MACROCYCLIC SERINE PROTEASE INHIBITORS, PHARMACEUTICAL COMPOSITIONS THEREOF, AND THEIR USE FOR TREATING HCV INFECTIONS

CROSS REFERENCE TO RELATED APPLICATIONS

[0001] This application claims priority to U.S. Provisional Application No. 61/441,563, filed February 10, 2011; the disclosure of which is incorporated herein by reference in its entirety.

FIELD

[0002] Provided herein are macrocyclic serine protease inhibitor compounds, and pharmaceutical compositions and processes of preparation thereof. Also provided are methods of their use for the treatment of an HCV infection in a host in need thereof.

BACKGROUND

[0003] Hepatitis C virus (HCV) is known to cause at least 80% of posttransfusion hepatitis and a substantial proportion of sporadic acute hepatitis (Kuo et al., Science 1989, 244, 362-364; Thomas, Curr. Top. Microbiol. Immunol. 2000, 25-41). Preliminary evidence also implicates HCV in many cases of "idiopathic" chronic hepatitis, "cryptogenic" cirrhosis, and probably hepatocellular carcinoma unrelated to other hepatitis viruses, such as hepatitis B virus (Di Besceglie et al., Scientific American 1999, October, 80-85; Boyer et al., J. Hepatol. 2000, 32, 98-112).

[0004] HCV is an enveloped virus containing a positive-sense single-stranded RNA genome of approximately 9.4 kb (Kato et al., Proc. Natl. Acad. Sci. USA 1990, 87, 9524-9528; Kato, Acta Medica Okayama, 2001, 55, 133-159). The viral genome consists of a 5' untranslated region (UTR), a long open reading frame encoding a polyprotein precursor of approximately 3011 amino acids, and a short 3' UTR. The 5' UTR is the most highly conserved part of the HCV genome and is important for the initiation and control of polyprotein translation. Translation of the HCV genome is initiated by a cap-independent mechanism known as an internal ribosome entry. This mechanism involves the binding of ribosomes to an RNA sequence known as the internal ribosome entry site (IRES). An RNA pseudoknot structure has recently been determined to be an essential structural element of the
HCV IRES. Viral structural proteins include a nucleocapsid core protein (C) and two envelope glycoproteins, E1 and E2. HCV also encodes two proteinases, a zinc-dependent metallloproteinase encoded by the NS2-NS3 region and a serine proteinase encoded in the NS3 region. These proteinases are required for cleavage of specific regions of the precursor polyprotein into mature peptides. The carboxyl half of nonstructural protein 5, NS5B, contains the RNA-dependent RNA polymerase. The function of the remaining nonstructural proteins, NS4A and NS4B, and that of NS5A (the amino-terminal half of nonstructural protein 5) remain unknown.

Presently, the most effective HCV therapy employs a combination of alpha-interferon and ribavirin, leading to sustained efficacy in about 40% of patients (Poynard et al, Lancet 1998, 352, 1426-1432). Recent clinical results demonstrate that pegylated alpha-interferon is superior to unmodified alpha-interferon as monotherapy. However, even with experimental therapeutic regimens involving combinations of pegylated alpha-interferon and ribavirin, a substantial fraction of patients do not have a sustained reduction in viral load (Manns et al, Lancet 2001, 358, 958-965; Fried et al, N. Engl. J. Med. 2002, 347, 975-982; Hadziyannis et al, Ann. Intern. Med. 2004, 140, 346-355). Thus, there is a clear and unmet need to develop effective therapeutics for treatment of HCV infection.

[0037] In describing an optically active compound, the prefixes R and S are used to denote the absolute configuration of the molecule about its chiral center(s). The (+) and (-) are used to denote the optical rotation of the compound, that is, the direction in which a plane of polarized light is rotated by the optically active compound. The (-) prefix indicates that the compound is levorotatory, that is, the compound rotates the plane of polarized light to the left or counterclockwise. The (+) prefix indicates that the compound is dextrorotatory, that is, the compound rotates the plane of polarized light to the right or clockwise. However, the sign of optical rotation, (+) and (-), is not related to the absolute configuration of the molecule, R and S.

[0041] HCV has a single positive-stranded RNA genome having about 9.6 kb in length that encodes a large polyprotein having about 3010 amino acids. This precursor polyprotein is then processed into a range of structural proteins, including core protein, C, and envelope glycoproteins, E1 and E2; and non-structural proteins, including NS2, NS3, NS4A, NS4B, NS5A, and NS5B, by host signal peptidases and two viral proteases, NS2-3 and NS3. The NS3 protein contains a trypsin-like serine protease domain at its N-terminus,
while its C-terminal domain has helicase activity. Because of its vital role in viral replication, HCV NS3 serine protease has been actively pursued as a drug target for developing a new anti-HCV therapy.

[0043] Provided herein are compounds which are useful for the treatment of HCV infection, which, in one embodiment, can have activity as HCV serine protease inhibitors. Also provided herein are pharmaceutical compositions that comprise the compounds, methods of manufacture of the compounds, and methods of use of the compounds for the treatment of HCV infection in a subject in need of treatment.

In one embodiment, the compound provided herein is
or an isotopic variant thereof; or a pharmaceutically acceptable salt, solvate, and prodrug thereof.

In another embodiment, the compound provided herein is selected from:

![Compound A101](image)

![Compound B101](image)

![Compound B102](image)

![Compound B103](image)

![Compound B104](image)
and isotopic variants thereof; and pharmaceutically acceptable salts, solvates, and prodrugs thereof.

