SMALL MOLECULE INHIBITORS OF FIBROSIS

CROSS-REFERENCE TO RELATED APPLICATIONS

[0001] This application claims the benefit of U.S. Patent Application No. 61/832,768, filed June 7, 2013, which is hereby incorporated by reference in its entirety.

BACKGROUND OF THE INVENTION

[0002] Fibrosis, generally defined as the production of excessive amounts of connective tissue, develops as a consequence of diverse underlying diseases. Chronic inflammation or tissue damage/remodeling are typical fibrosis inducing events. Specific disease examples include idiopathic pulmonary fibrosis (IPF), liver fibrosis associated with the later stages of alcoholic and nonalcoholic liver cirrhosis, kidney fibrosis, cardiac fibrosis, and keloid formation resulting from abnormal wound healing [Wynn, T. A. (2004) Nature Reviews Immunology. 4: 583-594; Friedman, S.L. (2013) Science Translation Medicine. 5(167):1-17]. Additionally, fibrosis is a key pathological feature associated with chronic autoimmune diseases, including rheumatoid arthritis, Crohn's disease, systemic lupus erythematosus, and scleroderma. Diseases representing a dire unmet medical need include idiopathic pulmonary fibrosis (IPF), scleroderma and nonalcoholic steatohepatitis (NASH) related liver fibrosis. The increased incidence of NASH related liver fibrosis is expected to directly parallel those of type 2 diabetes and obesity.

[0003] Scleroderma is a rare chronic autoimmune disease characterized by the replacement of normal tissue with dense, thick fibrous tissue. While the exact underlying cause of scleroderma is unknown, the disease generally involves immune cell mediated activation of dermal myofibroblasts leading to the deposition of excessive amounts of extracellular matrix proteins (e.g., type I collagen) that causes a thickening of the skin and in some cases the hardening and eventual failure of multiple organs. At present, there is no cure for scleroderma. Treatment is limited to attempts to manage symptoms and typically requires a combination of approaches. While scleroderma localized to the skin is typically not life threatening, systemic scleroderma affecting multiple internal organs can be a life-threatening disease.

DETAILED DESCRIPTION OF THE INVENTION

[00138] Fibrosis represents a critically important yet surprisingly neglected health problem. Nearly 45% of all natural deaths in the Western world are attributed to chronic fibroproliferative diseases. However, there is currently only one clinically approved drug (Pirfenidone) that specifically targets the pathogenesis of fibrosis and is directly indicated for the treatment of a fibrotic disease. Fibrosis affects nearly every tissue in the body and, when highly progressive, can lead to organ malfunction and death. Clearly, the identification of novel anti-fibrotic drugs represents an unmet medical need that would have significant beneficial impact on patients in multiple disease populations. In addition, at present there is no cure for scleroderma and treatment is limited to symptom management.

[00139] Fibrosis, generally defined as the production of excessive amounts of connective tissue, develops as a consequence of diverse underlying diseases. Chronic inflammation or tissue damage/remodeling are typical fibrosis inducing events. Fibrosis affects nearly every tissue in the body and, when highly progressive, can lead to organ malfunction and death. Specific disease examples include idiopathic pulmonary fibrosis (IPF); liver fibrosis associated with the later stages of alcoholic and nonalcoholic liver cirrhosis; kidney fibrosis; cardiac fibrosis; and keloid formation resulting from abnormal wound healing. Additionally, fibrosis is a key pathological feature associated with chronic autoimmune diseases, including rheumatoid arthritis, scleroderma, Crohn's disease and systemic lupus erythematosus. As such, fibrosis represents a critically important yet surprisingly neglected health problem. Indeed, nearly 45% of all natural deaths in the Western world are attributed to chronic fibroproliferative diseases. However, at present, there is only one clinically approved drug (Pirfenidone, approved for the treatment of IPF in Europe only) that specifically targets the pathogenesis of fibrosis and is directly indicated for the treatment of a fibrotic disease. Unfortunately, Pirfenidone has significant liver and GI side effects, and patients treated with Pirfenidone are advised to avoid direct sunlight exposure, as it is known to cause photosensitivity reactions leading to rash, dry skin or pruritus. Recently, lysophosphatidic acid 1 (LPA1) antagonists (e.g., AM-152) have been demonstrated to be efficacious in preclinical models of IPF. However, clinical efficacy remains to be demonstrated

for AM-152. Clearly, the identification of novel anti-fibrotic drugs represents a major unmet medical need that would have significant beneficial impact on patients in multiple disease populations.

