USE OF PYRAZOLOPYRIMIDINE DERIVATIVES FOR THE TREATMENT OF PI3K6 RELATED DISORDERS

This application claims the benefit of priority of U.S. Provisional Appl. No. 61/771,480, filed March 1, 2013, which is incorporated herein by reference in its entirety.

TECHNICAL FIELD

The present application provides methods of treating PI3Kδ related disorders using pyrazolopyrimidine derivatives.

BACKGROUND

The phosphoinositide 3-kinases (PI3Ks) belong to a large family of lipid signaling kinases that phosphorylate phosphoinositides at the D3 position of the inositol ring (Cantley, Science, 2002, 296(5573): 1655-7). PI3Ks are divided into three classes (class I, II, and III) according to their structure, regulation and substrate specificity. Class I PI3Ks, which include PBKα, PBKβ, PBKγ, and PBKδ, are a family of dual specificity lipid and protein kinases that catalyze the phosphorylation of phosphatidylinositol-4,5-bisphosphate (PIP₂) giving rise to phosphatidylinosito-3,4,5-trisphosphate (PIP₃). PIP₃ functions as a second messenger that controls a number of cellular processes, including growth, survival, adhesion and migration. All four class I PI3K isoforms exist as heterodimers composed of a catalytic subunit (pi 10) and a tightly associated regulatory subunit that controls their expression, activation, and subcellular localization. PBKα, PI3Kβ, and PI3Kδ associate with a regulatory subunit known as p85 and are activated by growth factors and cytokines through a tyrosine kinase-dependent mechanism (Jimenez, et al., J Biol Chem., 2002, 277(44):4 1556-62) whereas PI3Kγ associates with two regulatory subunits (pi 01 and p84) and its activation is driven by the activation of G-protein-coupled receptors (Brock, et al., J Cell Biol., 2003, 160(1):89-99). PBKα and PI3Kβ are ubiquitously expressed. In contrast, PI3Kγ and PI3Kδ are predominantly expressed in leukocytes (Vanhaesebroeck, et al., Trends Biochem Sci., 2005, 30(4): 194-204).

The differential tissue distribution of the PI3K isoforms factors in their distinct biological functions. Genetic ablation of either PBKot or PBKβ results in embryonic lethality, indicating that PBKot and PBKβ have essential and non-redundant functions, at least during development (Vanhaesebroeck, et al., 2005). In contrast, mice which lack PBKγ and PBKδ are viable, fertile and have a normal life span although they show an altered immune system. PBKγ deficiency

The phenotypes of PI3Kγ and PBKδ-mutant mice suggest that these enzymes may play a role in inflammation and other immune-based diseases and this is borne out in preclinical models. PBKγ-mutant mice are largely protected from disease in mouse models of rheumatoid arthritis (RA) and asthma (Camps, et al., Nat Med. 2005, 11(9):936-43; Thomas, et al., Eur J Immunol. 2005, 35(4):1283-91). In addition, treatment of wild-type mice with a selective inhibitor of PI3Kγ was shown to reduce glomerulonephritis and prolong survival in the MRL-lpr model of systemic lupus nephritis (SLE) and to suppress joint inflammation and damage in models of RA (Barber, et al., Nat Med. 2005, 11(9):933-5; Camps, et al., 2005). Similarly, both PBKδ-mutant mice and wild-type mice treated with a selective inhibitor of PI3Kδ have been shown to have attenuated allergic airway inflammation and hyper-responsiveness in a mouse model of asthma (Ali, et al., Nature. 2004, 431(7011):1007-11; Lee, et al., FASEB J. 2006, 20(3):455-65) and to have attenuated disease in a model of RA (Randis, et al., Eur. J. Immunol., 2008, 38(5):1215-24).

B cell proliferation has shown to play a major role in the development of inflammatory autoimmune diseases (Puri, Frontiers in Immunology (2012), 3(256), 1-16; Walsh, Kidney International (2007) 72, 676-682). For example, B cells support T-cell autoreactivity, an important component of inflammatory autoimmune diseases. Once activated and matured, B cells can traffic to sites of inflammation and recruit inflammatory cells or differentiate to plasmablasts. Thus, activity of B-cells can be affected by targeting B-cell stimulatory cytokines, B-cell surface receptors, or via B-cell depletion. Rituximab — an IgGlκ mouse/human chimeric monoclonal antibody directed against the B-cell surface receptor CD20 — has been shown to deplete CD20+ B cells. Use of rituximab has been shown to have efficacy in treating idiopathic thrombocytopenic purpura, autoimmune hemolytic anemia, or vasculitis. For example, treatment with rituximab resulted in remission of the disease in patients suffering from anti-neutrophil cytoplasm antibody associated (ANCA) systemic vasculitis (AASV) with demonstrated peripheral B-cell depletion (Walsh, 2007; Lovric,
Nephrol Dial Transplant (2009) 24: 179-185). Similarly, a complete response was reported in one-third to two-thirds of patients having mixed cryoglobulinemia vasculitis after treatment with rituximab, including patients who presented with a severe form of vasculitis that was resistant or intolerant to other treatments (Cacoub, Ann Rheum Dis 2008;67:283-287). Similarly, rituximab has been shown to have efficacy in treating patients with idiopathic thrombocytopenic purpura (or immune thrombocytopenic purpura) (Garvey, British Journal of Haematology, (2008) 141, 149-169; Godeau, Blood (2008), 112(4), 999-1004; Medeo, European Journal of Haematology, (2008) 81, 165-169) and autoimmune hemolytic anemia (Garvey, British Journal of Haematology, (2008) 141, 149-169).

PBKδ signaling has been tied to B cell survival, migration, and activation (Puri, Frontiers in Immunology, 2012, 3(256), 1-16, at pages 1-5; and Clayton, J Exp Med, 2002, 196(6):753-63). For example, PI3Kδ is required for antigen-dependent B-cell activation driven by B cell receptor. By blocking B-cell adhesion, survival, activation, and proliferation, PI3Kδ inhibition can impair the ability of B cells to activate T cells, preventing their activation and reducing secretion of autoantibodies and pro-inflammatory cytokines. Hence, by their ability to inhibit B cell activation, PI3Kδ inhibitors would be expected to treat B cell mediated diseases that were treatable by similar methods such as B cell depletion by rituximab. Indeed, PI3Kδ inhibitors have been shown to be useful mouse models of various autoimmune diseases that are also treatable by rituximab such as arthritis (Puri (2012)). Further, innate-like B cells, which are linked to autoimmunity are sensitive to PI3Kδ activity, as MZ and B-1 cells are nearly absent in mice lacking the p110δ gene (Puri (2012). PI3Kδ inhibitors can reduce trafficking of and activation of MZ and B-1 cells, which are implicated in autoimmune diseases.

In addition to their potential role in inflammatory diseases, all four class I PI3K isoforms may play a role in cancer. The gene encoding p110α is mutated frequently in common cancers, including breast, prostate, colon and endometrial (Samuels, et al., Science, 2004, 304(5670):554; Samuels, et al., Curr Opin Oncol. 2006, 18(1):77-82). Eighty percent of these mutations are represented by one of three amino acid substitutions in the helical or kinase domains of the enzyme and lead to a significant upregulation of kinase activity resulting in oncogenic transformation in cell culture and in animal models (Kang, et al., Proc Natl Acad Sci U S A. 3

For these reasons, there is a need to develop new PI3K inhibitors that can be used inflammatory disorders, autoimmune diseases and cancer. This invention is directed to this need and others.

