(54) Title: COMPOSITIONS FOR CONTROLLING PLANT PESTS

(57) Abstract:
The present invention relates to compositions for controlling plant pests, which contain the compound of the formula (I): (see formula I) in a mixture with metalaxyl, the compound of the formula: (see formula XXI).
Abstract

The present invention relates to compositions for controlling plant pests, which contain the compound of the formula (I):

\[
\begin{align*}
\text{Cl} & \quad \text{S} \quad \text{CH}_2 \quad \text{N} \quad \text{N} \quad \text{CH}_3 \\
& \quad \text{N} \quad \text{NO}_2
\end{align*}
\]

in a mixture with metalaxyl, the compound of the formula:

\[
\begin{align*}
\text{CH}_3 & \quad \text{O} \quad \text{CH}_2 \quad \text{C} \quad \text{N} \quad \text{CH} \quad \text{CO}_2 \text{CH}_3 \\
& \quad \text{H}_3\text{C} \quad \text{CH}_3
\end{align*}
\]

(XXI).
Compositions for controlling plant pests

This is a divisional patent application of Canadian Patent Application 2,334,618 filed May 29, 1999.

The present invention relates to pesticides which comprise an active compound combination of the compound of the formula (I)

\[
\begin{array}{c}
\text{Cl} \\
\text{S} \\
\text{CH}_2 \\
\text{N} \\
\text{CH}_3 \\
\text{NO}_2
\end{array}
\]

(I)

with fungicides.

Fungicidally active compounds, such as azole derivatives, aryl benzyl ethers, benzamide, morpholine compounds and other heterocycles, are known (cf. K.H. Büchel "Pflanzenschutz und Schädlingsbekämpfung", pages 140 to 153, Georg Thieme-Verlag, Stuttgart 1977, EP published specification 0 040 345, German Offenlegungsschrift 2 324 010, German Offenlegungsschrift 2 201 063, EP published specification 0 112 284, EP published specification 0 304 758 and DD patent specification 140 412).

Mixtures of certain nitromethylene derivatives with fungicidally active compounds and their use as pesticides in crop protection are already known (US-P-4 731 385; JP published specifications 63-68507, 63/68505; 63/72 608; 63/72 609, 63/72 610, WO 96/03 045, Japanese patent specification 08 245 323, Japanese patent specification 04 368 303, Japanese patent specification 05 017 311, WO 92/21 241, WO 97/22 254). Mixtures of certain open-chain nitromethylene and nitroguanidines with fungicides are already known (Japanese published specification 30 47 106; US-P 5 181 587).

Mixtures of cyclopropylcarboxamides with certain nitromethylene or nitroguanidine derivatives are already known (Japanese published specification 3 271 207).
Mixtures of, inter alia, imidacloprid and fungicidally active compounds for use in the protection of materials and against termites, but not for use against plant-damaging pests, are already known (EP published specification 0 511 541). Mixtures of imidacloprid and azolylmethylocycloalkanes, in particular triticonazole, are known from EP published specification 545 834.

However, hitherto it has not been known that nitroguanidine derivatives and fungicides with the exception of cyclopropylcarboxamides and triticonazole have such a mutually beneficial effect in their activity that they are outstandingly suitable as compositions for controlling plant pests, whilst being tolerated well by plants.

Summary of Invention

The present invention provides a composition comprising the compound of the formula (I)

\[
\begin{align*}
\text{Cl} & \quad \text{N} \\
\text{S} & \quad \text{CH}_2 \\
\text{H} & \quad \text{N} \\
\text{N} & \quad \text{CH}_3 \\
\text{NO}_2 & \quad \text{N}
\end{align*}
\]

(I)

and the compound of the formula (XXI)

\[
\begin{align*}
\text{CH}_3 & \quad \text{O} \\
\text{CH}_2 & \quad \text{C} \\
\text{N} & \quad \text{CH} \\
\text{CO}_2 & \text{CH}_3 \\
\text{H}_3 & \text{C} \\
\text{CH}_3 & \text{CH}_3
\end{align*}
\]

(XXI)

(METALAXYL).

The present invention further provides a method for controlling fungi and insects, characterized in that the composition as described herein is allowed to act on at least one of the fungi, the insects or their habitat.
The present invention further provides a process for preparing the composition as described herein, characterized in that the composition as described herein is mixed with at least one of an extender or a surfactant.

