MALEIMIDE DERIVATIVES AS MODULATORS OF WNT PATHWAY

Field

[0001] The invention relates to WNT pathway modulators, processes for making them and methods for using them.

Priority

[0002] This application claims priority from UK application GB 1322334.2, filed 17 December 2013, the entire contents of which are incorporated herein by cross-reference.

Background

[0003] Wnt proteins are secreted glycoproteins acting as growth factors that regulate various cellular functions include proliferation, differentiation, death, migration, and polarity, by activating multiple intracellular signaling cascades, including the β-catenin-dependent and -independent pathways. There are 19 Wnt members have been found in humans and mice, and they exhibit unique expression patterns and distinct functions during development. In humans and mice, the 10 members of the Frizzled (Fz) family comprise a series of seven-pass transmembrane receptors that have been identified as Wnt receptors. In addition to Fz proteins, single-pass transmembrane proteins, such as low-density lipoprotein receptor-related protein 5 (LRP5), LRP6, receptor tyrosine kinase (RTK)-like orphan receptor I(RorI), Ror2, and receptor-like tyrosine kinase (Ryk), have been shown to function as co-receptors for Wnt signaling. Therefore, it has been assumed traditionally that the binding of different Wnts to their specific receptors selectively triggers different Wnts to their specific receptors selectively triggers different outcomes via distinct intracellular pathways.

[0004] Diverse Wnts, Wnt receptors, and downstream pathway all contribute to the role of Wnt. These pathways all play a role in development, stem cell maintenance, cancer and metastasis.

[0005] In the absence of Wnt signaling, β-catenin is bound and phosphorylated by a "destruction complex" containing the adenomatous polyposis coli (APC) and Axin proteins, as well as glycogen synthase kinase 3 (GSK3) and casein kinase I (CKI). Phosphorylated β-catenin is bound by the F box protein Slimb/p-TrCP and polyubiquitinated, leading to proteosomal
degradation. In addition, the complex acts to prevent nuclear localization of β-catenin. Upon Wnt binding to Frizzled (Fz) and low-density lipoprotein-related proteins 5 and 6 (LRP5/6), GSK3, Axin, and other destruction complex components are recruited to the receptor complex. The function of the destruction complex is inhibited, and unphosphorylated β-catenin accumulates in the cytoplasm and eventually translocates to the nucleus. There, it associates with TCF proteins, converting TCF from a repressor into an activator of Wnt-responsive gene transcription.

[0006] Wnt in Cancer & Stem Cell:

[0007] Deregulation of components of Wnt/β-catenin signaling is implied in a wide spectrum of diseases including degenerative diseases, metabolic diseases, and a number of cancers such as cervical, colon, breast, bladder, head and neck, gastric, lung, ovarian, prostate, thyroid, non-small-cell lung, as well as chronic lymphocytic leukemia, mesothelioma, melanoma, pancreatic adenocarcinoma, basal cell carcinoma, osteosarcoma, hepatocellular carcinoma, Wilms' tumor and medulloblastoma.

[0008] Wnt signaling plays a role both during development, and within stem cell niches in adults. This is best established in skin, hematopoietic stem cells, mammary gland and in intestinal proliferation. For example, high level expression of DKK1, an inhibitor of Wnt signaling, blocks normal stem cell proliferation in mouse intestine, suggesting there is an essential role for Wnt signaling in maintenance of stem cells in the digestive tract. Wnt roles in self renewal and expansion of stem cells have also been demonstrated for embryonic and neural stem cells, suggesting that Wnt signaling may be a general requirement of stem cell maintenance. Inhibition of Wnt signaling, e.g., by overexpression of axin or an extracellular Wnt-binding protein, sFRP, reduces hematopoietic stem cell (HSC) growth in vitro and the ability to reconstitute HSCs in vivo. Notably, while overexpression of activated β-catenin can expand HSC populations in culture for extended periods, two groups have reported that β-catenin is not required for HSC survival and serial transplantation, supporting the proposal that there is more to Wnt signaling than stabilization of β-catenin in stem cell survival. Diverse Wnts can regulate stem cell proliferation: Wnts 1, 5a, and 10b are able to stimulate expansion of HSC populations and Wnt5a acts synergistically with stem cell factor (SCF) to expand and promote self renewal of HSCs. The demonstration of a role for Wnt5a in HSC self renewal and its ability to synergize with stem cell factor is particularly interesting because Wnt5a often acts
in a β-catenin independent manner. While Wnt signaling is critical for stem cell maintenance, it may therefore be via signaling pathways distinct from or in parallel to the β-catenin pathway.