[00144] In yet another embodiment, the compound provided herein is selected from:

[00145] In still another embodiment, the compound provided herein is selected from:
and isotopic variants thereof; and pharmaceutically acceptable salts, solvates, and prodrugs thereof.

The compounds provided herein are intended to encompass all possible stereoisomers, unless a particular stereochemistry is specified. Where the compound provided herein contains an alkenyl or alkenylene group, the compound may exist as one or a mixture of geometric cis/trans (or Z/E) isomers. Where structural isomers are interconvertible, the compound may exist as a single tautomer or a mixture of tautomers. This can take the form of proton tautomerism in the compound that contains, for example, an imino, keto, or oxime group; or so-called valence tautomerism in the compound that contain an aromatic moiety. It follows that a single compound may exhibit more than one type of isomerism.

The compounds provided herein may be enantiomerically pure, such as a
single enantiomer or a single diastereomer, or be stereoisomeric mixtures, such as a mixture of enantiomers, e.g., a racemic mixture of two enantiomers; or a mixture of two or more diastereomers. As such, one of skill in the art will recognize that administration of a compound in its (R) form is equivalent, for compounds that undergo epimerization in vivo, to administration of the compound in its (S) form. Conventional techniques for the preparation/isolation of individual enantiomers include synthesis from a suitable optically pure precursor, asymmetric synthesis from achiral starting materials, or resolution of an enantiomeric mixture, for example, chiral chromatography, recrystallization, resolution, diastereomeric salt formation, or derivatization into diastereomeric adducts followed by separation.

[00148] When the compound provided herein contains an acidic or basic moiety, it may also be provided as a pharmaceutically acceptable salt. See, Berge et al., J. Pharm. Sci. 1977, 66, 1-19; and Handbook of Pharmaceutical Salts, Properties, and Use; Stahl and Wermuth, Ed.; Wiley-VCH and VHCA: Zurich, Switzerland, 2002.

Methods of Synthesis

[00152] The compound provided herein can be prepared, isolated, or obtained by any method known to one of skill in the art. For example, a compound of Formula I can be prepared as shown in Scheme I. A variety of R^β-OH groups can be introduced at the hydroxyl position of compound 13 using various chemistries to form an ether linkage with conversion of the stereochemistry at that position, including, one-step reactions, e.g., Mitsunobu; and two-step reactions, e.g., nucleophilic substitution, where the hydroxyl of compound 13 is first converted into a reactive leaving group, such as a sulfonate ester. Nonlimiting sulfonate esters include methansulfonate (mesylate), ethansulfonate (esylate), p-toluensulfonate (tosylate), 4-bromobenzenesulfonate, and trifluoromethanesulfonate (triflate) esters.

[00153] The starting materials used in the synthesis of the compounds provided herein are either commercially available or can be readily prepared. Suitable examples of R^6 groups can be found, e.g., in U.S. Appl. Publ. Nos. 2009/0202480; and 2010/0260710; and U.S.
Pharmaceutical Compositions

Provided herein are pharmaceutical compositions comprising a compound provided herein, e.g., a compound of Formula I, as an active ingredient, including an isotopic variant thereof; or a pharmaceutically acceptable salt, solvate, or prodrug thereof; or a pharmaceutically acceptable salt, solvate, hydrate, or prodrug; and a pharmaceutically acceptable vehicle, carrier, diluent, or excipient, or a mixture thereof.

Suitable excipients are well known to those skilled in the art, and non-limiting examples of suitable excipients are provided herein. Whether a particular excipient is suitable for incorporation into a pharmaceutical composition or dosage form depends on a variety of factors well known in the art, including, but not limited to, the method of administration. For example, oral dosage forms such as tablets may contain excipients not suited for use in parenteral dosage forms. The suitability of a particular excipient may also depend on the specific active ingredients in the dosage form. For example, the decomposition of some active ingredients may be accelerated by some excipients such as lactose, or when exposed to water. Active ingredients that comprise primary or secondary
amines are particularly susceptible to such accelerated decomposition. Consequently, provided herein are pharmaceutical compositions and dosage forms that contain little, if any, lactose, or other mono- or di-saccharides. As used herein, the term "lactose-free" means that the amount of lactose present, if any, is insufficient to substantially increase the degradation rate of an active ingredient. In one embodiment, lactose-free compositions comprise an active ingredient provided herein, a binder/filler, and a lubricant. In another embodiment, lactose-free dosage forms comprise an active ingredient, microcrystalline cellulose, pregelatinized starch, and magnesium stearate.

The compound provided herein may be administered alone, or in combination with one or more other compounds provided herein. The pharmaceutical compositions that comprise a compound provided herein, e.g., a compound of Formula I, including an isotopic variant thereof; or a pharmaceutically acceptable salt, solvate, or prodrug thereof, can be formulated in various dosage forms for oral, parenteral, and topical administration. The pharmaceutical compositions can also be formulated as modified release dosage forms, including delayed-, extended-, prolonged-, sustained-, pulsatile-, controlled-, accelerated-, fast-, targeted-, programmed-release, and gastric retention dosage forms. These dosage forms can be prepared according to conventional methods and techniques known to those skilled in the art (see, Remington: The Science and Practice of Pharmacy, supra; Modified-Release Drug Delivery Technology, 2nd ed.; Rathbone et al., Eds.; Marcel Dekker, Inc.: New York, NY, 2008).