The present invention further provides a method for protecting at least one of a seed or the shoots and foliage of a plant grown from the seed from damage by an insect or a fungus, said method comprising treating the unsown seed with the composition as described herein.

The present invention further provides use of a seed treated by the method as described herein for controlling fungi and insects.

The present invention relates to compositions against plant pests which contain the compound of the formula (I)

\[
\begin{array}{c}
\text{Cl} \\
\text{N} \\
\text{S} \\
\text{CH}_2 \\
\text{N} \\
\text{H} \\
\text{N} \\
\text{CH}_3 \\
\text{NO}_2 \\
\end{array}
\]

(I)

in a mixture with fungicidally active compounds, except for cyclopropylcarboxamide derivatives and azolymethylcycloalkanes.

Examples of fungicides in the compositions according to the invention for controlling plant pests which may be mentioned are:

(1) azole derivatives of the formula
(II-1) \( R^1 = \text{Cl} \), \( R^2 = \text{Cl} \), \( R^3 = -\text{C(H}_3\text{)}_3 \), \( N = 1 \),

(TEBUCONAZOLE)

(II-2) \( R^1 = \text{Cl} \), \( R^2, R^3 = -\text{OCH}_2\text{CH}_{(n>C_3H_7)O} \), \( n = 1 \),

(PROPICONAZOLE)

(II-3) \( R^1 = \text{Cl} \), \( n = 1 \),

\( R^2, R^3 = -\text{OCH}_2\text{CH(CH}_3\text{)}_O \),

(DIFENCONAZOLE)

(II-4) \( R^1 = \text{Cl} \), \( R^2 = -\text{CH}+\text{CH}_3 \), \( R^3 = -\text{OH} \), \( n = 1 \),

(CYPROCONAZOLE)

(II-5) \( R^1 = \text{F} \), \( R^2, R^3 = -\text{OH} \), \( n = 1 \),

(FLUTRIAFOL)
(II-6) \[ R^3 = \text{Cl} - \begin{array}{c} \text{Cl} \\ \text{Cl} \end{array}, R^4 = -(\text{CH}_2)_3\text{CH}_3, R^5 = \text{OH}, n = 1, \]

(HEXACONAZOLE)

(II-7) \[ R^1 = \text{Cl} - \begin{array}{c} \text{Cl} \\ \text{Cl} \end{array}, R^2 = -(\text{CH}_2)_3\text{CH}_3, R^3 = \text{CN}, n = 1, \]

(MYCLOBUTANIL)

(II-8) \[ R^1 = \text{Cl} - \begin{array}{c} \text{Cl} \\ \text{Cl} \end{array}, R^2 = -(\text{CH}_2)_2\text{CH}_3, R^3 = \text{H}, n = 1, \]

(PENCONAZOLE)

(II-9) \[ R^1 = \text{Cl} - \begin{array}{c} \text{Cl} \\ \text{Cl} \end{array}, R^2, R^3 = -\text{OCHCH}_2\text{CH}_2\text{O}-, n = 1, \]

(FURCONAZOLE)

(II-10) \[ R^1 = \text{Cl} - \begin{array}{c} \text{Cl} \\ \text{Cl} \end{array}, R^2, R^3 = -\text{OCHCH}_2\text{O}, n = 1, \]

(ETACONAZOLE)

(II-11) \[ R^1 = \text{Cl} - \begin{array}{c} \text{Cl} \\ \text{Cl} \end{array}, R^2, R^3 = -\text{OCH}_2\text{CHCH}_2\text{Br}, n = 1, \]

(BROMUCONAZOLE)
(II-12) \( R^1 = \text{aryl}, \ R^2 = \text{aryl}, \ R^3 = \text{OH}, \ n = 1, \)

(II-13) \( R^1 = \text{aryl}, \ R^2, R^3 = \text{aryl}, \ n = 1, \)

(II-14) \( R^1 = \text{aryl}, \ R^2 = \text{aryl}, \ R^3 = \text{CN}, \ n = 1, \) (FENBUCONAZOLE)

(II-15) \( R^1 = \text{aryl}, \ R^2 = \text{aryl}, \ R^3 = \text{H}, \ n = 1, \) (TETRACONAZOLE)

(II-16) \( R^1 = \text{aryl}, \ R^2 = \text{aryl}, \ R^3 = \text{H}, \ n = 0, \) (TRIADIMENOL)