The compounds described herein can modulate activity of one or more of various kinases including, for example, phosphoinositide 3-kinases (PI3Ks). The term "modulate" is meant to refer to an ability to increase or decrease the activity of one or more members of the PI3K family. Accordingly, the compounds described herein can be used in methods of modulating a PI3K by contacting the PI3K with any one or more of the compounds or compositions described herein. In some embodiments, compounds of the present invention can act as inhibitors of one or more
PBKs. In further embodiments, the compounds described herein can be used to modulate activity
of a PBK in an individual in need of modulation of the receptor by administering a modulating

Given that cancer cell growth and survival is impacted by multiple signaling pathways,
the present invention is useful for treating disease states characterized by drug resistant kinase

which they modulate the activities of, may be used in combination. This approach could prove
highly efficient in treating disease states by targeting multiple signaling pathways, reduce the
likelihood of drug-resistance arising in a cell, and reduce the toxicity of treatments for disease.

In some embodiments, the compounds of the invention can be used in combination with one or more other kinase inhibitors including imatinib, particularly for treating patients resistant to imatinib or other kinase inhibitors.

In some embodiments, the compounds of the invention can be used in combination with a chemotherapeutic in the treatment of cancer, such as multiple myeloma, and may improve the treatment response as compared to the response to the chemotherapeutic agent alone, without exacerbation of its toxic effects. Examples of additional pharmaceutical agents used in the treatment of multiple myeloma, for example, can include, without limitation, melphalan, melphalan plus prednisone [MP], doxorubicin, dexamethasone, and Velcade (bortezomib). Further additional agents used in the treatment of multiple myeloma include Bcr-Abl, Flt-3, RAF and FAK kinase inhibitors. Additive or synergistic effects are desirable outcomes of combining a PI3K inhibitor of the present invention with an additional agent. Furthermore, resistance of multiple myeloma cells to agents such as dexamethasone may be reversible upon treatment with the PI3K inhibitor of the present invention. The agents can be combined with the present
compound in a single or continuous dosage form, or the agents can be administered simultaneously or sequentially as separate dosage forms.

In some embodiments, a corticosteroid such as dexamethasone is administered to a patient in combination with the compounds of the invention where the dexamethasone is administered intermittently as opposed to continuously.

In some further embodiments, combinations of the compounds of the invention with other therapeutic agents can be administered to a patient prior to, during, and/or after a bone marrow transplant or stem cell transplant.

Pharmaceutical Formulations and Dosage Forms

When employed as pharmaceuticals, the compounds described herein can be administered in the form of pharmaceutical compositions. These compositions can be prepared in a manner well known in the pharmaceutical art, and can be administered by a variety of routes, depending upon whether local or systemic treatment is desired and upon the area to be treated.

Administration may be topical (including transdermal, epidermal, ophthalmalic and to mucous membranes including intranasal, vaginal and rectal delivery), pulmonary (e.g., by inhalation or insufflation of powders or aerosols, including by nebulizer; intratracheal or intranasal), oral or parenteral. Parenteral administration includes intravenous, intraarterial, subcutaneous, intraperitoneal intramuscular or injection or infusion; or intracranial, e.g., intrathecal or intraventricular, administration. Parenteral administration can be in the form of a single bolus dose, or may be, for example, by a continuous perfusion pump. Pharmaceutical compositions and formulations for topical administration may include transdermal patches, ointments, lotions, creams, gels, drops, suppositories, sprays, liquids and powders. Conventional pharmaceutical carriers, aqueous, powder or oily bases, thickeners and the like may be necessary or desirable.

This invention also includes pharmaceutical compositions which contain, as the active ingredient, the compound described herein or a pharmaceutically acceptable salt thereof, in combination with one or more pharmaceutically acceptable carriers (excipients). In some embodiments, the composition is suitable for topical administration. In making the compositions of the invention, the active ingredient is typically mixed with an excipient, diluted by an excipient or enclosed within such a carrier in the form of, for example, a capsule, sachet, paper, or other container. When the excipient serves as a diluent, it can be a solid, semi-solid, or liquid material, which acts as a vehicle, carrier or medium for the active ingredient. Thus, the compositions can be in the form of tablets, pills, powders, lozenges, sachets, cachets, elixirs, suspensions,
emulsions, solutions, syrups, aerosols (as a solid or in a liquid medium), ointments containing, for example, up to 10% by weight of the active compound, soft and hard gelatin capsules, suppositories, sterile injectable solutions, and sterile packaged powders.

In preparing a formulation, the active compound can be milled to provide the appropriate particle size prior to combining with the other ingredients. If the active compound is substantially insoluble, it can be milled to a particle size of less than 200 mesh. If the active compound is substantially water soluble, the particle size can be adjusted by milling to provide a substantially uniform distribution in the formulation, e.g. about 40 mesh.

The compounds described herein may be milled using known milling procedures such as wet milling to obtain a particle size appropriate for tablet formation and for other formulation types. Finely divided (nanoparticulate) preparations of the compounds described herein can be prepared by processes known in the art, e.g., see International App. No. WO 2002/000196.

Some examples of suitable excipients include lactose, dextrose, sucrose, sorbitol, mannitol, starches, gum acacia, calcium phosphate, alginates, tragacanth, gelatin, calcium silicate, microcrystalline cellulose, polyvinylpyrrolidone, cellulose, water, syrup, and methyl cellulose. The formulations can additionally include: lubricating agents such as talc, magnesium stearate, and mineral oil; wetting agents; emulsifying and suspending agents; preserving agents such as methyl- and propylhydroxy-benzoates; sweetening agents; and flavoring agents. The compositions of the invention can be formulated so as to provide quick, sustained or delayed release of the active ingredient after administration to the patient by employing procedures known in the art.

The compositions can be formulated in a unit dosage form, each dosage containing from about 5 to about 1000 mg (1 g), more usually about 100 to about 500 mg, of the active ingredient. The term "unit dosage forms" refers to physically discrete units suitable as unitary dosages for human subjects and other mammals, each unit containing a predetermined quantity of active material calculated to produce the desired therapeutic effect, in association with a suitable pharmaceutical excipient.

In some embodiments, the compositions of the invention contain from about 5 to about 50 mg of the active ingredient. One having ordinary skill in the art will appreciate that this embodies compositions containing about 5 to about 10, about 10 to about 15, about 15 to about 20, about 20 to about 25, about 25 to about 30, about 30 to about 35, about 35 to about 40, about 40 to about 45, or about 45 to about 50 mg of the active ingredient.
In some embodiments, the compositions of the invention contain from about 50 to about
500 mg of the active ingredient. One having ordinary skill in the art will appreciate that this
embodies compositions containing about 50 to about 100, about 100 to about 150, about 150 to
about 200, about 200 to about 250, about 250 to about 300, about 350 to about 400, or about 450
to about 500 mg of the active ingredient.