[0009] Fibrosis:

[0010] Wnt/p-catenin signaling pathway is essential to embryonic development in general and organ morphogenesis, so it is not surprising that dysregulation of this pathway in adult has been linked to fibroblast biology and fibrosis. It has been demonstrated that Wnt/p-catenin signaling play a role in severe fibrotic diseases, such as pulmonary fibrosis, liver fibrosis, skin fibrosis and renal fibrosis.

[0011] Others:

[0012] Dysregulation of Wnt/P-catenin signaling contributes to the development of diabetic retinopathy by inducing retinal inflammation, vascular leakage, and neovascularization.

[0013] The binding of Wnt proteins to plasma membrane receptors on mesenchymal cells induces the differentiation of these cells into the osteoblast lineage and thereby supports bone formation. Wnts are also key signaling proteins in joint remodeling processes. Active Wnt signaling contributes to osteophyte formation and might have an essential role in the anabolic pattern of joint remodeling that is observed in ankylosing spondylitis and osteoarthritis. By contrast, blockade of Wnt signaling facilitates bone erosion and contributes to catabolic joint remodeling, a process that is observed in rheumatoid arthritis.

[0014] There is therefore a need for compounds that modulate and/or inhibit the WNT pathway so as to treat diseases associated with WNT activity.

Definitions

**Pharmaceutical compositions**

[0138] To prepare the pharmaceutical compositions of this invention, at least one compound of formula (I) optionally in combination with at least one of the other aforementioned agents can be used as the active ingredient(s). The active ingredient(s) is intimately admixed with a pharmaceutical carrier according to conventional pharmaceutical compounding techniques, which carrier may take a wide variety of forms depending of the form of preparation desired for administration, e.g., oral or parenteral such as intramuscular. In preparing the compositions in oral dosage form, any of the usual pharmaceutical media may be employed. Thus, for liquid oral preparations, such as for example, suspensions, elixirs and solutions, suitable carriers and additives include water, glycols, oils, alcohols, flavoring agents, preservatives, coloring agents and the like; for solid oral preparations such as, for example, powders, capsules, gelcaps and tablets, suitable carriers and additives include starches, sugars, diluents, granulating agents, lubricants, binders, disintegrating agents and the like. Because of their ease in administration, tablets and capsules represent the most advantageous oral dosage unit form, in which case solid pharmaceutical carriers are obviously employed. If desired, tablets may be sugar coated or enteric coated by standard techniques. For parenterals, the carrier will usually comprise sterile water, though other ingredients, for example, for purposes such as aiding solubility or for preservation, may be included.

[0139] Injectable suspensions may also prepared, in which case appropriate liquid carriers, suspending agents and the like may be employed. The pharmaceutical compositions herein will contain, per dosage unit, e.g., tablet, capsule, powder, injection, teaspoonful and the like, an amount of the active ingredient(s) necessary to deliver an effective dose as described above. The pharmaceutical compositions herein will contain, per dosage unit, e.g., tablet, capsule, powder,
injection, suppository, teaspoonful and the like, from about 0.03 mg to 100 mg/kg (preferred 0.1 - 30 mg/kg) and may be given at a dosage of from about 0.1 - 300 mg/kg per day (preferred 1 - 50 mg/kg per day) of each active ingredient or combination thereof. The dosages, however, may be varied depending upon the requirement of the patients, the severity of the condition being treated and the compound being employed. The use of either daily administration or post-periodic dosing may be employed.