(II-17) \( R^1 = \text{aryl}, \ R^2 = \text{aryl}, \ R^3 = \text{H}, \ n = 0, \) (TRIADIMEFON)

(II-18) \( R^1 = \text{aryl}, \ R^2 = \text{aryl}, \ R^3 = \text{H}, \ n = 0, \) (BITERTANOL)
(II-19) \( R^1 = \text{Cl} - \text{Cl} - \text{CH}_2 - , R^2 = \text{-CH(OH)-C(CH}_3\text{_3), n = 0, R}^3 = \text{H,} \)

(DICLOBUTRAZOLE)

(II-20) \( R^1 \text{ and } R^2 = \text{Cl} - \text{Cl} - \text{CH} = , R^3 = \text{-CH-tButyl, n = 0,} \)

\]
Compounds from the groups (15), (16), (17), (18), (23), (34), (25), (28), (31), (32), (33) and (38) to (47) are described, for example, in K.H. Büchel, "Pflanzenschutz und Schädlingsbekämpfung", pages 121-153, Georg Thieme-Verlag, Stuttgart, 1977. The compound of group (39) is known from EP published specification 281 842.

The compound of group (50) is known from WO 97/ 06 171.

The compound of group (51) is known from DE-24 33 410.

The compounds of groups (52) to (54) are known from W. Paulus, "Microbicides for the Protection of Materials", Chapman & Hall 1993.

The compound of group (55) is known from EP-0 512 349.

In addition to the active compound of the formula (I), the active compound combinations according to the invention contain at least one fungicidal active compound, for example selected from the compounds of groups (1) to (55). In addition, they may also contain other active compounds and customary auxiliaries and additives and also diluents.

Preferred fungicidally active compounds in the compositions according to the invention are:

kresoxim-methyl, tebuconazole, metalaxyl, azoxystrobin, triadimenol, bitertanol, fenpicolonil, cyproconazole, propiconazole, fludioxonil and triazoxides.

The mixtures show a clear synergistic effect when the active compounds in the active compound combinations according to the invention are present in certain weight ratios. However, the weight ratios of the active compounds in the active compound combinations can be varied within a relatively wide range. In general,

0.1 to 10 parts by weight, preferably

0.3 to 3 parts by weight of at least one fungicidal active compound, for example from groups (1) to (55).
are present per part by weight of active compound of the formula (I).

The active compound combinations according to the invention have very good fungicidal properties. They can be employed in particular for controlling phytopathogenic fungi, such as Plasmodiophoromycetes, Oomycetes, Chytridiomycetes, Zygomycetes, Ascomycetes, Basidiomycetes, Deuteromycetes, etc.

The active compound combinations according to the invention are particularly suitable for controlling cereal diseases, such as Erysiphe, Cochliobolus, Septoria, Pyrenophora and Leptosphaeria, and against fungal attack on vegetables, grapevines and fruits, for example against Venturia or Podosphaera on apples, Uncinula on grapevines or Sphaerotheca on cucumbers.

The active compound combinations are also highly suitable for controlling animal pests, preferably arthropods, in particular insects, which are encountered in agriculture, in forestry, in the protection of stored products and of materials, and in the hygiene sector. They are active against normally sensitive and resistant species and against all or some stages of development. The abovementioned pests include:

From the order of the Isopoda, for example, Oniscus asellus, Armadillidium vulgare and Porcellio scaber.

From the order of the Diplopoda, for example, Blaniulus guttulatus.

From the order of the Chilopoda, for example, Geophilus carpophagus and Scutigera spec.

From the order of the Symphyla, for example, Scutigerella immaculata.

From the order of the Thysanura, for example, Lepisma saccharina.

From the order of the Collembola, for example, Onychiurus armatus.

