TRIAZOLE ACC INHIBITORS AND USES THEREOF**CROSS REFERENCE TO RELATED APPLICATIONS**

[0001] This application claims priority to U.S. Patent Application Number 62/259,966, filed on November 25, 2015.

BACKGROUND OF THE INVENTION

[0002] Obesity is a health crisis of epic proportions. The health burden of obesity, measured by quality-adjusted life-years lost per adult, has surpassed that of smoking to become the most serious, preventable cause of death. In the US, about 34% of adults have obesity, up from 31% in 1999 and about 15% in the years 1960 through 1980. Obesity increases the rate of mortality from all causes for both men and women at all ages and in all racial and ethnic groups. Obesity also leads to social stigmatization and discrimination, which decreases quality of life dramatically. The chronic diseases that result from obesity cost the US economy more than \$150 billion in weight-related medical bills each year. Furthermore, about half of the obese population, and 25% of the general population, have metabolic syndrome, a condition associated with abdominal obesity, hypertension, increased plasma triglycerides, decreased HDL cholesterol, and insulin resistance, which increases the risk for type-2 diabetes (T2DM), stroke and coronary heart disease. [Harwood, *Expert Opin. Ther. Targets* 9: 267, 2005].

[0003] Diet and exercise, even when used in conjunction with the current pharmacotherapy, do not provide sustainable weight loss needed for long-term health benefit. Currently, only a few anti-obesity drugs are approved in the US, the fat absorption inhibitor orlistat (Xenical[®]), the 5-HT_{2C} antagonist lorcaserin (Belviq[®]), and the combination therapy phentermine/topiramate (Qsymia[®]). Unfortunately, poor efficacy and unappealing gastrointestinal side effects limit the use of orlistat. Surgery can be effective but is limited to patients with extremely high body-mass indices (BMI) and the low throughput of surgery limits the impact of this modality to about 200k patients per year. The majority of obesity drugs in clinical development are designed to reduce caloric intake through central action in the CNS (e.g., anorectics and satiety agents). However, the FDA has taken an unfavorable position against CNS-active agents, due to their modest efficacy and observed/potential side-effect profiles.

[0004] The continuing and increasing problem of obesity, and the current lack of safe and effective drugs for treating it, highlight the overwhelming need for new drugs to treat this condition and its underlying causes.

[0005] Another ongoing problem is the lack of antifungal drugs with activity against a broad range of fungal pathogens. Often, a given antifungal drug will have activity against one fungal species but lack activity against other, even closely related, species, such as *Candida albicans*, *Candida krusei*, and *Candida parapsilosis*.

[0037] The phrase “candidal onychomycosis” as used herein refers to a fungal yeast infection of the fingernails and/or toenails caused by a *Candida spp.*, including for example, *Candida albicans* and *Candida parapsilosis*.

[0038] As used herein, the term “dermatomycosis” refers to a fungal infection of the skin caused by a dermatophyte.

[0039] As used herein, the phrase “fungal infection” refers to any superficial fungal infection, including for example, one or more of a superficial fungal infection of the skin, onychomycosis, and a fungal infection of a hair follicle, each of which is as defined herein. Such fungal infections can include superficial fungal infections of the skin, including for example, one or more of Tinea cruris, Tinea corporis, interdigital Tinea pedis, moccasin-type Tinea pedis, Tinea manuum, Tinea versicolor (pityriasis), Tinea nigra, cutaneous candidiasis, Tinea faciei, and white and black piedra; fungal infections of the hair follicle including one or more of Tinea capitis, Tinea Favose (favus), and Tinea barbae; and onychomycosis, a fungal infection of one or more of the nail bed, matrix, and nail plate, caused by, for example, dermatophytes, yeasts, and non-dermatophyte molds.

[0040] As used herein, the phrase “fungal infection of the hair follicle” refers to a fungal infection of at least the tubular infolding of the epidermis (skin) containing the root of a hair of any one or more of the scalp, eyebrows, eyelashes, and bearded area of an individual. The phrase “fungal infection of the hair follicle” also refers to a fungal infection of the tubular

infolding of the epidermis (skin) containing the root of a hair of any one or more of the scalp, eyebrows, eyelashes, and bearded area, along with a fungal infection of the hair shaft, of an individual. Such fungal infections can include, for example, one or more of *Tinea capitis*, *Tinea favosa*, and *Tinea Barbae*. The term “hair follicle” refers to a tubular infolding of the epidermis (skin) containing the root of a hair. The follicle is lined by cells derived from the epidermal layer of the skin. *Tinea capitis* (or severe highly-inflammatory cases sometimes termed Kerion) is a superficial fungal infection (dermatophytosis) of the skin of the scalp, eyebrows, and eyelashes, that attacks the hair follicles and shaft. The disease is primarily caused by dermatophytes in the *Trichophyton* and *Microsporum* genera, including for example, *Microsporum audouinii*, *Microsporum canis*, *Microsporum distortum*, *Microsporum gypseum*, *Trichophyton megninii*, *Trichophyton mentagrophytes*, *Trichophyton rubrum*, *Trichophyton schoenleinii*, *Trichophyton tonsurans*, and *Trichophyton verrucosum*. The clinical presentation is typically a single or multiple patches of hair loss, sometimes with a 'black dot' pattern (often with broken-off hairs), that may be accompanied by inflammation, scaling, pustules, and itching. *Tinea favosa* can be considered a variety of *Tinea capitis* because it involves the scalp; however, it may also involve glabrous skin and nails. *Tinea favosa* is primarily caused by dermatophytes in the *Trichophyton* and *Microsporum* genera, including for example, *Microsporum gypseum* and *Trichophyton schoenleinii*. *Tinea barbae* is a superficial dermatophytosis that is limited to the bearded areas of the face, neck, chin, cheeks, and/or lips and occurs almost exclusively in older adolescent and adult males. The clinical presentation of *Tinea barbae* includes inflammatory, deep, kerion-like plaques and non-inflammatory superficial patches resembling *Tinea corporis* or bacterial folliculitis. The mechanism that causes *Tinea barbae* is similar to that of *Tinea capitis*, and is frequently the result of a *Trichophyton rubrum* (*T. rubrum*) infection but may also be the result of *Trichophyton mentagrophytes* var *granulosum* and *Trichophyton verrucosum*. Finally *Microsporum canis* and *Trichophyton mentagrophytes* var *erinacei* have been known to cause *Tinea barbae* but are relatively rare.

[0041] As used herein, the term “infection” refers to the invasion, development and/or multiplication of a microorganism within or on another organism. An infection may be localized to a specific region of an organism or systemic.

[0042] The term “onychomycosis” as used herein refers to a fungal infection of the nail bed, matrix, and/or nail plate. Onychomycosis is caused by three main classes of fungi: dermatophytes, yeasts (candidal onychomycosis), and non-dermatophyte molds. Dermatophytes are the most common cause of onychomycosis. Onychomycosis caused by non-dermatophyte molds is becoming more common worldwide. Onychomycosis due to *Candida* is less common.

Dermatophytes that can cause onychomycosis include one or more of *Trichophyton rubrum*, *Trichophyton interdigitale*, *Epidermophyton floccosum*, *Trichophyton violaceum*, *Microsporum gypseum*, *Trichophyton tonsurans*, *Trichophyton soudanense*, and *Trichophyton verrucosum*, and such disease is often also referred to as Tinea unguium. Candidal onychomycosis include cutaneous candidiasis and mucocutaneous candidiasis that are caused by one or more *Candida* species, including for example, *Candida albicans* and *Candida parapsilosis*. Non-dermatophyte molds that can cause onychomycosis can include one or more of, for example, *Scopulariopsis brevicaulis*, *Fusarium spp.*, *Aspergillus spp.*, *Alternaria*, *Acremonium*, *Scytalidium dimidiatum*, and *Scytalidium hyalinum*. There are four classic types of onychomycosis including the following: distal and lateral subungual onychomycosis (DLSO) that is the most common form of onychomycosis, and is usually caused by *Trichophyton rubrum* and/or *Trichophyton interdigitale*, which invades the nail bed and the underside of the nail plate; white superficial onychomycosis (WSO) is caused by fungal (e.g., *T. mentagrophytes*) invasion of the superficial layers of the nail plate to form "white islands" on the plate, non-dermatophyte molds cause deep white superficial onychomycosis; proximal subungual onychomycosis (PSO) is fungal penetration of the newly formed nail plate through the proximal nail fold and it is the least common form of onychomycosis in healthy people, but is found more commonly when the patient is immunocompromised; endonyx onychomycosis (EO), and candidal onychomycosis (CO) which is *Candida* species invasion of the fingernails.

