(54) Title: SYSTEMS AND METHODS FOR A PRESERVED, DEOXYGENATED, FLAVORED BEVERAGE AND COMPOSITIONS THEREOF

Figure 1

(57) Abstract: A beverage product includes a mixture having a dissolved oxygen content of less than 500 parts per billion, the mixture including tea flavor, hops flavor, and water. The beverage product further includes a container holding the mixture, the container being sealed to prevent the introduction of dissolved oxygen, a headspace of the container including inert gas.

WO 2019/133416 A1

SYSTEMS AND METHODS FOR A PRESERVED, DEOXYGENATED, FLAVORED  
BEVERAGE AND COMPOSITIONS THEREOF

BACKGROUND

[0001] Beverages having rich flavors and low calories are very desirable for consumers. Additionally, consumers typically disfavor artificial sweeteners or other non-natural ingredients. Therefore, it is desirable to provide a flavorful beverage with low calories.

BRIEF SUMMARY

[0002] In one embodiment, a beverage product includes a mixture having a dissolved oxygen content of less than 500 parts per billion, the mixture including tea flavor, hops flavor, and water. The beverage product further includes a container holding the mixture, the container being sealed to prevent the introduction of dissolved oxygen, a headspace of the container including inert gas. In one alternative, the oxygen content is less than 100 parts per billion. In another alternative, the mixture is carbonated. Alternatively, the mixture does not include alcohol. In another alternative, the beverage does not include yeast.

[0003] In one embodiment, a beverage includes a mixture having a dissolved oxygen content of less than 500 parts per billion, the mixture including tea flavor, hops flavor, and water. In one alternative, the oxygen content is less than 100 parts per billion. In another alternative, the mixture is carbonated. Alternatively, the mixture does not include alcohol. In another alternative, the beverage does not include yeast.

[0004] In one embodiment, a beverage consisting essential of a mixture having a dissolved oxygen content of less than 500 parts per billion, the mixture including tea flavor, hops flavor, and water. In one alternative, the oxygen content is less than 100 parts per billion. In another alternative, the mixture is carbonated. Alternatively, the mixture does not include alcohol. In another alternative, the beverage does not include yeast.

[0005] In one embodiment, a method of producing a beverage includes forming a mixture of tea flavor, hops flavor, and water having a dissolved oxygen content of less than 0.5%. The method further includes purging the mixture with an inert gas to maintain an anoxic

environment of the mixture or reduce the anoxic environment of the mixture. The method further includes sealing the purged mixture in a container to produce an anaerobic, nonalcoholic beverage.

[0006] In one alternative, the steps in the process do not include a step of removing alcohol from either the mixture or the purged mixture and the mixture does not contain alcohol. In another alternative, the steps in the process do not include a step of adding fungus to the mixture and do not include a step of adding bacteria to the mixture. Alternatively, the forming includes disrupting an equilibrium of dissolved oxygen in the water to produce water with a reduced dissolved oxygen content. The forming further includes steeping tea in the water with the reduced dissolved oxygen content. The forming further includes removing the tea from the water with the reduced dissolved oxygen content to produce a composition of the water with the reduced dissolved oxygen content and the tea flavor that remains after the removing of the tea. The forming further includes sparging the composition with an inert gas to reduce the dissolved oxygen and thereby produce the water having the dissolved oxygen content of less than 0.5% combined with the tea flavor. Optionally, the forming includes anaerobically introducing hops to the composition and removing the hops from the composition to produce the hops flavor that remains after the removing of the hops. In one alternative, the purging is carried out in a vessel and, between the steps of the purging and the sealing, maintaining the increased anoxic environment while communicating the mixture to the container. In another alternative, the disrupting does not include vacuuming the mixture or in-line vacuum degassing the mixture. In one embodiment, a process is produced according to any of the methods above.

[0007] In one embodiment, an apparatus for storing hops includes a lid fitting onto a bucket, the lid comprising an air inlet, an air outlet, and a valve. In one alternative, the valve is a pressure release valve. In another alternative, the apparatus includes a dip tube. In another embodiment, the apparatus includes a barb or a thread or a quick disconnect, to accept an air hose.

#### BRIEF DESCRIPTION OF THE DRAWINGS

[0008] Figure 1 shows one embodiment of a process flow chart for adding hop flavor to tea;

[0009] Figure 2 shows another embodiment of a process flow chart for adding hop flavor to tea;

[0010] Figure 3 shows another embodiment of a process flow chart for adding hop flavor to tea;

[0011] Figure 4 shows a depiction of one embodiment of the apparatus used in the hopping process;

[0012] Figure 5 shows a depiction of one embodiment of a hops storage device.