From the order of the Orthoptera, for example, Blatta orientalis, Periplaneta americana, Leucophaea maderae, Blattella germanica, Acheta domesticus,
Gryllotalpa spp., Locusta migratoria migratorioides, Melanoplus differentialis and Schistocerca gregaria.
From the order of the Dermaptera, for example, Forficula auricularia.
From the order of the Isoptera, for example, Reticulitermes spp.
From the order of the Anoplura, for example, Pediculus humanus corporis, Haematopinus spp. and Linognathus spp.
From the order of the Mallophaga, for example, Trichodectes spp. and Damalinea spp.
From the order of the Thysanoptera, for example, Hercinotherps femoralis and Thrips tabaci.
From the order of the Heteroptera, for example, Eurygaster spp., Dysdercus intermedius, Piesma quadrata, Cimex lectularius, Rhodnius prolixus and Triatoma spp.
From the order of the Homoptera, for example, Aleurodes brassicae, Bemisia tabaci, Trialeurodes vaporariorum, Aphis gossypii, Brevicoryne brassicae, Cryptomyzus ribis, Doralis fabae, Doralis pomi, Eriosoma lanigerum, Hyalopterus arundinis, Macrosiphum avenae, Myzus spp., Phorodon humuli, Rhopalosiphum padi, Phylloxera vastatrix, Pemphigus spp., Empoasca spp., Euscelis bilobatus, Nephrotettix cineticeps, Lecanium corni, Saissetia oleae, Laodelphax striatellus, Nilaparvata lugens, Aonidiella aurantii, Aspidiotus hederae, Pseudococcus spp. and Psylla spp.

From the order of the Hymenoptera, for example, Diprion spp., Hoplocampa spp., Lasius spp., Monomorium pharaonis and Vespa spp.

The fact that the active compound combinations are well tolerated by plants at the concentrations required for controlling plant diseases permits the treatment of above-ground parts of plants, of propagation stock and seeds, and of the soil.

The active compound combinations according to the invention can be converted into the customary formulations, such as solutions, emulsions, suspensions, powders, foams, pastes, granules, aerosols, microencapsulations in polymeric compounds and in coating compositions for seeds, and ULV formulations.

These formulations are produced in a known manner, for example by mixing the active compounds with extenders, that is liquid solvents, liquefied gases under pressure, and/or solid carriers, optionally with the use of surfactants, that is
emulsifiers and/or dispersants, and/or foam formers. If the extender used is water, it is also possible to use, for example, organic solvents as auxiliary solvents. Essentially, suitable liquid solvents include aromatics, such as xylene, toluene or alkynaphthalenes, chlorinated aromatics or chlorinated aliphatic hydrocarbons, such as chlorobenzenes, chloroethylenes or methylene chloride, aliphatic hydrocarbons, such as cyclohexane, or paraffins, for example petroleum fractions, alcohols, such as butanol or glycol and also their ethers and esters, ketones, such as acetone, methyl ethyl ketone, methyl isobutyl ketone or cyclohexanone, strongly polar solvents, such as dimethylformamide and dimethyl sulphoxide, and also water. Liquefied gaseous extenders or carriers refer to those liquids which are gaseous at normal temperature and under atmospheric pressure, for example aerosol propellants, such as halogenated hydrocarbons, and also butane, propane, nitrogen and carbon monoxide. Suitable solid carriers are: for example ground natural minerals, such as kaolins, clays, talc, chalk, quartz, attapulgite, montmorillonite or diatomaceous earth, and ground synthetic minerals, such as finely divided silica, alumina and silicates. Suitable solid carriers for granules are: for example crushed and fractionated natural rocks, such as calcite, marble, pumice, sepiolite and dolomite, or else synthetic granules of inorganic and organic meals, and granules of organic materials such as sawdust, coconut shells, maize cobs and tobacco stalks. Suitable emulsifiers and/or foam formers are: for example nonionic and anionic emulsifiers, such as polyoxyethylene fatty acid esters, polyoxyethylene fatty alcohol ethers, for example alkylaryl polyglycol ethers, alkylsulphonates, alkyl sulphates, arylsulphonates, or else protein hydrolysates. Suitable dispersants are: for example lignin-sulphite waste liquors and methylcellulose.

Tackifiers, such as carboxymethylcellulose and natural and synthetic polymers, in the form of powders, granules or latices, such as gum arabic, polyvinyl alcohol and polyvinyl acetate, or else natural phospholipids, such as cephalins and lecithins and synthetic phospholipids, can be used in the formulations. Other possible additives are mineral and vegetable oils.
It is possible to use colorants such as inorganic pigments, for example iron oxide, titanium oxide and Prussian blue, and organic dyestuffs, such as alizarin dyestuffs, azo dyestuffs and metal phthalocyanine dyestuffs, and trace nutrients, such as salts of iron, manganese, boron, copper, cobalt, molybdenum and zinc.

The formulations generally comprise between 0.1 and 95 per cent by weight of active compound, preferably between 0.5 and 90%.

In the formulations, the active compound combinations according to the invention can be present as a mixture with other known active compounds, such as fungicides, insecticides, acaricides and herbicides, and as mixtures with fertilizers or plant growth regulators.