[0043] As used herein, the term "superficial fungal infection of the skin" refers to a fungal infection present on the outer layer of skin, including Tinea cruris (jock itch), Tinea corporis (ringworm), Tinea pedis, interdigital Tinea pedis, moccasin-type Tinea pedis, Tinea manuum, Tinea versicolor (piyriasis), Tinea nigra, cutaneous candidiasis, Tinea faciei (facial ringworm), and white and black piedra. Tinea corporis (body ringworm), Tinea cruris (jock itch), and Tinea faciei (facial ringworm), can be caused by *Epidermophyton floccosum*, *Microsporum canis*, *Trichophyton mentagrophytes*, *T. rubrum*, *T. tonsurans*, *T. verrucosum*, and/or *T. violaceum*. Tinea pedis (athlete's foot) or Tinea manuum (fungal infection of the hand), are caused by *Epidermophyton floccosum*, *Microsporum canis*, *Trichophyton mentagrophytes*, *T. rubrum*, *T. tonsurans*, *T. verrucosum*, and/or *T. violaceum*. Cutaneous candidiasis can be caused by *C. albicans*.

The amount of a compound of the present invention in the composition will also depend upon the particular compound in the composition.

Uses of Compounds and Compositions Thereof

Pharmaceutical Uses

[0181] Acetyl-CoA carboxylase (ACC) catalyzes the ATP-dependent carboxylation of acetyl-CoA to form malonyl-CoA. This reaction, which proceeds in two half-reactions, a biotin carboxylase (BC) reaction and a carboxyltransferase (CT) reaction, is the first committed step in fatty acid (FA) biosynthesis and is the rate-limiting reaction for the pathway. In addition to its role as a substrate in FA biosynthesis, malonyl-CoA, the product of the ACC-catalyzed reaction, also plays an important regulatory role in controlling mitochondrial FA uptake through allosteric inhibition of carnitine palmitoyltransferase I (CPT-I), the enzyme catalyzing the first committed

step in mitochondrial FA oxidation. Malonyl-CoA, therefore, is a key metabolic signal for the control of FA production and utilization in response to dietary changes and altered nutritional requirements in animals, for example during exercise, and therefore plays a key role in controlling the switch between carbohydrate and fat utilization in liver and skeletal muscle [Harwood, 2005].

[0182] In mammals, ACC exists as two tissue-specific isozymes, ACC1 which is present in lipogenic tissues (liver, adipose) and ACC2, which is present in oxidative tissues (liver, heart, skeletal muscle). ACC1 and ACC2 are encoded by separate genes, display distinct cellular distributions, and share 75% overall amino acid sequence identity, except for an extension at the N-terminus of ACC2 that direct ACC2 to the mitochondrial membrane. ACC1, which lacks this targeting sequence, is localized to the cytoplasm. In the heart and skeletal muscle, which have a limited capacity to synthesize fatty acids, the malonyl-CoA formed by ACC2 functions to regulate FA oxidation. In the liver, the malonyl-CoA formed in the cytoplasm through the actions of ACC1 is utilized for FA synthesis and elongation leading to triglyceride formation and VLDL production, whereas the malonyl-CoA formed at the mitochondrial surface by ACC2 acts to regulate FA oxidation [Tong and Harwood, *J. Cellular Biochem.* 99: 1476, 2006]. This compartmentalization of malonyl-CoA results from a combination of synthesis proximity [Abu-Elheiga *et al.*, PNAS (USA) 102: 12011, 2005] and the rapid action of malonyl-CoA decarboxylase [Cheng *et al.*, *J. Med. Chem.* 49:1517, 2006].

[0183] Simultaneous inhibition of the enzymatic activities of ACC1 and ACC2 offers the ability to inhibit *de novo* FA production in lipogenic tissues (e.g. liver & adipose) while at the same time stimulating FA oxidation in oxidative tissues (e.g. liver & skeletal muscle) and therefore offers an attractive modality for favorably affecting, in a concerted manner, a multitude of cardiovascular risk factors associated with obesity, diabetes, insulin resistance, and the metabolic syndrome.

[0184] Several lines of evidence strongly support the concept of direct inhibition of ACC activity as an important therapeutic target for treating obesity, diabetes, insulin resistance, and the metabolic syndrome.

[0185] Abu-Elheiga *et al.* [*Proc. Natl. Acad. Sci. USA* 100:10207-10212, 2003] demonstrated that ACC2 knock-out mice exhibit reduced skeletal and cardiac muscle malonyl-CoA, increased muscle FA oxidation, reduced hepatic fat, reduced total body fat, elevated skeletal muscle uncoupling protein-3 (UCP3) which is indicative of increased energy expenditure, reduced body weight, reduced plasma free FAs, reduced plasma glucose, and reduced tissue glycogen, and are protected from diet-induced diabetes and obesity.

[0186] Savage *et al.* [*J. Clin. Invest.* 116: 817, 2006], using ACC1 and ACC2 antisense oligonucleotides, demonstrated stimulation of FA oxidation in isolated rat hepatocytes and in rats fed high-fat diets, and lowering of hepatic triglycerides, improvements in insulin sensitivity, reductions in hepatic glucose production, and increases in UCP1 mRNA in high fat-fed rats. These effects were greater when both ACC1 and ACC2 expression were suppressed than when either ACC1 or ACC2 expression alone was suppressed.

[0187] Harwood *et al.* [*J. Biol. Chem.* 278: 37099, 2003] demonstrated that the isozyme-nonselective ACC inhibitor, CP-640186, which equally inhibits ACC1 and ACC2 ($IC_{50} = \sim 60$ nM) isolated from rat, mouse, monkey and human without inhibiting either pyruvate carboxylase or propionyl-CoA carboxylase, reduced FA synthesis, triglyceride synthesis and secretion in Hep-G2 cells without affecting cholesterol synthesis, and reduced apoB secretion without affecting apoA1 secretion. CP-640186 also stimulated FA oxidation in C2C12 cells and in rat muscle slices and increased CPT-I activity in Hep-G2 cells. In experimental animals, CP-640186 acutely reduced malonyl-CoA concentration in both lipogenic and oxidative tissues in both the fed and fasted state, reduced liver and adipose tissue FA synthesis, and increased whole body FA oxidation. In sucrose-fed rats treated with CP-640186 for three weeks, CP-640186 time- and dose-dependently reduced liver, muscle and adipose triglycerides, reduced body weight due to selective fat reduction without reducing lean body mass, reduced leptin levels, reduced the hyperinsulinemia produced by the high sucrose diet without changing plasma glucose levels, and improved insulin sensitivity.

[0188] Saha *et al.* [*Diabetes* 55:A288, 2006] demonstrated stimulation of insulin sensitivity in insulin-resistant rat muscle tissue by CP-640186 within 30 min of compound administration, and studies by Furler *et al.* [*Diabetes* 55:A333, 2006] used dual tracer analysis to show that acute (46 min) treatment of rats with CP-640186 stimulated FA clearance without decreasing glucose clearance.

