_3$N (0.5 ml, 3.6 mmol) in CH$_2$Cl$_2$ (10 ml) at 0 °C for 10 min and at rt for 1 h. The mixture was diluted with EtOAc (50 ml) and washed with NaHCO$_3$ (sat.). The organic layer was dried (MgSO$_4$) and concentrated in vacuo. Flash chromatography of the residue on a silica gel column with EtOAc–hexane (50–50) as eluent gave Example 69A (100 mg, 85%). MS (ESI) m/z 493 (MH$^+$). Compound 32B was similarly prepared from 18B. MS (ESI) m/z 493 (MH$^+$).
Example 70

The mixture was stirred for 2.5 h. Aqueous work-up with NH₄Cl (sat) followed by column chromatography (30-50% EtOAc in hexane) gave 23 (1.63 g). MS m/z 383 (M+1).

Step 3:
Ketone 23 (1.634 g, 0.00426 mol) was dissolved in CH₃OH, NH₄OAc and NaCNBH₃ were added. The mixture was stirred for 2 h. The reaction was quenched with NH₄OH and the mixture extracted with CH₂Cl₂. The organic extracts were dried and concentrated to give an oil. MS m/z 383 (M+1).

The oil was dissolved in CH₂Cl₂, Et₃N was added and the mixture C(O)Ole to 0°C. Ethyl chloroformate was added and the mixture was stirred overnight. Aqueous work-up with NH₄Cl (sat) followed by column chromatography (30% EtOAc in hexane) gave 0.797 g of an inseparable 3:1 mixture of α-24 and β-24. MS m/z 456 (M+1).
5 Step 4:

The product mixture from step 3 (330 mg, 0.724 mmol) was dissolved in EtOAc (14 ml) and Pd(C) (10% by wt) was added. The mixture was stirred under H₂ (1 atm) for 2 h. The mixture was filtered, concentrated, and dissolved in CH₂OH (15 ml). PtO₂ (10% by wt) was added, the mixture was placed under H₂ atmosphere (50 psi), and agitated on a parr shaker for 3 days. The mixture was filtered and concentrated to give 280 mg of acids 25. MS m/z 368 (M+1).

Step 5:

The crude acids 25 (0.724 mmol) were dissolved in CH₂Cl₂. (COCl)₂ (0.1 ml, 1.5 eq) and a drop of DMF were added. The mixture was stirred for 30 min, when ¹H NMR showed complete conversion. The CH₂Cl₂ was replaced with toluene and the resulting solution was C(O)Oled to 0°C. Pd(Ph₃P)₄ was added, followed by dropwise addition of Bu₃SnH. After stirring at 0°C for 30 min, TLC showed complete reaction. Column chromatography (20-50% EtOAc in hexane) gave 248 mg of aldehydes 26. MS m/z 352 (M+1).

Step 6:

Phosphonate 27 (248 mg, 0.768 mmol, 3 eq), see US 6,063,847, was dissolved in THF (4 ml) and the mixture was C(O)Oled to 0°C. LHMDS (0.768 ml, 3 eq of a 1M solution in THF) was added and the resulting mixture stirred for 30 min. Ti(i-OPr)₄ (0.227 ml, 3 eq.) was added and 5 min later a solution of aldehydes 26 (90 mg, 0.256 mol) in THF (4 ml) was added. The mixture was stirred for 1.5 h
when TLC showed complete conversion. Saturated sodium potassium tartrate was added and the THF removed under vacuum. The residue was extracted with EtOAc, dried, concentrated and purified by PTLC (1:1 EtOAc/hexane) to give the title compound (80 mg). MS m/z 521 (M+1).

A solution of the above mesylate was stirred with 950 mg of NaN₃ (14.6 mmol, 5 equiv.) in 10 ml DMSO at 65 °C for 1.5 hr. It was diluted with 150 ml of EtOAc, washed with 3x50 ml H₂O, 50 ml brine, dried over MgSO₄, filtered and concentrated to provide 1.3 g of azide.

To a solution of this azide in 15 ml EtOAc and 0.2 ml H₂O at 0 °C was added 1M Me₃P in THF and stirred at room temperature for 4 hr. It was concentrated and chromatographed with 4% MeOH-DCM to provide 1.06 g of amine.

