10 BACKGROUND

25

Huntington's disease (HD) is a progressive, autosomal dominant neurodegenerative disorder of the brain, having symptoms characterized by involuntary movements, cognitive impairment, and mental deterioration. Death, typically caused by pneumonia or coronary artery disease, usually occurs 13 to 15 years after the onset of symptoms. The prevalence of HD is between three and seven individuals per 100,000 in populations of western European descent. In North America, an estimated 30,000 people have HD, while an additional 200,000 people are at risk of inheriting the disease from an affected parent. The disease is caused by an expansion of uninterrupted trinucleotide CAG repeats in the "mutant" huntingtin (Htt) gene, leading to production of HTT (Htt protein) with an expanded poly-glutamine (polyQ) stretch, also known as a "CAG repeat" sequence. There are no current small molecule therapies targeting the underlying cause of the disease, leaving a high unmet need for medications that can be used for treating or ameliorating HD. Consequently, there remains a need to identify and provide small molecule compounds for treating or ameliorating HD.

All other documents referred to herein are incorporated by reference into the present application as though fully set forth herein.

As used herein, the term "substituent" means positional variables on the atoms of a core molecule that are substituted at a designated atom position, replacing one or more hydrogens on the designated atom, provided that the designated atom's normal valency is not exceeded, and that the substitution results in a stable compound. Combinations of substituents and/or variables are permissible only if such combinations result in stable compounds. A person of ordinary skill in the art should note that any carbon as well as heteroatom with valences that appear to be unsatisfied as described or shown herein is assumed to have a sufficient number of hydrogen atom(s) to satisfy the valences described or shown. In certain instances one or more substituents having a double bond (e.g., "oxo" or "=O") as the point of attachment may be described, shown or listed herein within a substituent group, wherein the structure may only show a single bond as the point of attachment to the core structure of Formula (I). A person of ordinary skill in the art would understand that, while only a single bond is shown, a double bond is intended for those substituents.

As used herein, the term "and the like," with reference to the definitions of chemical terms provided herein, means that variations in chemical structures that could be expected by one skilled in the art include, without limitation, isomers (including chain, branching or positional structural isomers), hydration of ring systems (including saturation or partial unsaturation of monocyclic, bicyclic or polycyclic ring structures) and all other variations where allowed by available valences which result in a stable compound.

For the purposes of this description, where one or more substituent variables for a compound of Formula (I) or a form thereof encompass functionalities incorporated into a compound of Formula (I), each functionality appearing at any location within the disclosed compound may be independently selected, and as appropriate, independently and/or optionally substituted.

As used herein, the terms "independently selected," or "each selected" refer to functional variables in a substituent list that may occur more than once on the structure of Formula (I), the pattern of substitution at each occurrence is independent of the pattern at any other occurrence. Further, the use of a generic substituent variable on any formula or structure for a compound

described herein is understood to include the replacement of the generic substituent with species substituents that are included within the particular genus, *e.g.*, aryl may be replaced with phenyl or naphthalenyl and the like, and that the resulting compound is to be included within the scope of the compounds described herein.

As used herein, the terms "each instance of" or "in each instance, when present," when used preceding a phrase such as "... C_{3-14} cycloalkyl, C_{3-14} cycloalkyl- C_{1-4} alkyl, aryl, aryl- C_{1-4} alkyl, heteroaryl, heteroaryl- C_{1-4} alkyl, heterocyclyl and heterocyclyl- C_{1-4} alkyl," are intended to refer to the C_{3-14} cycloalkyl, aryl, heteroaryl and heterocyclyl ring systems when each are present either alone or as a substituent.

As used herein, the term "protected" means that a functional group in a compound of Formula (I) or a form thereof is in a form modified to preclude undesired side reactions at the protected site when the compound is subjected to a reaction. Suitable protecting groups will be recognized by those with ordinary skill in the art as well as by reference to standard textbooks such as, for example, T.W. Greene et al, Protective Groups in organic Synthesis (1991), Wiley, New York. Such functional groups include hydroxy, phenol, amino and carboxylic acid. Suitable protecting groups for hydroxy or phenol include trialkylsilyl or diarylalkylsilyl (e.g., t-butyldimethylsilyl, t-butyldiphenylsilyl or trimethylsilyl), tetrahydropyranyl, benzyl, substituted benzyl, methyl, methoxymethanol, and the like. Suitable protecting groups for amino, amidino and guanidino include t-butoxycarbonyl, benzyloxycarbonyl, and the like. Suitable protecting groups for carboxylic acid include alkyl, aryl or arylalkyl esters. In certain instances, the protecting group may also be a polymer resin, such as a Wang resin or a 2-chlorotrityl-chloride resin. Protecting groups may be added or removed in accordance with standard techniques, which are well-known to those skilled in the art and as described herein. It will also be appreciated by those skilled in the art, although such protected derivatives of compounds described herein may not possess pharmacological activity as such, they may be administered to a subject and thereafter metabolized in the body to form compounds described herein which are pharmacologically active. Such derivatives may therefore be described as "prodrugs". All prodrugs of compounds described herein are included within the scope of the use described herein.

As used herein, the term "prodrug" means a form of an instant compound (*e.g.*, a drug precursor) that is transformed *in vivo* to yield an active compound of Formula (I) or a form thereof. The transformation may occur by various mechanisms (*e.g.*, by metabolic and/or non-metabolic chemical processes), such as, for example, by hydrolysis and/or metabolism in blood, liver and/or other organs and tissues. A discussion of the use of prodrugs is provided by T. Higuchi and W. Stella, "Pro-drugs as Novel Delivery Systems," Vol. 14 of the A.C.S. Symposium Series, and in Bioreversible Carriers in Drug Design, ed. Edward B. Roche, American Pharmaceutical Association and Pergamon Press, 1987.