[0013] Figure 6 shows a depiction of one embodiment of a hops storage device; and

[0014] Figure 7 shows another embodiment of a process flow chart for the hops storage device.

#### DETAILED DESCRIPTION

[0015] Certain terminology is used herein for convenience only and is not to be taken as a limitation on the embodiments of the system and methods for a preserved, deoxygenated, flavored beverage and compositions thereof. In many embodiments, one of the flavors for the beverage is hops.

[0016] For beverages including flavors such as hops, the hop flavor may degrade significantly over time. This is especially true of the aroma that hops may bring to a beverage. Therefore, it is desirable to produce beverages that have a stable hop flavor and no sugars or sweeteners. In this way the brewed beverages may be sold bottled or canned without significant degradation of the hop flavor. Since typically, hops are used in beer that is deoxygenated by the fermentation process, such oxygen degradation is less of an issue with beer (although still exists). Additionally, residual sugar and alcohol still exist, so the beverage will have significant calories. Typically, the production of a flavorful beverage, that has good shelf life, is not possible without, sugar, fermentation, and yeast. Even if alcohol in a beverage is reduced, it will still typically contain some residual alcohol. Even if an attempt is made to remove yeast, some will typically

remain. Therefore, processes including fermentation, will not yield the same types of beverages that are described in the deoxygenating and hopping process below.

**[0017]** In one embodiment, hop flavor is added to tea. Tea may include black tea, white tea, green tea, herbal tea, and various other teas. One embodiment of a method preparing a tea with hop flavor includes the following steps. Water is heated to about 185 F and tea is steeped in the water for about 3 minutes before the tea leaves are removed from the water. The resultant flavored water is then transferred into a container, such as a fermenter, brite tank, unitank or similar sealable apparatus. As part of this transfer, in many alternatives, the tea flavored water is strained, sealed, and cooled to about 36 F. Alternatively, or in addition, one or more flavoring agents is added to the flavored water, e.g., sugar, honey fruit juice, etc. Such agents are not added in many embodiments, especially those producing no or low calorie beverages. The container, again for example, a fermenter, brite tank, unitank or similar sealable apparatus, can be used for a hopping process. An inert gas, such as carbon dioxide, nitrogen, argon, etc., is sparged for about 30 minutes through an air diffusion device, such as a 2 micron air diffusion stone, at about 5 psi to deoxygenate the tea before hops are added. In many embodiments, it is desirable to achieve a benchmark can be <100 parts per billion dissolved Oxygen (DO) content in the tea. Generally, lower levels of dissolved Oxygen provide for better preserved hop flavor.

**[0018]** Hops are deoxygenated prior to addition to the flavored, deoxygenated water. For example, the hops can be placed in a vacuum in a container, apparatus, or vessel and/or purged with an inert gas, etc. prior to addition so as to deoxygenate the hops. The deoxygenated hops are then introduced anaerobically (such that they do not include oxygen) to the flavored, deoxygenated water. For example, a “hop gun”, hopinator or other such device can be used to introduce the hops anaerobically. In many embodiments, the hops may not be deoxygenated. In some scenarios, the results may be similar in terms of flavor preservation, whether or not deoxygenated hops are used. In some scenarios, the hops may not be deoxygenated and the sparging may be completed after the application of hops. After the deoxygenated hops have been added, the headspace of the container, apparatus, or vessel is purged with an inert gas after the container, apparatus, or vessel is sealed, so as to maintain an anoxic environment for the resultant mixture. In many embodiments, adding hops can be considered dry hopping with the additional aspect of an anaerobic environment.

[0019] In many alternatives, the hops are removed from the mixture by allowing them to settle and transferring to another deoxygenated, sealed container. A filter can, if so desired, be used to separate the hops from the beverage. After the hops are removed from the mixture, the resultant liquid or beverage is purged with an inert gas. In many embodiments, if desired, the beverage is then carbonated. The inert gas could be constantly bubbled through the hop-steeping vessel to further reduce O<sub>2</sub> infiltration. An inert gas may be used at this stage as well.