[0140] Preferably these compositions are in unit dosage forms from such as tablets, pills, capsules, powders, granules, sterile parenteral solutions or suspensions, metered aerosol or liquid sprays, drops, ampoules, autoinjector devices or suppositories; for oral parenteral, intranasal, sublingual or rectal administration, or for administration by inhalation or insufflation. Alternatively, the composition may be presented in a form suitable for once-weekly or once-monthly administration; for example, an insoluble salt of the active compound, such as the decanoate salt, may be adapted to provide a depot preparation for intramuscular injection. For preparing solid compositions such as tablets, the principal active ingredient is mixed with a pharmaceutical carrier, e.g. conventional tableting ingredients such as corn starch, lactose, sucrose, sorbitol, talc, stearic acid, magnesium stearate, dicalcium phosphate or gums, and other pharmaceutical diluents, e.g. water, to form a solid preformulation composition containing a homogeneous mixture of a compound of the present invention, or a pharmaceutically acceptable salt thereof. When referring to these preformulation compositions as homogeneous, it is meant that the active ingredient is dispersed evenly throughout the composition so that the composition may be readily subdivided into equally effective dosage forms such as tablets, pills and capsules. This solid preformulation composition is then subdivided into unit dosage forms of the type described above containing from 0.1 to about 500 mg of each active ingredient or combinations thereof of the present invention.

[0141] The tablets or pills of the compositions of the present invention can be coated or otherwise compounded to provide a dosage form affording the advantage of prolonged action. For example, the tablet or pill can comprise an inner dosage and an outer dosage component, the latter being in the form of an envelope over the former. The two components can be separated by an enteric layer which serves to resist disintegration in the stomach and permits the inner component to pass intact into the duodenum or to be delayed in release. A variety of material can be used for such enteric layers or coatings, such materials including a number of polymeric acids with such materials as shellac, acetyl alcohol and cellulose acetate.
This liquid forms in which the compositions of the present invention may be incorporated for administration orally or by injection include, aqueous solutions, suitably flavoured syrups, aqueous or oil suspensions, and flavoured emulsions with edible oils such as cottonseed oil, sesame oil, coconut oil or peanut oil, as well as elixirs and similar pharmaceutical vehicles. Suitable dispersing or suspending agents for aqueous suspensions, include synthetic and natural gums such as tragacanth, acacia, alginate, dextran, sodium carboxymethylcellulose, methylcellulose, polyvinylpyrrolidone or gelatin.

The pharmaceutical composition may contain between about 0.01 mg and 100 mg, preferably about 5 to 50 mg, of each compound, and may be constituted into any form suitable for the mode of administration selected. Carriers include necessary and inert pharmaceutical excipients, including, but not limited to, binders, suspending agents, lubricants, flavorants, sweeteners, preservatives, dyes, and coatings. Compositions suitable for oral administration include solid forms, such as pills, tablets, caplets, capsules (each including immediate release, timed release and sustained release formulations), granules, powders, and liquid forms, such as solutions, syrups, elixirs, emulsions, and suspensions. Forms useful for parenteral administration include sterile solutions, emulsions and suspensions.

Advantageously, compounds of the present invention may be administered in a single daily dose, or the total daily dosage may be administered in divided doses of two, three or four times daily. Furthermore, compounds for the present invention can be administered in intranasal form via topical use of suitable intranasal vehicles, or via transdermal skin patches well known to those of ordinary skill in that art. To be administered in the form of transdermal delivery system, the dosage administration will, of course, be continuous rather than intermittent throughout the dosage regimen.

For instance, for oral administration in the form of a tablet or capsule, the active drug component can be combined with an oral, non-toxic pharmaceutically acceptable inert carrier such as ethanol, glycerol, water and the like. Moreover, when desired or necessary, suitable binders; lubricants, disintegrating agents and coloring agents can also be incorporated into the mixture. Suitable binders include, without limitation, starch, gelatin, natural sugars such as glucose or betalactose, corn sweeteners, natural and synthetic gums such as acacia, tragacanth or sodium oleate, sodium stearate, magnesium stearate, sodium benzoate, sodium acetate, sodium
chloride and the like. Disintegrators include, without limitation, starch, methyl cellulose, agar, bentonite, xanthan gum and the like.