In one example, when a compound of Formula (I) or a form thereof contains a carboxylic acid functional group, a prodrug can comprise an ester formed by the replacement of the hydrogen atom of the acid group with a functional group such as alkyl and the like. In another example, when a compound of Formula (I) or a form thereof contains a hydroxyl functional group, a prodrug form can be prepared by replacing the hydrogen atom of the hydroxyl with another functional group such as alkyl, alkylcarbonyl or a phosphonate ester and the like. In another example, when a compound of Formula (I) or a form thereof contains an amine functional group, a prodrug form can be prepared by replacing one or more amine hydrogen atoms with a functional group such as alkyl or substituted carbonyl. Pharmaceutically acceptable prodrugs of compounds of Formula (I) or a form thereof include those compounds substituted with one or more of the following groups: carboxylic acid esters, sulfonate esters, amino acid esters, phosphonate esters and mono-, di- or triphosphate esters or alkyl substituents, where appropriate. As described herein, it is understood by a person of ordinary skill in the art that one or more of such substituents may be used to provide a compound of Formula (I) or a form thereof as a prodrug.

One or more compounds described herein may exist in unsolvated as well as solvated forms with pharmaceutically acceptable solvents such as water, ethanol, and the like, and the description herein is intended to embrace both solvated and unsolvated forms.

As used herein, the term "solvate" means a physical association of a compound described herein with one or more solvent molecules. This physical association involves varying degrees of ionic and covalent bonding, including hydrogen bonding. In certain instances the solvate will be capable of isolation, for example when one or more solvent molecules are incorporated in the crystal lattice of the crystalline solid. As used herein, "solvate" encompasses both solution-phase and isolatable solvates. Non-limiting examples of suitable solvates include ethanolates, methanolates, and the like.

Stahl *et al*, Camille G. (eds.) *Handbook of Pharmaceutical Salts. Properties, Selection and Use.* (2002) Zurich: Wiley-VCH; S. Berge *et al*, *Journal of Pharmaceutical Sciences* (1977) 66(1) 1-19; P. Gould, *International J. of Pharmaceutics* (1986) 33, 201-217; Anderson *et al*, *The Practice of Medicinal Chemistry* (1996), Academic Press, New York; and in *The Orange Book* (Food & Drug Administration, Washington, D.C. on their website). These disclosures are incorporated herein by reference thereto.

Suitable basic salts include, but are not limited to, aluminum, ammonium, calcium, lithium, magnesium, potassium, sodium and zinc salts.

All such acid salts and base salts are intended to be included within the scope of pharmaceutically acceptable salts as described herein. In addition, all such acid and base salts are

considered equivalent to the free forms of the corresponding compounds for purposes of this description.

Compounds of Formula (I) and forms thereof, may further exist in a tautomeric form. All such tautomeric forms are contemplated and intended to be included within the scope of the compounds of Formula (I) or a form thereof as described herein.

The compounds of Formula (I) or a form thereof may contain asymmetric or chiral centers, and, therefore, exist in different stereoisomeric forms. The present description is intended to include all stereoisomeric forms of the compounds of Formula (I) as well as mixtures thereof, including racemic mixtures.

The compounds described herein may include one or more chiral centers, and as such may exist as racemic mixtures (R/S) or as substantially pure enantiomers and diastereomers. The compounds may also exist as substantially pure (R) or (S) enantiomers (when one chiral center is present). In one particular aspect, the compounds described herein are (S) isomers and may exist as enantiomerically pure compositions substantially comprising only the (S) isomer. In another particular aspect, the compounds described herein are (R) isomers and may exist as enantiomerically pure compositions substantially comprising only the (R) isomer. As one of skill in the art will recognize, when more than one chiral center is present, the compounds described herein may also exist as a (R,R), (R,S), (S,R) or (S,S) isomer, as defined by IUPAC Nomenclature Recommendations.

As used herein, the term "substantially pure" refers to compounds consisting substantially of a single isomer in an amount greater than or equal to 90%, in an amount greater than or equal to 92%, in an amount greater than or equal to 95%, in an amount greater than or equal to 98%, in an amount greater than or equal to 99%, or in an amount equal to 100% of the single isomer.

In one aspect of the description, a compound of Formula (I) or a form thereof is a substantially pure (S) enantiomer form present in an amount greater than or equal to 90%, in an amount greater than or equal to 92%, in an amount greater than or equal to 95%, in an amount greater than or equal to 98%, in an amount greater than or equal to 99%, or in an amount equal to 100%.

In one aspect of the description, a compound of Formula (I) or a form thereof is a substantially pure (R) enantiomer form present in an amount greater than or equal to 90%, in an amount greater than or equal to 92%, in an amount greater than or equal to 95%, in an amount

greater than or equal to 98%, in an amount greater than or equal to 99%, or in an amount equal to 100%.

As used herein, a "racemate" is any mixture of isometric forms that are not "enantiomerically pure", including mixtures such as, without limitation, in a ratio of about 50/50, about 60/40, about 70/30, or about 80/20.

In addition, the present description embraces all geometric and positional isomers. For example, if a compound of Formula (I) or a form thereof incorporates a double bond or a fused ring, both the cis- and trans-forms, as well as mixtures, are embraced within the scope of the description. Diastereomeric mixtures can be separated into their individual diastereomers on the basis of their physical chemical differences by methods well known to those skilled in the art, such as, for example, by chromatography and/or fractional crystallization. Enantiomers can be separated by use of chiral HPLC column or other chromatographic methods known to those skilled in the art. Enantiomers can also be separated by converting the enantiomeric mixture into a diastereomeric mixture by reaction with an appropriate optically active compound (*e.g.*, chiral auxiliary such as a chiral alcohol or Mosher's acid chloride), separating the diastereomers and converting (*e.g.*, hydrolyzing) the individual diastereomers to the corresponding pure enantiomers. Also, some of the compounds of Formula (I) may be atropisomers (*e.g.*, substituted biaryls) and are considered as part of this description.