[0020] Embodiments herein can also be applied to reduce oxidation in unfermented, non-tea based beverages, such as fruit juices, sodas, sugar sweetened beverages, and beverages that comprise hops and water as their main ingredients. Hops typically are used in beverages that are fermented, such as beer. With such beverages, as a result of the fermentation process, the resulting beverage has a low oxygen content, since the oxygen has been consumed in the fermentation process. Therefore, ordinarily, if hops were added to tea without reduction of oxygen, the flavor would degrade more quickly. Generally, oxygen degrades the delicate aromatic compounds that processes like dry hopping add.

[0021] Another exemplary embodiment for a process for preparing a beverage, such as a non-alcoholic beverage, includes the following steps:

- o Reducing dissolved oxygen in water, e.g., by boiling water and then cooling the water, e.g., to about 185 degrees C.
- o Steeping tea leaves in the deoxygenated water, e.g., for about 3 minutes, then straining to remove the tea leaves, then sealing and cooling the resulting liquid, e.g., to about 4 degrees C.
- o Sparging the liquid with an inert gas, e.g., for about 30 minutes, so as to deoxygenate tea liquid, e.g., reducing the dissolved Oxygen, e.g., preferably to <500, more preferably <400, even more preferably <300, yet even more preferably <200, or even yet more preferably <100 parts per billion.
- o Vacuum sealing (or purging or both) the hops with an inert gas and adding the hops to the deoxygenated tea liquid anaerobically.

- o After sealing the tea liquid in a vessel etc., purging headspace of the vessel with an inert gas to maintain an anoxic environment.
- o After removing the hops, purging a container of the tea liquid with an inert gas, and then if desired;
- o and then carbonating the liquid or beverage, or adding a flavor anaerobically.

**[0022]** Beverage and other products employing the beverage, can be considered products produced by processes according to embodiments herein.

**[0023]** More particularly, with reference to the figures, note that Figure 1 indicates that a mixture 2 is formed by combining water 4, tea flavor 6, and hops flavor 8 in a container that essentially excludes atmospheric oxygen 14. Other flavors in combination with tea or in the place of tea could also be used, including fruit juice, lemonade, limeade, coffee, plant-based waters, artificial flavorings, sugars, sodas, bone broth, horchata, agua firesca, ginger flavored beverages, flavored water and beverages that contain no flavoring other than hops. The container may be a fermenter, bright tank, unitank, or the like. The oxygen concentration of the resulting mixture may be reduced from these components by purging them with inert gas or an in-line vacuum degassing system 10. The inert gas may be carbon dioxide, nitrogen, argon, etc. The gassed mixture is isolated from ambient oxygen by sealing the gassed mixture 12 in a container 14 resulting in a non-oxidized hopped beverage 16.

**[0024]** Referring to Figure 2, in one embodiment of a method of preparing a beverage, water 4 is heated in step 18, which disrupts the oxygen equilibrium in the water. Tea leaves are added in step 20 and steeped in the water for some amount of time in step 22, depending on the concentration of flavor desired. In step 24, the tea leaves are removed. Any of concentrated tea flavoring extract, concentrate, powder 6 or the like may be added to the water 4 with the disrupted the oxygen equilibrium. The oxygen concentration of the mixture may lowered to e.g., to <100, <200, <300, <400, <500 parts per billion as may be preferred in one embodiment or another by injecting a non-oxidative (inert) gas or gasses in step 26, and/or vacuum stripping in step 28.

[0025] In many embodiments, an airstone is used for delivery of the inert gas into the mixture, or the gas may be injected directly through ports, tubing, or perforated tubing, etc. A dissolved oxygen sensor may be used to assess the oxygen content of the mixture.

[0026] Hops flavor is then added in step 30. Examples of hops flavor that can be used, include, but are not limited to whole leaf hops, pellet hops, hops powder, hops oil, and/or hops extract. In many embodiments, a non-oxidative gas is added to the hops prior to introducing the hops flavor into the mixture, and/or the hops are added to a second, deoxygenated container after which the tea mixture is added. In many configurations, a pump is used to facilitate mixing and hops flavor extraction. In some embodiments, during this hop extraction process, non-oxidative gas is injected to the mixture. In other embodiments, the mixture is sent through an in-line degasser to maintain a low oxygen environment. Some portion of the insoluble hops material may then be removed, depending on the embodiment desired. In many embodiments, this is carried out by transferring the liquid to a second vessel, filtering the liquid, dumping the gravity settled hops, or decanting floating hops in step 32 while maintaining a low oxygen concentration by stripping or sparging oxygen or isolating the mixture from atmospheric oxygen infiltration in step 10. The resultant beverage is sealed in step 12 in a container 14 resulting in in step 16, a low oxygen hopped beverage that contains no appreciable alcohol content.