[0146] The liquid forms in suitable flavored suspending or dispersing agents such as the synthetic and natural gums, for example, tragacanth, acacia, methyl-cellulose and the like. For parenteral administration, sterile suspensions and solutions are desired. Isotonic preparations which generally contain suitable preservatives are employed when intravenous administration is desired.

[0147] The compounds or combinations of the present invention can also be administered in the form of liposome delivery systems, such as small unilamellar vesicles, large unilamellar vesicles, and multilamellar vesicles. Liposomes can be formed from a variety of phospholipids, such as cholesterol, stearylamine or phosphatidylcholines.

[0148] Compounds or combinations of the present invention may also be delivered by the use of monoclonal antibodies as individual carriers to which the compound molecules are coupled. The compounds of the present invention may also be coupled with soluble polymers as targetable drug carriers. Such polymers can include polyvinylpyrrolidone, pyran copolymer, polyhydroxypropylmethacrylamidephenol, polyhydroxyethylaspartamid-ephenol, or polyethyl eneoxidepolylylysine substituted with palmitoyl residue. Furthermore, the compounds of the present invention may be coupled to a class of biodegradable polymers useful in achieving controlled release of a drug, for example, polyactic acid, polyepsilon caprolactone, polyhydroxy butyric acid, polyorthoesters, polyacetals, polydihydropyranes, polycyanoacrylates and cross-linked or amphipathic block copolymers of hydrogels.

[0149] Compounds or combinations of this invention may be administered in any of the foregoing compositions and according to dosage regimens established in the art whenever treatment of the addressed disorders is required.

[0150] The daily dosage of the products may be varied over a wide range from 0.01 to 1.000 mg per mammal per day. For oral administration, the compositions are preferably provided in the form of tablets containing, 0.01, 0.05, 0.1, 0.5, 1.0, 2.5, 5.0, 10.0, 15.0, 25.0, 50.0, 100, 150, 200, 250 and 500 milligrams of each active ingredient or combinations thereof for the symptomatic adjustment of the dosage to the patient to be treated. An effective amount of the drug is ordinarily supplied at a dosage level of from about 0.1 mg/kg to about 300 mg/kg of
body weight per day. Preferably, the range is from about 1 to about 50 mg/kg of body weight per day. The compounds or combinations may be administered on a regimen of 1 to 4 times per day.

[0151] Optimal dosages to be administered may be readily determined by those skilled in the art, and will vary with the particular compound used, the mode of administration, the strength of the preparation, the mode of administration, and the advancement of disease condition. In addition, factors associated with the particular patient being treated, including patient age, weight, diet and time of administration, will result in the need to adjust dosages.

[0152] In a further aspect, the invention also provides a process for preparing a pharmaceutical composition comprising at least one compound of formula (I), optionally in combination with at least one of the other aforementioned agents and a pharmaceutically acceptable carrier.

[0153] The compositions are preferably in a unit dosage form in an amount appropriate for the relevant daily dosage.

[0154] Suitable dosages, including especially unit dosages, of the compounds of the present invention include the known dosages including unit doses for these compounds as described or referred to in reference text such as the British and US Pharmacopoeias, Remington’s Pharmaceutical Sciences (Mack Publishing Co.), Martindale The Extra Pharmacopoeia (London, The Pharmaceutical Press) (for example see the 31st Edition page 341 and pages cited therein) or the above mentioned publications.

Synthesis of Acids

[0161] Synthesis of acid-intermediate, 2-(6-methyl-5,7-dioxo-2,3,4,5,6,7-hexahydro-1H-pyrrolo[3,4-b]pyridin-1-yl)acetic acid.

To a solution of furo[3,4-b]pyridine-5,7-dione, (5 g, 33.55 mmol) in toluene (100 mL) was added methyl amine (33.5 mL, 67.11, 2M solution in THF) and fitted with dean stark setup and heated at 130 °C for 16 h. After completion, the reaction mixture was cooled to room temperature and toluene was decanted and solid was washed with toluene, the combined toluene layers were concentrated, purified by column chromatography to afford 2.5 g (46%) of desired compound as a white solid.