The active compound combinations can be employed as such, in the form of their formulations or of the use forms prepared therefrom, such as ready-to-use solutions, emulsifiable concentrates, emulsions, suspensions, wettable powders, soluble powders and granules.

The application is carried out in a customary manner, for example by watering, spraying, atomizing, scattering, spreading, dry dressing, wet dressing, liquid dressing, slurry treatment of seeds or incrustation.

In the treatment of parts of plants, the active compound concentrations in the use forms can be varied within a relatively wide range. In general, they are between 1 and 0.0001% by weight, preferably between 0.5 and 0.001%.

In the treatment of seed, the amounts of active compound which are generally required are from 0.001 to 50 g per kilogram of seed, preferably from 0.01 to 10 g.

In the treatment of the soil, active compound concentrations of from 0.00001 to 0.1% by weight, preferably from 0.0001 to 0.02% by weight, are required at the site of action.
Furthermore, it has been found that the active compound combinations according to
the invention have a potent insecticidal action against insects which destroy industrial
materials.

The following insects may be mentioned by way of example and as being preferred,
but without any limitation:

Beetles, such as

Hylotrupes bajulus, Chlorophorus pilosis, Anobium punctatum, Xestobium
rufovillosum, Ptilinus pecticornis, Dendrobius pertinex, Ernobius mollis, Priobium
carpini, Lyctus brunneus, Lyctus africanus, Lyctus planicollis, Lyctus linearis, Lyctus
pubescens, Trogoxylon aequale, Minthes rugicollis, Xyleborus spec., Tryptodendron
spec., Apathe monachus, Bostrychus capucins, Heterobostrychus brunneus, Sinoxylon
spec., Dinoderus minutus.

Dermapterans, such as

Sirex juvencus, Urocerus gigas, Urocerus gigas taignus, Urocerus augur.

Termites, such as

Kalotermes flavicollis, Cryptotermes brevis, Heterotermes indicola, Reticulitermes
flavipes, Reticulitermes santonensis, Reticulitermes lucifugus, Mastotermes
darwiniensis, Zootermopsis nevadensis, Coptotermes formosanus.

Bristletails, such as Lepisma saccharina.

Industrial materials are to be understood as meaning, in the present context, non-live
materials such as, preferably, plastics, glues, sizes, paper and board, leather, wood
and timber products, and coatings.
The materials to be protected against attack by insects are very particularly wood and timber products.

Wood and timber products which can be protected by the composition according to the invention or mixtures comprising such a composition are to be understood as meaning, for example, construction timber, wooden beams, railway sleepers, bridge components, jetties, wooden vehicles, boxes, pallets, containers, telephone poles, wood panelling, windows and doors made of wood, plywood, particle board, joiner's articles, or wood products which, quite generally, are used in the construction of houses or in joinery.

The active compound combinations can be used as such, in the form of concentrates or generally customary formulations, such as powders, granules, solutions, suspensions, emulsions or pastes.

The formulations mentioned can be prepared in a manner known per se, for example by mixing the active compounds with at least one solvent or diluent, emulsifier, dispersant and/or binder or fixative, water repellent, if appropriate desiccants and UV stabilizers and, if appropriate, dyes and pigments and other processing auxiliaries.

The insecticidal compositions or concentrates used for the protection of wood and wooden materials comprise the active compound according to the invention at a concentration of 0.0001 to 95% by weight, in particular 0.001 to 60% by weight.

The amount of the compositions or concentrates employed depends on the species and the occurrence of the insects and on the medium. The optimum rate of application can be determined upon use in each case by test series. However, in general, it suffices to employ 0.0001 to 20% by weight, preferably 0.001 to 10% by weight, of the active compound, based on the material to be protected.
The solvent and/or diluent used is an organochemical solvent or solvent mixture and/or an oily or oil-type organochemical solvent or solvent mixture of low volatility and/or a polar organochemical solvent or solvent mixture and/or water and, if appropriate, an emulsifier and/or wetting agent.

Organocemical solvents which are preferably employed are oily or oil-type solvents having an evaporation number of above 35 and a flash point of above 30°C, preferably above 45°C. Substances which are used as such oily and oil-type solvents which have low volatility and are insoluble in water are suitable mineral oils or their aromatic fractions, or mineral-oil-containing solvent mixtures, preferably white spirit, petroleum and/or alkylbenzene.