[0189] ACC is the rate-limiting enzyme in fatty acid synthesis and its product, malonyl CoA, serves as an important regulator of fatty acid oxidation. Hence, ACC inhibitors both reduce *de novo* lipid synthesis and promote the oxidation of existing fat. This dual effect on lipid metabolism raises the possibility that ACC inhibitors will be substantially more effective in reducing excess fat than other mechanisms. Furthermore, ACC inhibitors will impact insulin sensitivity, plasma and tissue triglycerides, and fasting plasma glucose as a consequence of whole-body and tissue-specific fat mass reduction without the need for poly-pharmacy.

[0190] ACC inhibitors need only access the liver and muscle in the peripheral compartment. Avoiding the CNS will address many of side effects associated with the late-stage obesity

programs targeting CNS receptors. ACC inhibitors are also expected to have superior safety profiles to existing metabolic disease agents. For example, it is unlikely that an ACC inhibitor will precipitate life-threatening hypoglycemia as is often seen with insulin mimetics, insulin secretagogues, and insulin degradation inhibitors. Also, since ACC inhibitors will reduce whole-body fat mass, they will be superior to the glitazones that increase whole-body fat mass as part of their mechanism of action.

[0191] A peripherally acting agent that causes significant weight loss and improves other metabolic endpoints fits well within the US FDA's requirements for approval of a new obesity agent. However, if an approval for obesity continues to be challenging in 5-7 years, ACC inhibitors could be approved for familial combined hyperlipidemia and non-alcoholic steatohepatitis (NASH). There are currently no marketed ACC inhibitors, so an isozyme-nonselective ACC inhibitor would represent first-in-class therapy for treating obesity and metabolic syndrome.

[0192] The activity of a provided compound as an inhibitor of ACC or treatment for obesity or metabolic syndrome, may be assayed *in vitro* or *in vivo*. An *in vivo* assessment of the efficacy of the compounds of the invention may be made using an animal model of obesity or metabolic syndrome, e.g., a rodent or primate model. Cell-based assays may be performed using, e.g., a cell line isolated from a tissue that expresses ACC. Additionally, biochemical or mechanism-based assays, e.g., transcription assays using a purified protein, Northern blot, RT-PCR, etc., may be performed. *In vitro* assays include assays that determine cell morphology, protein expression, and/or the cytotoxicity, enzyme inhibitory activity, and/or the subsequent functional consequences of treatment of cells with compounds of the invention. Alternate *in vitro* assays quantitate the ability of the inhibitor to bind to protein or nucleic acid molecules within the cell. Inhibitor binding may be measured by radiolabeling the inhibitor prior to binding, isolating the inhibitor/target molecule complex and determining the amount of radiolabel bound. Alternatively, inhibitor binding may be determined by running a competition experiment where new inhibitors are incubated with purified proteins or nucleic acids bound to known radioligands. Detailed conditions for assaying a compound utilized in this invention as an inhibitor of ACC are set forth in the Examples below. The aforementioned assays are exemplary and not intended to limit the scope of the invention. The skilled practitioner can appreciate that modifications can be made to conventional assays to develop equivalent assays that obtain the same result.

[0219] The exact amount required will vary from subject to subject, depending on the species, age, and general condition of the subject, the severity of the infection, the particular agent, its mode of administration, and the like. A provided compound or composition of the invention is preferably formulated in dosage unit form for ease of administration and uniformity of dosage. The expression "dosage unit form" as used herein refers to a physically discrete unit of agent appropriate for the patient to be treated. It will be understood, however, that the total daily usage of a provided compound or composition of the present invention will be decided by the attending physician within the scope of sound medical judgment. The specific effective dose level for any particular patient or organism will depend upon a variety of factors including the disorder being treated and the severity of the disorder; the activity of the specific compound employed; the specific composition employed; the age, body weight, general health, sex and diet of the patient; the time of administration, route of administration, and rate of excretion of the specific compound employed; the duration of the treatment; drugs used in combination or coincidental with the specific compound employed, and like factors well known in the medical arts.

[0220] A pharmaceutically acceptable composition of this invention can be administered to humans and other animals orally, rectally, parenterally, intracisternally, intravaginally, intraperitoneally, topically (as by powders, ointments, or drops), buccally, as an oral or nasal spray, or the like, depending on the severity of the infection being treated. In certain embodiments, a provided compound of the invention may be administered orally or parenterally at dosage levels of about 0.01 mg/kg to about 50 mg/kg and preferably from about 1 mg/kg to about 25 mg/kg, of subject body weight per day, one or more times a day, to obtain the desired therapeutic effect.

[0221] Liquid dosage forms for oral administration include, but are not limited to, pharmaceutically acceptable emulsions, microemulsions, solutions, suspensions, syrups and elixirs. In addition to the active compounds, the liquid dosage forms may contain inert diluents commonly used in the art such as, for example, water or other solvents, solubilizing agents and emulsifiers such as ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate, benzyl alcohol, benzyl benzoate, propylene glycol, 1,3-butylene glycol, dimethylformamide, oils (in particular, cottonseed, groundnut, corn, germ, olive, castor, and sesame oils), glycerol, tetrahydrofurfuryl alcohol, polyethylene glycols and fatty acid esters of sorbitan, and mixtures

thereof. Besides inert diluents, the oral compositions can also include adjuvants such as wetting agents, emulsifying and suspending agents, sweetening, flavoring, and perfuming agents.

[0222] Injectable preparations, for example, sterile injectable aqueous or oleaginous suspensions may be formulated according to the known art using suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation may also be a sterile injectable solution, suspension or emulsion in a nontoxic parenterally acceptable diluent or solvent, for example, as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution, U.S.P. and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil can be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid are used in the preparation of injectables.

[0223] The injectable formulations can be sterilized, for example, by filtration through a bacterial-retaining filter, or by incorporating sterilizing agents in the form of sterile solid compositions which can be dissolved or dispersed in sterile water or other sterile injectable medium prior to use.

[0224] In order to prolong the effect of a provided compound, it is often desirable to slow the absorption of a compound from subcutaneous or intramuscular injection. This may be accomplished by the use of a liquid suspension of crystalline or amorphous material with poor water solubility. The rate of absorption of the compound then depends upon its rate of dissolution that, in turn, may depend upon crystal size and crystalline form. Alternatively, delayed absorption of a parenterally administered compound form is accomplished by dissolving or suspending a compound in an oil vehicle. Injectable depot forms are made by forming microencapsule matrices of a compound in biodegradable polymers such as polylactide-polyglycolide. Depending upon the ratio of compound to polymer and the nature of the particular polymer employed, the rate of compound release can be controlled. Examples of other biodegradable polymers include poly(orthoesters) and poly(anhydrides). Depot injectable formulations are also prepared by entrapping a compound in liposomes or microemulsions that are compatible with body tissues.

[0225] Compositions for rectal or vaginal administration are preferably suppositories which can be prepared by mixing the compounds of this invention with suitable non-irritating excipients or carriers such as cocoa butter, polyethylene glycol or a suppository wax which are solid at ambient temperature but liquid at body temperature and therefore melt in the rectum or vaginal cavity and release the active compound.

[0226] Solid dosage forms for oral administration include capsules, tablets, pills, powders, and granules. In such solid dosage forms, the active compound is mixed with at least one inert, pharmaceutically acceptable excipient or carrier such as sodium citrate or dicalcium phosphate and/or a) fillers or extenders such as starches, lactose, sucrose, glucose, mannitol, and silicic acid, b) binders such as, for example, carboxymethylcellulose, alginates, gelatin, polyvinylpyrrolidinone, sucrose, and acacia, c) humectants such as glycerol, d) disintegrating agents such as agar-agar, calcium carbonate, potato or tapioca starch, alginic acid, certain silicates, and sodium carbonate, e) solution retarding agents such as paraffin, f) absorption accelerators such as quaternary ammonium compounds, g) wetting agents such as, for example, cetyl alcohol and glycerol monostearate, h) absorbents such as kaolin and bentonite clay, and i) lubricants such as talc, calcium stearate, magnesium stearate, solid polyethylene glycols, sodium lauryl sulfate, and mixtures thereof. In the case of capsules, tablets and pills, the dosage form may also comprise buffering agents.