In some embodiments, the compositions of the invention contain from about 500 to about
1000 mg of the active ingredient. One having ordinary skill in the art will appreciate that this
embodies compositions containing about 500 to about 550, about 550 to about 600, about 600 to
about 650, about 650 to about 700, about 700 to about 750, about 750 to about 800, about 800 to
about 850, about 850 to about 900, about 900 to about 950, or about 950 to about 1000 mg of the
active ingredient.

Similar dosages may be used of the compounds described herein in the methods and uses
of the invention.

The active compound can be effective over a wide dosage range and is generally
administered in a pharmaceutically effective amount. It will be understood, however, that the
amount of the compound actually administered will usually be determined by a physician,
according to the relevant circumstances, including the condition to be treated, the chosen route of
administration, the actual compound administered, the age, weight, and response of the individual
patient, the severity of the patient's symptoms, and the like.

For preparing solid compositions such as tablets, the principal active ingredient is mixed
with a pharmaceutical excipient to form a solid preformulation composition containing a
homogeneous mixture of a compound of the present invention. When referring to these
preformulation compositions as homogeneous, the active ingredient is typically dispersed evenly
throughout the composition so that the composition can be readily subdivided into equally
effective unit dosage forms such as tablets, pills and capsules. This solid preformulation is then
subdivided into unit dosage forms of the type described above containing from, for example,
about 0.1 to about 1000 mg of the active ingredient of the present invention.

The tablets or pills of the present invention can be coated or otherwise compounded to
provide a dosage form affording the advantage of prolonged action. For example, the tablet or pill
can comprise an inner dosage and an outer dosage component, the latter being in the form of an
envelope over the former. The two components can be separated by an enteric layer which serves
to resist disintegration in the stomach and permit the inner component to pass intact into the
duodenum or to be delayed in release. A variety of materials can be used for such enteric layers
or coatings, such materials including a number of polymeric acids and mixtures of polymeric acids with such materials as shellac, cetyl alcohol, and cellulose acetate.

The liquid forms in which the compounds and compositions of the present invention can be incorporated for administration orally or by injection include aqueous solutions, suitably flavored syrups, aqueous or oil suspensions, and flavored emulsions with edible oils such as cottonseed oil, sesame oil, coconut oil, or peanut oil, as well as elixirs and similar pharmaceutical vehicles.

Compositions for inhalation or insufflation include solutions and suspensions in pharmaceutically acceptable, aqueous or organic solvents, or mixtures thereof, and powders. The liquid or solid compositions may contain suitable pharmaceutically acceptable excipients as described supra. In some embodiments, the compositions are administered by the oral or nasal respiratory route for local or systemic effect. Compositions can be nebulized by use of inert gases. Nebulized solutions may be breathed directly from the nebulizing device or the nebulizing device can be attached to a face mask, tent, or intermittent positive pressure breathing machine.

Solution, suspension, or powder compositions can be administered orally or nasally from devices which deliver the formulation in an appropriate manner.

Topical formulations can contain one or more conventional carriers. In some embodiments, ointments can contain water and one or more hydrophobic carriers selected from, for example, liquid paraffin, polyoxyethylene alkyl ether, propylene glycol, white Vaseline, and the like. Carrier compositions of creams can be based on water in combination with glycerol and one or more other components, e.g. glycerinemonostearate, PEG-glycerinemonostearate and cetylstearyl alcohol. Gels can be formulated using isopropyl alcohol and water, suitably in combination with other components such as, for example, glycerol, hydroxyethyl cellulose, and the like. In some embodiments, topical formulations contain at least about 0.1, at least about 0.25, at least about 0.5, at least about 1, at least about 2, or at least about 5 wt % of the compound described herein. The topical formulations can be suitably packaged in tubes of, for example, 100 g which are optionally associated with instructions for the treatment of the select indication, e.g., psoriasis or other skin condition.

The amount of compound or composition administered to a patient will vary depending upon what is being administered, the purpose of the administration, such as prophylaxis or therapy, the state of the patient, the manner of administration, and the like. In therapeutic applications, compositions can be administered to a patient already suffering from a disease in an amount sufficient to cure or at least partially arrest the symptoms of the disease and its
complications. Effective doses will depend on the disease condition being treated as well as by
the judgment of the attending clinician depending upon factors such as the severity of the disease,
the age, weight and general condition of the patient, and the like.

The compositions administered to a patient can be in the form of pharmaceutical
compositions described above. These compositions can be sterilized by conventional sterilization
techniques, or may be sterile filtered. Aqueous solutions can be packaged for use as is, or
lyophilized, the lyophilized preparation being combined with a sterile aqueous carrier prior to
administration. The pH of the compound preparations typically will be between 3 and 11, more
preferably from 5 to 9 and most preferably from 7 to 8. It will be understood that use of certain of
the foregoing excipients, carriers, or stabilizers will result in the formation of pharmaceutical
salts.

The therapeutic dosage of a compound of the present invention can vary according to, for
example, the particular use for which the treatment is made, the manner of administration of the
compound, the health and condition of the patient, and the judgment of the prescribing physician.

The proportion or concentration of a compound described herein in a pharmaceutical composition
can vary depending upon a number of factors including dosage, chemical characteristics (e.g.,
hydrophobicity), and the route of administration. For example, the compounds described herein
can be provided in an aqueous physiological buffer solution containing about 0.1 to about 10% w/v of
the compound for parenteral administration. Some typical dose ranges are from about 1
\( \mu g/kg \) to about 1 g/kg of body weight per day. In some embodiments, the dose range is from
about 0.01 mg/kg to about 100 mg/kg of body weight per day. The dosage is likely to depend on
such variables as the type and extent of progression of the disease or disorder, the overall health
status of the particular patient, the relative biological efficacy of the compound selected,
formulation of the excipient, and its route of administration. Effective doses can be extrapolated
from dose-response curves derived from \textit{in vitro} or animal model test systems.

The compositions of the invention can further include one or more additional
pharmaceutical agents such as a chemotherapeutic, steroid, anti-inflammatory compound, or
immunosuppressant, examples of which are listed herein.

\textbf{Kits}

The present invention also includes pharmaceutical kits useful, for example, in the
treatment or prevention of PI3K-associated diseases or disorders, such as cancer, which include
one or more containers containing a pharmaceutical composition comprising a therapeutically
effective amount of a compound described herein. Such kits can further include, if desired, one or more of various conventional pharmaceutical kit components, such as, for example, containers with one or more pharmaceutically acceptable carriers, additional containers, etc., as will be readily apparent to those skilled in the art. Instructions, either as inserts or as labels, indicating quantities of the components to be administered, guidelines for administration, and/or guidelines for mixing the components, can also be included in the kit.

**Synthesis**

Compounds described herein, including salts thereof, can be prepared using known organic synthesis techniques and can be synthesized according to any of numerous possible synthetic routes. In some embodiments, the compounds can be prepared as described in US Patent Application No. 13/601,349, filed August 31, 2012, which is incorporated herein by reference in its entirety.