Substances which are advantageously used are mineral oils with a boiling range of 170 to 220°C, white spirit with a boiling range of 170 to 220°C, spindle oil with a boiling range of 250 to 350°C, petroleum or aromatics of the boiling range 160 to 280°C, essence of turpentine and the like.

In a preferred embodiment, liquid aliphatic hydrocarbons with a boiling range of 180 to 210°C or high-boiling mixtures of aromatic and aliphatic hydrocarbons with a boiling range of 180 to 220°C and/or spindle oil and/or monochloronaphthalene, preferably α-monochloronaphthalene, are used.

The organic oily or oil-type solvents of low volatility having an evaporation number of above 35 and a flash point of above 30°C, preferably above 45°C, can be partially replaced by organochemical solvents of high or medium volatility, with the proviso that the solvent mixture also has an evaporation number of above 35 and a flash point of above 30°C, preferably above 45°C, and that the insecticide/fungicide mixture is soluble or emulsifiable in this solvent mixture.

In a preferred embodiment, part of the organochemical solvent or solvent mixture is replaced by an aliphatic polar organochemical solvent or solvent mixture. Substances
which are preferably used are aliphatic organochemical solvents having hydroxyl and/or ester and/or ether groups, such as, for example, glycol ethers, esters or the like.

The organochemical binders used within the scope of the present invention are the synthetic resins and/or binding drying oils which are known per se and can be diluted with water and/or are soluble or dispersible or emulsifiable in the organochemical solvents employed, in particular binders composed of, or comprising, an acrylate resin, a vinyl resin, for example polyvinyl acetate, polyester resin, polycondensation or polyaddition resin, polyurethane resin, alkyd resin or modified alkyd resin, phenolic resin, hydrocarbon resin, such as indene-coumarone resin, silicone resin, drying vegetable oils and/or drying oils and/or physically drying binders based on a natural and/or synthetic resin.

The synthetic resin used as the binder can be employed in the form of an emulsion, dispersion or solution. Up to 10% by weight of bitumen or bituminous substances can also be used as binders. In addition, dyes, pigments, water repellents, odour-masking substances and inhibitors or anticorrosives known per se and the like can also be employed.

The composition or the concentrate preferably comprises, in accordance with the invention, at least one alkyd resin or modified alkyd resin and/or a drying vegetable oil as the organochemical binders. Preferably used according to the invention are alkyd resins with an oil content of over 45% by weight, preferably 50 to 68% by weight.

All or some of the abovementioned binder can be replaced by a fixative (mixture) or a plasticizer (mixture). These additives are intended to prevent volatilization of the active compounds and crystallization or precipitation. They preferably replace 0.01 to 30% of the binder (based on 100% of binder employed).
The plasticizers are from the chemical classes of the phthalic esters, such as dibutyl phthalate, dioctyl phthalate or benzyl butyl phthalate, the phosphoric esters, such as tributyl phosphate, the adipic esters, such as di-(2-ethylhexyl) adipate, the stearates, such as butyl stearate or amyl stearate, the oleates, such as butyl oleate, the glycerol ethers or relatively high-molecular-weight glycol ethers, glycerol esters and p-toluene-sulphonic esters.

Fixatives are chemically based on polyvinyl alkyl ethers, such as, for example, polyvinyl methyl ether, or ketones, such as benzophenone or ethylenebenzophenone.

Also particularly suitable as a solvent or diluent is water, if appropriate as a mixture with one or more of the abovementioned organochemical solvents or diluents, emulsifiers and dispersants.

Particularly effective protection of wood is achieved by large-scale industrial impregnation processes, for example vacuum, double-vacuum or pressure processes.

If appropriate, the ready-to-use compositions can additionally comprise other insecticides.

Suitable additional components which may be admixed are, preferably, the insecticides mentioned in WO 94/29 268.

Very particularly preferred components which may be admixed are insecticides, such as chlorpyriphos, phoxim, silafluofen, alphamethrin, cyfluthrin, cypermethrin, deltamethrin, permethrin, imidacloprid, NI-25, flufenoxuron, hexaflumuron and triflumuron.

The good pesticidal activity of the active compound combinations according to the invention is demonstrated by the examples below. Whereas the individual active
compounds or the known active compound combinations have weaknesses in the pesticidal activity, the tables of the examples below show unambiguously that the activity which was found of the active compound combinations according to the invention is greater than the sum of the activities of the individual active compounds and also greater than the activities of the known active compound combinations.