In one embodiment, the pharmaceutical compositions are provided in a dosage form for oral administration, which comprise a compound provided herein, e.g., a compound of Formula I, including an isotopic variant thereof; or a pharmaceutically acceptable salt, solvate, or prodrug thereof; and one or more pharmaceutically acceptable excipients or carriers.

In another embodiment, the pharmaceutical compositions are provided in a dosage form for parenteral administration, which comprise a compound provided herein, e.g., a compound of Formula I, including an isotopic variant thereof; or a pharmaceutically acceptable salt, solvate, or prodrug thereof; and one or more pharmaceutically acceptable excipients or carriers.

In yet another embodiment, the pharmaceutical compositions are provided in a
dosage form for topical administration, which comprise a compound provided herein, e.g., a compound of Formula I, including an isotopic variant thereof; or a pharmaceutically acceptable salt, solvate, or prodrug thereof; and one or more pharmaceutically acceptable excipients or carriers.

[00160] The pharmaceutical compositions provided herein can be provided in a unit-dosage form or multiple-dosage form. A unit-dosage form, as used herein, refers to physically discrete a unit suitable for administration to a human and animal subject, and packaged individually as is known in the art. Each unit-dose contains a predetermined quantity of an active ingredient(s) sufficient to produce the desired therapeutic effect, in association with the required pharmaceutical carriers or excipients. Examples of a unit-dosage form include an ampoule, syringe, and individually packaged tablet and capsule. For example, a 100 mg unit dose contains about 100 mg of an active ingredient in a packaged tablet or capsule. A unit-dosage form may be administered in fractions or multiples thereof. A multiple-dosage form is a plurality of identical unit-dosage forms packaged in a single container to be administered in segregated unit-dosage form. Examples of a multiple-dosage form include a vial, bottle of tablets or capsules, or bottle of pints or gallons.

[00161] The pharmaceutical compositions provided herein can be administered at once, or multiple times at intervals of time. It is understood that the precise dosage and duration of treatment may vary with the age, weight, and condition of the patient being treated, and may be determined empirically using known testing protocols or by extrapolation from in vivo or in vitro test or diagnostic data. It is further understood that for any particular individual, specific dosage regimens should be adjusted over time according to the individual need and the professional judgment of the person administering or supervising the administration of the formulations.

A. Oral Administration

[00162] The pharmaceutical compositions provided herein for oral administration can be provided in solid, semisolid, or liquid dosage forms for oral administration. As used herein, oral administration also includes buccal, lingual, and sublingual administration. Suitable oral dosage forms include, but are not limited to, tablets, fastmelts, chewable tablets, capsules, pills, strips, troches, lozenges, pastilles, cachets, pellets, medicated chewing gum, bulk powders, effervescent or non-effervescent powders or granules, oral mists, solutions,
emulsions, suspensions, wafers, sprinkles, elixirs, and syrups. In addition to the active
ingredient(s), the pharmaceutical compositions can contain one or more pharmaceutically
acceptable carriers or excipients, including, but not limited to, binders, fillers, diluents,
disintegrants, wetting agents, lubricants, glidants, coloring agents, dye-migration inhibitors,
sweetening agents, flavoring agents, emulsifying agents, suspending and dispersing agents,
preservatives, solvents, non-aqueous liquids, organic acids, and sources of carbon dioxide.

[00163] Binders or granulators impart cohesiveness to a tablet to ensure the tablet
remaining intact after compression. Suitable binders or granulators include, but are not
limited to, starches, such as corn starch, potato starch, and pre-gelatinized starch (e.g.,
STARCH 1500); gelatin; sugars, such as sucrose, glucose, dextrose, molasses, and lactose;

cellulose, powdered cellulose, dextrates, kaolin, mannitol, silicic acid, sorbitol, starch, pre-
gelatinized starch, and mixtures thereof. The amount of a binder or filler in the
pharmaceutical compositions provided herein varies upon the type of formulation, and is
readily discernible to those of ordinary skill in the art. The binder or filler may be present
from about 50 to about 99% by weight in the pharmaceutical compositions provided herein.

[00208] Materials useful in forming an erodible matrix include, but are not limited to, chitin, chitosan, dextran, and pullulan; gum agar, gum arabic, gum karaya, locust bean gum, gum tragacanth, carrageenans, gum ghatti, guar gum, xanthan gum, and scleroglucan; starches, such as dextrin and maltodextrin; hydrophilic colloids, such as pectin; phosphatides, such as lecithin; alginates; propylene glycol alginate; gelatin; collagen; cellulosics, such as ethyl cellulose (EC), methylethyl cellulose (MEC), carboxymethyl cellulose (CMC), CMEC, hydroxyethyl cellulose (HEC), hydroxypropyl cellulose (HPC), cellulose acetate (CA), cellulose propionate (CP), cellulose butyrate (CB), cellulose acetate butyrate (CAB), CAP, CAT, hydroxypropyl methyl cellulose (HPMC), HPMC, HPMCAS, hydroxypropyl methyl cellulose acetate trimellitate (HPMCAT), and ethyl hydroxyethyl cellulose (EHEC); polyvinyl pyrrolidone; polyvinyl alcohol; polyvinyl acetate; glycerol fatty acid esters; polyacrylamide; polyacrylic acid; copolymers of ethacrylic acid or methacrylic acid (EUDRAGIT®, Rohm America, Inc., Piscataway, NJ); poly(2-hydroxyethyl-methacrylate); polylactides; copolymers of L-glutamic acid and ethyl-L-glutamate; degradable lactic acid-glycolic acid copolymers; poly-D(-)-3-hydroxybutyric acid; and other acrylic acid derivatives, such as homopolymers and copolymers of butylmethacrylate, methyl methacrylate, ethyl methacrylate, ethylacrylate, (2-dimethylaminoethyl)methacrylate, and (trimethylaminoethyl)methacrylate chloride.