**[0164]** $^1$H NMR (400 MHz, CDCl$_3$) δ (ppm): 8.98-8.96 (m, 1H), 8.19-8.17 (m, 1H), 7.65-7.62 (m, 1H), 3.26 (s, 3H).

**[0165]** LC-MS: $m/z$ 163 [M+H$^+$] with a purity of 99.35 %.

**[0166]** Step 2: Preparation of 6-methyl-3,4-dihydro-1H-pyrrolo[3,4-b]pyridine-5,7(2H,6H)-dione.

**[0167]** To a solution of Compound 6-methyl-5H-pyrrolo[3,4-b]pyridine-5, 7(6H)-dione, (3 g, 18.51 mmol) in THF (60 mL) was added 300 mg of 10% Pd/C and reaction was stirred at room temperature under hydrogen balloon for 16 h. After completion, the reaction mixture was filtered through celite bed and filtrate was concentrated under vacuum. The crude compound was purified by column chromatography to afford 900 mg (29%) of desired compound as a yellow solid.

**[0168]** $^1$H NMR (400 MHz, DMSO-$d_6$) δ (ppm): 7.69 (brs, 1H), 3.22 (t, $J = 6$ Hz, 2H), 2.77 (s, 3H), 2.17 (t, $J = 6.4$ Hz, 2H), 1.73-1.67 (m, 2H).

**[0169]** LC-MS: $m/z$ 167 [M+H$^+$] with a purity of 86.4%.

[0283] A stirred solution of the arylhalide (1 equiv.), boronic acid (1.11 equiv.) and sodium carbonate (3.33 equiv., pre-dissolved in 2 mL of water) in 3 mL of 1,4-dioxane and water was degassed for 15 min with nitrogen. Bis(triphenylphosphine)palladium(II) dichloride, Pd(dppf)Cl$_2$-DCM (0.06 equiv.) was added to reaction mixture and the reaction mixture was heated to reflux at 100 °C for 3-18 h. After completion of starting material, the reaction mixture was concentrated and water was added to reaction mixture and extracted with ethyl acetate. The combined organic layers were washed with brine, dried with Na$_2$SO$_4$ and concentrated under vacuum. The crude compound was purified by reversed phase chromatography to afford the purified amine.

Method C:

A stirred solution of the arylhalide (1 equiv.), boronic acid (1.11 equiv.) and sodium carbonate (3.33 equiv., pre-dissolved in 2 mL of water) in 3 mL of 1,4-dioxane and water was degassed for 15 min with nitrogen. Bis(triphenylphosphine)palladium(II) dichloride (0.06 equiv.) was added to reaction mixture and the reaction mixture was heated to reflux for 3-18 h. After completion of starting material, the reaction mixture was concentrated and water was added to reaction mixture and extracted with ethyl acetate. The combined organic layers were washed with brine, dried with Na\(_2\)SO\(_4\) and concentrated under vacuum. The crude compound was purified by reversed phase chromatography to afford the purified amine.

Materials and Methods

Cell lines and culture conditions:

HEK293-STF cell line was modified from Human embryonic kidney cell line HEK293 transfected with the STF reporter. HEK293-STF3A cell line was further modified from HEK293-STF cell line to express Wnt3A. This cell line was used to identify compounds that regulate either early or late signaling components of the Wnt pathway. These two cell lines were obtained from David Virshup's laboratory, Duke-NUS. L-Wnt3A (ATCC, #CRL-2647) cell line was used for providing Wnt3A conditioned media. The three cell lines were grown in DMEM with 10% FBS incubated in 37°C with 5% CO2.

Cell viability assay:

5000 cells in 75 µl culture media were seeded in each well of black 96 well plates (Greiner #655090) and incubated overnight at 37°C. 25 µl of serially diluted compound was added to the cells giving final concentration of 50 µM to 1.5 nM. After 1 day of treatment, 100 µl of CellTiter-Glo Luminescent Cell Viability Assay reagent (#G7571, Promega) was added to each well and incubated for 10 minutes at room temperature. Luminescence was measured using Tecan Safire2 microplate reader.