In the examples below, the active compound of the formula (I)

![Chemical structure](image)

(I)

is used.

The fungicidally active compounds which are also used are given in the examples.
Example A

Phaedon larvae test

Solvent: 7 parts by weight of dimethylformamide
Emulsifier: 1 part by weight of alkylaryl polyglycol ether

To produce a suitable preparation of active compound, 1 part by weight of an active compound or an active compound combination is mixed with the stated amounts of solvent and emulsifier, and the concentrate is diluted with water to the desired concentration.

Cabbage leaves (Brassica oleracea) are treated by being dipped into the preparation of active compound of the desired concentration and are populated with larvae of the mustard beetle (Phaedon cochleariae) while the leaves are still moist.

After the desired period of time, the kill in % is determined. 100% means that all beetle larvae have been killed; 0% means that none of the beetle larvae have been killed.

In this test, for example, the following active compound combinations according to the present invention show a synergistically increased activity compared to the individually applied active compounds:
**Table A**

(plant-damaging insects)

**Phaedon larvae test**

Example E

Critical concentration test/soil insects

Test insect: Spodoptera frugiperda
Solvent: 4 parts by weight of acetone
Emulsifier: 1 part by weight of alkylaryl polyglycol ether

To produce a suitable preparation of active compound, 1 part by weight of the active compound or the active compound mixture is mixed with the stated amounts of solvent and emulsifier, and the concentrate is diluted with water to the desired concentration.

The active compound preparation is mixed intimately with soil. Here, the concentration of the active compound in the preparation is almost irrelevant; only the amount by weight of active compound or active compound mixture per volume unit of soil, which is stated in ppm (mg/l), matters.

Soil is filled into 0.5 l pots and these are allowed to stand at 20°C. Immediately after preparation, 3 pre-germinated maize corns are placed into each pot. After the maize corns have emerged, boring sleeves are placed onto the pots. 9 days after preparation, the maize is populated with the test insects. After a further 5 days, the kill in % is determined. 100% means that all test insects have been killed; 0% means that the number of insects which are still alive is the same as for the untreated control.

In this test, for example, the following active compound combinations according to the present invention show a synergistically enhanced activity compared to the individually applied active compounds:

Example F

Critical concentration test/root-systemic action

5 Test insect: Phaedon cochleariae larvae
Solvent: 4 parts by weight of acetone
Emulsifier: 1 part by weight of alkylaryl polyglycol ether

To produce a suitable preparation of active compound, 1 part by weight of the active compound or the active compound mixture is mixed with the stated amounts of solvent and emulsifier, and the concentrate is diluted with water to the desired concentration.

The active compound preparation is mixed intimately with soil. Here, the concentration of the active compound in the preparation is almost irrelevant; only the amount by weight of active compound or active compound mixture per volume unit of soil, which is stated in ppm (mg/l), matters.

Soil is filled into 250 ml pots and these are planted with cabbage (Brassica oleracea). The active compound or the active compound combination can thus be taken up by the plant roots from the soil and transported into the leaves.

After 7 days, the leaves are populated with the abovementioned test animals. After a further 3 days, the kill in % is determined. 100% means that all test insects have been killed; 0% means that the number of insects which are still alive is the same as in the untreated control.

In this test, for example, the following active compound combinations according to the present invention show a synergistically enhanced activity compared to the individually applied active compounds:

Example G

Formula for the calculation of the efficacy of a combination of two active compounds

The expected activity for a given combination of two active compounds can be calculated as follows (cf. Colby, S.R., “Calculating Synergistic and Antagonistic Responses of Herbicide Combinations”, Weeds 15, pages 20-22, 1967):

if

\[ E = X + Y - \frac{X \times Y}{100} \]

then

If the actual fungicidal activity exceeds the calculated value, then the activity of the combination is superadditive, i.e. a synergistic effect exists. In this case, the efficacy which was actually observed must be greater than the value for the expected efficacy (E) calculated from the formula set out above.
Phytophthora test (tomato) / protective

Solvent: 47 parts by weight of acetone
Emulsifier: 3 parts by weight of alkylaryl polyglycol ether

To produce a suitable preparation of active compound, 1 part by weight of the active compound or the active compound mixture is mixed with the stated amounts of solvent and emulsifier, and the concentrate is diluted with water to the desired concentration, or a commercial formulation of active compound or active compound combination is diluted with water to the desired concentration.