[00209] In certain embodiments, the pharmaceutical compositions provided herein are formulated with a non-erodible matrix device. Materials suitable for use as a non-erodible matrix device include, but are not limited to, insoluble plastics, such as polyethylene, polypropylene, polyisoprene, polyisobutylene, polybutadiene, polymethylmethacrylate, polybutylmethacrylate, chlorinated polyethylene, polyvinylchloride, methyl acrylate-methyl methacrylate copolymers, ethylene-vinyl acetate copolymers, ethylene/propylene copolymers, ethylene/ethyl acrylate copolymers, vinyl chloride copolymers with vinyl acetate, vinylidene chloride, ethylene and propylene, ionomer polyethylene terephthalate, butyl rubbers, epichlorohydrin rubbers, ethylene/vinyl alcohol copolymer, ethylene/vinyl acetate/vinyl alcohol terpolymer,

[00211] The pharmaceutical compositions provided herein in a modified release dosage form can be prepared by methods known to those skilled in the art, including direct compression, dry or wet granulation followed by compression, and melt-granulation followed by compression.

2. Osmotic Controlled Release Devices

[00212] The pharmaceutical compositions provided herein in a modified release dosage form can be fabricated using an osmotic controlled release device, including, but not limited to, one-chamber system, two-chamber system, asymmetric membrane technology (AMT), and extruding core system (ECS). In general, such devices have at least two components: (a) a core which contains an active ingredient; and (b) a semipermeable membrane with at least one delivery port, which encapsulates the core. The semipermeable membrane controls the influx of water to the core from an aqueous environment of use so as to cause drug release by extrusion through the delivery port(s).

[00213] In addition to the active ingredient(s), the core of the osmotic device optionally includes an osmotic agent, which creates a driving force for transport of water from the environment of use into the core of the device. One class of osmotic agents is water-swellable hydrophilic polymers, which are also referred to as "osmopolymers" and "hydrogels." Suitable water-swellable hydrophilic polymers as osmotic agents include, but are not limited to, hydrophilic vinyl and acrylic polymers, polysaccharides such as calcium alginate, polyethylene oxide (PEO), polyethylene glycol (PEG), polypropylene glycol (PPG), poly(2-hydroxyethyl methacrylate), poly(acrylic) acid, poly(methacrylic) acid, polyvinylpyrrolidone (PVP), crosslinked PVP, polyvinyl alcohol (PVA), PVA/PVP
copolymers, PVA/PVP copolymers with hydrophobic monomers such as methyl methacrylate and vinyl acetate, hydrophilic polyurethanes containing large PEO blocks, sodium croscarmellose, carrageenan, hydroxyethyl cellulose (HEC), hydroxypropyl cellulose (HPC), hydroxypropyl methyl cellulose (HPMC), carboxymethyl cellulose (CMC) and carboxyethyl, cellulose (CEC), sodium alginate, polycarbophil, gelatin, xanthan gum, and sodium starch glycolate.

The other class of osmotic agents is osmogens, which are capable of imbibing water to affect an osmotic pressure gradient across the barrier of the surrounding coating. Suitable osmogens include, but are not limited to, inorganic salts, such as magnesium sulfate, magnesium chloride, calcium chloride, sodium chloride, lithium chloride, potassium sulfate, potassium phosphates, sodium carbonate, sodium sulfite, lithium sulfate, potassium chloride, and sodium sulfate; sugars, such as dextrose, fructose, glucose, inositol, lactose, maltose, mannitol, raffinose, sorbitol, sucrose, trehalose, and xylitol; organic acids, such as ascorbic acid, benzoic acid, fumaric acid, citric acid, maleic acid, sebacic acid, sorbic acid, adipic acid, edetic acid, glutamic acid, p-toluenesulfonic acid, succinic acid, and tartaric acid; urea; and mixtures thereof.

Osmotic agents of different dissolution rates can be employed to influence how rapidly the active ingredient(s) is initially delivered from the dosage form. For example, amorphous sugars, such as MANNOGEM™ EZ (SPI Pharma, Lewes, DE) can be used to provide faster delivery during the first couple of hours to promptly produce the desired therapeutic effect, and gradually and continually release of the remaining amount to maintain the desired level of therapeutic or prophylactic effect over an extended period of time. In this case, the active ingredient(s) is released at such a rate to replace the amount of the active ingredient metabolized and excreted.

The core can also include a wide variety of other excipients and carriers as described herein to enhance the performance of the dosage form or to promote stability or processing.