For preparing pharmaceutical compositions from the compounds described by this invention, inert, pharmaceutically acceptable carriers can be either solid or liquid. Solid form preparations include powders, tablets, dispersible granules, capsules, cachets and suppositories. The powders and tablets may be comprised of from about 5 to about 95 percent active ingredient. Suitable solid carriers are known in the art, e.g., magnesium carbonate, magnesium stearate, talc, sugar or lactose. Tablets, powders, cachets and capsules can be used as solid dosage forms suitable for oral administration. Examples of pharmaceutically acceptable carriers and methods of manufacture for various compositions may be found in A. Gennaro (ed.), *The Science and Practice of Pharmacy*, 20th Edition, Lippincott Williams & Wilkins, Baltimore, MD, (2000).

Liquid form preparations include solutions, suspensions and emulsions. As an example may be mentioned water or water-propylene glycol solutions for parenteral injection or addition of sweeteners and opacifiers for oral solutions, suspensions and emulsions. Liquid form preparations may also include solutions for intranasal administration.
Aerosol preparations suitable for inhalation may include solutions and solids in powder form, which may be in combination with a pharmaceutically acceptable carrier, such as an inert compressed gas, e.g., nitrogen.

Also included are solid form preparations which are intended to be converted, shortly before use, to liquid form preparations for either oral or parenteral administration. Such liquid forms include solutions, suspensions and emulsions.

The compounds of the invention may also be deliverable transdermally. The transdermal compositions can take the form of creams, lotions, aerosols and/or emulsions and can be included in a transdermal patch of the matrix or reservoir type as are conventional in the art for this purpose.

Preferably the compound is administered orally.

Preferably, the pharmaceutical preparation is in a unit dosage form. In such form, the preparation is subdivided into suitably sized unit doses containing appropriate quantities of the active component, e.g., an effective amount to achieve the desired purpose.

The daily dose of a compound of Formula I for treatment of a disease or condition cited above is about 0.001 to about 100 mg/kg of body weight per day, preferably about 0.001 to about 10 mg/kg. For an average body weight of 70 kg, the dosage level is therefore from about 0.1 to about 700 mg of drug per day, given in a single dose or 2-4 divided doses.

The amount and frequency of administration of the compounds of the invention and/or the pharmaceutically acceptable salts thereof will be regulated according to the judgment of the attending clinician considering such factors as age, condition and size of the patient as well as severity of the symptoms being treated.

Further embodiments of the invention encompass the administration of compounds of Formula I along with at least one additional cardiovascular agent. The contemplated additional cardiovascular agent is one that differs in either atomic make up or arrangement from the compounds of Formula I. Additional cardiovascular agents that can be used in combination with the novel compounds of this invention include drugs which have anti-thrombotic, anti-platelet
aggregation, antiatherosclerotic, antirestenotic and/or anti-coagulant activity. Such drugs are useful in treating thrombosis-related diseases including thrombosis, atherosclerosis, restenosis, hypertension, angina pectoris, arrhythmia, heart failure, myocardial infarction, glomerulonephritis, thrombotic and thromboembolic stroke, peripheral vascular diseases, other cardiovascular diseases, cerebral ischemia, inflammatory disorders and cancer, as well as other disorders in which thrombin and its receptor play a pathological role. Suitable cardiovascular agents are selected from the group consisting of thromboxane A2 biosynthesis inhibitors such as aspirin; thromboxane antagonists such as seratrodast, picotamide and ramatroban; adenosine diphosphate (ADP) inhibitors such as clopidogrel; cyclooxygenase inhibitors such as aspirin, meloxicam, rofecoxib and celecoxib; angiotensin antagonists such as valsartan, telmisartan, candesartan, irbesartan, losartan and eprosartan; endothelin antagonists such as tezosentan; phosphodiesterase inhibitors such as milrinone and enoximone; angiotensin converting enzyme (ACE) inhibitors such as captopril, enalapril, enalaprilat, spirapril, quinapril, perindopril, ramipril, fosinopril, trandolapril, lisinopril, moexipril and benazapril; neutral endopeptidase inhibitors such as candoxatril and ecadotril; anticoagulants such as ximelagatran, fondaparinux and enoxaparin; diuretics such as chlorothiazide, hydrochlorothiazide, ethacrynic acid, furosemide and amiloride; platelet aggregation inhibitors such as abciximab and eptifibatide; and GP IIb/IIIa antagonists.