All stereoisomers (for example, geometric isomers, optical isomers and the like) of the present compounds (including those of the salts, solvates, esters and prodrugs of the compounds as well as the salts, solvates and esters of the prodrugs), such as those which may exist due to asymmetric carbons on various substituents, including enantiomeric forms (which may exist even in the absence of asymmetric carbons), rotameric forms, atropisomers, and diastereomeric forms, are contemplated within the scope of this description, as are positional isomers (such as, for example, 4-pyridyl and 3-pyridyl). Individual stereoisomers of the compounds described herein may, for example, be substantially free of other isomers, or may be present in a racemic mixture, as described supra.

The use of the terms "salt", "solvate", "ester", "prodrug" and the like, is intended to equally apply to the salt, solvate, ester and prodrug of enantiomers, stereoisomers, rotamers, tautomers, positional isomers, racemates or isotopologues of the instant compounds.

The term "isotopologue" refers to isotopically-enriched compounds described herein which are identical to those recited herein, but for the fact that one or more atoms are replaced by an atom having an atomic mass or mass number different from the atomic mass or mass number usually found in nature. Examples of isotopes that can be incorporated into compounds described herein include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorus, fluorine and chlorine, such as ²H, ³H, ¹³C, ¹⁴C, ¹⁵N, ¹⁸O, ¹⁷O, ³¹P, ³²P, ³⁵S, ¹⁸F, ³⁵Cl and ³⁶Cl, respectively, each of which are also within the scope of this description.

Certain isotopically-enriched compounds described herein (*e.g.*, those labeled with ³H and ¹⁴C) are useful in compound and/or substrate tissue distribution assays. Tritiated (*i.e.*, ³H) and carbon-14 (*i.e.*, ¹⁴C) isotopes are particularly preferred for their ease of preparation and detectability. Further, substitution with heavier isotopes such as deuterium (*i.e.*, ²H) may afford certain therapeutic advantages resulting from greater metabolic stability (*e.g.*, increased in vivo half-life or reduced dosage requirements) and hence may be preferred in some circumstances.

Polymorphic crystalline and amorphous forms of the compounds of Formula (I) and of the salts, solvates, hydrates, esters and prodrugs of the compounds of Formula (I) are further intended to be included in the present description.

Effective amounts for a given subject may be determined by routine experimentation that is within the skill and judgment of a clinician or a practitioner skilled in the art in light of factors related to the subject. Dosage and administration may be adjusted to provide sufficient levels of the active agent(s) or to maintain the desired effect. Factors which may be taken into account include genetic screening, severity of the disease state, status of disease progression, general health of the subject, ethnicity, age, weight, gender, diet, time of day and frequency of administration, drug combination(s), reaction sensitivities, experience with other therapies, and tolerance/response to therapy.

The dose administered to achieve an effective target plasma concentration may be orally administered once (once in approximately a 24 hour period; i.e., "q.d."), twice (once in approximately a 12 hour period; i.e., "b.i.d." or "q.12h"), thrice (once in approximately an 8 hour

period; i.e., "t.i.d." or "q.8h"), or four times (once in approximately a 6 hour period; i.e., "q.d.s.", "q.i.d." or "q.6h") daily.

In certain aspects, the dose administered to achieve an effective target plasma concentration may also be administered in a single, divided, or continuous dose for a patient or subject having a weight in a range of between about 40 to about 200 kg (which dose may be adjusted for patients or subjects above or below this range, particularly children under 40 kg). The typical adult subject is expected to have a median weight in a range of about 70 kg. Longacting pharmaceutical compositions may be administered every 2, 3 or 4 days, once every week, or once every two weeks depending on half-life and clearance rate of the particular formulation.

The compounds and compositions described herein may be administered to the subject via any drug delivery route known in the art. Nonlimiting examples include oral, ocular, rectal, buccal, topical, nasal, sublingual, transdermal, subcutaneous, intramuscular, intraveneous (bolus and infusion), intracerebral, and pulmonary routes of administration.

In another aspect, the dose administered may be adjusted based upon a dosage form described herein formulated for delivery at about 0.02, 0.025, 0.03, 0.05, 0.06, 0.075, 0.08, 0.09, 0.10, 0.20, 0.25, 0.30, 0.50, 0.60, 0.75, 0.80, 0.90, 1.0, 1.10, 1.20, 1.25, 1.50, 1.75, 2.0, 3.0, 5.0, 10, 20, 30, 40, 50, 100, 150, 200, 250, 300, 400, 500, 1000, 1500, 2000, 2500, 3000 or 4000 mg/day.

For any compound, the effective amount can be estimated initially either in cell culture assays or in relevant animal models, such as a mouse, guinea pig, chimpanzee, marmoset or tamarin animal model. Relevant animal models may also be used to determine the appropriate concentration range and route of administration. Such information can then be used to determine useful doses and routes for administration in humans. Therapeutic efficacy and toxicity may be determined by standard pharmaceutical procedures in cell cultures or experimental animals, *e.g.*, ED₅₀ (the dose therapeutically effective in 50% of the population) and LD₅₀ (the dose lethal to 50% of the population). The dose ratio between therapeutic and toxic effects is therapeutic index, and can be expressed as the ratio, LD₅₀/ED₅₀. In certain aspects, the effective amount is such that a large therapeutic index is achieved. In further particular aspects, the dosage is within a range of circulating concentrations that include an ED₅₀ with little or no toxicity. The dosage may vary within this range depending upon the dosage form employed, sensitivity of the patient, and the route of administration.

METABOLITES

Also included within the scope of the present description are the use of *in vivo* metabolic products of the compounds described herein. Such products may result, for example, from the oxidation, reduction, hydrolysis, amidation, esterification and the like of the administered compound, primarily due to enzymatic processes. Accordingly, the description includes the use of compounds produced by a process comprising contacting a compound described herein with a mammalian tissue or a mammal for a period of time sufficient to yield a metabolic product thereof.