Materials useful in forming the semipermeable membrane include various grades of acrylics, vinyls, ethers, polyamides, polyesters, and cellulosic derivatives that are water-permeable and water-insoluble at physiologically relevant pHs, or are susceptible to being rendered water-insoluble by chemical alteration, such as crosslinking. Examples of
suitable polymers useful in forming the coating, include plasticized, unplasticized, and
reinforced cellulose acetate (CA), cellulose diacetate, cellulose triacetate, CA propionate,
cellulose nitrate, cellulose acetate butyrate (CAB), CA ethyl carbamate, CAP, CA methyl
carbamate, CA succinate, cellulose acetate trimellitate (CAT), CA dimethylaminoacetate, CA

polyvinyl halides, polyvinyl esters and ethers, natural waxes, and synthetic waxes.

[00218] Semipermeable membrane can also be a hydrophobic microporous membrane,
wherein the pores are substantially filled with a gas and are not wetted by the aqueous
medium but are permeable to water vapor, as disclosed in U.S. Pat. No. 5,798,119. Such
hydrophobic but water-vapor permeable membrane are typically composed of hydrophobic
polymers such as polyalkenes, polyethylene, polypropylene, polytetrafluoroethylene,
polyacrylic acid derivatives, polyethers, polysulfones, polyethersulfones, polystyrenes,
polyvinyl halides, polyvinylidene fluoride, polyvinyl esters and ethers, natural waxes, and
synthetic waxes.

[00219] The delivery port(s) on the semipermeable membrane can be formed post-
coating by mechanical or laser drilling. Delivery port(s) can also be formed in situ by erosion
of a plug of water-soluble material or by rupture of a thinner portion of the membrane over an
indentation in the core. In addition, delivery ports can be formed during coating process, as
in the case of asymmetric membrane coatings of the type disclosed in U.S. Pat. Nos.
5,612,059 and 5,698,220.

[00220] The total amount of the active ingredient(s) released and the release rate can
substantially by modulated via the thickness and porosity of the semipermeable membrane,
the composition of the core, and the number, size, and position of the delivery ports.

[00274] The dose may be in the form of one, two, three, four, five, six, or more sub-doses that are administered at appropriate intervals per day. The dose or sub-doses can be administered in the form of dosage units containing from about 0.1 to about 1,000 milligram, from about 0.1 to about 500 milligrams, or from about 0.5 to about 100 milligram active ingredient(s) per dosage unit, and if the condition of the patient requires, the dose can, by way of alternative, be administered as a continuous infusion.

Combination Therapy

[00276] The compounds provided herein may also be combined or used in combination with other therapeutic agents useful in the treatment and/or prevention of an HCV infection.

[00277] As used herein, the term "in combination" includes the use of more than one therapy (e.g., one or more prophylactic and/or therapeutic agents). However, the use of the term "in combination" does not restrict the order in which therapies (e.g., prophylactic and/or therapeutic agents) are administered to a subject with a disease or disorder. A first therapy (e.g., a prophylactic or therapeutic agent such as a compound provided herein) can be administered prior to (e.g., 5 minutes, 15 minutes, 30 minutes, 45 minutes, 1 hour, 2 hours, 4 hours, 6 hours, 12 hours, 24 hours, 48 hours, 72 hours, 96 hours, 1 week, 2 weeks, 3 weeks, 4 weeks, 5 weeks, 6 weeks, 8 weeks, or 12 weeks before), concomitantly with, or subsequent to (e.g., 5 minutes, 15 minutes, 30 minutes, 45 minutes, 1 hour, 2 hours, 4 hours, 6 hours, 12 hours, 24 hours, 48 hours, 72 hours, 96 hours, 1 week, 2 weeks, 3 weeks, 4 weeks, 5 weeks, 6 weeks, 8 weeks, or 12 weeks after) the administration of a second therapy (e.g., a prophylactic or therapeutic agent) to the subject. Triple therapy is also contemplated herein.

[00278] As used herein, the term "synergistic" includes a combination of a compound provided herein and another therapy (e.g., a prophylactic or therapeutic agent) which has been or is currently being used to prevent, treat, or manage a condition, disorder, or disease, which is more effective than the additive effects of the therapies. A synergistic effect of a combination of therapies (e.g., a combination of prophylactic or therapeutic agents) permits the use of lower dosages of one or more of the therapies and/or less frequent administration of said therapies to a subject with a condition, disorder, or disease. The ability to utilize lower dosages of a therapy (e.g., a prophylactic or therapeutic agent) and/or to administer said therapy less frequently reduces the toxicity associated with the administration of said therapy to a subject without reducing the efficacy of said therapy in the prevention, treatment, or management of a condition, disorder, or disease). In addition, a synergistic effect can
result in improved efficacy of agents in the prevention, treatment, or management of a condition, disorder, or disease. Finally, a synergistic effect of a combination of therapies (e.g., a combination of prophylactic or therapeutic agents) may avoid or reduce adverse or unwanted side effects associated with the use of either therapy alone.

[00279] The compound provided herein can be administered in combination or alternation with another therapeutic agent, such as an anti-HCV agent. In combination therapy, effective dosages of two or more agents are administered together, whereas in alternation or sequential-step therapy, an effective dosage of each agent is administered serially or sequentially. The dosages given will depend on absorption, inactivation, and excretion rates of the drug as well as other factors known to those of skill in the art. It is to be noted that dosage values will also vary with the severity of the condition to be alleviated. It is to be further understood that for any particular subject, specific dosage regimens and schedules should be adjusted over time according to the individual need and the professional judgment of the person administering or supervising the administration of the compositions.