[0227] Solid compositions of a similar type may also be employed as fillers in soft and hard-filled gelatin capsules using such excipients as lactose or milk sugar as well as high molecular weight polyethylene glycols and the like. The solid dosage forms of tablets, dragees, capsules, pills, and granules can be prepared with coatings and shells such as enteric coatings and other coatings well known in the pharmaceutical formulating art. They may optionally contain opacifying agents and can also be of a composition that they release the active ingredient(s) only, or preferentially, in a certain part of the intestinal tract, optionally, in a delayed manner. Examples of embedding compositions that can be used include polymeric substances and waxes. Solid compositions of a similar type may also be employed as fillers in soft and hard-filled gelatin capsules using such excipients as lactose or milk sugar as well as high molecular weight polyethylene glycols and the like.

[0228] A provided compound can also be in micro-encapsulated form with one or more excipients as noted above. The solid dosage forms of tablets, dragees, capsules, pills, and granules can be prepared with coatings and shells such as enteric coatings, release controlling coatings and other coatings well known in the pharmaceutical formulating art. In such solid dosage forms the active compound may be admixed with at least one inert diluent such as sucrose, lactose or starch. Such dosage forms may also comprise, as is normal practice, additional substances other than inert diluents, e.g., tableting lubricants and other tableting aids such as magnesium stearate and microcrystalline cellulose. In the case of capsules, tablets and pills, the dosage forms may also comprise buffering agents. They may optionally contain opacifying agents and can also be of a composition that they release the active ingredient(s)

only, or preferentially, in a certain part of the intestinal tract, optionally, in a delayed manner. Examples of embedding compositions that can be used include polymeric substances and waxes.

[0229] Dosage forms for topical or transdermal administration of a compound of this invention include ointments, pastes, creams, lotions, gels, powders, solutions, sprays, inhalants or patches. The active component is admixed under sterile conditions with a pharmaceutically acceptable carrier and any needed preservatives or buffers as may be required. Ophthalmic formulation, ear drops, and eye drops are also contemplated as being within the scope of this invention. Additionally, the present invention contemplates the use of transdermal patches, which have the added advantage of providing controlled delivery of a compound to the body. Such dosage forms can be made by dissolving or dispensing the compound in the proper medium. Absorption enhancers can also be used to increase the flux of the compound across the skin. The rate can be controlled by either providing a rate controlling membrane or by dispersing the compound in a polymer matrix or gel.

[0252] In certain embodiments, a provided compound, or a pharmaceutically acceptable composition thereof, are administered in combination with antisense agents, a monoclonal or polyclonal antibody or a siRNA therapeutic.

[0253] Those additional agents may be administered separately from a provided compound or composition thereof, as part of a multiple dosage regimen. Alternatively, those agents may be part of a single dosage form, mixed together with a provided compound in a single composition. If administered as part of a multiple dosage regime, the two active agents may be submitted simultaneously, sequentially or within a period of time from one another, normally within five hours from one another.

[0254] As used herein, the term “combination,” “combined,” and related terms refers to the simultaneous or sequential administration of therapeutic agents in accordance with this invention. For example, a provided compound may be administered with another therapeutic agent simultaneously or sequentially in separate unit dosage forms or together in a single unit dosage form. Accordingly, the present invention provides a single unit dosage form comprising a provided compound, an additional therapeutic agent, and a pharmaceutically acceptable carrier, adjuvant, or vehicle.

[0255] The amount of both, a provided compound and additional therapeutic agent (in those compositions which comprise an additional therapeutic agent as described above) that may be combined with the carrier materials to produce a single dosage form will vary depending upon the host treated and the particular mode of administration. Preferably, compositions of this invention should be formulated so that a dosage of between 0.01 - 100 mg/kg body weight/day of a provided compound can be administered.

[0256] In those compositions which comprise an additional therapeutic agent, that additional therapeutic agent and a provided compound may act synergistically. Therefore, the amount of additional therapeutic agent in such compositions will be less than that required in a monotherapy utilizing only that therapeutic agent. In such compositions a dosage of between 0.01 - 100 µg/kg body weight/day of the additional therapeutic agent can be administered.

[0257] The amount of additional therapeutic agent present in a composition comprising a provided compound will be no more than the amount that would normally be administered in a composition comprising that therapeutic agent as the only active agent. Preferably the amount of additional therapeutic agent in a provided composition will range from about 50% to 100% of the amount normally present in a composition comprising that agent as the only therapeutically active agent.

Agricultural Uses

[0258] The invention further refers to an agricultural composition comprising at least one provided compound as defined above or an agriculturally acceptable salt thereof and a liquid or solid carrier. Suitable carriers, as well as auxiliaries and further active compounds which may also be contained in the composition of the invention are defined below.

[0259] Suitable “agriculturally acceptable salts” include but are not limited to the salts of those cations or the acid addition salts of those acids whose cations and anions, respectively, have no adverse effect on the fungicidal action of a provided compound. Thus, suitable cations are in particular the ions of the alkali metals, preferably sodium and potassium, of the alkaline earth metals, preferably calcium, magnesium and barium, and of the transition metals, preferably

manganese, copper, zinc and iron, and also the ammonium ion which, if desired, may carry one to four C₁-C₄-alkyl substituents and/or one phenyl or benzyl substituent, preferably diisopropylammonium, tetramethylammonium, tetrabutylammonium, trimethylbenzylammonium. Additional agriculturally acceptable salts include phosphonium ions, sulfonium ions, preferably tri(C₁-C₄-alkyl)sulfonium and sulfoxonium ions, preferably tri(C₁-C₄-alkyl)sulfoxonium. Anions of useful acid addition salts are primarily chloride, bromide, fluoride, hydrogen- sulfate, sulfate, dihydrogenphosphate, hydrogenphosphate, phosphate, nitrate, bicarbonate, carbonate, hexafluorosilicate, hexafluorophosphate, benzoate, and also the anions of C₁-C₄-alkanoic acids, preferably formate, acetate, propionate and butyrate. Such agriculturally acceptable acid addition salts can be formed by reacting a provided compound bearing a basic ionizable group with an acid of the corresponding anion, preferably hydrochloric acid, hydrobromic acid, sulfuric acid, phosphoric acid or nitric acid.

[0260] A provided compound or composition thereof is suitable as fungicides. They are distinguished by an outstanding effectiveness against a broad spectrum of phytopathogenic fungi, including soil-borne fungi, which derive especially from the classes of the Plasmodiophoromycetes, Peronosporomycetes (syn. Oomycetes), Chytridiomycetes, Zygomycetes, Ascomycetes, Basidiomycetes and Deuteromycetes (syn. Fungi imperfecti). Some are systemically effective and they can be used in crop protection as foliar fungicides, fungicides for seed dressing and soil fungicides. Moreover, they are suitable for controlling harmful fungi, which inter alia occur in wood or roots of plants.

[0261] In some embodiments, a provided compound or composition thereof is particularly important in the control of phytopathogenic fungi on various cultivated plants, such as cereals, e.g. wheat, rye, barley, triticale, oats or rice; beet, e.g. sugar beet or fodder beet; fruits, such as pomes, stone fruits or soft fruits, e.g. apples, pears, plums, peaches, almonds, cherries, strawberries, raspberries, blackberries or gooseberries; leguminous plants, such as lentils, peas, alfalfa or soybeans; oil plants, such as rape, mustard, olives, sunflowers, coconut, cocoa beans, castor oil plants, oil palms, ground nuts or soybeans; cucurbits, such as squashes, cucumber or melons; fiber plants, such as cotton, flax, hemp or jute; citrus fruit, such as oranges, lemons, grapefruits or mandarins; vegetables, such as spinach, lettuce, asparagus, cabbages, carrots, onions, tomatoes, potatoes, cucurbits or paprika; lauraceous plants, such as avocados, cinnamon or camphor; energy and raw material plants, such as corn, soybean, rape, sugar cane or oil palm; corn; tobacco; nuts; coffee; tea; bananas; vines (table grapes and grape juice grape vines); hop; turf; natural rubber plants or ornamental and forestry plants, such as flowers, shrubs, broad-

leaved trees or evergreens, e.g. conifers; and on the plant propagation material, such as seeds, and the crop material of these plants.