The reactions for preparing compounds described herein can be carried out in suitable solvents which can be readily selected by one of skill in the art of organic synthesis. Suitable solvents can be substantially non-reactive with the starting materials (reactants), the intermediates, or products at the temperatures at which the reactions are carried out, *e.g.*, temperatures which can range from the solvent's freezing temperature to the solvent's boiling temperature. A given reaction can be carried out in one solvent or a mixture of more than one solvent. Depending on the particular reaction step, suitable solvents for a particular reaction step can be selected by the skilled artisan.

Preparation of compounds described herein can involve the protection and deprotection of various chemical groups. The need for protection and deprotection, and the selection of appropriate protecting groups, can be readily determined by one skilled in the art. The chemistry of protecting groups can be found, for example, in T. W. Greene and P. G. M. Wuts, *Protective Groups in Organic Synthesis*, 3rd Ed., Wiley & Sons, Inc., New York (1999), which is incorporated herein by reference in its entirety.

Reactions can be monitored according to any suitable method known in the art. For example, product formation can be monitored by spectroscopic means, such as nuclear magnetic resonance spectroscopy (*e.g.*, $^1$H or $^1$C), infrared spectroscopy, spectrophotometry (*e.g.*, UV-visible), mass spectrometry, or by chromatographic methods such as high performance liquid chromatography (HPLC), liquid chromatography-mass spectroscopy (LCMS), or thin layer chromatography (TLC). Compounds can be purified by those skilled in the art by a variety of
methods, including high performance liquid chromatography (HPLC) ("Preparative LC-MS Purification: Improved Compound Specific Method Optimization" Karl F. Blom, Brian Glass, Richard Sparks, Andrew P. Combs J. Combi. Chem. 2004, 6(6), 874-883, which is incorporated herein by reference in its entirety) and normal phase silica chromatography.

For example, compounds of Formula I can be formed as shown in Scheme I. The compound (i) can be halogenated with N-chlorosuccinamide, N-bromosuccinamide or N-iodosuccinamide to give compound (ii) where X₁ = Cl, Br, or I. The halo group of (ii) can be coupled to Cy-M, where M is a boronic acid, boronic ester or an appropriately substituted metal (e.g., Cy-M is Cy-B(OH), Cy-Sn(Bu₄), or Zn-Cy), under standard Suzuki conditions or standard Stille conditions (e.g., in the presence of a palladium(O) catalyst, such as tetrakis(triphenylphosphine)palladium(0) and a base (e.g., a bicarbonate or carbonate base) or standard Negishi conditions (e.g., in the presence of a palladium(O) catalyst, such as tetrakis(triphenylphosphine)palladium(0), to give a derivative of formula (iii). Alternatively, Cy-M can be a cyclic amine (where M is H and attached to the amine nitrogen) with coupling to compound (ii) being performed by heating in base or under Buchwald conditions (e.g., in the presence of a palladium(O) catalyst, such as tetrakis(triphenylphosphine)palladium(0) and a base (e.g., an alkoxide base)) to afford ketone (iii). Reduction of the ketone (iii) with a suitable reagent, such as sodium tetrahydroborate can furnish the alcohol (iv) which can be converted to a derivative bearing a leaving group (v), (e.g., Lg is chloride via reaction with cyanuric chloride or mesylate via reaction with methanesulfonic anhydride). Finally, compound (v) can be reacted with 3-methyl-1 H-pyrazolo[3,4-<i>c</i>]pyrimidin-4-amine ((vi)) under basic conditions (e.g., NaH or CSCO₃ or K₂CO₃) to give a compound of Formula I (vii).
Alternatively, compounds of Formula I can also be formed as shown in Scheme II. The ketone compound (i) can be halogenated with N-chlorosuccinimide, N-bromosuccinimide or N-iodosuccinimide to give compound (ii) where \( X^1 = \text{Cl}, \text{Br}, \text{or I} \). Ketone (ii) can be reduced with a suitable reagent, such as sodium tetrahydroborate, to give an alcohol (iii) which can be converted to a derivative bearing a leaving group, (e.g., Lg is chloride via reaction with cyanuric chloride or mesylate via reaction with methanesulfonic anhydride) and then reacted with a heterocycle to give a heterocyclic derivative (iv). The enantiomers of compound (iv) can be separated by chiral chromatography to afford a single enantiomer of heterocyclic compound (v). Finally, the halo group of (v) can be coupled to Cy-M, where M is a boronic acid, boronic ester or an appropriately substituted metal (e.g., Cy-M is Cy-B(OH)2, Cy-Sn(Bu)4, or Zn-Cy), under standard Suzuki conditions or standard Stille conditions (e.g., in the presence of a palladium(O) catalyst, such as tetrakis(triphenylphosphine)palladium(0) and a base (e.g., a bicarbonate or carbonate base) or standard Negishi conditions (e.g., in the presence of a palladium(O) catalyst, such as tetrakis(triphenylphosphine)palladium(0)), to give a derivative of Formula I (vi).
Compounds of Formula I can also be formed as shown in Scheme III. The phenol (i) can be alkylated using Mitsunobu conditions (e.g., R OH, DEAD, Ph$_3$P) or standard alkylation conditions (R'-Lg, Lg = leaving group) to afford ether derivatives (ii), respectively. The halo group of (ii) can be coupled to Cy-M, where M is a boronic acid, boronic ester or an appropriately substituted metal (e.g., Cy-M is Cy-B(OH)$_2$, Cy-Sn(Bu)$_4$, or Zn-Cy), under standard Suzuki conditions or standard Stille conditions (e.g., in the presence of a palladium(O) catalyst, such as tetrakis(triphenylphosphine)palladium (0) and a base (e.g., a bicarbonate or carbonate base) or standard Negishi conditions (e.g., in the presence of a palladium(O) catalyst, such as tetrakis(triphenylphosphine)palladium (0), to give a derivative of formula (iii). Alternatively, Cy-M can be a cyclic amine (where M is H and attached to the amine nitrogen) with coupling to compound (ii) being performed by heating in base or under Buchwald conditions (e.g., in the presence of a palladium(O) catalyst, such as tetrakis(triphenylphosphine)-palladium (0) and a base (e.g., an alkoxide base)) to afford compounds of formula (iii). The ketone (iii) can be transformed using similar methods as shown in Scheme I and II to afford compounds of Formula I (iv). Alternatively, the halo-ketone (ii) can be transformed using similar methods as shown in Scheme I and II to afford halo intermediate (v). Suzuki, Stille, Negishi or Buchwald coupling of Cy-M with halo intermediate (v) by similar methods described in Schemes I and II can also afford compounds of Formula I (vi).
Ketones which can be used in the processes of Scheme I, II and III, can be formed as shown in Scheme IV below. The carboxylic acid (i) can be activated with a coupling agent (e.g., HBTU or HATU) and then reacted with N,N-dimethylhydroxylamine to give a N-methoxy-N-methylcarboxamide. The phenols can be alkylated using Mitsunobu conditions (e.g., R²OH, DEAD, Ph₃P) or standard alkylating conditions (R²-Lg, Lg = leaving group) to afford the ether derivatives (ii), respectively. The halo group of (ii) (X¹ is halo) can be coupled to Cy-M, where M is a boronic acid, boronic ester or an appropriately substituted metal (e.g., Cy-M is Cy-B(OH)₂, Cy-Sn(Bu)₄, or Zn-Cy), under standard Suzuki conditions or standard Stille conditions (e.g., in the presence of a palladium(O) catalyst, such as tetrakis(triphenylphosphine)palladium(0))
and a base (e.g., a bicarbonate or carbonate base) or standard Negishi conditions (e.g., in the presence of a palladium(O) catalyst, such as tetrakis(triphenylphosphine)palladium(0), to give a derivative of formula (iii). Alternatively, Cy-M can be a cyclic amine (where M is H and attached to the amine nitrogen) with coupling to compound (ii) being performed by heating in base or under Buchwald conditions (e.g., in the presence of a palladium(O) catalyst, such as tetrakis(triphenylphosphine)palladium(0) and a base (e.g., an alkoxy base)) to afford amides (iii). Reaction of compound (iii) with a Grignard reagent of formula Me-MgX² (X² = halo) can give ketone (iv). The ketone (iv) can be transformed using similar methods as shown in Scheme I, II and III to afford compounds of Formula I.