[00140] Despite the diversity of diseases and triggers that can initiate a fibrotic process in a given tissue or organ, common biochemical and cellular mechanisms occur in all instances studied to date. Following injury or inflammatory insult, resident fibroblasts (in some cases recruited bone marrow-derived circulating fibrocytes or epithelial cells that have undergone an epithelial-to-mesenchymal transition) are activated and "transdifferentiate" into α-smooth muscle actin (α-SMA) expressing myofibroblasts that secrete the extracellular matrix (ECM) components required for wound repair. In the case of liver fibrosis, a resident pericyte population termed a quiescent hepatic stellate cell (HSC) "transdifferentiates" into a type I collagen producing α-SMA expressing fibrogenic "activated" HSC. Transforming growth factor-β1 (TGF-β1) mediated Smad 3/4 signaling commonly drives the transdifferentiation of resident fibroblasts or HSCs to myofibroblasts or activated HSCs and stimulates production of ECM components in the latter populations. Platelet-derived growth factor (PDGF) also serves as a common pro-fibrotic cytokine that drives cell activation and proliferation.

[00141] One therapeutic approach for the treatment of progressive fibrosis diseases is to target one of the multitudes of complex causative immunological processes. This approach is limited by a lack of mechanistic clarity and potential exacerbation of the underlying disease. An attractive alternative approach for the treatment of diverse fibrotic diseases is to directly target the transdifferentiation pathway responsible for interconversion of quiescent fibroblasts and activated pro-fibrotic myofibroblasts. Drugs capable of blocking the conversion of fibroblasts to activated myofibroblasts could be administered prophylactically following injury or insult (e.g., myocardial infaction) or therapeutically in the early stages of disease in organs capable of repair (e.g., liver fibrosis, IPF or scleroderma). Direct suppressors of TGF-β1 production (e.g., Pirfenidone) are not ideal candidates for chronic dosing and are especially undesirable for the treatment of autoimmune diseases, as they have the potential to exacerbate autoimmune responses. Alternatively, drugs capable of inducing the reversion of existing myofibroblasts to a quiescent cell fate would have broad applicability for the treatment of fibrosis in multiple tissue types and could potentially be efficacious at later stages of disease.

[00142] High content imaging assays have been established, using primary human lung fibroblasts and primary rodent HSCs, that enable the identification of small molecules that either inhibit myofibroblast formation/activation or induce the reversion of activated myofibroblasts to a quiescent fibroblast state. Conditions, involving serum starvation and subsequent TGF-β treatment, have been identified that facilitate robust *in vitro* transdifferentiation in a miniaturized

(384 well plate) format that is amenable to high throughput small molecule screening. The inhibition assay is based on α-SMA immunofluorescent staining and cell morphology changes associated with fibroblast to myofibroblast transdifferentiation, Using the selective ALK-5 TGF-β1 receptor inhibitor (SB-43154) as a positive control, the inhibition assay has been used to initiate a screen of a collection of ~100,000 small molecules that consists of bioactive small molecules and a diversity set that has been assembled based on 2D and 3D structural diversity and inherent "drug-likeness" properties. Preliminary screening led to the identification of multiple previously identified anti-fibrotic molecules. The majority of these have limited clinical utility, as a result of known off target toxicity issues or demonstrated lack of *in vivo* efficacy. However, in addition to these, the triazole antifungal agent Itraconazole was identified as a highly efficacious inhibitor of myofibroblast formation (at doses well below those associated with toxicity in fibroblasts or other control cell types).