[0262] In some embodiments, a provided compound or compositions thereof is used for controlling a multitude of fungi on field crops, such as potatoes, sugar beets, tobacco, wheat, rye, barley, oats, rice, corn, cotton, soybeans, rape, legumes, sunflowers, coffee or sugar cane; fruits; vines; ornamentals; or vegetables, such as cucumbers, tomatoes, beans or squashes.

[0263] The term "plant propagation material" is to be understood to denote all the generative parts of the plant such as seeds and vegetative plant material such as cuttings and tubers (e.g. potatoes), which can be used for the multiplication of the plant. This includes seeds, roots, fruits, tubers, bulbs, rhizomes, shoots, sprouts and other parts of plants, including seedlings and young plants, which are to be transplanted after germination or after emergence from soil. These young plants may also be protected before transplantation by a total or partial treatment by immersion or pouring.

[0264] In some embodiments, treatment of plant propagation materials with a provided compound or compositions thereof is used for controlling a multitude of fungi on cereals, such as wheat, rye, barley and oats; rice, corn, cotton and soybeans.

[0265] The term "cultivated plants" is to be understood as including plants which have been modified by breeding, mutagenesis or genetic engineering including but not limiting to agricultural biotech products on the market or in development. Genetically modified plants are plants, which genetic material has been so modified by the use of recombinant DNA techniques that under natural circumstances cannot readily be obtained by cross breeding, mutations or natural recombination. Typically, one or more genes have been integrated into the genetic material of a genetically modified plant in order to improve certain properties of the plant. Such genetic modifications also include but are not limited to targeted post-translational modification of protein(s), oligo- or polypeptides e.g. by glycosylation or polymer additions such as prenylated, acetylated or farnesylated moieties or PEG moieties.

[0266] Plants that have been modified by breeding, mutagenesis or genetic engineering, e.g. have been rendered tolerant to applications of specific classes of herbicides, such as hydroxyphenylpyruvate dioxygenase (HPPD) inhibitors; acetolactate synthase (ALS) inhibitors, such as sulfonyl ureas (see e.g. US 6,222,100, WO 01/82685, WO 00/26390, WO 97/41218, WO 98/02526, WO 98/02527, WO 04/106529, WO 05/20673, WO 03/14357, WO 03/13225, WO 03/14356, WO 04/16073) or imidazolinones (see e.g. US 6,222,100, WO 01/82685, WO 00/26390, WO 97/41218, WO 98/002526, WO 98/02527, WO 04/106529, WO 05/20673, WO 03/014357, WO 03/13225, WO 03/14356, WO 04/16073); enolpyruvylshikimate-3-phosphate

synthase (EPSPS) inhibitors, such as glyphosate (see e.g. WO 92/00377); glutamine synthetase (GS) inhibitors, such as glufosinate (see e.g. EP-A 242 236, EP-A 242 246) or oxynil herbicides (see e.g. US 5,559,024) as a result of conventional methods of breeding or genetic engineering. Several cultivated plants have been rendered tolerant to herbicides by conventional methods of breeding (mutagenesis), e.g. Clearfield® summer rape (Canola, BASF SE, Germany) being tolerant to imidazolinones, e.g. imazamox. Genetic engineering methods have been used to render cultivated plants, such as soybean, cotton, corn, beets and rape, tolerant to herbicides such as glyphosate and glufosinate, some of which are commercially available under the trade names RoundupReady® (glyphosate-tolerant, Monsanto, U.S.A.) and LibertyLink® (glufosinate- tolerant, Bayer CropScience, Germany).

[0267] Furthermore, plants are also covered that, by the use of recombinant DNA techniques, are capable to synthesize one or more insecticidal proteins, especially those known from the bacterial genus *Bacillus*, particularly from *Bacillus thuringiensis*, such as δ -endotoxins, e.g. CryIA(b), CryIA(c), CryIF, CryIF(a2), CryIIA(b), CryIIIA, CryIIIB(bi) or Cry θ c; vegetative insecticidal proteins (VIP), e.g. VIP1, VIP2, VIP3 or VIP3A; insecticidal proteins of bacteria colonizing nematodes, e.g. *Photorhabdus* spp. or *Xenorhabdus* spp.; toxins produced by animals, such as scorpion toxins, arachnid toxins, wasp toxins, or other insect-specific neurotoxins; toxins produced by fungi, such *Streptomyces* toxins, plant lectins, such as pea or barley lectins; agglutinins; proteinase inhibitors, such as trypsin inhibitors, serine protease inhibitors, patatin, cystatin or pain inhibitors; ribosome-inactivating proteins (RIP), such as ricin, maize-RIP, abrin, luffin, saporin or bryodin; steroid metabolism enzymes, such as 3-hydroxysteroid oxidase, ecdysteroid-IDP-glycosyl-transferase, cholesterol oxidases, ecdysone inhibitors or HMG-CoA-reductase; ion channel blockers, such as blockers of sodium or calcium channels; juvenile hormone esterase; diuretic hormone receptors (helicokinin receptors); stilbene synthase, bibenzyl synthase, chitinases or glucanases. In the context of the present invention these insecticidal proteins or toxins are to be understood expressly also as pre-toxins, hybrid proteins, truncated or otherwise modified proteins. Hybrid proteins are characterized by a new combination of protein domains, (see, e.g. WO 02/015701). Further examples of such toxins or genetically modified plants capable of synthesizing such toxins are disclosed, e.g., in EP-A 374 753, WO 93/007278, WO 95/34656, EP-A 427 529, EP-A 451 878, WO 03/18810 und WO 03/52073. The methods for producing such genetically modified plants are generally known to the person skilled in the art and are described, e.g., in the publications mentioned above. These insecticidal proteins contained in the genetically modified plants impart to the plants producing these proteins tolerance to harmful pests from all taxonomic groups of arthropods, especially to

beetles (Coleoptera), two-winged insects (Diptera), and moths (Lepidoptera) and to nematodes (Nematoda). Genetically modified plants capable to synthesize one or more insecticidal proteins are, e.g., described in the publications mentioned above, and some of them are commercially available such as YieldGard® (corn cultivars producing the CryIAb toxin), YieldGard® Plus (corn cultivars producing Cry1 Ab and Cry3Bb1 toxins), Starlink® (corn cultivars producing the Cry9c toxin), Herculex® RW (corn cultivars producing Cry34Ab1, Cry35Ab1 and the enzyme Phosphinothricin-N-Acetyltransferase [PAT]); NuCOTN® 33B (cotton cultivars producing the Cry1 Ac toxin), Bollgard® I (cotton cultivars producing the CryIAc toxin), Bollgard® II (cotton cultivars producing CryIAc and Cry2Ab2 toxins); VIPCOT® (cotton cultivars producing a VIP-toxin); NewLeaf® (potato cultivars producing the Cry3A toxin); Bt-Xtra®, NatureGard®, KnockOut®, BiteGard®, Protecta®, Bt 1 1 (e.g. Agrisure® CB) and Bt176 from Syngenta Seeds SAS, France, (corn cultivars producing the CryIAb toxin and PAT enzyme), MIR604 from Syngenta Seeds SAS, France (corn cultivars producing a modified version of the Cry3A toxin, c.f. [0268] Furthermore, plants are also covered that, by the use of recombinant DNA techniques, are capable to synthesize one or more proteins to increase the resistance or tolerance of those plants to bacterial, viral or fungal pathogens. Examples of such proteins are the so-called "pathogenesis-related proteins" (PR proteins, see, e.g. EP-A 392225), plant disease resistance genes (e.g. potato cultivars, which express resistance genes acting against *Phytophthora infestans* derived from the Mexican wild potato *Solanum bulbocastanum*) or T4-lysozym (e.g. potato cultivars capable of synthesizing these proteins with increased resistance against bacteria such as *Erwinia amylovora*). The methods for producing such genetically modified plants are generally known to the person skilled in the art and are described, e.g., in the publications mentioned above.