Scheme IV

Ketones which can be used in the processes of Scheme I, II and III, can also be formed as shown in Scheme V below. The halo group (e.g., X¹ = I) of (i) can be coupled to a zinc reagent Cy-Zn (e.g., such as tert-butyl 3-iodoazetidine-l-carboxylate with Zn dust) under standard Knochel/Negishi conditions (e.g., in the presence of a palladium(O) catalyst, such as tri-(2-furyl)phosphine and tris(dibenzylideneacetone)dipalladium(0) and 1,2-dibromoethane and chlorotrimethylsilane) to give a derivative of formula (ii). The azetidine (ii) can be deprotected (e.g., Pg = Boc, using TFA) and then reacted under alkylating, acylating or reductive amination (e.g., R³X such as R³-Br, R³-COCl, R³-S0₂Cl, R³N=C=0 or R³CHO and a reducing agent) conditions to afford ketone derivatives (iii) which can be converted to compounds of Formula I (v) by similar methods shown in Schemes I, II, and III). Alternatively, the ketone (ii) can be reduced with suitable reagents (NaBH₄ or Corey's chiral CBS catalyst to give predominantly one isomer of the alcohol), the resulting alcohol can be converted to a leaving group (e.g., Lg is
chloride via reaction with cyanuric chloride or mesylate via reaction with methanesulfonic anhydride) and then the chloride or mesylate reacted with an appropriate heterocycle (e.g., similar to methods shown in Schemes I, II and III) to afford derivatives of formula (iv). The protecting group on the amine can be removed under standard conditions and then reacted under alkylation, acylating or reductive amination conditions (e.g., R³X such as R³-Br, R³-COCl, R³-SO₂Cl, R³N=C=O or R³CHO and a reducing agent) to give compounds of Formula I (v).

Scheme V

Compound of Formula I can be synthesized from an acid chloride compound (i) as illustrated in Scheme VI. Condensation of an acid chloride (i) with malononitrile in the presence of a base, such as sodium hydride, can give a dicyanoenol intermediate, which can be O-methylated with an appropriate reagent, such as dimethyl sulfate in the presence of an appropriate base, such as sodium bicarbonate, to yield an enol ether (ii). Reaction of enol ether (ii) with hydrazine dihydrochloride in the presence of a suitable base, such as triethylamine, can give a
pyrazole compound (iii). Pyrazole compound (iii) can then be reacted with formamide to give pyrazolopyrimidine (iv). Finally, compound (iv) can be reacted with appropriate compound bearing a leaving group (v) under basic conditions to give a compound of Formula I (vi).

![Scheme VI](image)

Compounds of Formula I can also be formed as shown in Scheme VII. The halo group, $X^1$, of (i) can be coupled to an alkene (e.g., acrylate or acrylamide) under standard Heck conditions (e.g., in the presence of a palladium(II) catalyst, such as palladium acetate) to give an alkene of formula (ii). Reaction of alkene (ii) with nitromethane in the presence of DBU can afford the nitro derivative (iii) which can be reduced under standard conditions (e.g., $\text{NiCl}_2$/NaBH$_4$) to give a free amine which cyclizes to form lactam (iv). The lactam can be alkylated under standard conditions (e.g., $R^3X^2$, where $X^2 =$ halo, in the presence of a base, such as TEA or NaH) to give an $N$-alkyl-lactam (v). Compounds of formula (v), and pyrrolidines derived from the reduction of the lactam (v) with suitable reducing agents, such as LiAlH$_4$, can be converted to compounds of Formula I using conditions described in Schemes I, II and III.
Compounds of Formula I can also be formed as shown in Scheme VIII. The halo group X\(^1\) of (i) can be coupled to an alkene boronic acid or ester under standard Suzuki conditions (e.g., in the presence of a palladium(0) catalyst, such as tetrakis(triphenylphosphine)palladium(0)) to give an alkene of formula (ii). Epoxidation of alkene (ii) with mCPBA can afford the epoxide (iii) which can be reacted with a secondary or primary amine (amine = NH\(_2\)R\(^3\)) to give amino compounds of formula (iv). Secondary or tertiary amine derivatives (iv) can be further reacted with carbonyldimidazole or phosgene to form an oxazolidinone (v) or an acetyl-halide (e.g., chloro-acetylchloride in the presence of base, such as TEA) to give the \(N\)-acyl derivative which can be converted to the morpholinone derivative (vi) upon treatment with a base (e.g., NaH). Compounds of formula (iv, v, and vi) can be deprotected using standard conditions (e.g., compounds protected with THP groups may be treated with an acid, such as TFA or HCl) to give compounds of Formula I.
Compounds of Formula I can also be formed as shown in Scheme IX. Sharpless amino-hydroxylation of an alkene of formula (i) under suitable conditions (A or B, as described in JACS, 2001, 123(9), 1862-1871 and J. Org. Chem, 201 1, 76, 358-372) can give either amino-hydroxy isomer (ii) or (iii). Compounds (ii) and (iii) can be reacted with carbonyldiamidazole or phosgene to form an oxazolidinone (iv), or an acetyl-halide (e.g., chloro-acetylchloride in the presence of base, such as TEA) to give an N-acyl derivative which can be converted to the morpholinone derivative (v) upon treatment with a base (e.g., NaH). The alternate amino-hydroxy isomer (iii) can be converted to oxazolidinone and morpholinone derivatives as shown in Scheme XV.
Compounds of Formula I can be synthesized as shown in Scheme X. The halo group (e.g., $X^1 = \text{Cl, Br, I}$) of (i) can be converted to the boronate ester (ii) under standard conditions (e.g., pinnacle boronate ester in the presence of a palladium(0) catalyst, such as tetrakis(triphenylphosphine)palladium(0)). Boronate (ii) can be reacted with an arylhalide or heteroarylhalide (e.g., $R^2 \cdot X^2$) under Suzuki conditions (e.g., in the presence of a palladium(0) catalyst, such as tetrakis(triphenylphosphine)palladium(0)) and a base, such as $\text{Na}_2\text{C}^2\text{O}_4$ to give formula (iii). Formula (iii) can be converted to Formula I using the reaction conditions described in Schemes I, II or III.
Compounds of Formula I, where \( R^1 = \text{F or CN} \), can be formed as shown in Scheme XL. Compound (i) can be acylated with a suitable acylating reagent (e.g., Me-COCl) to form an ester which can be rearranged under Lewis acid conditions (e.g., BF\(_3\)/HOAc complex) to afford ketone (ii). Ketone (ii) can be halogenated with \( N \)-chlorosuccinimide, \( N \)-bromosuccinimide or \( N \)-iodosuccinimide to give phenol (iii), where \( X^1 = \text{Cl, Br, or I} \). Compound (iii) can be alkylated (e.g., \( R^2-X \) and a base, such as NaH or \( \text{Na}_2\text{C}_3 \), or under Mitsunobu conditions) to afford the ether (iv). The fluoro group of (iv) can be displaced (e.g., with NaCN or KCN) to give cyano derivative (v). The halo group of (v) can be coupled to Cy-M, where M is a boronic acid, boronic ester or an appropriately substituted metal (e.g., Cy-M is Cy-B(OH)\(_2\), Cy-Sn(Bu)\(_4\) or Zn-Cy), under standard Suzuki conditions or standard Stille conditions (e.g., in the presence of a palladium(O) catalyst, such as tetrakis(triphenylphosphine)palladium(0) and a base (e.g., a bicarbonate or carbonate base) or standard Negishi conditions (e.g., in the presence of a palladium(O) catalyst, such as tetrakis(triphenylphosphine)palladium(0)), to give a derivative of formula (vi). Alternatively, Cy-M can be a cyclic amine (where M is H and attached to the amine nitrogen) and coupled to compound (v) by heating in base or under Buchwald conditions (e.g., in the presence of a palladium(O) catalyst, such as tetrakis(triphenylphosphine)palladium(0) and a base (e.g., an alkoxide base)) to afford ketone (vi). Reduction of the ketone (vi) with a suitable reagent, such as sodium tetrahydroborate or the Corey CBS reagent can furnish the alcohol which can be converted to a derivative bearing a leaving group, (e.g., Lg is chloride via reaction with cyanuric chloride or mesylate via reaction with methanesulfonic anhydride) and then reacted with 3-methyl-1\( H \)-pyrazolo[3,4-<i>l]pyrimidin-4-amine under basic conditions (e.g., NaH or \( \text{CSCO}_3 \) or \( \text{K}_2\text{CO}_3 \)) to give a compound of Formula I (viii). Alternatively, the last two steps can be inverted.
so that the ketone (v) can be reduced to give analcohol which is converted to a leaving group and
displaced with the heterocycle first and then the Suzuki, Stille, Negish or Buchwald coupling is
performed to give compounds of Formula I (viii). The fluoro derivatives (iv) can also be
converted to compounds of Formula I by eliminating the cyanation step in Scheme XI.