STF3A assay:
[01016] 2x10^4 HEK293-STF3 A cells in 75 µl culture media were seeded in each well of white 96 well plates (Greiner #655098) and incubated overnight at 37 °C. 25 µl serially diluted compound was added to the cells to give final concentration of 50 µM to 1.5 nM. After 1 day of treatment, 100 µl of Steady-Glo Luciferase Assay reagent (E2520, Promega) was added to each well and incubated for 10 minutes at room temperature. Luminescence was measured using Tecan Safire2 plate reader.

[01017] STF/WNT3A conditioned medium (STF/WNT3A CM) assay:

[01018] L-Wnt3A cells were cultured in three T-175 flasks at 3x10^4 cells/ml in 30 ml culture medium per flask. After 4 days of incubation, the Wnt3A conditioned media were harvested and then centrifuged at 2000 rpm for 10 minutes to remove the debris. The Wnt3A conditioned media were stored at -20 °C if not used immediately.

[01019] 2x10^4 HEK293-STF cells in 25 µl culture media were added in each well of white 96 well plates (Greiner #655098). 25 µl serially diluted compound was added to the cells. After 4 hours of incubation, 100 µl Wnt-3A conditioned medium was added to the cells. The final concentration of compound ranged from 33 µM to 1 nM. After incubation for 1 day at 37 °C, 100 µl of Steady-Glo® Luciferase Assay reagent (E2520, Promega) was added to each well and incubated for 10 minutes at room temperature. Luminescence was measured using Tecan Safire2 microplate reader.

[01020] Western blot:

[01021] 8.0 x 10^5 cells in 2.5 ml media were seeded in T-25 flasks. Compounds were diluted to 600 nM in 1 ml medium and 0.5 ml was added to the T-25 flask to give a final concentration of 100 nM. After incubation in 37 °C for two days, the culture media were collected and centrifuged at 2000 rpm for 10 min. The supernatants were collected and 32 µl from each sample was used for SDS PAGE gel electrophoresis. After transferring the separated proteins to the membrane it was incubated with the primary Wnt3A antibody (1:1000, #09-162, Millipore) overnight. After washing with Tris-Buffered Saline containing 0.05% Tween 20 (TBST), the membrane was incubated with polyclonal Goat anti-Rabbit IgG HRP-conjugated secondary antibody (1:3000, #P0448) for 1 hour at room temperature. After washing with TBST, the membrane was developed with Amersham™ ECL™ Select Western Blotting
Detection Reagent (#RPN2235, GE Healthcare Life Sciences) and documented with Bio-Rad Molecular Imager VersaDoc MP.

**[01022]** MMTV-Wntl Mouse Model:

**[01023]** 8-10 weeks old Female BALBc mice were anesthetised with 150mg/kg Ketamine +75mg/kg Xylazine. Under aseptic conditions, skin near the 4th mammary fat pad was incised, Mammary fat pad was tweaked with forceps and tumor fragment ~ 2mm³ was implanted. The incision was closed using a tissue adhesive. Animals were randomised into groups of eight and treated daily with the test compounds for 14 days. Tumors were measured in two dimensions using calipers, and volume was calculated using the formula: Tumor Volume (mm³) = w² x 1/2. Maximum tumor volume limit was 2000mm³.

