UNITED STATES PATENT OFFICE.

AUGUST SAHLSTROM, OF CHICAGO, ILLINOIS.

IMPROVEMENT IN FOOT-SCRAPERS.

Specification forming part of Letters Patent No. **113,351**, dated April 4, 1871.

To all whom it may concern:

Be it known that I, AUGUST SAHLSTROM, of the city of Chicago, county of Cook, and State of Illinois, have invented a new and useful Combined Foot Scraper and Brush; and I do hereby declare the following to be a full, clear, and exact description thereof, which will enable others skilled in the art to make and use the same, reference being had to the accompanying drawing, forming part of this specification, in which—

Figure 1 is a side elevation of my invention, and Fig. 2 is a plan or top view of the same with brush removed.

Similar letters of reference indicate corresponding parts in both figures of the drawing.

My invention has for its object to provide a foot scraper and brush combined, by the use of which a person may remove the dirt adhering to his or her boots and shoes; and the improvement consists in a metal frame, within which is placed a brush, said frame being made of two parts; and is hinged or locked together around the brush, so as to hold the brush in a vertical position, and is provided at one end of the movable or hinged part with a horizontal projection, the upper surface of which is provided with a thin edge, which forms the scraper.

In the accompanying drawing, A represents the fixed part of the metal frame, and A' the movable part. The part A is firmly bolted to the step or sill of the door, and is provided at one end with a vertical slot or mortise, into

which the curved end of portion A' is introduced, and is also provided at its opposite end with a slot, which receives a corresponding projection upon the end of part A' when closed, through which passes a vertical bolt or pin, *a*, by which the whole is firmly connected together.

B is the brush, which may be made of any suitable material and of the size desired to fill the interior of the frame when closed, and is firmly secured therein by means of the pins *e*, *e*, projecting inward from the upper side of the frame, which engage or enter the sides of the brush.

The movable part A' is provided with a horizontal projection, C, the upper surface of which is made with a thin or beveled edge, which forms a cheap and effective scraper.

Having thus described my invention, what I claim as new, and desire to secure by Letters Patent, is—

1. The frame A A', provided with scraper C, substantially as and for the purpose described.

2. In combination, the frame A A' with brush B, substantially as and for the purpose described.

The above specification of my invention signed by me this 16th day of January, 1871.

AUGUST SAHLSTROM.