Such products typically are identified by preparing a radio-labeled isotopologue (*e.g.*, ¹⁴C or ³H) of a compound described herein, administering the radio-labeled compound in a detectable dose (*e.g.*, greater than about 0.5 mg/kg) to a mammal such as a rat, mouse, guinea pig, dog, monkey or human, allowing sufficient time for metabolism to occur (typically about 30 seconds to about 30 hours), and identifying the metabolic conversion products from urine, bile, blood or other biological samples. The conversion products are easily isolated since they are "radiolabeled" by virtue of being isotopically-enriched (others are isolated by the use of antibodies capable of binding epitopes surviving in the metabolite). The metabolite structures are determined in conventional fashion, *e.g.*, by MS or NMR analysis. In general, analysis of metabolites may be done in the same way as conventional drug metabolism studies well-known to those skilled in the art. SPECIFIC SYNTHETIC EXAMPLES

To describe in more detail and assist in understanding, the following non-limiting examples are offered to more fully illustrate the scope of compounds described herein and are not to be construed as specifically limiting the scope thereof. Such variations of the compounds described herein that may be now known or later developed, which would be within the purview of one skilled in the art to ascertain, are considered to fall within the scope of the compounds as described herein and hereinafter claimed. These examples illustrate the preparation of certain compounds. Those of skill in the art will understand that the techniques described in these examples represent techniques, as described by those of ordinary skill in the art, that function well in synthetic practice, and as such constitute preferred modes for the practice thereof. However, it should be appreciated that those of skill in the art should, in light of the present disclosure, appreciate that many changes can be made in the specific methods that are disclosed and still obtain a like or similar result without departing from the spirit and scope of the present description.

Other than in the following examples of the embodied compounds, unless indicated to the contrary, all numbers expressing quantities of ingredients, reaction conditions, experimental data, and so forth used in the specification and claims are to be understood as being modified by the term "about". Accordingly, all such numbers represent approximations that may vary depending upon the desired properties sought to be obtained by a reaction or as a result of variable experimental conditions. Therefore, within an expected range of experimental reproducibility, the term "about" in the context of the resulting data, refers to a range for data provided that may vary according to a standard deviation from the mean. As well, for experimental results provided, the resulting data may be rounded up or down to present data consistently, without loss of significant figures. At the very least, and not as an attempt to limit the application of the doctrine of

equivalents to the scope of the claims, each numerical parameter should be construed in light of the number of significant digits and rounding techniques used by those of skill in the art.

While the numerical ranges and parameters setting forth the broad scope of the present description are approximations, the numerical values set forth in the examples set forth below are reported as precisely as possible. Any numerical value, however, inherently contains certain errors necessarily resulting from the standard deviation found in their respective testing measurements.

Example 1

Preparation of Compound 11

Step 1: To suspension of 3,6-dichloropyridazin-4-amine (1.48 g, 9.02 mmol) in CH₂Cl₂ (25 mL) was added di-tertbutyl dicarbonate (2.2 g, 10 mmol) in one portion followed by addition of a few crystals of DMAP. The reaction was stirred at room temperature for 4 h. Almost complete conversion was observed accompanied by formation of di-Boc material. The solvent was removed under reduced pressure and the product was isolated by silica gel column chromatography eluting with EtOAc/hexanes gradient (0-20% EtOAc) to afford tert-butyl *N*-(3,6-dichloropyridazin-4-yl)carbamate (1.71 g, 72%) as a white solid.

Step 2: To a mixture of tert-butyl *N*-(3,6-dichloropyridazin-4-yl)carbamate (1.71 g, 6.47 mmol), CuI (75 mg, 0.39 mmol) and Pd(PPh₃)₂Cl₂_(140 mg, 0.20 mmol) in CH₃CN (25 mL) under an argon atmosphere was added Et₃N (4.50 mL, 32.3 mmol) followed by ethynyl(trimethyl)silane (1.10 mL, 7.78 mmol). The mixture was heated under an argon atmosphere for 1 h, after which, no starting material was detected by UPLC. The solvent was concentrated and the residue was treated with EtOAc. The solid was filtered, washed well with EtOAc and discarded. The mother liquor was concentrated and the residue was purified by silica gel column chromatography eluting with EtOAc/hexanes gradient (0-20% EtOAc) to afford tert-butyl *N*-[6-chloro-3-(2-trimethylsilylethynyl)pyridazin-4-yl]carbamate (1.12 g, 53%) as an oil which solidified on standing.

Step 3: To a solution of tert-butyl *N*-[6-chloro-3-(2-trimethylsilylethynyl)pyridazin-4-yl]carbamate (1.1 g, 3.4 mmol) in DMF (10mL) was added powdered K₂CO₃ (1.00 g, 7.24 mmol). The mixture was heated at 60 °C for 30 min. The reaction was then diluted with water and extracted with EtOAc. Upon drying of the organic phase over Na₂SO₄ and concentration of the solvent, the residue was purified by silica gel column chromatography eluting with EtOAc/hexanes gradient (0-50% EtOAc) to afford tert-butyl 3-chloropyrrolo[3,2-c]pyridazine-5-carboxylate (0.600 g, 70%) as a white solid. MS *m/z* 254.3 [M+H]⁺.

Step 4: 1-Bromo-4-iodo-2-methoxybenzene (50 g, 160 mmol) was suspended in dichloromethane (75 mL) at -10 °C. 1 N BBr₃ in CH₂Cl₂ (250 mL, 250 mmol) was cannulated in over 30 minutes, with the internal temperature remaining below 0 °C throughout the addition. After the addition, the mixture was stirred at 0 °C for 1 h, and then at room temperature for an additional 16 h. The mixture was cooled in an ice bath. 10% Aqueous Na₂CO₃ (250 mL) was added in portions. The
 mixture was then partitioned between H₂O and dichloromethane. The dichloromethane layer was

dried over MgSO₄ and then filtered. 2-Bromo-5-iodophenol (46 g, 96%) was obtained from the filtrate as a pinkish-white solid.