Scheme XI

Compounds of Formula I can also be formed as shown in Scheme XII. Compound (i)
can be acylated with a suitable acylating reagent (e.g., Me-COCl) to form an ester which can be
rearranged under Lewis acid conditions (e.g., AICI₃ or BF₃/HOAc complex) to afford ketone (ii).
Halogenation of ketone (ii) using NX₁S (e.g., NX₁S = N-chlorosuccinamide, N-
bromosuccinamide or N-iodosuccinamide) can give compound (iii), where X₁ = Cl, Br, or I. The
phenol can be converted to an ether (iv) using standard conditions (e.g., inorganic base, such as

Formula I (viii)
K₂CO₃, and an alkyl halide, such as Et-I). The halo group of (iv) can be coupled to R³-M, where M is a boronic acid, boronic ester or an appropriately substituted metal (e.g., R³-M is R³-B(OH)₂, R³-Sn(Bu)₄, or Zn-R³ and R³ is asubstituted or unsubstituted olefin, such as vinyl) under standard Suzuki conditions or standard Stille conditions (e.g., in the presence of a palladium(O) catalyst, such as tetrakis(triphenylphosphine)palladium (0) and a base (e.g., a bicarbonate or carbonate base) to give a derivative of formula (v). The alkene can then be dihydroxylated using Sharpless conditions to afford the diol (vi). Enhancement of one enantiomer of the secondary alcohol can be achieved using standard Sharpless asymmetric dihydroxylation methods. The secondary alcohol can be converted to the N-Boc protected amine via a 6 step process (e.g. silyl protection (e.g., TBS-Cl and DIEA) of the primary alcohol, mesylation of the secondary alcohol, displacement of the mesylate with NaN₃, reduction of the azide with Ph₃P, Boc protection of the resulting primary amine and then deprotection of the silyl protecting group on the primary alcohol with TBAF) to afford amino-alcohol (vii). The amino-alcohol (vii) can be converted into the oxazolidinone by treatment with phosgene and subsequent reduction of the ketone with a suitable reagent, such as sodium tetrahydroborate or sodium borohydride can furnish the alcohol (viii) which can be converted to a derivative bearing a leaving group (ix) (e.g., Lg is chloride via reaction with cyanuric chloride or mesylate via reaction with methanesulfonic anhydride). Finally, compound (ix) can be reacted with an appropriate heterocycle (x) (e.g., 3-methyl-1 H-pyrazolo[3,4-<i<i>pyrimidin-4-amine or 4-aminopyrido[2,3-<i<i>pyrimidin-5(8H)-one) under basic conditions (e.g., NaH or Cs₂CO₃ or K₂CO₃) to give a compound of Formula I (xi).

The compounds of Example 268 and 269 were synthesized from the same chiral intermediate in Example 261. According to the crystal structure determination in Example 269, the stereochemistry at the carbon at the 1-position of the ethan-1,1-diyl group is S. Because the compound of Example 268 was synthesized from the same chiral intermediate as Example 269, one of ordinary skill in the art would expect that the carbon at the 1-position of the ethan-1,1-diyl group of Example 268 is also in the S-configuration. **RESULTS:** The asymmetric unit contains one molecule and one water molecule as shown in figure 1 with thermal ellipsoids drawn to the 50% probability level. The predicted structure is confirmed. The absolute configuration is determined based upon the known S configuration at C21. The configuration at C7 is determined to be S. The flack parameter also confirms the correct configuration. Based on the crystal structure, the compound of Example 269 is believed to be 4-((S)-1-(4-amino-3-methyl-1H-pyrazolo[3,4-d]pyrimidin-1-yl)ethyl)-6-chloro-2-(1-((S)-2-hydroxypropyl)azetidin-3-yl)-3-methoxybenzonitrile. The crystal structure is shown in FIG. 1.

Step 1: 4-[3-chloro-5-(chloroethyl)-6-ethoxy-2-fluorophenyl]-1,3-oxazolidin-2-one

4-[3-chloro-6-ethoxy-2-fluoro-5-(l-hydroxyethyl)phenyl]-1,3-oxazolidin-2-one (150 mg, 0.49 mmol) (from Step 10) was stirred in dichloromethane (4 mL) with N,N-dimethylformamide (96 µL) and thionyl chloride (110 µL, 1.5 mmol) was added. The mixture was evaporated. Water was added and the mixture was extracted with ethyl acetate. The extracts were washed with brine, dried over sodium sulfate, filtered and evaporated to give the desired compound, 159 mg, 100%.