[00280] It has been recognized that drug-resistant variants of HCV can emerge after prolonged treatment with an antiviral agent. Drug resistance most typically occurs due to the mutation of a gene that encodes for an enzyme used in viral replication. The efficacy of a drug against the viral infection can be prolonged, augmented, or restored by administering the compound in combination or alternation with a second, and perhaps third, antiviral compound that induces a different mutation from that caused by the principle drug. Alternatively, the pharmacokinetics, biodistribution, or other parameters of the drug can be altered by such combination or alternation therapy. In general, combination therapy is typically preferred over alternation therapy because it induces multiple simultaneous stresses on the virus.

In certain embodiments, the compound provided herein is combined with one or more agents selected from the group consisting of an interferon, ribavirin, amantadine, an interleukin, a NS3 protease inhibitor, a cysteine protease inhibitor, a phenanthrenequinone, a thiazolidine, a benzanilide, a helicase inhibitor, a polymerase inhibitor, a nucleotide analogue, a gliotoxin, a cerulenin, an antisense phosphorothioate oligodeoxynucleotide, an inhibitor of IRES-dependent translation, and a ribozyme. Example A
HCV Protease Assay

[00312] General procedure: Measurement of the inhibitory effect of compounds on HCV protease activity was performed using the HiLyte Fluor™ TR/QXL™ 610 FRET peptide from AnaSpec, Inc. (San Jose, CA) under conditions developed in-house using 2-3 nM HCV NS3-NS4A protease, which was produced according to the method of Taremi et al. (Protein Science, 1998, 7, 2143-2149). The compounds were tested at a variety of concentrations in assay buffer containing a final DMSO concentration of 5%. Reactions were allowed to proceed for 60 min at 30°C and fluorescence measurements were recorded with a PerkinElmer Victor3 V 1420 Multilabel Counter. The IC_{50} values were determined from the percent inhibition versus concentration data using a sigmoidal non-linear regression analysis based on four parameters with XLfit 4.1 software.

Example B
HCV Replicon Assay

[00313] General procedure: The HCV luciferase replicon assay measures the ability of a test compound to inhibit HCV replication in cell culture after 3 days of treatment in a human hepatoma cell line (Huh-7) bearing a HCV replicon containing a luciferase-neomycin phosphotransferase fusion gene. The inhibition of HCV replication was measured by quantification of luciferase protein expression. Briefly, Huh-7 cells containing either the HCV genotype 1a H77 strain or genotype 1b Conl strain subgenomic luciferase replicon (Hla-luc or Zluc, respectively) were grown in DMEM containing glucose, L-glutamine and sodium pyruvate, 10% fetal bovine serum (FBS), 100 IU/mL penicillin, 100 μg/mL streptomycin, 2 mM GlutaMAX, non-essential amino acids and 0.25 (Hla-luc) or 0.5 (Zluc) mg/mL G418. GlutaMAX was obtained from Invitrogen, Corp.; all other media reagents were obtained from Mediatech, Inc. For dose-response testing, the cells were seeded in 96-well plates at 1 x 10^4 (Hla-luc) or 7.5 x 10^3 (Zluc) cells/well in a volume of 50 μL, and incubated at 37°C/5% CO₂. Three hours after plating, 50 μL of ten 5-fold serial dilutions of
compound were added, and cell cultures were incubated at 37 °C/5% C0₂ for 72 hours. In all cases, Huh-7 cells lacking the HCV replicon served as negative control. To assess luciferase expression, the media/compound was removed from the plates and ONE-glo Luciferase assay reagent (Promega) was added to each well. The assay plates were shaken for 3 minutes at room temperature and luciferase activity for each well was measured with a 1 sec read time on the Victor3V multilabel counter using a 700 nm cut-off filter (Perkin Elmer). EC50 values were calculated from dose response curves from the resulting best-fit equations determined by Microsoft Excel and XLfit 4.1 software.

[003 14] For cytotoxicity evaluation, ZLuc cells were treated with compounds as described above and cellular viability was monitored using the Cell Titer 96 AQueous One Solution Cell Proliferation Assay (Promega). Plates were then read at 490 nm in a Victor3V 1420 multilabel counter (Perkin Elmer) and CC50 concentrations were determined using Microsoft Excel and XLfit 4.1 software.

[003 15] The biological results are summarized in Tables 1 and 2, wherein A represents a value smaller than 10 nM, B represents a value between 10 nM to 100 nM, C represents a value between 100 nM to 1 µM, D represents a value between 1 µM to 10 µM, and E represents a value greater than 10 µM.

[003 16] In Table 1, the values of FS with 45% HS were determined using the genotype 1b HCV replicon luciferase screening assay using ZLuc cells, except that activity in the presence of 10% fetal calf serum (FCS) or 45% human serum (HS) was determined in parallel. The fold shift (FS) with 45% HS is the EC₅₀ value in the presence of 45% HS divided by the EC₅₀ value in the presence of 10% FCS. FS (la/lb) is the EC₅₀ value against genotype 1a HCV divided by the EC₅₀ value against the genotype 1b in the replicon luciferase screening assay.

[003 17] In Table 2, fold shift was obtained using the transient transfection assay, where the activity of a compound against a mutated replicon was compared to a wild-type replicon. The FS against a mutant is the EC₅₀ value against the mutant replicon divided by the EC₅₀ value against the wild-type replicon.