[0027] Referring to Figure 4, one embodiment of a vessel 40 used for the sparging and hopping process is a container that essentially excludes oxygen. Commercially available containers such as a fermenter, brite tank, unitank or other similar containers can be used for vessel 40. The vessel 40 has a port 42 introduce the inert gas during the sparging process. Port 42 may be a valve, inlet, or other connection area for introducing the inert gas. Vessel 40 has an opening to introduce hops such as a port or valve 44. Vessel 40 has a way to vent gas such as a manually controllable valve 46 or pressure release valve 48. A container that can handle elevated pressures up to 1, 2, 5, 10, 15 psi or higher (depending on the preferred embodiment) is desirable for the sparging and subsequent transferring processes. Liquid port with valve 52 can be used to add the liquid before the hopping process or remove the liquid after the hopping process. The actual containers used may vary, however, in many embodiments, the container excludes oxygen and has various ports for the introduction and removal of liquids, gases, and mixtures.

**[0028]** Additional ports 54 at the bottom of the vessel 40 or towards or at the top of the vessel 40 can also be used for transferring or mixing of the mixture. Among the necessary intermediates are liquids having hops flavor (can be a mixture of flavor compounds) and reduced the dissolved Oxygen, e.g., preferably to <500, more preferably <400, even more preferably <300, yet even more preferably <200, or even yet more preferably <100 parts per billion.

**[0029]** Some, but not all embodiments, produce a product such as an alcohol free, hop flavored beverage that has hop flavor similar to those flavors found in fermented beverages. In some embodiments, alcohol such as of beer, wine, or distilled spirits are sparged with an inert gas and then added to the hopped beverage. In some embodiments, purified alcohol is added to the mixture before the sparging and hopping process to make an alcoholic hopped beverage without the use of biological processes within the oxygen reduction or hopping process.

**[0030]** Some, but not all embodiments, produce a product such as an additive of the hopped liquid as a flavoring agent to baked goods such as soda breads, quick breads, scones, cakes and pastries.

**[0031]** Some, but not all embodiments, produce a product such as an additive of the hopped liquid product as a flavoring agent to waffles.

**[0032]** One embodiment of an apparatus for facilitating storage of hops in a lower oxygen environment is now described. Presently, in commercial brewery or beverage making facilities, bulk hops are typically sold in 11 pound bags that have been purged of oxygen for long term storage. Once the bag is opened, oxygen can be introduced into the hops, causing them to oxidize and degrade over time. Bags can be purged of oxygen and resealed but that is a difficult process. There exists a need for a robust, ridged apparatus to purge the inert gas from the hops and store them that is both relatively inexpensive (and preferably stackable) so that the many varieties of hops can be stored for longer periods of time without degradation of flavor.

**[0033]** Referring to Figure 5, a container for storing hops in a reduced oxygen environment is described. Some, but not all embodiments, of this container comprise a lid 60 that fits (e.g., separately sold) containers such as a 0.5, 1, 2, 5, 10, or 55-gallon bucket or a bin. In many embodiments, the lid 60 is composed of a ridged material, such as plastic or metal. The lid

60 has a sealable device for introducing pressurized gas 62, e.g., a barb for attaching an air hose. A connection for the pressurized gas to the lid 60 could also be a threaded junction. The connection for the pressurized gas to the lid 60 could also be a quick disconnection device. An air inlet can connect to a perforated post that extends down into the container 64. In many embodiments, the perforations or holes are small enough to exclude hop bines or pellets from entering the post, e.g., smaller than 6 mm in diameter. A controllable vent port 66 and/or pressure release valve 68 is attached to the lid to facilitate gas venting from the sealed container. In many embodiments, the exit port has a barb or threaded connection for attaching an oxygen content monitoring device. The lid device 70 attaches to separately produced receptacle 72 such as a bucket or bin in a way that creates an airseal to separate the internal from external environment.

[0034] Referring to Figure 6, another embodiment includes a whole container 74 such as a bucket or bin with a sealable port for introducing pressurized gas from the side 76 which in many instances is a barb for attaching an air hose. The connection for the pressurized gas to the lid could also be a threaded junction. The connection for the pressurized gas to the lid could also be a quick disconnection device. In many embodiments, the air inlet connects to a perforated post that extends sideways into the container 78. In many embodiments, the perforations or holes are small enough to exclude hop bines or pellets from entering the post, e.g., smaller than 6 mm in diameter. A controllable vent port 80 and/or pressure release valve 82 is attached to the lid 84 to facilitate gas venting from the sealed container. In many embodiments, the exit port has a barb or threaded connection for attaching an oxygen content monitoring device. Another embodiment of includes an elevated rim or bumper on the lid or top of the device 86. This rim or bumper may be made of rubber, plastic or metal to protect the ports and facilitate stacking of the hops containment device.