[0269] Furthermore, plants are also covered that, by the use of recombinant DNA techniques, are capable to synthesize one or more proteins to increase the productivity (e.g. biomass production, grain yield, starch content, oil content or protein content), tolerance to drought, salinity or other growth-limiting environmental factors or tolerance to pests and fungal, bacterial or viral pathogens of those plants.

[0270] Furthermore, plants are also covered that, by the use of recombinant DNA techniques, contain a modified amount of substances of content or new substances of content,

specifically to improve human or animal nutrition, e.g. oil crops that produce health-promoting long-chain omega-3 fatty acids or unsaturated omega-9 fatty acids (e.g. Nexera® rape, DOW Agro Sciences, Canada).

[0271] Furthermore, plants are also covered that, by the use of recombinant DNA techniques, contain a modified amount of substances of content or new substances of content, specifically to improve raw material production, e.g. potatoes that produce increased amounts of amylopectin (e.g. Amflora® potato, BASF SE, Germany).

The invention also relates to a method for improving plant health by treating a plant, its propagation material and/or the locus where the plant is growing or is to grow with an effective amount of a provided compound or composition thereof.

[0276] The term "plant health" is to be understood to denote a condition of the plant and/or its products which is determined by several indicators alone or in combination with each other such as yield (e.g. increased biomass and/or increased content of valuable ingredients), plant vigor (e.g. improved plant growth and/or greener leaves ("greening effect")), quality (e.g. improved content or composition of certain ingredients) and tolerance to abiotic and/or biotic stress. The above identified indicators for the health condition of a plant may be interdependent or may result from each other.

[0277] A provided compound can be present in different crystal modifications whose biological activity may differ. They are likewise subject matter of the present invention.

[0278] A provided compound is employed as such or in form of a composition by treating the fungi or the plants, plant propagation materials, such as seeds, soil, surfaces, materials or rooms to be protected from fungal attack with a fungicidally effective amount of the active substances. The application can be carried out both before and after the infection of the plants, plant propagation materials, such as seeds, soil, surfaces, materials or rooms by the fungi.

[0279] Plant propagation materials may be treated with a provided compound or composition thereof comprising at least one provided compound prophylactically either at or before planting or transplanting.

[0280] The invention also relates to agrochemical compositions comprising a solvent or solid carrier and at least one provided compound and to the use for controlling harmful fungi.

[0281] An agrochemical composition comprises a fungicidally effective amount of a provided compound. The term "effective amount" denotes an amount of a provided compound or composition thereof, which is sufficient for controlling harmful fungi on cultivated plants or in the protection of materials and which does not result in a substantial damage to the treated plants. Such an amount can vary in a broad range and is dependent on various factors, such as the fungal species to be controlled, the treated cultivated plant or material, the climatic conditions and the specific compound used.

[0282] A provided compound or a pharmaceutically acceptable salt thereof can be converted into customary types of agrochemical compositions, e.g. solutions, emulsions, suspensions, dusts, powders, pastes and granules. The composition type depends on the particular intended purpose; in each case, it should ensure a fine and uniform distribution of the provided compound.

[0283] Examples for composition types are suspensions (SC, OD, FS), emulsifiable concentrates (EC), emulsions (EW, EO, ES), pastes, pastilles, wettable powders or dusts (WP,

[0300] The agrochemical compositions generally comprise between 0.01 and 95%, preferably between 0.1 and 90%, most preferably between 0.5 and 90%, by weight of active substance. The active substances are employed in a purity of from 90% to 100%, preferably from 95% to 100% (according to NMR spectrum).

[0301] Water-soluble concentrates (LS), flowable concentrates (FS), powders for dry treatment (DS), water-dispersible powders for slurry treatment (WS), water-soluble powders (SS), emulsions (ES) emulsifiable concentrates (EC) and gels (GF) are usually employed for the purposes of treatment of plant propagation materials, particularly seeds. These compositions can be applied to plant propagation materials, particularly seeds, diluted or undiluted. The compositions in question give, after two-to-tenfold dilution, active substance concentrations of from 0.01 to 60% by weight, preferably from 0.1 to 40% by weight, in the ready-to-use preparations. Application can be carried out before or during sowing. Methods for applying or treating a provided agrochemical compound or composition thereof on to plant propagation material, especially seeds, are known in the art, and include dressing, coating, pelleting, dusting, soaking and in-furrow application methods of the propagation material. In a preferred embodiment, a provided compound or composition thereof is applied on to the plant propagation material by a method such that germination is not induced, e.g. by seed dressing, pelleting, coating and dusting.

[0302] In a preferred embodiment, a suspension-type (FS) composition is used for seed treatment. Typically, a FS composition may comprise 1-800 g/l of active substance, 1-200 g/l Surfactant, 0 to 200 g/l antifreezing agent, 0 to 400 g/l of binder, 0 to 200 g/l of a pigment and up to 1 liter of a solvent, preferably water.

[0303] The active substances can be used as such or in the form of their compositions, e.g. in the form of directly sprayable solutions, powders, suspensions, dispersions, emulsions, dispersions, pastes, dustable products, materials for spreading, or granules, by means of spraying, atomizing, dusting, spreading, brushing, immersing or pouring. The application forms depend entirely on the intended purposes; it is intended to ensure in each case the finest possible distribution of the active substances according to the invention. Aqueous application forms can be prepared from emulsion concentrates, pastes or wettable powders (sprayable powders, oil dispersions) by adding water. To prepare emulsions, pastes or oil dispersions, the substances, as such or dissolved in an oil or solvent, can be homogenized in water by means of a wetter, tackifier, dispersant or emulsifier. Alternatively, it is possible to prepare concentrates composed of active substance, wetter, tackifier, dispersant or emulsifier and, if appropriate, solvent or oil, and such concentrates are suitable for dilution with water.

[0304] The active substance concentrations in the ready-to-use preparations can be varied within relatively wide ranges. In general, they are from 0.0001 to 10%, preferably from 0.001 to 1 % by weight of active substance.

[0305] The active substances may also be used successfully in the ultra-low-volume process (ULV), it being possible to apply compositions comprising over 95% by weight of active substance, or even to apply the active substance without additives.

[0306] When employed in plant protection, the amounts of active substances applied are, depending on the kind of effect desired, from 0.001 to 2 kg per ha, preferably from 0.005 to 2 kg per ha, more preferably from 0.05 to 0.9 kg per ha, in particular from 0.1 to 0.75 kg per ha.

[0307] In treatment of plant propagation materials such as seeds, e.g. by dusting, coating or drenching seed, amounts of active substance of from 0.1 to 1000 g, preferably from 1 to 1000 g, more preferably from 1 to 100 g and most preferably from 5 to 100 g, per 100 kilogram of plant propagation material (preferably seed) are generally required.

[0308] When used in the protection of materials or stored products, the amount of active substance applied depends on the kind of application area and on the desired effect. Amounts customarily applied in the protection of materials are, e.g., 0.001 g to 2 kg, preferably 0.005 g to 1 kg, of active substance per cubic meter of treated material.

[0309] Various types of oils, wetters, adjuvants, herbicides, bactericides, other fungicides and/or pesticides may be added to the active substances or the compositions comprising them, if appropriate not until immediately prior to use (tank mix). These agents can be admixed with the compositions according to the invention in a weight ratio of 1:100 to 100:1, preferably 1:10 to 10:1.

[0310] Adjuvants which can be used are in particular organic modified polysiloxanes such as Break Thru S 240®; alcohol alkoxylates such as Atplus 245®, Atplus MBA 1303®, Plurafac LF 300® and Lutensol ON 30®; EO/PO block polymers, e.g. Pluronic RPE 2035® and Genapol B®; alcohol ethoxylates such as Lutensol XP 80®; and dioctyl sulfosuccinate sodium such as Leophen RA®.

[0311] The compositions according to the invention can, in the use form as fungicides, also be present together with other active substances, e.g. with pesticides, growth regulators, fungicides or else with fertilizers, as pre-mix or, if appropriate, not until immediately prior to use (tank mix). The pesticide may be, for example, an insecticide, a fungicide, an herbicide, or an additional nematicide. The composition may also comprise one or more additional active substances, including biological control agents, microbial extracts, natural products, plant growth activators and/or plant defense agents.

[0312] Mixing a provided compound or compositions thereof in the use form as fungicides with other fungicides results in many cases in an expansion of the fungicidal spectrum of

activity being obtained or in a prevention of fungicide resistance development. Furthermore, in many cases, synergistic effects are obtained.

[0324] The present invention furthermore relates to agrochemical compositions comprising a mixture of at least one provided compound (component 1) and at least one further active substance useful for plant protection, e.g. selected from the groups A) to J) (component 2), in particular one further fungicide, e.g. one or more fungicide from the groups A) to F), as described above, and if desired one suitable solvent or solid carrier. Those mixtures are of particular interest, since many of them at the same application rate show higher efficiencies against harmful fungi. Furthermore, combating harmful fungi with a mixture of a provided compound and at least one fungicide from groups A) to F), as described above, is more efficient than combating those fungi with a provided compound alone or fungicides from groups A) to F) alone. By applying a provided compound together with at least one active substance from groups A) to I) a synergistic effect can be obtained, i.e. more than simple addition of the individual effects is obtained (synergistic mixtures).

[0325] According to this invention, applying a provided compound together with at least one further active substance is to be understood to denote that at least one provided compound and at least one further active substance occur simultaneously at the site of action (i.e. the harmful fungi to be controlled or their habitats such as infected plants, plant propagation materials,

particularly seeds, surfaces, materials or the soil as well as plants, plant propagation materials, particularly seeds, soil, surfaces, materials or rooms to be protected from fungal attack) in a fungicidally effective amount. This can be obtained by applying a provided compound and at least one further active substance simultaneously, either jointly (e.g. as tank-mix) or separately, or in succession, wherein the time interval between the individual applications is selected to ensure that the active substance applied first still occurs at the site of action in a sufficient amount at the time of application of the further active substance(s). The order of application is not essential for working of the present invention.

[0326] In binary mixtures, i.e. compositions according to the invention comprising one provided compound (component 1) and one further active substance (component 2), e.g. one active substance from groups A) to J), the weight ratio of component 1 and component 2 generally depends from the properties of the active substances used, usually it is in the range of from 1 :100 to 100:1, regularly in the range of from 1 :50 to 50:1, preferably in the range of from 1 :20 to 20:1, more preferably in the range of from 1 :10 to 10:1 and in particular in the range of from 1 :3 to 3:1.

[0327] In ternary mixtures, i.e. compositions according to the invention comprising a provided compound (component 1) and a first further active substance (component 2) and a second further active substance (component 3), e.g. two active substances from groups A) to J), the weight ratio of component 1 and component 2 depends from the properties of the active substances used, preferably it is in the range of from 1:50 to 50:1 and particularly in the range of from 1 :10 to 10:1, and the weight ratio of component 1 and component 3 preferably is in the range of from 1:50 to 50:1 and particularly in the range of from 1:10 to 10:1.

[0328] The components can be used individually or already partially or completely mixed with one another to prepare the composition according to the invention. It is also possible for them to be packaged and used further as combination composition such as a kit of parts.

[0329] In one embodiment of the invention, the kits may include one or more, including all, components that may be used to prepare a subject agrochemical composition. For example, kits may include one or more fungicide component(s) and/or an adjuvant component and/or an insecticide component and/or a growth regulator component and/or an herbicide. One or more of the components may already be combined together or pre-formulated. In those embodiments where more than two components are provided in a kit, the components may already be combined together and as such are packaged in a single container such as a vial, bottle, can, pouch, bag or canister. In other embodiments, two or more components of a kit may be packaged separately, i.e., not pre-formulated. As such, kits may include one or more separate

containers such as vials, cans, bottles, pouches, bags or canisters, each container containing a separate component for an agrochemical composition. In both forms, a component of the kit may be applied separately from or together with the further components or as a component of a combination composition according to the invention for preparing the composition according to the invention.

[0330] The user applies the composition according to the invention usually from a predosage device, a knapsack sprayer, a spray tank or a spray plane. Here, the agrochemical composition is made up with water and/or buffer to the desired application concentration, it being possible, if appropriate, to add further auxiliaries, and the ready-to-use spray liquor or the agrochemical composition according to the invention is thus obtained. In some embodiments, 50 to 500 liters of the ready-to-use spray liquor are applied per hectare of agricultural useful area. In some embodiments 100 to 400 liters of the ready-to-use spray liquor are applied per hectare. In some embodiments, the invention provides a kit for greenhouse application of a ready-to-use composition of the invention.

[0362] In some embodiments, the present subject matter also relates to a method of treating and/or preventing a fungal infection of the hair follicle, including for example, one or more of Tinea capitis, Tinea favosa, and Tinea barbae, in a mammal comprising administering to a mammal in need thereof an effective amount a provided compound or composition thereof.

[0363] In some embodiments, conditions treated by administration of a provided compound or composition include Tinea capitis and/or Tinea favosa and/or Tinea barbae.

[0364] Tinea capitis and/or Tinea favosa and/or Tinea barbae are treatable by the administration of a provided compound or composition thereof.

[0365] Tinea capitis is a superficial fungal infection (dermatophytosis) of the skin of the scalp, eyebrows, and eyelashes that attacks the hair shaft and follicles. The disease is primarily caused by dermatophytes in the *Trichophyton* and *Microsporum* genera, including for example, *Microsporum audouini*, *Microsporum canis*, *Microsporum distortum*, *Microsporum gypseum*, *Trichophyton megninii*, *Trichophyton mentagrophytes*, *Trichophyton rubrum*, *Trichophyton schoenleinii*, *Trichophyton tonsurans*, and *Trichophyton verrucosum*. The clinical presentation

is typically a single or multiple patches of hair loss, sometimes with a 'black dot' pattern (often with broken-off hairs), that may be accompanied by inflammation, scaling, pustules, and itching. Tinea favosa can be considered a variety of Tinea capitis because it involves the scalp. Tinea favosa is primarily caused by dermatophytes in the *Trichophyton* and *Microsporum* genera, including for example, *Microsporum gypseum* and *Trichophyton schoenleinii*. Tinea barbae is a superficial dermatophytosis that is limited to the bearded areas of the face and neck and occurs almost exclusively in older adolescent and adult males. The clinical presentation of Tinea barbae includes inflammatory, deep, kerion-like plaques and non-inflammatory superficial patches resembling Tinea corporis or bacterial folliculitis. The mechanism that causes Tinea barbae is similar to that of Tinea capitis, and is frequently the result of a *Trichophyton rubrum* (*T. rubrum*) infection but may also be the result of *Trichophyton mentagrophytes* var *granulosum* and *Trichophyton verrucosum*. Finally *Microsporum canis* and *Trichophyton mentagrophytes* var *erinacei* have been known to cause Tinea barbae but are relatively rare.