HCV in vitro Infection Core ELISA Assay

[00318] **Generation of Recombinant JFH-1 Virus Stocks:** The recombinant JFH-1 HCV virus used in the HCV in vitro infection assay was generated by transfection of HPC cells with JFH-1 RNA produced by in vitro transcription. The JFH-1 DNA template was derived synthetically using sequence information derived from NCBI Accession # AB047639 (Wakita, et al., Nat. Med. 2005, 11:791-796). Source: DNA2.0, Menlo Park, CA. The
cDNA for the JFH-1 HCV clone was synthesized by DNA2.0 and contains a T7 promoter to drive the transcription of the JFH-1 genomic RNA. This plasmid was amplified using the Hi-Speed Plasmid Midi kit (Qiagen) according to the manufacturer's instructions. Thirty micrograms of purified DNA was digested overnight at 37 °C with 300 U XbaI. The digested DNA served as a template for the in vitro transcription of the JFH-1 genomic RNA using the MEGAScript T7 kit (Ambion) as instructed by the manufacturer. The JFH-1 RNA product was resuspended to 1 µg/µL in RNA storage solution (Ambion). The quality of the JFH-1 RNA was verified by agarose gel electrophoresis (1.2% E-gel) prior to electroporation.

Complete growth media for Huh-7 and HPC cells (Huh-7 media) was prepared as follows: DMEM (containing glucose, L-glutamine and sodium pyruvate), 10% FBS, 100 IU/mL penicillin, 100 µg/mL streptomycin, 2 mM GlutaMAX, 1% MEM non-essential amino acids. Subconfluent HPC cells were treated with trypsin-EDTA, collected with Huh-7 media, and centrifuged at 1,500 rpm for 5 min at 4 °C in an Allegra 6R centrifuge (Beckman Coulter) in a 50 mL conical tube. The cells were then rinsed twice by resuspending the cells in 50 mL of PBS and centrifuging at 1,500 rpm for 5 min at 4 °C.

JFH-1 RNA was electroporated into HPC cells using a Thermo Scientific Hybaid OptiBuffer kit (containing buffer A, solution B and compounds C and D). After washing, the HPC cells were resuspended in OptiBuffer buffer A at 1x10^7 cells/mL, and 400 µL (4x10^6 cells) was transferred to a 1.5 mL RNase-free microfuge tube and gently centrifuged at 2,000 rpm in a Microfuge 18 (Beckman Coulter) centrifuge at room temperature for 5 minutes. During this centrifugation step, the electroporation medium was prepared by mixing 2.5 mL of OptiBuffer solution B with 1 vial of OptiBuffer compound C (5.5 mg of ATP), 1 vial of OptiBuffer compound D (7.7 mg of glutathione) and 2.5 mL of autoclaved water. After aspirating the supernatant, the cell pellet was resuspended in 400 µL of electroporation medium. JFH-1 RNA (8 µg) was added to the resuspended cells, whereupon they were transferred to a 0.4 cm cuvette and electroporated in a Bio-Rad GenePulsar XCell electroporation module with a single pulse at 960 µF, 270 V and maximum resistance. A mock transfection, without RNA, was electroporated as a negative control.

Growth media (600 µL) was immediately added to the cuvette. Cells were then transferred into a 15 mL conical tube containing 3.4 mL of Huh-7 media. Approximately 1.2x10^5 cells were seeded into each well of a Corning Costar 6-well plate and incubated at 37 °C with 5% CO_2.
When confluent, the transfected HPC cells were trypsinized and split into new 75 cm² flasks. Once confluent, cultures were split into 225 cm² flasks and continuously split 1:5 when confluent. At each split, conditioned media was collected from the 225 cm² flasks and centrifuged at 2,000 rpm for 10 min in a table-top centrifuge. Aliquots of this virus stock were stored at -80 °C for future use.

Core ELISA: The HCV in vitro infection core ELISA assay measures the ability of a test compound to inhibit replication of an infectious HCV (strain JFH-1; genotype 2a) in cell culture. Recently, an in vitro infection model identified by Wakita et al. (Nat. Med. 2005, 11:791-796) was found to replicate in retinoic acid-inducible gene I (RIG-I)-deficient or cluster of differentiation (CD)-81-positive Huh-7 hepatoma cell lines. We have developed this model for determining the efficacy of antiviral compounds against an infectious virus in vitro using HCV producing cells (HPC), a proprietary Huh-7-derived cell sublineage capable of propagating the JFH-1 HCV virus. The readout of the assay is quantification of HCV core protein by ELISA 5 days post infection with JFH-1 virus and treatment with a test compound.

Ninety-six-well collagen-coated plates were seeded with HPC cells at a density of 2.5x10³ cells per well in 50 µL of Huh-7 media. Compound stock solutions were made up freshly in Huh-7 media (DMEM (containing glucose, L-glutamine and sodium pyruvate), 10% FBS, 100 IU/mL penicillin, 100 µg/mL streptomycin, 2 mM GlutaMAX, 1% MEM non-essential amino acids) as 4X stock. Nine additional 5-fold drug dilutions were prepared from the 4X stocks in Huh-7 media. At least 4 hours after HPC cells were seeded, the media in the 96-well culture plates was aspirated and 50 µL of each drug dilution and 100 µL of JFH-1 HCV was added to each well.

At 16 hrs post treatment and infection, the virus inoculum was removed by aspiration. The cultures were treated at the same final concentrations of drug diluted to IX in Huh-7 media to a final volume of 200 µL. Cells were incubated in the presence of drug for 4 additional days at 37°C/5% CO₂.