[0035] Figure 7 shows a method of using embodiments of the hop storing containers. Referring to Figure 7, in many embodiments, the above described apparatus is used by purging the container with inert gas in step 100. Hops are added to the container in step 102 and then the container is sealed in step 104 using a lid or other port device. An inert gas is then added and the gas inside the container is vented in step 106 to lower the oxygen level. Once the desired oxygen level is obtained the ports are sealed creating a hops storage container with a low oxygen

environment in step 108. In step 110, the hops are safely stored in the container in a low oxygen environment.

[0036] In many embodiments, a beverage including hops flavor having low oxygen content is created. In many alternatives, the beverage also includes tea flavoring. In many alternatives, no yeast is added to the beverage and no yeast remains in the beverage. In many embodiments, the dissolved Oxygen is very low, e.g., preferably to <500, more preferably <400, even more preferably <300, yet even more preferably <200, or even yet more preferably <100 parts per billion. In many embodiments, the beverage contains no sugar and therefore no fermentation is possible to reduce dissolved oxygen.

[0037] In sum, with respect to the description herein, numerous specific details are provided, such as examples of components and/or methods, to provide a thorough teaching and understanding of embodiments of the present invention. One skilled in the relevant art will recognize, however, that an embodiment can be practiced without one or more of the specific details, or with other apparatus, systems, assemblies, methods, components, materials, parts, and/or the like. In other instances, well-known structures, materials, or operations are not specifically shown or described in detail to avoid obscuring aspects of embodiments of the present invention.

[0038] Similarly, embodiments can be implemented in many forms, and based on the disclosure and teachings provided herein, a person of ordinary skill in the art will appreciate other ways and/or methods to implement an equivalent. Reference throughout this specification to "one embodiment", "an embodiment", or "a specific embodiment" means that a particular feature, structure, or characteristic described in connection with the embodiment is included in at least one embodiment and not necessarily in all embodiments. Thus, respective appearances of the phrases "in one embodiment", "in an embodiment", or "in a specific embodiment" in various places throughout this specification are not necessarily referring to the same embodiment.

[0039] Furthermore, the particular features, structures, or characteristics of any specific embodiment may be combined in any suitable manner with one or more other embodiments. It is to be understood that other variations and modifications of the embodiments

described and illustrated herein are possible in light of the teachings herein and are to be considered as part of the spirit and scope of the present invention.

[0040] It will also be appreciated that one or more of the elements depicted in the drawings/figures can also be implemented in a more separated or integrated manner, or even removed or rendered as otherwise operable in certain cases, as is useful in accordance with a particular application.

[0041] Additionally, any signal arrows in the drawings/Figures should be considered only as exemplary, and not limiting, unless otherwise specifically noted. Furthermore, the term "or" as used herein is generally intended to mean "and/or" unless otherwise indicated. Combinations of components or steps will also be considered as being noted, where terminology is foreseen as rendering the ability to separate or combine is unclear.

[0042] As used in the description herein and throughout the claims that follow, "a", "an", and "the" includes plural references unless the context clearly dictates otherwise. Also, as used in the description herein and throughout the claims that follow, the meaning of "in" includes "in" and "on" unless the context clearly dictates otherwise.

[0043] The foregoing description of illustrated embodiments, including what is described in the Abstract and the Summary and the overview paragraphs, are not intended to be exhaustive or to limit the disclosed system, apparatuses, methods, compositions of matter or other disclosed subject matter to the precise forms disclosed herein. While specific embodiments of, and examples for, the disclosed system, apparatuses, methods, compositions of matter or other disclosed subject matter are described herein for teaching-by-illustration purposes only, various equivalent modifications are possible within the spirit and scope of the disclosed system, apparatuses, methods, compositions of matter or other disclosed subject matter, as those skilled in the relevant art will recognize and appreciate. As indicated, these modifications may be made in light of the foregoing description of illustrated embodiments and are to be included within the true spirit and scope of the disclosure herein provided.