Step 12: 4-{3-[l-(4-amino-3-methyl-1H-pyrazolo[3,4-d]pyrimidin-1-yl)ethyl]-5-chloro-2-ethoxy-6-fluorophenyl}-1,3-oxazolidin-2-one
4-[3-chloro-5-(chloroethyl)-6-ethoxy-2-fluorophenyl]-1,3-oxazolidin-2-one (160 mg, 0.50 mmol) (from Step 1) was stirred in N,N-dimethylformamide (21 mL) with cesium carbonate (324 mg, 0.99 mmol) and 3-methyl-1H-pyrazolo[3,4-c]pyrimidin-4-amine (89 mg, 0.60 mmol) was added. The mixture was heated to 80 °C for 1.5 hours and cooled to rt. The mixture was diluted with water and extracted with ethyl acetate. The extracts were washed with brine, dried over sodium sulfate, filtered and evaporated. Purification by preparative LCMS (pH 10) using RP-HPLC (XBridge C18 column, eluting with a gradient of acetonitrile/water containing 0.1% ammonium hydroxide, at flow rate of 30 mL/min) separated the two diastereomers (peak 1 [compound 353] Rt = 4.9 min. and peak 2 [compound 354] Rt = 5.6 min.); providing compound 354 as the desired single enantiomer, 28 mg, 13%. peak 2: LCMS calculated for C_{19}H_{21}ClF_{6}N_{6}O_{3} (M+H)^+: m/z = 435.1; found: 435.1. 1HNMR (300 MHz, CD3OD): δ 8.15 (s, 1 H), 7.62 (m, 1 H), 6.31 (m, 1 H), 5.39 (m, 1 H), 4.79 (m, 1 H), 4.40 (m, 1 H), 3.95 (m, 1 H), 3.80 (m, 1 H), 2.60 (s, 3 H), 1.80 (m, 3 H), 1.40 (m, 3 H).

Examples 355-358. Diastereomers of 5-[3-[1-(4-amino-3-methyl-1H-pyrazolo[3,4-c]/pyrimidin-1-yl)ethy]-5-chloro-2-ethoxy-6-fluorophenyl]-1,3-oxazolidin-2-one
Step 1: tert-Butyl [2-(3-acetyl-5-chloro-2-ethoxy-6-fluorophenyl)-2-hydroxyethyl] carbamate

0.2 M Osmium tetraoxide in water (10 mL) was added to a solution of tert-butyl [(4-chlorobenzoyl)oxy]carbamate (Lawrence Harris, *J. Org. Chem.*, 2011, 76, 358-372). (19 g, 70 mmol) in acetonitrile (210 mL) and stirred for 10 minutes. 1-(5-chloro-2-ethoxy-4-fluoro-3-vinylphenyl)ethanone (11.2 g, 46 mmol) (from Example 353, Step 1) as a solution in acetonitrile (210 mL) was added to the carbamate solution followed by the addition of water (50 mL) and the reaction was stirred for 3 hours at room temperature. The reaction was quenched with saturated 10 M dipotassium disulfite in water (240 mL) and stirred for 5 minutes. Water was added and the reaction mixture was extracted with ethyl acetate. The extracts were washed with saturated sodium bicarbonate solution, brine and dried over sodium sulfate, filtered and evaporated. Purification on silica gel using ethyl acetate in hexanes (0-100%) gave the desired compound as a racemic mixture, 16.6 g, 95%. LCMS calculated for \( \text{C}_{17}\text{H}_{23}\text{ClFN}_{5}\text{Na} (M+Na)^+ \): m/z = 398.1; found: 398.0.

Step 2: 5-{3-[l-(4-amino-3-methyl-lH-pyrazolo[3,4-d]pyrimidin-l-yl)ethyl]-5-chloro-2-ethoxy-6-fluorophenyl}-l,3-oxazolidin-2-one
The desired single enantiomer (peak 3) was prepared using the same procedure as Example 353 (steps 8-12), except that the intermediate from step 1 in this example was racemic and thus the final separation of the four diastereomers occurred in step 12. Chiral purification on Phenomenex Lux Cellulose C-4, 21 x 250 mm (Chiral Technologies), 5 micron particle size, at flow rate of 18 mL/min using 30% ethanol in hexanes gave the peak 1: compound 355 (single enantiomer) (retention time = 12.7 minutes), peak 2: compound 356 (single enantiomer) (retention time = 14.2 minutes), peak 3: compound 357 (single enantiomer) (retention time = 20.3 minutes), and peak 4: compound 358 (single enantiomer) (retention time = 28.9 minutes); the most active enantiomer was peak 3. AlphaScreen™ GST Detection Kit including donor and acceptor beads was purchased from PerkinElmer Life Sciences (Waltham, MA). PI3K8 (p70s6k/p85α) is purchased from Millipore (Bedford, MA). ATP, MgCl2, DTT, EDTA, HEPES and CHAPS are purchased from Sigma-Aldrich (St. Louis, MO).

AlphaScreen™ Assay for PI3K5

The kinase reaction are conducted in 384-well REMP plate from Thermo Fisher Scientific in a final volume of 40 µL. Inhibitors are first diluted serially in DMSO and added to the plate wells before the addition of other reaction components. The final concentration of DMSO in the assay is 2%. The PI3K assays are carried out at room temperature in 50 mM HEPES, pH 7.4, 5mM MgCl2, 50 mM NaCl, 5mM DTT and CHAPS 0.04%. Reactions are initiated by the addition of ATP, the final reaction mixture consisted of 20 µM PIP2, 20 µM ATP, 1.2nM PI3K8 are incubated for 20 minutes. 10 µL of reaction mixture are then transferred to 5 µL, 50nM biotinylated I(1,3,4,5)P4 in quench buffer: 50 mM HEPES pH 7.4, 150 mM NaCl. 10 mM EDTA, 5 mM DTT, 0.1% Tween-20, followed with the addition of 10 µL, AlphaScreen™ donor and acceptor beads suspended in quench buffer containing 25nM PI(3,4,5)P3 detector protein. The final concentration of both donor and acceptor beads is 20 mg/ml. After plate sealing, the plate are incubated in a dark location at room temperature for 2 hours. The activity of the product is determined on Fusion-alpha microplate reader (Perkin-Elmer). IC50 determination is performed by fitting the curve of percent control activity versus the log of the inhibitor concentration using the GraphPad Prism 3.0 software.

Example A2: PI3K Enzyme Assay

Materials: Lipid kinase substrate, phosphoinositol-4,5-bisphosphate (PIP2), are purchased from Echelon Biosciences (Salt Lake City, UT). PI3K isoforms α, β, δ and γ are purchased from Millipore (Bedford, MA). ATP, MgCl2, DTT, EDTA, MOPS and CHAPS are purchased from Sigma-Aldrich (St. Louis, MO).