Media was removed from the plates by aspiration. Cells were fixed with 250 µL 1:1 acetone:methanol for 90 seconds, washed once in PBS and then three times with IX KPL wash solution. The assay plates were then blocked with 150 µL/well 10% FBS-TNE (50 mM Tris-HCl (pH 7.5; Sigma), 100 mM NaCl, 1 mM EDTA with 10% FBS) for 1 hr at room temperature. Cells were washed three times with IX KPL wash solution and incubated
with 100 µL/well anti-hepatitis C core mAb (1 mg/mL stock diluted 1:500 in 10% FBS-TNE) for 2 hours at 37 °C. Cells were washed three times with 1X KPL wash solution and incubated with 100 µL/well HRP-goat anti-mouse antibody (diluted 1:2,500 in 10% FBS-TNE) for 1 hr at 37 °C.

[00326] OPD solution was prepared using 1 OPD tablet + 12 mL citrate/phosphate buffer (16 mM citric acid, 27 mM Na₂HPO₄) plus 5 µL 30% H₂O₂ per plate. Cells were washed three times with 1X KPL wash solution and developed with 100 µL/well OPD solution for 30 minutes in the dark at room temperature. The reaction was stopped with 100 µL/well of 2N H₂SO₄, and absorbance measured at A₄₉₀ nm in a Victor³ V 1420 multilabel counter (Perkin Elmer). The EC₅₀ values for each compound were calculated from dose response curves from the resulting best-fit equations determined by Microsoft Excel and XLfit 4.1 software. The negative control for inhibition of virus replication was untreated HPC cells infected with the JFH-1 HCV virus strain. The negative ELISA control was untreated, uninfected HPC cells. The positive ELISA control was untreated HPC cells infected the JFH-1 HCV virus strain.

Example D
Luciferase replicon transient transfection assay

[00327] General procedure: The luciferase replicon transient transfection assay measures the ability of a test compound to inhibit the replication of a transiently-transfected HCV luciferase-bearing wild-type or mutant replicon in human hepatoma cells that had been cured of the HCV replicon with IFN (cured GS4.1). The mutant replicons bear a specific single-site mutation in NS3 that is known to confer resistance to protease inhibitors currently in development. The inhibition of HCV replication was measured by quantification of luciferase protein expression. This assay has been validated using a panel of replicons bearing known protease inhibitor resistance mutations and their respective reference compounds. Briefly, subconfluent cured GS4.1 cells in OptiBuffer (ThermoElectron Corp.) were electroporated with 40 µg of wild-type or mutant luciferase-bearing HCV replicon RNA. The cells were then seeded in 96-well opaque white plates at 2.4x10⁴ cells/well in 150 µL/well in Huh-7 media (DMEM containing glucose, L-glutamine and sodium pyruvate, 10% fetal bovine serum, 100 IU/mL penicillin, 100 µg/mL streptomycin, 2 mM GlutaMAX, and 1X MEM non-essential amino acids [Mediatech, Inc. and Invitrogen Corp.]) and incubated for 4 hours at 37°C/5% CO₂. Ten 1:5 dilutions of each compound were made in Huh-7 media
at concentrations that were 4X higher than the final concentrations to be tested and 50 µE/well was added to the transfected cells. Untreated, mock-transfected cells served as a negative control of luciferase expression. The plates were incubated at 37°C/5% CO₂ for 4 days whereupon the media was removed and 50 µL of ONE-glo luciferase substrate (Promega) was added to each well. The plates were agitated on a rotating platform at room temperature for 3 minutes and read in a Victor³V microplate reader (Perkin-Elmer) using a 700 nm cut-off filter with a 1 second read time. EC₅₀ values were calculated from dose response curves from the resulting best-fit equations determined by Microsoft Excel and XLfit 4.1 software.

Example E
MTS Cytotoxicity Assay

[00328] The cytotoxicity assay measures the viability of cells after treatment with a test compound for 5 days. The assay readout is the bioreduction of the yellow MTS tetrazolium compound to a purple formazan product. This conversion is mediated by NADPH or NADH and is directly proportional to the number of live cells in a culture.

[00329] Ninety-six-well Corning Costar plates were seeded with HPC cells at a density of 3.0x10³ cells per well in 50 µL of Huh-7 media. Compound stock solutions were made up freshly in Huh-7 media as 2X stocks. Seven additional 3-fold drug dilutions were prepared from the 2X stocks in Huh-7 media for a total of 8 dilutions.

[00330] At least 4 hours after HPC cells were seeded, 50 µL of each drug dilution was added to the cultures. At 16 hrs post treatment, the existing media was removed by aspiration. Cultures were treated at the same final concentrations of drug diluted to IX in Huh-7 medium to a final volume of 100 µL. Cells were incubated for 4 additional days at 37°C/5% CO₂ in the presence of drug.

[00331] After 5 days of treatment, the CellTiter 96® Aqueous One Solution cell proliferation assay was performed by adding 20 µL of MTS solution to each well. The plates were then incubated at 37°C/5% CO₂ for 3 hours. Plates were read at A₄90 nm in a Victor³ V 1420 multilabel counter (Perkin Elmer) and CC₅₀ concentrations were determined using Microsoft Excel and XLfit 4.1 software. The positive control for cell death: culture wells containing only Huh-7 medium. The negative control for cell death: culture wells containing untreated, uninfected HPC cells.