To test for protective activity, young plants are sprayed with the commercial active compound preparation at the stated application rate. After the spray coating has dried on, the plants are inoculated with an aqueous spore suspension of *Phytophthora infestans*. The plants are then placed in an incubation cabin at approximately 20°C and 100% relative atmospheric humidity.

Evaluation is carried out 3 days after the inoculation. 0% means an efficacy which corresponds to that of the control, whereas an efficacy of 100% means that no infection is observed.

The table below shows unambiguously that the activity which was found of the active compound combinations according to the invention is greater than the calculated efficacy (see above), i.e., a synergistic effect is present.

Example 1

Botrytis test (bean) / protective

Solvent: 47 parts by weight of acetone
Emulsifier: 3 parts by weight of alkylaryl polyglycol ether

To produce a suitable preparation of active compound, 1 part by weight of the active compound or the active compound mixture is mixed with the stated amounts of solvent and emulsifier, and the concentrate is diluted with water to the desired concentration, or a commercial formulation of active compound or active compound combination is diluted with water to the desired concentration.

To test for protective activity, young plants are sprayed with the active compound preparation at the stated application rate. After the spray coating has dried on, 2 small pieces of agar colonized by *Botrytis cinerea* are placed onto each leaf. The inoculated plants are placed in a dark chamber at approximately 20°C and 100% relative atmospheric humidity.

2 days after the inoculation, the size of the disease spots on the leaves is evaluated. 0% means an efficacy which corresponds to that of the control, whereas an efficacy of 100% means that no infection is observed.

The table below shows unambiguously that the activity which was found of the active compound combinations according to the invention is greater than the calculated efficacy (see above), i.e., a synergistic effect is present.

Example J

Fusarium culmorum test (wheat) / seed treatment

The active compounds are applied as a dry dressing. They are prepared by extending the active compound in question with ground minerals to give a finely pulverulent mixture which ensures even distribution on the surface of the seeds.

For the dressing, the infected seeds are shaken with the dressing in a closed glass bottle for 3 minutes.

2 × 100 seeds of the wheat are sown at a depth of 1 cm into standard soil, and the wheat is cultivated in a greenhouse at a temperature of approximately 18°C and at a relative atmospheric humidity of approximately 95% in seed containers receiving 15 hours of light per day.

The evaluation of the plants for symptoms is carried out approximately 3 weeks after sowing. 0% means an efficacy which corresponds to that of the control, whereas an efficacy of 100% means that no infection is observed.

Example N

Critical concentration test/root systemic action

Test insect:  Spodoptera frugiperda
Solvent:  4 parts by weight of acetone
Emulsifier:  1 part by weight of alkylaryl polyglycol ether

To produce a suitable preparation of active compound, 1 part by weight of active compound is mixed with the stated amount of solvent, the stated amount of emulsifier is added and the concentrate is diluted with water to the desired concentration.

The preparation of active compound is mixed intimately with soil. Here, the concentration of the active compound in the preparation is virtually immaterial; only the amount by weight of active compound per volume unit of soil, which is stated in ppm (mg/l), matters. The soil is filled into 250 ml pots and these are allowed to stand at 20°C.

Immediately after preparation, 3 maize corns are placed into each pot. 14 days after the preparation, the test insects are placed into an insect bracket and attached to the plant. 4 days after the infection, the efficacy of the active compound is determined in % by counting the dead and live test insects. The efficacy is 100% if all test insects have been killed; it is 0% if the same number of test insects is alive as in the untreated control.

Example O

Critical concentration test/soil insects

Test insect: \text{Diabrotica balteata} - larvae in the soil
Solvent: 4 parts by weight of acetone
Emulsifier: 1 part by weight of alkylaryl polyglycol ether

To produce a suitable preparation of active compound, 1 part by weight of active compound is mixed with the stated amount of solvent, the stated amount of emulsifier is added and the concentrate is diluted with water to the desired concentration. Here, the concentration of the active compound in the preparation is almost irrelevant; only the amount by weight of active compound per volume unit of soil, which is stated in ppm (mg/l), matters. The soil is filled into 0.5 l pots and these are allowed to stand at 20\textdegree C.

Immediately after preparation, 5 maize corns are placed into each pot. After 3 days, the test insects are placed into the treated soil. After a further 7 days, the efficacy is determined. The efficacy is calculated from the number of maize plants which have emerged.

Active compounds, application rates and results are shown in the table below:
