**ABSTRACT**

The present invention relates to a synergistic composition for inhibiting the corrosion of metal surfaces, particularly ferrous metals, in contact with aqueous systems comprising a combination of an inorganic nitrite and an aminoalkyl-phosphonic acid.

**22 Claims, 6 Drawing Figures**

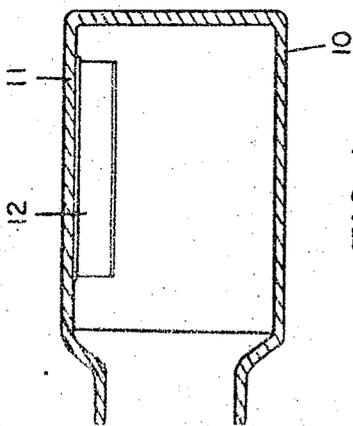

FIG. 1

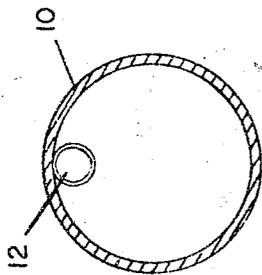

FIG. 2

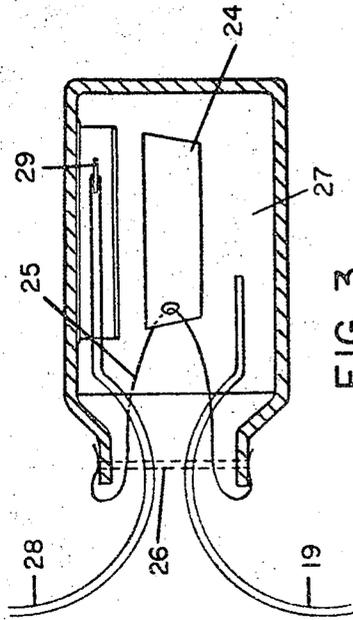

FIG. 3

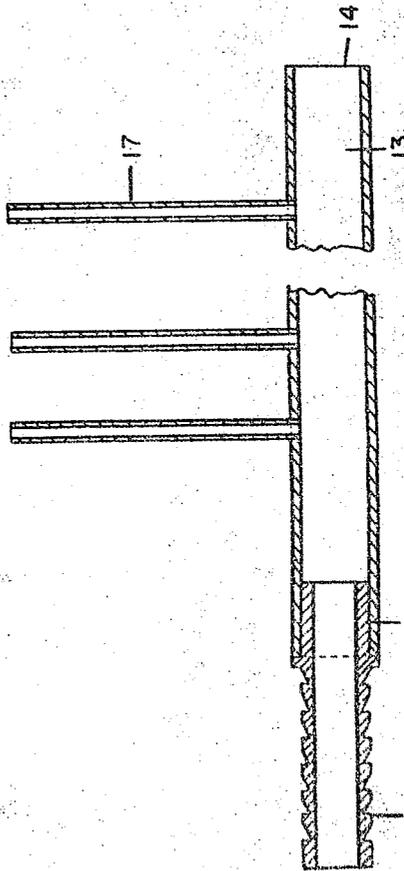

FIG. 4

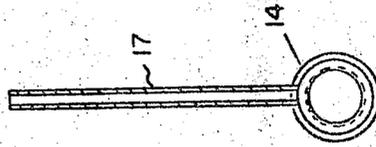

FIG. 5

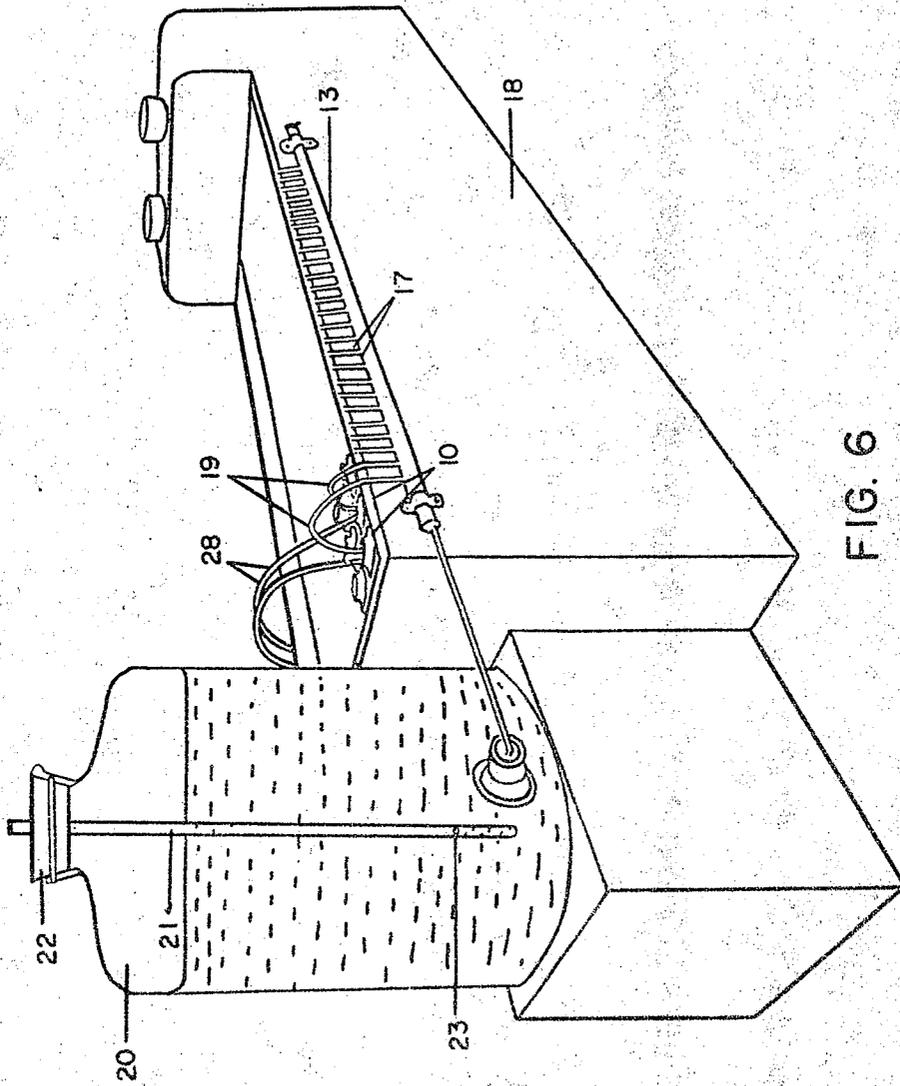

FIG. 6

gism obtained for carboxy methylamino di(methylene phosphonic acid), a compound of Class III;

FIG. 11 shows the synergism obtained for ethylene diamine tetra(methylene phosphonic acid), a compound of Class V; and FIG. 12 shows the synergism of a compound of Class VI wherein  $m$  has an average value of 41.5.

From these graphs, it can easily be seen that excellent results are obtained when the compounds of formula I present in the mixtures are hydrazine tetra(methylene phosphonic acid), ethylene diamine tetra(methylene phosphonic acid), methylamino di(methylene phosphonic acid) and  $\alpha$ -anilino ortho hydroxy benzyl phosphonic acid.

Particularly preferred synergistic combinations of the present invention are those where the value of corrosion observed in practice by means of this test is 50% or less than 50% of the value of the corrosion for that combination on the linear interpolation between the values for 100% inorganic nitrite and 100% aminoalkylphosphonic acid. As can be seen from the graphs, mixtures which give such a corrosion value are:

1. Mixtures of methylamino di(methylene phosphonic acid) and sodium nitrite containing from 30% to 85% sodium nitrite.
2. Mixtures of hydrazine tetra(methylene phosphonic acid) and sodium nitrite containing from 22% to 30% of sodium nitrite.
3. Mixtures of  $\alpha$ -anilino ortho hydroxy benzyl phosphonic acid and sodium nitrite containing from 30% to 85% of sodium nitrite.
4. Mixtures of ethylene diamine tetra(methylene phosphonic acid) and sodium nitrite containing from 25% to 85% sodium nitrite.

Mixtures of the compound of Class VI where the average value of  $m$  is 41.5 and sodium nitrite containing from 20% to 80% sodium nitrite.

The nitrite that is used may be an alkali metal nitrite, for example, potassium nitrite, but is preferably sodium nitrite.

The present invention also provides an aqueous system containing a synergistic combination as hereinbefore defined.

Furthermore there is provided a method of forming or replenishing an inhibited aqueous solution which comprises adding to the system inorganic nitrite or a compound of formula I or both in such quantities that

the effect of their addition is to cause synergism as hereinbefore defined. Conveniently, the corrosion inhibiting mixture is present in an amount of from 50 to 10,000 parts per million of the aqueous solution. However amounts greater than 200 parts per million are usually unnecessary except when added in initial 'shock' doses.

If desired there may be added to the mixture, specific corrosion inhibitors for non-ferrous metals such as a silicate to control attack on aluminum, or a specific inhibitor to control attack on (or induced by) copper. There may also be added other corrosion inhibitors for ferrous metals known per se, e.g., zinc, polyphosphate or chromium ions or amines.

The following Examples further illustrate the present invention. Parts and percentages are expressed by weight.

#### EXAMPLES 1 to 8

In each of the following Examples, four mixtures were made up from sodium nitrite and a compound of formula I as illustrated in Table 1, each mixture containing 20%, 40%, 60% and 80% by weight of the compound of formula I respectively. Samples of each of these mixtures were added to 100 millilitre samples of the aggressive as hereinbefore defined water so that four solutions were prepared each containing 100 parts per million of the mixture. The aerated bottle test was carried out on these solutions.

In order to demonstrate the synergistic effect of the mixtures of the present invention when compared with the individual constituents of the mixture, samples containing sodium nitrite and the respective compound of formula I were tested separately in a similar manner at concentrations of 100 parts per million. The corrosion ratio was calculated as hereinbefore defined and the results are shown in Table 1.

The results obtained clearly show the synergism of mixtures of the present invention.

#### EXAMPLES 9 to 20

The same procedure described in Examples 1 to 8 was followed except that instead of four mixtures, three mixtures were made up containing 25%, 50% and 75% by weight of various other compounds of formula I. The results are shown in Table 2.

TABLE 1

Example	Compound of Formula I	Corrosion Ratio of mixtures containing varying percentages of compound of formula I					
		100%	80%	60%	40%	20%	0%
1	$\text{CH}_3\text{N}(\text{CH}_2\text{PO}_3\text{H}_2)_2$	0.63	0.59	0.16	0.03	0.19	1.00
2	$\text{C}_2\text{H}_5\text{N}(\text{CH}_2\text{PO}_3\text{H}_2)_2$	1.19	0.69	0.51	0.14	0.33	1.00

Some further laboratory tests were carried out using a Laboratory Heat Exchanger Rig, a form of laboratory testing intended to simulate practical use conditions more closely than does the Aerated Solution Bottle Test just described. In this rig, corrosive water is aerated and circulated over a number of metal coupons, and is heated by being passed through a heated steel heat exchanger tube. After a suitable test period, the metal coupons and the heat exchanger tube are examined, and their state assessed.

In detail, the rig consists of a closed water circuit, made up of the following items in order:

- 2 litre reservoir
- 1 litre reservoir
- flow meter
- coupon chamber
- heat exchanger
- cooling condenser

Corrosive water in the 2 litre reservoir is aerated with compressed air introduced through a sintered disc at about 5 litres per minute, and is then pumped to the 1-

litre reservoir. From this reservoir it is pumped through the flow meter to the glass coupon chamber in which are a number of rectangular metal coupons each 2.5 by 5.0 cms. mounted on a perspex jig. The water then flows through the heat exchanger which is made up of a 3/8 inch internal diameter steel tube with copper end pieces around which is wound a 960 watt heater coil; from the heat exchanger the water flows through the cooling condenser back to the 2 litre reservoir.

A flow rate in the circuit of about 1.0 gallon per minute provides a velocity of about 1.25 feet per second and a Reynolds number of approx. 6,000 in the heat exchanger. The heater coil gives the heat exchanger tube a skin temperature of about 60°C. and the water leaves at about 45°C. a difference across the heat transfer surface of some 15°C. The cooling condenser is so operated as to cool the water to about 35°C. before it begins a fresh circuit.

Metal coupons are scrubbed with pumice and then immersed in acid as follows:

metal	acid
mild steel	Conc. HCl diluted 1:1 with water at room temperature for 1 minute
copper	do.
brass	do.
aluminium	5% phosphoric acid/2% chromic acid, at 75°C. for 5 minutes

The results obtained are illustrated in Table 3 and show quite clearly that synergistic mixtures of the present invention are at least as good as, if not better than, corrosion inhibiting mixtures containing zinc and/or chromate ions.

CORROSION RATE OF METAL COUPONS					Condition of Heat Exchange Tube
Run	Mild Steel	Copper	Brass	Aluminium	
1	69	42	15.6	5.5	SEVERELY CORRODED WHOLE SURFACE ENCRUSTED WITH HEAVY CORROSION PRODUCTS
2	42.5	1	5	25	
3	4.4	0.3	0.5	2.6	SMALL PATCHES OF CORROSION. REST OF TUBE SURFACE COVERED BY A PROTECTIVE GREEN FILM
4	1.8	1.6	1.0	1.3	do.
5	2.6	1.5	1.1	1.1	SURFACE PROTECTED APART FROM SOME SMALL PITS.
6	19.4	0.8	2.4	6.7	CORROSION UNDER SCALE DEPOSIT

After such immersion, the coupons are rinsed with water, dried and weighed; they are then mounted on a perspex jig, care being taken to ensure that none of the coupons touch each other, and that they are insulated from the bolt holding the jig together. The heat exchanger tube is cleaned with pumice, dipped in conc. hydrochloric acid diluted 1:1 with water, and then rinsed in water and dried.

The rig is assembled, and cleaned thoroughly by circulating conc. hydrochloric acid diluted 1:1 with water, then flushing with tap water for about half an hour (about 30 gallons in all) and draining. The necessary quantity of additives to produce the desired concentrations is put into one of the reservoirs and the rig is filled with 4.5 litres of a standardised corrosive test water, which is characterised as follows:

Phenol Alkalinity	0	as p.p.m. of CaCO <sub>3</sub>
Total Alkalinity	20	
Total Hardness	80	p.p.m.
Chloride	10	
Conductance	180	

The pump is primed and started, and the heater switched on.

The concentration of inhibitor and the water level in the rig are checked daily and any losses made good.

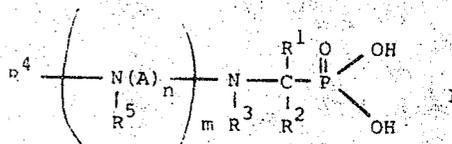

After a standard period of 10 days, the heat exchanger tube is removed, sectioned and examined; the test coupons are removed, cleaned as before except that the acid is in each case inhibited with 1% hexamine, rinsed, dried and reweighed. The results observed enable an assessment to be made of the anti-scaling and anti-corrosive action of the inhibitor under test.

The following additives were tested, all parts and percentages being by weight:

Run	Additives and Concentration
1	None
2	200 ppm Sodium nitrite
3	200 ppm 20% methylamino dimethylene diphosphonic acid 80% sodium nitrite
4	Initial level of 400 ppm 20% methylamino dimethylene diphosphonic acid 80% sodium nitrite followed by maintenance as for Run 3
5	50 ppm Synergised Zinc/Chromate, 8% Zn <sup>++</sup> , 44% CrO <sub>4</sub> <sup>-2</sup>
6	100 ppm Zinc/Polyphosphate, 10% ZnO, 5% P <sub>2</sub> O <sub>5</sub> , 32.5% Na <sub>2</sub> O

We claim:

1. A synergistic combination consisting essentially of a combination of from 10% to 99% by weight of an alkali metal nitrite and from 90% to 1% by weight of a compound having the formula

wherein

40 R<sup>1</sup> and R<sup>2</sup> may be the same or different and each represents hydrogen or a hydrocarbyl or hydroxy-substituted hydrocarbyl radical containing up to 8 carbon atoms,

R<sup>3</sup> and R<sup>4</sup> may be the same or different and each represents hydrogen or a hydrocarbyl or hydroxy-substituted hydrocarbyl radical containing up to 8 carbon atoms, a carboxy-alkyl or alkoxy radical containing up to 3 carbon atoms, a phosphonic acid, an alkylene phosphonic acid grouping containing up to 4 carbon atoms or an aralkylene phosphonic acid such that not more than two phosphonic acid groupings separated by less than two carbon atoms may be attached to any nitrogen atoms,

R<sup>5</sup> is hydrogen or an alkylene phosphonic acid containing up to 4 carbon atoms,

A is a saturated divalent hydrocarbyl radical containing up to 6 carbon atoms.

m is 0 or an integer from 1 to 60,

13

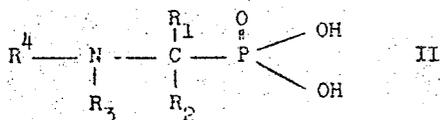

$n$  is 0 or 1; when  $m$  is 0,  $R^4$  may be a hydroxy grouping or  $R^3$  and  $R^4$  together with the nitrogen atom may form a six membered ring; when  $m$  is 1, the grouping  $R^3N-A-NR^3$  may form a heterocyclic ring, and when  $m$  is greater than 1, the constituent  $R^3$  groupings may be the same or different; and the water-soluble salts thereof.

2. A synergistic combination as claimed in claim 1 in which the water-soluble salt of the compound of formula I is the alkali metal or ammonium salt.

3. A synergistic combination as claimed in claim 1 in which the alkali metal nitrite is sodium nitrite.

4. A synergistic combination as claimed in claim 1, comprising a mixture containing from 10% to 99% of sodium nitrite and from 90% to 1% of a compound having the formula I, wherein  $R^1$  and  $R^2$  may be the same or different and each represents hydrogen or alkyl, alkenyl or cycloalkyl containing up to 8 carbon atoms,  $R^3$  and  $R^4$  may be the same or different and each represents hydrogen or alkyl, alkenyl or cycloalkyl radical containing up to 8 carbon atoms, an alkylene phosphonic acid grouping containing up to 4 carbon atoms such that not more than two phosphonic acid groupings separated by less than two carbon atoms may be attached to any nitrogen atom,  $R^5$  is hydrogen or an alkylene phosphonic acid containing up to 4 carbon atoms,  $A$  is an alkylene radical containing up to 6 carbon atoms,  $m$  is 0 or an integer from 1 to 60,  $n$  is 0 or 1, and when  $m$  is greater than 1, the constituent  $R^3$  groupings may be the same or different, and the water-soluble salts thereof.

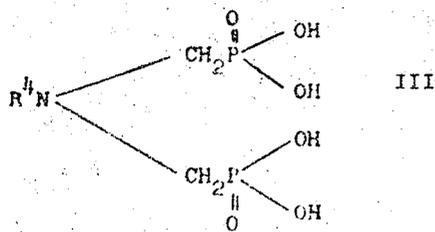

5. A synergistic combination as claimed in claim 1 in which the compound of formula I has the formula

where  $R^1$ ,  $R^2$ ,  $R^3$  and  $R^4$  may represent hydrogen, hydrocarbyl or hydroxy substituted hydrocarbyl,  $R^3$  and  $R^4$  may represent carboxyalkyl, or  $R^3$  and  $R^4$  together with the nitrogen atom may form a 6-membered ring, and the total number of carbon atoms in the groups  $R^3$  and  $R^4$  together does not exceed 10.

6. A synergistic combination as claimed in claim 5 in which the compound of formula II is  $\alpha$ (2-acetoxy anilino) benzyl phosphonic acid,  $\alpha$ -anilino ortho-hydroxy benzyl phosphonic acid, piperidino methylene phosphonic acid or amino methane phosphonic acid.

7. A synergistic combination as claimed in claim 1 in which the compound of formula I has the formula

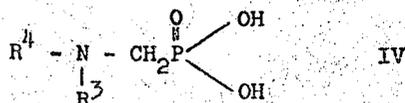

where  $R^1$  and  $R^2$  are both hydrogen,  $R^3$  is a methylene phosphonic acid grouping and  $R^4$  is a hydrocarbyl or hydroxysubstituted hydrocarbyl radical.

8. A synergistic combination as claimed in claim 7 in which the compound of formula III is methyl amino di(methylene phosphonic acid), ethyl amino di(methylene

14

phosphonic acid), *n*-hexylamino di(methylene phosphonic acid), *p*-toluidino di(methylene phosphonic acid) or hydroxy ethyl amino di(methylene phosphonic acid), *n*-pentylamino di(methylene phosphonic acid), *n*-propylamino di(methylene phosphonic acid), allylamino di(methylene phosphonic acid), or cyclohexylamino di(methylene phosphonic acid).

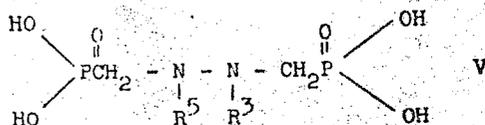

9. A synergistic combination as claimed in claim 1 in which the compound of formula I has the formula

wherein  $R^3$  is hydrogen or a methylene phosphonic acid grouping and  $R^4$  is a hydroxy,  $-CH_2COOH$  or a  $-CH_2CH_2COOH$  grouping.

10. A synergistic combination as claimed in claim 9 in which the compound of formula IV is hydroxy amino methylene phosphonic acid, carboxymethylamino di(methylene phosphonic acid) or hydroxy amino di(methylene phosphonic acid).

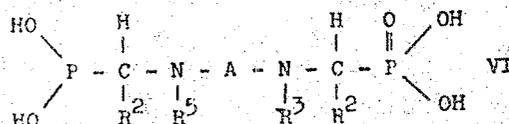

11. A synergistic combination as claimed in claim 1 in which the compound of formula I has the formula

wherein each of the groupings  $R^3$  and  $R^5$  is hydrogen or a methylene phosphonic acid grouping.

12. A synergistic combination as claimed in claim 11 in which the compound of formula V is hydrazine tetra(methylene phosphonic acid).

13. A synergistic combination as claimed in claim 1 in which the compound of formula I has the formula

where  $R^2$  is hydrogen or a hydroxy phenyl grouping,  $R^3$  and  $R^5$  are the same and are hydrogen or methylene phosphonic acid groupings and  $A$  is a linear or branched saturated divalent hydrocarbyl, containing from 1 to 6 carbon atoms; or the grouping  $R^3N-A-NR^3$  may form a ring.

14. A synergistic combination as claimed in claim 13 wherein  $A$ , in the compound of formula VI, is a methylene, ethylene, *n*-propylene, isopropylene, *n*-butylene, *m*-phenylene or *p*-phenylene grouping.

15. A synergistic combination as claimed in claim 13 wherein the compound of formula VI is ethylene diamine tetra(methylene phosphonic acid).

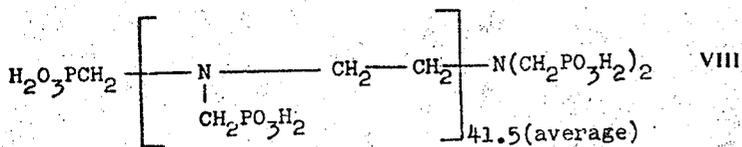

16. A synergistic combination as claimed in claim 1 in which the compound of formula I has the formula

where  $m$  is a positive integer from 2 to 60,  $R^3$ ,  $R^4$  and  $R^5$  may each be hydrogen or a methylene phosphonic

acid grouping, provided that at least 50% of these groups are methylene phosphonic acid groups, and that not all the R<sup>3</sup> groupings need be identical.

17. A synergistic combination as claimed in claim 16 in which the compound of formula VII is:

18. A synergistic combination as claimed in claim 1 consisting essentially of a mixture containing methylamino di(methylene phosphonic acid) and from 30 to 85% by weight of sodium nitrite.

19. A synergistic combination as claimed in claim 1 consisting essentially of a mixture containing hydrazine tetra(methylene phosphonic acid) and from 22% to 30% by weight of sodium nitrite.

20. A synergistic combination as claimed in claim 1 consisting essentially of a mixture containing  $\alpha$ -anilino ortho hydroxy benzyl phosphonic acid and from 30% to 85% of sodium nitrite.

21. A synergistic combination as claimed in claim 1

15 consisting essentially of a mixture containing ethylene diamine tetra (methylene phosphonic acid) and from 25% to 85% sodium nitrite.

22. A synergistic combination as claimed in claim 17 consisting essentially of a mixture containing a compound of formula VIII and from 20% to 80% sodium nitrite.