**[01024]** Wnt3A palmitoylation assay:

**[01025]** The assay used to determine the inhibition of the palmitoylation of Wnts by compound was described by Yap et al, (Yap MC, Kostiuk MA, Martin DD, Perinpanayagam MA, Hak PG, Siddam A, Majjigapu JR, Rajaiah G, Keller BO, Prescher JA, Wu P, Bertozzi CR, Falck JR, Berthiaume LG. 2010. Rapid and selective detection of fatty acylated proteins using omega-alkynyl-fatty acids and click chemistry. J Lipid Res. 51(6): 1566-1580) with some modification. 3 x 10⁶ HeLa cells were seeded in 10 cm culture dish and incubated at 37°C overnight. The cells were transfected with 5 µg pCDNA3.2/V5-Wnt3a vector (Najdi R, Proffitt K, Sprowl S, Kaur S, Yu J, Covey TM, Virshup DM, Waterman ML. 2012. A uniform human Wnt expression library reveals a shared secretory pathway and unique signaling activities. Differentiation, 84(2), 203-213. doi:10.1016/j.diff.2012.06.004) to over-express V5-tagged Wnt3a. After six hours, the cells were washed with PBS and treated with 100 µM alkyne palmitate in medium with 5% BSA. 100nM compound or DMSO was added and the cells were incubated overnight at 37°C. The cells were lysed and 600 µg cell lysate was collected and incubated with anti-V5 antibody (Invitrogen) followed by the pull down of V5-Wnt3a with the addition of Protein A/G agarose beads (Thermo scientific). The pulled down lysates containing V5-Wnt3a was click-reacted with biotin-azide (Invitrogen). The biotin-labelled protein lysate was then separated on SDS-PAGE and transferred to a nitrocellulose membrane. The membrane was incubated with primary anti-V5 antibody, followed by secondary anti-mouse Dylight 680 (Thermo scientific) to detect V5-Wnt3a. The membrane was then incubated with
streptavidin-Dylight 800 (Thermo scientific) to detect biotin labelled Wnt3a. The signals were captured on the Odyssey CLx Infrared Imaging System (LI-COR Bioscience).

[01026] **Soft agar Assay:**

[01027] AsPC-1 cells were maintained in RPMI164 supplemented with 10% FBS, 2 mM L-glutamine and P/S (100 units/ml penicillin and 100 μg/ml streptomycin). HPAF-II cells were maintained in MEM (Eagle's) supplemented with 10% FBS, 2 mM L-glutamine and P/S (100 units/ml penicillin and 100 μg/ml streptomycin). CFPAC-1 cells were maintained in Iscove MEM supplemented with 10% FBS, 2 mM L-glutamine and P/S (100 units/ml penicillin and 100 μg/ml streptomycin).

[01028] 600 μl of 0.6% agar was added to 24-well plate to form the base layer. Then a middle layer of 0.36% agar (containing 5000 cells and serially diluted compound) was added on to the base layer. Finally 500 μl of fresh growth medium was added to the top of the middle layer. The plates were incubated at 37 °C with 5% carbon dioxide in a humidified incubator for 2 weeks. Formation of colonies was observed using a light microscope. When the colony size was larger than 500 μm, 70 μl MTT (5 mg/ml) was added to each well and the plates were incubated at 37 °C for at least 2 hours. Colonies were counted with GelCount® instrument. The colony counts were plotted against compound concentrations using the GraphPad Prism software. The software was also used to perform non-linear curve fitting and calculation of compound concentration that inhibited 50% colony formation.

[01029] **Results:**

[01030] Maleimide compounds specifically inhibit mammalian PORCN.

[01031] PORCN-null HT1080 cells were transfected with mammalian or Xenopus PORCN expression plasmids, along with WNT3A, STF reporter and mCherry as transfection control. 6 hours after transfection, cells were treated with the compounds or DMSO as indicated, and the following day assayed for luciferase. Xenopus PORCN was resistant to the inhibitory effects of compounds. The two compounds, Compound 14 and 43 inhibit the activity of mammalian porcupine (Figure 1).
Treatment with Compounds 43 and 52 decreased tumor growth in all the treated mice (Figure 2 and Figure 3).

Figure 5. Palmitoylation of Wnt3a is inhibited by Compound 43. A. The Wnt3a-V5 was visualized using anti-V5 antibody, followed by anti-mouse Dylight 680. B. Biotin-azide clicked palmitate in V5-Wnt3a was detected with streptavidin-Dylight 800. A non-specific band was observed above the Wnt3a-V5 protein. Biotin-azide clicked palmitate was detected with streptavidin-Dylight 800 (lower band). DMSO was used as negative control. Lane 1: Without Alkyne palmitate; Lane 2: untreated control, DMSO + Alkyne palmitate; Lane 3: 100nM Compound 43 + Alkyne palmitate.

Results of the Soft Agar Assay are shown in Figures 5 to 7 and Table 1: Fifty percent colony growth inhibitory concentration (IC50, µM) of Compound 43 on pancreatic cell lines AsPC-1 and HPAF-II. Results shown below are mean ± standard deviation (SD) from two independent experiments.