[0366] Tinea capitis which may be caused by one or more of *Microsporum audouini*, *Microsporum canis*, *Microsporum distortum*, *Microsporum gypseum*, *Trichophyton megninii*, *Trichophyton mentagrophytes*, *Trichophyton rubrum*, *Trichophyton schoenleinii*, *Trichophyton tonsurans*, and/or *Trichophyton verrucosum*, and Tinea favosa which may be caused by one or more of *Microsporum gypseum* and/or *Trichophyton schoenleinii*, and Tinea barbae which may be caused by one or more of *Trichophyton rubrum* (*T. rubrum*), *Trichophyton mentagrophytes* var *granulosum*, *Trichophyton verrucosum*, *Microsporum canis* and *Trichophyton mentagrophytes* var *erinacei*, are treatable by the administration of a provided compound or composition thereof.

[0367] A provided compound or a pharmaceutically acceptable salt thereof has fungicidal activity against multiple organisms. Accordingly, the administration of the present compositions may treat, for example, conditions related to or caused by *Microsporum audouini*, *Microsporum canis*, *Microsporum distortum*, *Microsporum gypseum*, *Trichophyton megninii*, *Trichophyton mentagrophytes* var *granulosum*, *Trichophyton mentagrophytes* var *erinacei*, *Trichophyton rubrum*, *Trichophyton schoenleinii*, *Trichophyton tonsurans*, and/or *Trichophyton verrucosum*.

[0368] In some embodiments, the present subject matter relates to a method of treating and/or preventing onychomycosis in a subject comprising administering to a subject in need thereof an effective amount a provided compound or composition thereof.

[0369] Non-limiting conditions that are treated by the administration of a provided compound or composition thereof, include onychomycosis including onychomycosis caused by one or more of dermatophytes, yeasts (candidal onychomycosis), and non-dermatophyte molds.

[0370] Onychomycosis is treatable by the administration of a provided compound or composition thereof.

[0371] Onychomycosis is a fungal infection of the nail bed, matrix, and/or or nail plate. It is caused by 3 main classes of fungi: dermatophytes, yeasts (candidal onychomycosis), and nondermatophyte molds. Dermatophytes are the most common cause of onychomycosis, but onychomycosis caused by non-dermatophyte molds is becoming more common worldwide. Onychomycosis due to *Candida* is less common. Dermatophytes that can cause onychomycosis include one or more of *Trichophyton rubrum*, *Trichophyton interdigitale*, *Epidermophyton floccosum*, *Trichophyton violaceum*, *Microsporum gypseum*, *Trichophyton tonsurans*, *Trichophyton soudanense*, and *Trichophyton verrucosum*, and dermatophyte associated onychomycosis is often also referred to as tinea unguium. Candidal onychomycosis include cutaneous candidiasis and mucocutaneous candidiasis that are caused by one or more *Candida* species, including for example, *Candida albicans* and *Candida parapsilosis*. Non-dermatophyte molds that can cause onychomycosis can include one or more of, for example, *Scopulariopsis brevicaulis*, *Fusarium spp.*, *Aspergillus spp.*, *Alternaria*, *Acremonium*, *Scytalidium dimidiatum*, and *Scytalidium hyalinum*.

[0372] There are four classic types of onychomycosis including the following: distal subungual onychomycosis (DLSO) that is the most common form of onychomycosis, and is usually caused by *Trichophyton rubrum* and/or *Trichophyton interdigitale*, which invades the nail bed and the underside of the nail plate; white superficial onychomycosis (WSO) is caused by fungal (e.g., *T. mentagrophytes*) invasion of the superficial layers of the nail plate to form "white islands" on the plate, nondermatophyte molds cause deep white superficial onychomycosis; proximal subungual onychomycosis (PSO) is fungal penetration of the newly formed nail plate through the proximal nail fold and it is the least common form of onychomycosis in healthy people, but is found more commonly when the patient is immunocompromised; endonyx onychomycosis (EO), and candidal onychomycosis (CO) which is *Candida* species invasion of the fingernails.

[0373] A provided compound or composition thereof has fungicidal activity against multiple organisms. Accordingly, the administration of a provided compound or composition may treat, for example, conditions, including for example, onychomycosis, related to or caused by one or more dermatophytes, including for example, *Trichophyton rubrum*, *Trichophyton interdigitale*, *Epidermophyton floccosum*, *Trichophyton violaceum*, *Microsporum gypseum*, *Trichophyton tonsurans*, *Trichophyton soudanense*, and *Trichophyton verrucosum*; caused by one or more *Candida* species, including for example, *Candida albicans* and *Candida parapsilosis*; and/or

caused by one or more molds, including for example, *Scopulariopsis brevicaulis*, *a Fusarium spp.*, *a Aspergillus spp.*, *Alternaria*, *Acremonium*, *Scytalidium dimidiatum*, and *Scytalidium hyalinum*.

[0374] In some embodiments, the present invention provides a provided compound or composition thereof, wherein the composition is combined with a physical/mechanical penetration enhancer that, for example, acts by increasing permeability by reversibly damaging or altering the physicochemical nature of the stratum corneum or nail surface to reduce its diffusional resistance. Such mechanical enhancement can include those known in the art such as manual and electrical nail abrasion, acid etching, ablation by laser, microporation, iontophoresis, or application of low-frequency ultrasound, heat or electric currents on/through the nail or skin to make the diffusion of topical moieties more efficient.

[0375] A provided compound or compositions thereof can be topically administered in any formulation, including a gel. A sufficient amount of the topical preparation can be gently rubbed onto the affected area and surrounding skin, for example, in an amount sufficient to cover an affected area plus a margin of healthy skin or tissue surrounding the affected area, for example, a margin of about .5 inches. A provided composition can be applied to any body surface, including for example, a skin surface, scalp, eyebrows, eyelashes, bearded areas, nail surface, nail bed, nail matrix, and nail fold, as well as to the mouth, vagina, eye, nose, or other mucous membranes.

[0376] For most superficial fungal infections of the skin, a provided compound or composition thereof can be applied in a single, one-time application, once a week, once a bi-week, once a month, or from one to four times daily, for a period of time sufficient to alleviate symptoms or clear the fungal infection, for example, for a period of time of one week, from 1 to 12 weeks or more, from 1 to 10 weeks, from 1 to 8 weeks, from 2 to 12 weeks, from 2 to 10 weeks, from 2 to 8 weeks, from 2 to 6 weeks, from 2 to 4 weeks, from 4 to 12 weeks, from 4 to 10 weeks, from 4 to 8 weeks, from 4 to 6 weeks. [0388] Synthesis of compound 1.2. Into a 2-L 3-necked round-bottomed flask was placed **1.1** (30 g, 146.32 mmol, 1.00 equiv) in THF (600 mL). This was followed by the addition of *n*-BuLi (70.56 mL) dropwise with stirring at -78 °C over 1 hr. To this was added DMF (21.462 g, 293.62 mmol, 2.01 equiv) dropwise with stirring at -78 °C. The reaction was stirred for 1 hour at room temperature. The reaction was then quenched by the addition of 300 mL of NH₄Cl (aq). The resulting solution was extracted with 300 mL of EtOAc, the organic layers were combined and concentrated under vacuum. The crude product was purified by column chromatography to furnish 19.4 g (86%) of **1.2** as a yellow solid.

[0389] Synthesis of compound 1.3. Into a 500-mL 3-necked round-bottomed flask was placed DMSO (200 mL) and NaH (6.04 g, 151.00 mmol, 1.20 equiv). This was followed by the addition of *S,S*-dimethylmethanesulfinyl iodide (33.22 g, 150.95 mmol, 1.20 equiv) in several batches. To this was added **1.2** (19.4 g, 125.86 mmol, 1.00 equiv) dropwise with stirring at 15 °C. The resulting solution was stirred for 1 h at room temperature. The reaction was then quenched by the addition of 300 mL of NH₄Cl (aq.). The resulting solution was extracted with 400 mL of EtOAc, the organic layers were combined and concentrated under vacuum. The

crude product was purified by column chromatography to furnish 13.5 g (64%) of **1.3** as light yellow oil.