¹H NMR (acetone- d_6) δ: 9.24 (br s, 1H), 7.38 (d, J= 2 Hz, 1H), 7.31 (d, J= 8.5 Hz, 1H), 7.17 (dd, J= 8.5 Hz, 2 Hz, 1H).

- Step 5: 2-Bromo-5-iodophenol (54.9 g, 184 mmol), was dissolved in DMF (240 mL) at 0 °C. 2.5 M Sodium *tert*-pentoxide in THF (90 mL, 230 mmol) was then added dropwise. The reaction was stirred at 0 °C for 15 minutes after the addition was complete. Chloromethyl methyl ether (18 mL, 225 mmol) was added dropwise over 30 minutes. The mixture was warmed to ambient temperature and was stirred for 16 h. The mixture was diluted with H₂O (1500 mL) and was extracted into EtOAc (2 x 400 mL). The combined organic layers were washed with H₂O (300 mL), and then with brine. The organic layer was dried over MgSO₄, filtered, and concentrated under vacuum. The crude product was flushed through a silica plug using CH₂Cl₂ in hexanes (0–10%) to yield 1-bromo-4-iodo-2-(methoxymethoxy)benzene (61 g, 97%) as a clear liquid.
- ¹H NMR (acetone- d_6) δ: 7.56 (d, J= 2 Hz, 1H), 7.38 (d, J= 8Hz, 1H), 7.33 (dd, J= 8 Hz, 2 Hz, 1H), 5.35 (s, 2H), 3.50 (s, 3H).
 - Step 6: 1-Bromo-4-iodo-2-(methoxymethoxy)benzene (49 g, 143 mmol), 1-(tetrahydro-2*H*-pyran-2-yl)-4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)-1*H*-pyrazole (48.4 g, 174 mmol), PdCl₂(dppf)-dichloromethane adduct (3.1 g, 3.6 mmol), dioxane (500 mL), and aqueous 1 N K₂CO₃ (350 mL, 350 mmol) were heated at 90 °C for 2 h. The reaction mixture was then partitioned between H₂O and EtOAc. The organic layer was dried over MgSO₄, filtered, and concentrated under vacuum. Purification by silica gel chromatography (EtOAc in hexanes, 20–50%), followed by trituration with hexanes, yielded 4-(4-bromo-3-(methoxymethoxy)phenyl)-1-(tetrahydro-2*H*-pyran-2-yl)-1*H*-pyrazole (40.4 g, 77%) as an off-white solid.

- ¹H NMR (acetone-*d*₆) δ: 8.22 (s, 1H), 7.88 (s, 1H), 7.55 (d, *J*= 8.5 Hz, 1H), 7.47 (d, *J*= 2 Hz, 1H), 7.23 (dd, *J*= 8.5 Hz, 2 Hz, 1H), 5.44 (dd, *J*= 9.5 Hz, 2.5 Hz, 1H), 5.38 (S, 2H), 4.01 (m, 1H), 3.72 (m, 1H), 3.51 (s, 3H), 2.1-2.23 (m, 1H), 2.0-2.1 (m, 2H), 1.7-1.8 (m, 1H), 1.6-1.7 (m, 2H).
 - Step 7: Potassium acetate (22 g, 224 mmol) was pumped dry at 180 °C for 2 h, and then the flask was filled with argon. 4-(4-Bromo-3-(methoxymethoxy)phenyl)-1-(tetrahydro-2*H*-pyran-2-yl)-1*H*-pyrazole (20 g, 54.5 mmol), PdCl₂(dppf)-dichloromethane adduct (1.22 g, 1.47 mmol),
- 30 bis(pinacolato)diboron (20.8 g, 81.9 mmol), and dry toluene (200 mL) was added. This mixture

was heated at 110 °C for 2 days. The mixture was filtered through Celite[®], eluting with ether. The filtrate was concentrated under vacuum, re-dissolved in ether, and was filtered again through Celite[®] to remove solid impurities. Purification by silica gel chromatography (EtOAc in hexanes, 20–50%) yielded crude product (12 g) that was mostly free of protodeboronated by-product. This was dissolved in ether (100 mL) and washed with aqueous NaHCO₃ (2x1.5 L) and brine, then dried over MgSO₄, and then filtered. The filtrate was concentrated to provide pure product (7.05 g, 32%) as a glassy semi-solid.

Example 8

Preparation of Compound 17

Step 1: To a solution of methyl 4,6-dichloropyridazine-3-carboxylate (2.05 g, 9.9 mmol) in CH₃CN (26 mL) was added a solution of methyl 2-sulfanylacetate (0.90 mL, 10.0 mmol) in CH₃CN (8.5 mL) dropwise at 0 °C. Upon completion of addition, Et₃N (1.40 mL, 10.0 mmol) was added dropwise. The reaction stirred at 0 °C for 15 min. After 15 min, an additional portion

of Et₃N (1.40 mL, 10.0 mmol) was added and the mixture was allowed to warm to room temperature and stirred overnight. The reaction was diluted with water and concentrated. The mixture was acidified with 4N HCl to pH \approx 3 and the bright yellow solution turned colorless and a white precipitate was formed. The solid was collected by filtration and washed with water to afford methyl 3-chloro-7-hydroxy-thieno[3,2-c]pyridazine-6-carboxylate (2.26 g, 93.1% yield) as white solid. MS m/z 245.1 [M+H]⁺.

- Step 2: To a solution of methyl 3-chloro-7-hydroxy-thieno[3,2-c]pyridazine-6-carboxylate (2.26 g, 9.24 mmol) in DMF (30 mL) were added imidazole (1.0 g, 15 mmol) and TIPSCl (2.25 mL, 10 mmol). The mixture was stirred at room temperature for 15 min and then heated to 50 °C for 24 h.
- 10 Upon completion, the reaction was cooled to room temperature and was then diluted with water and the product was extracted with EtOAc. The combined organic phases were dried over Na₂SO₄, concentrated and the residue was purified by silica gel column chromatography, eluting with a EtOAc/CH₂Cl₂ gradient (0-5% EtOAc), to provide methyl 3-chloro-7-triisopropylsilyloxy-thieno[3,2-c]pyridazine-6-carboxylate (2.04 g, 55.1% yield) as an off-white solid.
- Step 3: A mixture of methyl 3-chloro-7-triisopropylsilyloxy-thieno[3,2-c]pyridazine-6-carboxylate (800 mg, 1.9 mmol), 4-[3-(methoxymethoxy)-4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenyl]-1-tetrahydropyran-2-yl-pyrazole (prepared in example 1, step7, 1.00 g, 2.4 mmol), [1,1'-bis(diphenylphosphino)ferrocene] dichloropalladium(II) complex with dichloromethane (85 mg, 0.10 mmol) and K₂CO₃ (830 mg, 6.0 mmol) in a vial was evacuated and backfilled with N₂ (repeated 3 X), 1,4-dioxane (7 mL) and water (1.8 mL) were added and the mixture was heated at 90 °C for 16h. The reaction was cooled to room temperature, diluted with water and acidified with 4N HCl. The product was extracted with CH₂Cl₂ (3 X). The organic phases were combined, dried over Na₂SO₄ and concentrated. Crude methyl 7-hydroxy-3-[2-(methoxymethoxy)-4-(1-tetrahydropyran-2-ylpyrazol-4-yl)phenyl]thieno[3,2-c]pyridazine-6-carboxylate was used directly in the next step without purification.
 - Step 4: Crude methyl 7-hydroxy-3-[2-(methoxymethoxy)-4-(1-tetrahydropyran-2-ylpyrazol-4-yl)phenyl]thieno[3,2-c]pyridazine-6-carboxylate obtained above was mixed with 5 N NaOH (3 mL, 15 mmol) and MeOH (15 mL) and heated at 95 °C until complete hydrolysis was observed (6h). Once complete, the reaction was cooled to room temperature and carefully acidified with 4N HCl to pH 3-4. The intermediate carboxylic acid was extracted with CH₂Cl₂/MeOH. The organic

phase was dried over Na₂SO₄. Volatiles were removed under reduced pressure and the residue was dissolved in DMSO (10 mL). The mixture was heated at 80 °C for 60 min after which complete decarboxylation of the intermediate α-ketoacid was observed. Upon cooling to room temperature, the mixture was diluted with water and the product was extracted with EtOAc. The organic phase was dried over Na₂SO₄ and the solvent was removed. The residue was purified by silica gel column chromatography eluting with a MeOH/CH₂Cl₂ gradient (0-5% MeOH) to afford 3-[2-(methoxymethoxy)-4-(1-tetrahydropyran-2-ylpyrazol-4-yl)phenyl]thieno[3,2-c]pyridazin-7-ol (0.64 g, 76% yield) as a yellow solid. Example 13

Preparation of Compound 80

Step 1: To a suspension of 3,6-dichloropyridazin-4-amine (2.0 g, 12.2 mmol) in 1-decanol (3.5 mL) were added 2,2,6,6-tetramethylpiperidin-4-amine (2.3 mL, 1.1 equiv.) and N,Ndiisopropylethylamine (3 mL, 1.4 equiv.) in a 60 mL sealed screw-cap tube. The reaction was stirred at 150 °C for 72 h after which the partially solidified reaction mixture was transferred to a round-bottom flask with the aid of methanol. The organic components were concentrated to afford a thick oil, which was rinsed with hexanes to remove 1-decanol (this may lead to solidification). The crude product was purified by column chromatography, eluting with a MeOH (with 2.5 % NH₄OH)/CH₂Cl₂ gradient (5 to 30% MeOH/NH₄OH). The first compound to elute was unreacted starting material 3,6-dichloropyridazin-4-amine. Then, a mixture of 6-chloro-N3-(2,2,6,6-tetramethylpiperidin-4-yl)pyridazine-3,4-diamine and 6-chloro-N3-(2,2,6,6tetramethylpiperidin-4-yl)pyridazine-3,5-diamine elute (they co-elute), followed by N3,N6bis(2,2,6,6-tetramethylpiperidin-4-yl)pyridazine-3,4,6-triamine. Column chromatography generally results in a 50-60% yield of 6-chloro-N3-(2,2,6,6-tetramethylpiperidin-4-yl)pyridazine-3,4-diamine and 6-chloro-N3-(2,2,6,6-tetramethylpiperidin-4-yl)pyridazine-3,5-diamine (2:1 ratio). The mixture of 6-chloro-N3-(2,2,6,6-tetramethylpiperidin-4-yl)pyridazine-3,4-diamine and 6-chloro-N3-(2,2,6,6-tetramethylpiperidin-4-yl)pyridazine-3,5-diamine (2.7 g, 77%) obtained after chromatography was used in the next step without further purification.

The reaction was quenched by the addition of saturated aqueous sodium bicarbonate slowly until reaching pH ~ 7. The aqueous layer was extracted with ethyl acetate three times. The organic layer was dried over Na₂SO₄, filtered, and concentrated in vacuo. The crude product was purified by column chromatography on silica gel, eluting with a MeOH/CH₂Cl₂ gradient (0-20% MeOH) to yield 6-chloro-3-(2,2,6,6-tetramethyl-4-piperidyl)triazolo[4,5-c]pyridazine (1.22 g, 43%) as brownish solid:

Example 14

Preparation of Compound 67

Step 1: An oven-dried flask was equipped with a magnetic stir bar and charged with [3-(methoxymethoxy)-4-[3-(2,2,6,6-tetramethyl-4-piperidyl)triazolo[4,5-c]pyridazin-6-yl]phenyl] trifluoromethanesulfonate (prepared in example 13, step 4, 60 mg, 0.11 mmol), 4,4,5,5-tetramethyl-2-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)-1,3,2-dioxaborolane (35 mg, 0.14 mmol), 1,1'-bis(diphenylphosphino)ferrocene-palladium(II)dichloride dichloromethane complex (5 mg, 0.006 mmol) and potassium acetate (33 mg, 0.33 mmol). The flask was sealed with a rubber septum, and then evacuated and backfilled with argon (repeated a total of 3 X). 1,4-Dioxane (1 mL) was added and the reaction was heated at 90 °C for 90 minutes, after which UPLC showed full conversion to the borylated product. The crude product was cooled to room temperature and used directly in the next step.

Step 2: To crude 6-(2-(methoxymethoxy)-4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenyl)-3-(2,2,6,6-tetramethylpiperidin-4-yl)-3*H*-[1,2,3]triazolo[4,5-c]pyridazine (~0.11 mmol) was added 6-bromopyridin-3-ol (25 mg, 0.14 mmol), 1,1'-bis(diphenylphosphino)ferrocenepalladium(II)dichloride dichloromethane complex (9 mg, 0.011 mmol), and aqueous 2 M K₂CO₃ (141 μL, 0.282 mmol). The mixture was purged with argon for 5 min, then heated to 85 °C for 16 h. The reaction was cooled to room temperature, diluted with water, and extracted with EtOAc (3 X). The combined organic phases were dried over Na₂SO₄, concentrated under reduced pressure, and purified using silica-gel chromatography eluting with a MeOH/CH₂Cl₂ gradient (0% to 30%

MeOH) to provide 6-[3-(methoxymethoxy)-4-[3-(2,2,6,6-tetramethyl-4-piperidyl)triazolo[4,5-c]pyridazin-6-yl]phenyl]pyridin-3-ol (37.5 mg, 68%) as a light brown solid. MS *m/z* 490.3 [M+H]⁺.

The reaction was concentrated, triturated with 20% MeOH/ether, and the resultant precipitate was filtered to afford 6-[3-hydroxy-4-[3-(2,2,6,6-tetramethyl-4-piperidyl)triazolo[4,5-c]pyridazin-6-yl]phenyl]pyridin-3-ol dihydrochloride (31 mg, 78%) as a light brown solid.

Example 15

Preparation of Compound 70

- 5 Step 1: A mixture imidazole (0.1 g, 1.47 mmol), 1-bromo-4-iodo-2-methoxybenzene (0.5 g, 1.6 mmol), 2-(2-pyridyl)benzimidazole (58.0 mg, 0.3 mmol), cesium carbonate (1.2 g, 3.66 mmol), copper (I) iodide (56 mg 0.29 mmol) in DMF (2 mL) was heated at 100 °C for 48 h. The reaction mixture was cooled to room temperature, filtered through Celite, washed with EtOAc, and concentrated. The crude material was purified by silica gel chromatography eluting with a
- EtOAc/hexane gradient (0-80% EtOAc) to provide 1-(4-bromo-3-methoxyphenyl)-1*H*-imidazole (0.25 g, 62%).
 - MS m/z 253.3, 255.3 [M+H]⁺; ¹H NMR (methanol- d_4) δ : 8.19 (s, 1H), 7.66 (d, J=8.5 Hz, 1H), 7.62 (t, J=1.4 Hz, 1H), 7.25 (d, J=2.2 Hz, 1H), 7.14-7.17 (m, 1H), 7.08 (dd, J=8.5, 2.2 Hz, 1H), 3.97 (s, 3H).
- Step 2: An oven-dried flask was equipped with a magnetic stir bar and charged with 1-(4-bromo-3-methoxyphenyl)-1*H*-imidazole (127.0 mg, 0.5 mmol), 4,4,5,5-tetramethyl-2-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)-1,3,2-dioxaborolane (254.0 mg, 1.0 mmol), 1,1'-

bis(diphenylphosphino)ferrocene-palladium(II)dichloride dichloromethane complex (38.0 mg, 0.05 mmol) and potassium acetate (200.0 mg, 2.0 mmol). The flask was sealed with a rubber septum, and then evacuated and backfilled with argon (repeated a total of 3 X). Dioxane (1 mL) was added and the reaction was heated at 90 °C for 90 min, after which UPLC showed full conversion to the borylated product. The crude mixture was cooled to room temperature and used directly in the next step.

Step 3: To the crude mixture from the above reaction was added 1,1'-bis(diphenylphosphino)ferrocene-palladium(II)dichloride dichloromethane complex (38.0 mg, 0.05 mmol) and 6-chloro-3-(2,2,6,6-tetramethyl-4-piperidyl)triazolo[4,5-c]pyridazine (prepared in example 13, step 2, 100.0 mg, 0.34 mmol). The tube was sealed with a rubber septum, and then evacuated and backfilled with argon (repeated a total of 3 X). Aqueous 2.0 M K₂CO₃ (0.75 mL, 1.5 mmol) was added and the reaction was heated to 90 °C for 16 h. The reaction was cooled to room temperature, diluted with water, and extracted with EtOAc (3 X). The combined organic phases were dried over Na₂SO₄, concentrated under reduced pressure, and purified by column chromatography, eluting with a MeOH/CH₂Cl₂ gradient (0% to 30% MeOH) to provide 6-(4-(1*H*-imidazol-1-yl)-2-methoxyphenyl)-3-(2,2,6,6-tetramethylpiperidin-4-yl)-3*H*-[1,2,3]triazolo[4,5-c]pyridazine (85 mg, 39%). MS *m/z* 433.3 [M+H]⁺.

Step 4: To a solution of 6-(4-(1*H*-imidazol-1-yl)-2-methoxyphenyl)-3-(2,2,6,6-tetramethylpiperidin-4-yl)-3*H*-[1,2,3]triazolo[4,5-c]pyridazine (50 mg, 0.115 mmol) in dichloromethane (3 mL) was added 1 M BBr₃ in CH₂Cl₂ (0.6 mL, 0.6 mmol). The mixture was stirred at room temperature for 3 h. Methanol (3 mL) was added and the reaction was stirred for an additional 3 h. The mixture was concentrated at reduced pressure. The residue was purified by column chromatography, eluting with a MeOH/CH₂Cl₂ gradient (with 2.5% NH₄OH) (0% to 30% MeOH/ NH₄OH) to provide 5-(1*H*-imidazol-1-yl)-2-(3-(2,2,6,6-tetramethylpiperidin-4-yl)-3*H*-[1,2,3]triazolo[4,5-c]pyridazin-6-yl)phenol (33 mg, 70%) as a yellow solid.

Example 16

Preparation of Compound 52

Step 1: A mixture of 3,6-dichloropyridazin-4-amine (1.0 g, 6.0 mmol), 1,2,2,6,6-

pentamethylpiperidin-4-amine (1.0 g, 6.1 mmol) and DIPEA (1.6 mL, 9.1 mmol) in decanol (10 mL) was heated at 150 °C for 7 days. Solvent was removed by blowing air and the residue was purified using silica-gel chromatography eluting with a MeOH/CH₂Cl₂ gradient (2.5% NH₄OH) (0% to 30% MeOH/ NH₄OH) to provide a mixture of 6-chloro-N3-(1,2,2,6,6-pentamethyl-4-piperidyl)pyridazine-3,5-diamine and 6-chloro-N3-(1,2,2,6,6-pentamethyl-4-piperidyl)pyridazine-3,4-diamine (0.85 g, 47%) as a brown solid which was used as is in the next step.

Step 2: To a solution of 6-chloro-N3-(1,2,2,6,6-pentamethyl-4-piperidyl)pyridazine-3,4-diamine, prepared above (0.85 g, 2.9 mmol, ~59% pure), in AcOH (4 mL) was added NaNO₂ (0.50 g, 1.21 mmol) and the mixture was stirred at room temperature for 1 h. The reaction was quenched by the addition of saturated aqueous sodium bicarbonate slowly until pH \approx 7. The aqueous layer was extracted with ethyl acetate three times. The organic layer was dried over Na₂SO₄, filtered, and concentrated under reduced pressure. The crude product was purified by column chromatography on silica gel, eluting with a MeOH/CH₂Cl₂ gradient (0-20% MeOH) to yield 6-chloro-3-(1,2,2,6,6-pentamethyl-4-piperidyl)triazolo[4,5-c]pyridazine (375 g, 43%) as a tan solid. MS m/z 309.1 [M+H]⁺.

The flask was sealed with a rubber septum, and then evacuated and backfilled with argon (repeated a total of 3 X). 1,4-Dioxane (2 mL) and water (0.5 mL) were added and the reaction was heated to 90 °C for 16 h. The reaction was cooled to room temperature, diluted with water, and extracted with EtOAc (3 X). The combined organic layers were dried over Na₂SO₄, concentrated under reduced pressure, and purified using silica gel chromatography eluting with a MeOH/CH₂Cl₂ gradient (0% to 30% MeOH) to provide 6-(2-(methoxymethoxy)-4-(1-(tetrahydro-2*H*-pyran-2-yl)-1*H*-pyrazol-4-yl)phenyl)-3-(1,2,2,6,6-pentamethylpiperidin-4-yl)-3*H*-[1,2,3]triazolo[4,5-c]pyridazine (75 mg, 57%). Meso Scale Discovery (MSD) 96-well or 384-well plates were coated overnight at 4°C with MW1 (expanded polyglutamine) or MAB2166 monoclonal antibody (for capture) at a concentration of 1 μ g/mL in PBS (30 μ L per well). Plates were then washed three times with 300 μ L wash buffer (0.05% Tween-20 in PBS) and blocked (100 μ L blocking buffer; 5% BSA in PBS) for 4-5 hours at room temperature with rotational shaking and then washed three times with wash buffer.

Samples (25 μ L) were transferred to the antibody-coated MSD plate and incubated overnight at 4°C. After removal of the lysates, the plate was washed three times with wash buffer, and 25 μ L of #5656S (Cell signaling; rabbit monoclonal) secondary antibody (diluted to 0.25 μ g/mL in 0.05% Tween-20 in blocking buffer) was added to each well and incubated with shaking for 1 Hour at room temperature. Following incubation with the secondary antibody, the wells were rinsed with wash buffer after which 25 μ L of goat anti-rabbit SULFO TAG secondary detection antibody (required aspect of the MSD system) (diluted to 0.25 μ g/mL in 0.05% Tween-20 in blocking buffer) was added to each well and incubated with shaking for 1 hour at room temperature. After rinsing three times with wash buffer, 150 μ L of read buffer T with surfactant (MSD) were added to each empty well, and the plate was imaged on a SI 6000 imager (MSD) according to manufacturers' instructions provided for 96- or 384-well plates. The resulting IC₅₀ values (μ M) for compounds tested are shown in Table 1.

As shown in Table 1, test compounds described herein had the following IC $_{50}$ values, an IC $_{50}$ value between > 3 μ M and \leq 9 μ M is indicated by a single star (*), an IC $_{50}$ value between > 1 μ M and \leq 3 μ M is indicated by two stars (**), an IC $_{50}$ value between > 0.5 μ M and \leq 1 μ M is indicated by three stars (***), an IC $_{50}$ value between > 0.1 μ M and \leq 0.5 μ M is indicated by four stars (****) and an IC $_{50}$ value of \leq 0.1 μ M is indicated by five stars (*****).