Preferred types of drugs for use in combination with the novel compounds of this invention are thromboxane A2 biosynthesis inhibitors, cyclooxygenase inhibitors and ADP antagonists. Especially preferred for use in the combinations are aspirin and clopidogrel bisulfate.

When the invention comprises a combination of a compound of Formula I and another cardiovascular agent, the two active components may be co-administered simultaneously or sequentially, or a single pharmaceutical composition comprising a compound of Formula I and another cardiovascular agent in a pharmaceutically acceptable carrier can be administered. The components of the combination can be administered individually or together in any conventional dosage form such as capsule, tablet, powder, cachet, suspension,
solution, suppository, nasal spray, etc. The dosage of the cardiovascular agent can be determined from published material, and may range from 1 to 1000 mg per dose.

In this specification, the term "at least one compound of Formula I" means that one to three different compounds of Formula I may be used in a pharmaceutical composition or method of treatment. Preferably one compound of Formula I is used. Similarly, the term "one or more additional cardiovascular agents" means that one to three additional drugs may be administered in combination with a compound of Formula I; preferably, one additional compound is administered in combination with a compound of Formula I. The additional cardiovascular agents can be administered sequentially or simultaneously with reference to the compound of Formula I.

When separate compounds of Formula I and the other cardiovascular agents are to be administered as separate compositions, they can be provided in a kit comprising in a single package, one container comprising a compound of Formula I in a pharmaceutically acceptable carrier, and a separate container comprising another cardiovascular agent in a pharmaceutically acceptable carrier, with the compound of Formula I and the other cardiovascular agent being present in amounts such that the combination is therapeutically effective. A kit is advantageous for administering a combination when, for example, the components must be administered at different time intervals or when they are in different dosage forms.

The activity of the compounds of Formula I can be determined by the following procedures.

**In Vitro Testing Procedure for Thrombin Receptor Antagonists:**

**Preparation of [3H]haTRAP**

\[ \text{A(pF-F)R(ChA)(hR)(I_2-Y)-NH}_2 \] (1.03 mg) and 10% Pd/C (5.07 mg) were suspended in DMF (250 µl) and diisopropylethylamine (10 µl). The vessel was attached to the tritium line, frozen in liquid nitrogen and evacuated. Tritium gas (342 mCi) was then added to the flask, which was stirred at room temperature for 2 hours. At the completion of the reaction, the excess tritium was removed and the reacted peptide solution was diluted with DMF (0.5 ml) and filtered to remove the
catalyst. The collected DMF solution of the crude peptide was diluted with water and freeze dried to remove the labile tritium. The solid peptide was redissolved in water and the freeze drying process repeated. The tritiated peptide ([\textsuperscript{3}H]haTRAP) was dissolved in 0.5 ml of 0.1% aqueous TFA and purified by HPLC using the following conditions: column, Vydac C18, 25 cm x 9.4 mm I.D.; mobile phase, (A) 0.1% TFA in water, (B) 0.1% TFA in CH\textsubscript{3}CN; gradient, (A/B) from 100/0 to 40/60 over 30 min; flow rate, 5 ml/min; detection, UV at 215 nm. The radiochemical purity of [\textsuperscript{3}H]haTRAP was 99% as analyzed by HPLC. A batch of 14.9 mCi at a specific activity of 18.4 Ci/mmol was obtained.