**CLAIMS**

What is claimed as new and desired to be protected by Letters Patent is:

1. A beverage product, comprising:
  - a mixture having a dissolved oxygen content of less than 500 parts per billion, the mixture including tea flavor, hops flavor, and water;
  - a container holding the mixture, the container being sealed to prevent the introduction of dissolved oxygen, a headspace of the container including inert gas.
2. The beverage product of claim 1, wherein the oxygen content is less than 100 parts per billion.
3. The beverage product of claim 2, wherein the mixture is carbonated.
4. The beverage product of claim 3, where an anaerobice in the mixture does not include alcohol.
5. The beverage product of claim 4, wherein the beverage does not include yeast.
6. A beverage comprising:
  - a mixture having a dissolved oxygen content of less than 500 parts per billion, the mixture including tea flavor, hops flavor, and water.
7. The beverage of claim 6, wherein the oxygen content is less than 100 parts per billion.
8. The beverage of claim 7, wherein the mixture is carbonated.
9. The beverage of claim 8, wherein the mixture does not include alcohol.
10. The beverage product of claim 9, wherein the beverage does not include yeast.
11. A beverage, consisting essential of:
  - a mixture having a dissolved oxygen content of less than 500 parts per billion, the mixture including tea flavor, hops flavor, and water.
12. The beverage of claim 11, wherein the oxygen content is less than 100 parts per billion.
13. The beverage of claim 12, wherein the mixture is carbonated.

14. The beverage of claim 13, wherein the mixture does not include alcohol.
15. The beverage of claim 14, wherein the beverage does not include yeast.
16. A method of producing a beverage, the method comprising:
  - forming a mixture of tea flavor, hops flavor, and water having a dissolved oxygen content of less than 0.5%;
  - purging the mixture with an inert gas to maintain an anoxic environment of the mixture or reduce the anoxic environment of the mixture;
  - sealing the purged mixture in a container to produce an anaerobic, nonalcoholic beverage.
17. The method of claim 16, wherein the steps in the process do not include a step of removing alcohol from either the mixture or the purged mixture and the mixture does not contain alcohol.
18. The method of claim 17, wherein the steps in the process do not include a step of adding fungus to the mixture and do not include a step of adding bacteria to the mixture.
19. The method of claim 18, wherein the forming includes:
  - disrupting an equilibrium of dissolved oxygen in the water to produce water with a reduced dissolved oxygen content;
  - steeping tea in the water with the reduced dissolved oxygen content;
  - removing the tea from the water with the reduced dissolved oxygen content to produce a composition of the water with the reduced dissolved oxygen content and the tea flavor that remains after the removing of the tea;
  - sparging the composition with an inert gas to reduce the dissolved oxygen and thereby produce the water having the dissolved oxygen content of less than 0.5% combined with the tea flavor.
20. The method of claim 19, wherein the forming includes: anaerobically introducing hops to the composition;
  - removing the hops from the composition to produce the hops flavor that remains after the removing of the hops.
21. The method of claim 20, wherein the purging is carried out in a vessel and, between the

steps of the purging and the sealing, maintaining the increased anoxic environment while communicating the mixture to the container.

22. The method of claim 21, wherein the disrupting does not include vacuuming the mixture or in-line vacuum degassing the mixture.

23. A product produced by the method of any one of claims 16-23.

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

See Search History document

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

See Search History document

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
Y	JP 2005/295989 A (HIRANO TETSUYA) 27 October 2005; see machine translation; abstract; page 1, bottom; page 2, top-middle	1-22, 23/16-19
Y	US 2014/0127373 A1 (HAN, Z et al.) 08 May 2014; abstract; paragraphs [0008], [0010], [0016]-[0017]	1-22, 23/16-19
Y	US 9,303,241 B2 (REEVES, J) 05 April 2016; abstract; column 1, lines 25-27; column 2, lines 12-18, 64-67; column 5, lines 58-59	20-22, 23/20-22
A	CN 104,762,153 A (UNIV DALIAN NATIONALITIES) 08 July 2015; see machine translation; entire document	1-23
A	CN 101,348,755 A (NINGBO FUQUANSHAN GREEN TEA WINE CO LTD) 21 January 2009; see machine translation; entire document	1-23

 Further documents are listed in the continuation of Box C. See patent family annex.

## \* Special categories of cited documents:

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier application or patent but published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

"&amp;" document member of the same patent family

Date of the actual completion of the international search

12 February 2019 (12.02.2019)

Date of mailing of the international search report

07 MAR 2019