The kinase reaction are conducted in clear-bottom 96-well plate from Thermo Fisher Scientific in a final volume of 24 µL. Inhibitors are first diluted serially in DMSO and added to
the plate wells before the addition of other reaction components. The final concentration of DMSO in the assay is 0.5%. The PI3K assays are carried out at room temperature in 20 mM MOPS, pH 6.7, 10 mM MgCl$_2$, 5 mM DTT and CHAPS 0.03%. The reaction mixture is prepared containing 50 μM PIP2, kinase and varying concentration of inhibitors. Reactions are initiated by the addition of ATP containing 2.2 μCi [$\gamma^{33}$P]ATP to a final concentration of 1000 μM. The final concentration of PI3K isoforms α, β, δ and γ in the assay were 1.3, 9.4, 2.9 and 10.8 nM, respectively. Reactions are incubated for 180 minutes and terminated by the addition of 100 μL of 1 M potassium phosphate pH 8.0, 30 mM EDTA quench buffer. A 100 μL aliquot of the reaction solution are then transferred to 96-well Millipore Multiscreen IP 0.45 μm PVDF filter plate (The filter plate is prewetted with 200 μL, 100% ethanol, distilled water, and 1 M potassium phosphate pH 8.0, respectively). The filter plate is aspirated on a Millipore Manifold under vacuum and washed with 18 x 200 μL wash buffer containing 1 M potassium phosphate pH 8.0 and 1 mM ATP. After drying by aspiration and blotting, the plate is air dried in an incubator at 37 °C overnight. Packard TopCount adapter (Millipore) is then attached to the plate followed with addition of 120 μL Microscint 20 scintillation cocktail (Perkin Elmer) in each well. After the plate sealing, the radioactivity of the product is determined by scintillation counting on Topcount (Perkin-Elmer). IC$_{50}$ determination is performed by fitting the curve of percent control activity versus the log of the inhibitor concentration using the GraphPad Prism 3.0 software.

**Example B1: B cell proliferation assay**

To acquire B cells, human PBMC are isolated from the peripheral blood of normal, drug free donors by standard density gradient centrifugation on Ficoll-Hypaque (GE Healthcare, Piscataway, NJ) and incubated with anti-CD19 microbeads (Miltenyi Biotech, Auburn, CA). The B cells are then purified by positive immunosorting using an autoMacs (Miltenyi Biotech) according to the manufacture’s instruction.

The purified B cells (2x10^7/well/200 µL) are cultured in 96-well ultra-low binding plates (Corning, Corning, NY) in RPMI1640, 10% FBS and goat F(ab')2 anti-human IgM (10 µg/ml) (Invitrogen, Carlsbad, CA) in the presence of different amount of test compounds for three days.

[^H]-thymidine (1 µCi/well) (PerkinElmer, Boston, MA) in PBS is then added to the B cell cultures for an additional 12 hours before the incorporated radioactivity is separated by filtration with water through GF/B filters (Packard Bioscience, Meriden, CT) and measured by liquid scintillation counting with a TopCount (Packard Bioscience).

**Example B2: Pfeiffer cell proliferation assay**
Pfeiffer cell line (diffuse large B cell lymphoma) are purchased from ATCC (Manassas, VA) and maintained in the culture medium recommended (RPMI and 10% FBS). To measure the anti-proliferation activity of the compounds, the Pfeiffer cells are plated with the culture medium (2x10^3 cells / well/ per 200 µl) into 96-well ultra-low binding plates (Corning, Corning, NY), in the presence or absence of a concentration range of test compounds. After 3-4 days, [^3H]-thymidine (1 µCi/well) (PerkinElmer, Boston, MA) in PBS is then added to the cell culture for an additional 12 hours before the incorporated radioactivity is separated by filtration with water through GF/B filters (Packard Bioscience, Meriden, CT) and measured by liquid scintillation counting with a TopCount (Packard Bioscience). IC₅₀ data for select compounds is presented in Table 4.

Example C: Akt phosphorylation assay

Ramos cells (B lymphocyte from Burkitts lymphoma) are obtained from ATCC
(Manassas, VA) and maintained in RPMI1640 and 10% FBS. The cells (3x10^7 cells /tube/3 mL
in RPMI) are incubated with different amounts of test compounds for 2 hrs at 37 °C and then
stimulated with goat F(ab')2 anti-human IgM (5 µg/mL) (Invitrogen) for 17 minutes in a 37 °C
water bath. The stimulated cells are spun down at 4 °C with centrifugation and whole cell
extracts are prepared using 300 µI, lysis buffer (Cell Signaling Technology, Danvers, MA). The
resulting lysates are sonicated and supernatants are collected. The phosphorylation level of Akt
in the supernatants are analyzed by using PathScan phospho-Akt (Ser473) sandwich ELISA kits
(Cell Signaling Technology) according to the manufacturer's instruction.

Example D: Pfeiffer Model of Lymphoma

Methods:

Female SCID mice, (5 to 8 weeks of age, Charles River Laboratories, Wilmington, MA)
were inoculated with 1 x 10^7 tumor cells (Pfeiffer, ATCC #CRL-2632, Manassas, VA) and
matrigel (BD Biosciences #354234) in 0.2 mL sterile saline. The inoculation was performed
subcutaneously on the flank. Tumor tissue fragments (approximately 3 mm x 3 mm) were
collected 3 to 6 weeks after the inoculation of cultured cells and implanted subcutaneously in lieu
of cellular inoculation. Tissue fragments were implanted as solid pieces using blunt-tip forceps.
The treatment of tumor bearing mice was started 15 to 25 days after tumor inoculation, depending
upon the tumor size. Animals were sorted to obtain roughly equivalent mean tumor volumes in
each group. Minimum mean tumor volume in all groups was 150 mm3 on the first day of
treatment and groups consisted of 7 animals. Experimental therapeutic agent, Example 347, was
administered to mice orally (PO). Treatment frequency was 2 times daily for a minimum of 14
days for efficacy. The size of subcutaneous tumors was measured 2 to 3 times weekly using a
digital caliper. The tumor volume was calculated by measuring the tumor in 2 dimensions and
utilizing the equation: Volume = [Length x (Width2)]/2; where the larger number was length, and
the smaller number width. If multiple tumors were formed, the final volume was the sum of the
individual tumors subject to the same equation: eg, 2 tumors; Volume = {[L1 x (W1)^2]/2} + {[L2
x (W2)^2]/2}. Effects on tumor growth were reported as percent tumor growth inhibition (%TGI).
Percent TGI was calculated with the equation: (1- (Tx vol. / control vol.))* 100, where control
volume was the vehicle or untreated tumor volume on a given day, and Tx volume was any
treatment group tumor volume on that same day. Statistical differences between treatment and
vehicle controls were assessed using ANOVA: Single Factor test.

Results:

Example 347 was evaluated as a single agent in the Pfeiffer human tumor xenograft
model of diffuse large B-cell lymphoma, a subtype of NHL. Pfeiffer cancer cells were shown to
be sensitive to the anti-proliferative effects of Example 347m vitro. Therefore, a tumor model
was established based on subcutaneous inoculation of tumor cells into immune compromised
SCID mice and tumor-bearing mice received twice daily oral doses of vehicle or Example 347 at
0.3, 1.3, or 10 mg/kg for 14 days. Example 347 treatment inhibited tumor growth by 22%, 24%,
36%, and 58% (percent tumor growth inhibition) with increasing dose (FIG. 2).