**Preparation of platelet membranes**

Platelet membranes were prepared using a modification of the method of Natarajan et al (Natarajan et al, Int. J. Peptide Protein Res., vol. 45, pp.145-151 (1995) from 20 units of platelet concentrates obtained from the North Jersey Blood Center (East Orange, N.J.) within 48 hours of collection. All steps were carried out at 4° C under approved biohazard safety conditions. Platelets were centrifuged at 100 x g for 20 minutes at 4° C to remove red cells. The supernatants were decanted and centrifuged at 3000 x g for 15 minutes to pellet platelets. Platelets were resuspended in 10 mM Tris-HCl, pH 7.5, 150 mM NaCl, 5 mM EDTA, to a total volume of 200 ml and centrifuged at 4400 x g for 10 minutes. This step was repeated two additional times. Platelets were resuspended in 5 mM Tris-HCl, pH 7.5, 5 mM EDTA to a final volume of approximately 30 ml and were homogenized with 20 strokes in a Dounce homogenizer. Membranes were pelleted at 41,000 x g, resuspended in 40-50 ml 20 mM Tris-HCl, pH 7.5, 1 mM EDTA, 0.1 mM dithiothreitol, and 10 ml aliquots were frozen in liquid N\textsubscript{2} and stored at -80° C. To complete membrane preparation, aliquots were thawed, pooled, and homogenized with 5 strokes of a Dounce homogenizer. Membranes were pelleted and washed 3 times in 10 mM triethanolamine-HCl, pH 7.4, 5 mM EDTA, and resuspended in 20-25 ml 50 mM Tris-HCl, pH 7.5, 10 mM MgCl\textsubscript{2}, 1 mM EGTA, and 1% DMSO. Aliquots of membranes were frozen in liquid N\textsubscript{2} and stored at -80° C. Membranes were stable for at least 3 months. 20 units of platelet concentrates typically yielded 250 mg of membrane protein. Protein concentration was determined by a Lowry assay (Lowry et al, J. Biol. Chem., vol. 193, pp.265-275 (1951).
High Throughput Thrombin Receptor Radioligand Binding Assay

Thrombin receptor antagonists were screened using a modification of the thrombin receptor radioligand binding assay of Ahn et al. (Ahn et al, Mol. Pharmacol., vol. 51, p.350-356 (1997). The assay was performed in 96 well Nunc plates (Cat. No. 269620) at a final assay volume of 200 µl. Platelet membranes and [3H]haTRAP were diluted to 0.4 mg/ml and 22.2 nM, respectively, in binding buffer (50 mM Tris-HCl, pH 7.5, 10 mM MgCl₂, 1 mM EGTA, 0.1% BSA). Stock solutions (10 mM in 100% DMSO) of test compounds were further diluted in 100% DMSO. Unless otherwise indicated, 10 µl of diluted compound solutions and 90 µl of radioligand (a final concentration of 10 nM in 5% DMSO) were added to each well, and the reaction was started by the addition of 100 µl of membranes (40 µg protein/well). The binding was not significantly inhibited by 5% DMSO. Compounds were tested at three concentrations (0.1, 1 and 10 µM). The plates were covered and vortex-mixed gently on a Lab-Line Titer Plate Shaker for 1 hour at room temperature. Packard UniFilter GF/C filter plates were soaked for at least 1 hour in 0.1% polyethyleneimine. The incubated membranes were harvested using a Packard FilterMate Universal Harvester and were rapidly washed four times with 300 µl ice cold 50 mM Tris-HCl, pH 7.5, 10 mM MgCl₂, 1 mM EGTA. MicroScint 20 scintillation cocktail (25 µl) was added to each well, and the plates were counted in a Packard TopCount Microplate Scintillation Counter. The specific binding was defined as the total binding minus the nonspecific binding observed in the presence of excess (50 µM) unlabeled haTRAP. The % Inhibition by a compound of [3H]haTRAP binding to thrombin receptors was calculated from the following relationship:

% Inhibition = \[
\frac{\text{Total binding-Binding in the presence of a test compound}}{\text{Total binding-Nonspecific binding}} \times 100
\]

Affinity values (Kᵢ) were then determined using the following formula:

\[
Kᵢ = \frac{IC_{50}}{1 + \left(\frac{\text{concentration of radioligand}}{\text{affinity (K_D) of radioligand}}\right)}
\]

Hence, a lower value of Kᵢ indicates greater binding affinity.
Materials

A(pF-F)R(ChA)(hR)Y-NH$_2$ and A(pF-F)R(ChA)(hR)(l$_2$-Y)-NH$_2$, were custom synthesized by AnaSpec Inc. (San Jose, CA). The purity of these peptides was >95%. Tritium gas (97%) was purchased from EG&G Mound, Miamisburg Ohio. The gas was subsequently loaded and stored on an IN/US Systems Inc. Trisorber.

MicroScint 20 scintillation cocktail was obtained from Packard Instrument Co.

Protocol For Ex-Vivo Platelet Aggregation In Cynomolagus Whole Blood

Drug administration and blood collection:

Conscious chained cynomolgus monkeys are allowed to equilibrate for 30 min. A needle catheter is inserted into a brachial vein for infusion of test drugs. Another needle catheter is inserted into the other brachial or saphenous vein and used for blood sampling. In those experiments where the compound is administered orally only one catheter is used. A baseline blood sample (1-2 ml) is collected in vacutainer tubes containing a thrombin inhibitor CVS 2139 (100 µg/0.1 ml saline) as an anticoagulant. The drug is then infused intravenously over a period of 30 min. Blood samples (1 ml) are collected at 5, 10, 20, 30 min during and 30, 60, 90 min after termination of the drug infusion. In PO experiments the animals are dosed with the drug using a gavage cannula. Blood samples are collected at 0, 30, 60, 90, 120, 180, 240, 300, 360 min after dosing. 0.5 ml of the blood is used for whole blood aggregation and the other 0.5 ml is used for determining the plasma concentration of the drug or its metabolites. Aggregation is performed immediately after collection of the blood sample as described below.

Whole Blood Aggregation:

A 0.5 ml blood sample is added to 0.5 ml of saline and warmed to 37°C in a Chronolog whole blood aggregometer. Simultaneously, the impedance electrode is warmed in saline to 37°C. The blood sample with a stir bar is placed in the heating block well, the impedance electrode is placed in the blood sample and the collection software is started. The software is allowed to run until the baseline is stabilized and then a 20 Ω calibration check is performed. 20 Ω is equal to 4 blocks on the graphic produced by the computer software. The agonist (haTRAP) is added by an adjustable volume pipette (5-25 µl) and the aggregation curve is
recorded for 10 minutes. Maximum aggregation in 6 minutes following agonist addition is the value recorded.

**In vitro Platelet Aggregation Procedure:**

Platelet aggregation studies were performed according to the method of Bednar *et al.* (Bednar, B., Condra, C., Gould, R.J., and Connolly, T.M., *Throm. Res.*, vol. 77, pp.453-463 (1995)). Blood was obtained from healthy human subjects who were aspirin free for at least 7 days by venipuncture using ACD as anticoagulant. Platelet rich plasma was prepared by centrifugation at 100Xg for 15 minutes at 15 deg C. Platelets were pelleted at 3000xg and washed twice in buffered saline containing 1 mM EGTA and 20 µg/ml apyrase to inhibit aggregation. Aggregation was performed at room temperature in buffered saline supplemented with 0.2 mg/ml human fibrinogen. Test compound and platelets were preincubated in 96-well flat-bottom plates for 60 minutes. Aggregation was initiated by adding 0.3 µM haTRAP or 0.1 U/ml thrombin and rapidly vortexing the mixture using a Lab Line Titer Plate Shaker (speed 7). Percent aggregation was monitored as increasing light transmittance at 405 nm in a Spectromax Plate Reader.

**In vivo Antitumor Procedure:**

Tests in the human breast carcinoma model in nude mouse are conducted according to the procedure reported in S. Even-Ram *et al.*, *Nature Medicine*, 4, 8, pp. 909-914 (1988).

Compounds of the present invention are surprisingly active in the ex-vivo platelet aggregation test model. In these studies, the compound of Example 2 of this invention, after oral administration at a dose of 0.1 mg/kg, completely inhibited aggregation of platelets induced by exogenously added thrombin receptor activating peptide for duration of 24 hours. Even after 48 hours, approximately 65% of inhibition of platelet aggregation was sustained. In contrast, N-alkyl carbamate analogs, Examples 1A, 2A and 13 of US 6,063,847, were studied under similar conditions using a dose of 0.5 mg/kg, a 5-fold increase over the dose of the compound of Example 2. Under these conditions, the N-alkyl compounds showed no significant inhibition of platelet aggregation at various time points.
While the present invention has been described in conjunction with the specific embodiments set forth above, many alternatives, modifications and variations thereof will be apparent to those of ordinary skill in the art. All such alternatives, modifications, and variations are intended to fall within the spirit and scope of the present invention.

INTERNATIONAL SEARCH REPORT

Box I  Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(e) for the following reasons:

1. [X] Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:
   
   Although claims 24-28 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.

2. [ ] Claims Nos.: because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:

3. [ ] Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II  Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. [ ] As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.

2. [ ] As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. [ ] As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:

4. [ ] No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.: 

Remark on Protest

[ ] The additional search fees were accompanied by the applicant's protest.

[ ] No protest accompanied the payment of additional search fees.