[00143] The activity of Itraconazole was confirmed *in vitro* by analyzing expression changes in multiple genes associated with fibroblast to myofibroblast transdifferentiation using biochemical methods (i.e., Western blot and RT-PCR). Using pharmacological methods, the mechanistic basis for the anti-fibrotic activity of this molecule has been established as dual inhibition of hedgehog signaling and vascular endothelial growth factor (VEFG) receptor glycosylation/trafficking (neither activity alone is sufficient). Encouragingly, it was established that the activity of Itraconazole translates to both human and rodent cell types, as well as to cells derived from multiple tissue types (e.g., lung, liver, skin, heart). Using Pirfenidone and AM-152 as benchmark control compounds, Itraconazole was demonstrated to have efficacy in both bleomycin-induced lung and carbon tetrachloride-induce liver fibrosis mouse models. As such, the FDA approved drug Itraconazole has been identified as a novel lead for the development of a new class of drugs for the treatment of multiple fibrosis related diseases.

[00144] A potential limitation to the use of this drug as an anti-fibrotic, especially for the treatment of liver fibrosis, is a known liver toxicity profile that is associated with coordination of heme iron by N4 of the 1,2,4 triazole moiety, leading to inhibition of P450 enzymes (most notably Cyp3A4), an activity distinct from the VEGF and Hgh activity of itraconazole. As such, medicinal chemistry efforts aimed at identifying optimized Itraconazole analogues with favorable liver toxicity profiles and further improvements in anti-fibrotic efficacy have been initiated. From an initial panel of ~30 Itraconazole analogues, in which the *pKa* of N4 is reduced or N4 nitrogen is substituted with carbon, several candidate leads have been identified wherein Cyp inhibition activity is eliminated and in vitro anti-fibrotic activity is retained. Notably, the pharmacokinetic properties of these compounds are comparable to those of the parent compound. Based on observed *in vitro* activity, *in vivo* efficacy, rodent serum exposure and human exposure

data, it is anticipated that a 5-fold improvement in efficacy and/or exposure is desirable for the final clinical candidate. A preliminary structure activity relationship study has revealed that potency enhancement can be achieved by making modifications at sites distal to the triazole substituent. Chemistry efforts are ongoing and will be used to optimize efficacy, exposure (C_{max} >5-fold *in vitro* EC_{50}) and toxicity profiles (based on human off-target panel profiling, hERG and AMES *in vitro* toxicity assays, and Cyp induction/inhibition assays). Reproducible disease modifying activity, i.e., efficacy equal to or greater than that of existing (pirfenidone) or potential future (AM-152) standards of care, will be demonstrated for an optimized Itraconazole analogue, using both lung and liver rodent fibrosis models.

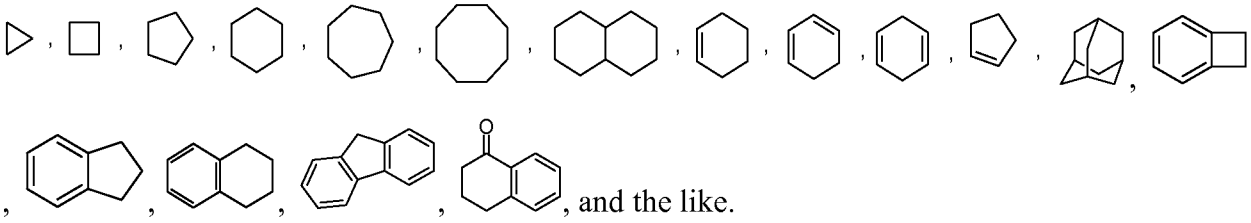
[00159] "Cycloalkyl" or "carbocycle" refers to a stable, non-aromatic, monocyclic or polycyclic carbocyclic ring, which may include fused or bridged ring systems, which is saturated or unsaturated. Representative cycloalkyls or carbocycles include, but are not limited to,

cycloalkyls having from three to fifteen carbon atoms, from three to ten carbon atoms, from three to eight carbon atoms, from three to six carbon atoms, from three to five carbon atoms, or three to four carbon atoms. Monocyclic cycloalkyls or carbocycles include, for example, cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl, and cyclooctyl. Polycyclic cycloalkyls or carbocycles include, for example, adamantyl, norbornyl, decalinyl, bicyclo[3.3.0]octane, bicyclo[4.3.0]nonane, cis-decalin, trans-decalin, bicyclo[2.1.1]hexane, bicyclo[2.2.1]heptane, bicyclo[2.2.2]octane, bicyclo[3.2.2]nonane, and bicyclo[3.3.2]decane, and 7,7-dimethyl-bicyclo[2.2.1]heptanyl. Unless otherwise stated specifically in the specification, a cycloalkyl or carbocycle group may be optionally substituted. Illustrative examples of cycloalkyl groups include, but are not limited to, the following moieties:



[00160] "Fused" refers to any ring structure described herein which is fused to an existing ring structure. When the fused ring is a heterocyclyl ring or a heteroaryl ring, any carbon atom on the existing ring structure which becomes part of the fused heterocyclyl ring or the fused heteroaryl ring may be replaced with a nitrogen atom.

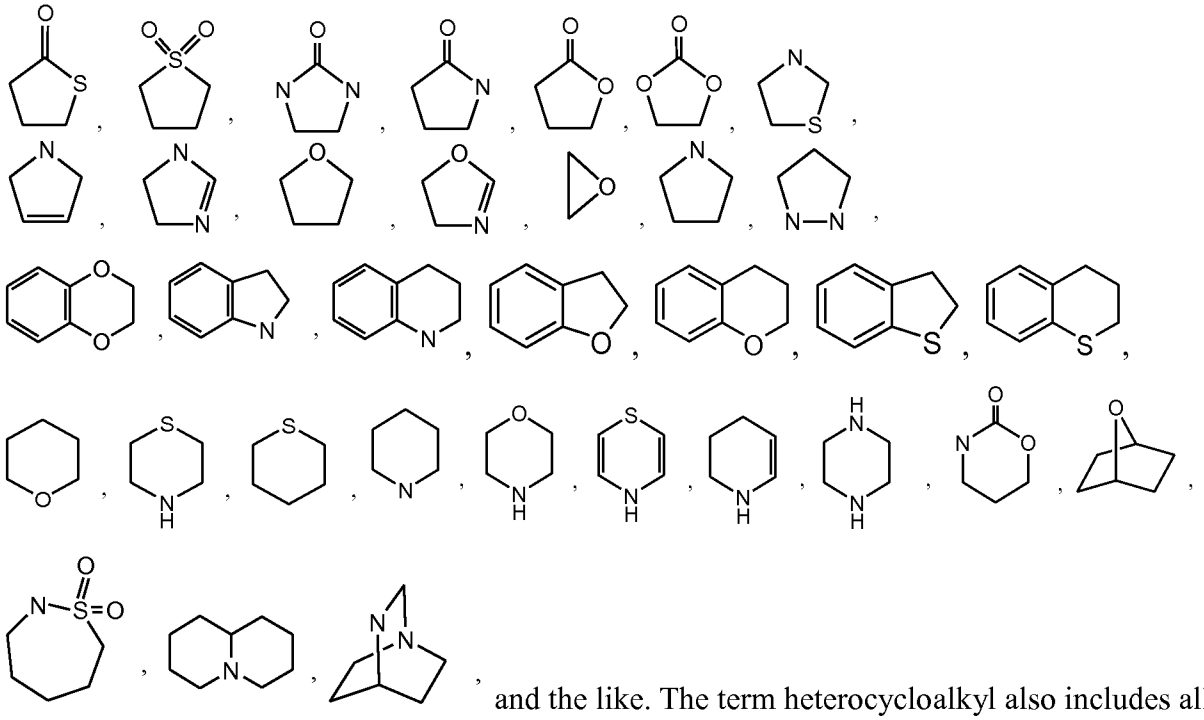
[00161] "Halo" or "halogen" refers to bromo, chloro, fluoro or iodo.

[00162] "Haloalkyl" refers to an alkyl radical, as defined above, that is substituted by one or more halo radicals, as defined above, *e.g.*, trifluoromethyl, difluoromethyl, fluoromethyl, trichloromethyl, 2,2,2-trifluoroethyl, 1,2-difluoroethyl, 3-bromo-2-fluoropropyl, 1,2-dibromoethyl, and the like. Unless stated otherwise specifically in the specification, a haloalkyl group may be optionally substituted.

[00163] "Haloalkoxy" similarly refers to a radical of the formula $-OR_a$ where R_a is a haloalkyl radical as defined. Unless stated otherwise specifically in the specification, a haloalkoxy group may be optionally substituted as described below.

[00164] "Heterocycloalkyl" or "heterocyclyl" or "heterocyclic ring" or "heterocycle" refers to a stable 3- to 24-membered non-aromatic ring radical comprising 2 to 23 carbon atoms and from one to 8 heteroatoms selected from the group consisting of nitrogen, oxygen, phosphorous and sulfur. Unless stated otherwise specifically in the specification, the heterocyclyl radical may be a monocyclic, bicyclic, tricyclic or tetracyclic ring system, which may include fused or bridged ring systems; and the nitrogen, carbon or sulfur atoms in the heterocyclyl radical may be optionally oxidized; the nitrogen atom may be optionally quaternized; and the heterocyclyl

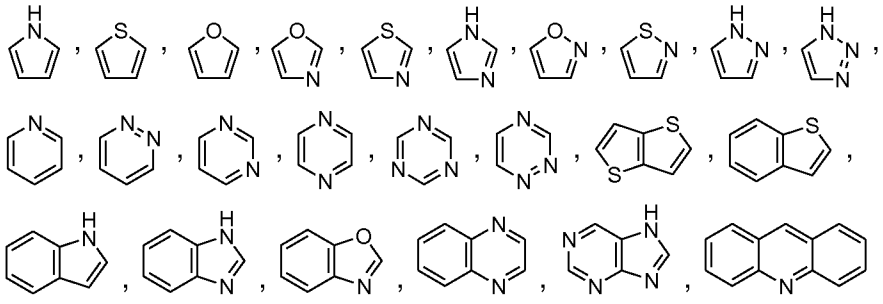
radical may be partially or fully saturated. Examples of such heterocyclyl radicals include, but are not limited to, azetidinyl, dioxolanyl, thienyl[1,3]dithianyl, decahydroisoquinolyl, imidazolinyl, imidazolidinyl, isothiazolidinyl, isoxazolidinyl, morpholinyl, octahydroindolyl, octahydroisoindolyl, 2-oxopiperazinyl, 2-oxopiperidinyl, 2-oxopyrrolidinyl, oxazolidinyl, piperidinyl, piperazinyl, 4-piperidonyl, pyrrolidinyl, pyrazolidinyl, quinuclidinyl, thiazolidinyl, tetrahydrofuryl, trithianyl, tetrahydropyranyl, thiomorpholinyl, thiamorpholinyl, 1-oxo-thiomorpholinyl, 1,1-dioxo-thiomorpholinyl, 12-crown-4, 15-crown-5, 18-crown-6, 21-crown-7, aza-18-crown-6, diaza-18-crown-6, aza-21-crown-7, and diaza-21-crown-7. Unless stated otherwise specifically in the specification, a heterocyclyl group may be optionally substituted. Illustrative examples of heterocycloalkyl groups, also referred to as non-aromatic heterocycles, include:



and the like. The term heterocycloalkyl also includes all ring forms of the carbohydrates, including but not limited to the monosaccharides, the disaccharides and the oligosaccharides. Unless otherwise noted, heterocycloalkyls have from 2 to 10 carbons in the ring. It is understood that when referring to the number of carbon atoms in a heterocycloalkyl, the number of carbon atoms in the heterocycloalkyl is not the same as the total number of atoms (including the heteroatoms) that make up the heterocycloalkyl (i.e. skeletal atoms of the heterocycloalkyl ring). Unless stated otherwise specifically in the specification, a heterocycloalkyl group may be optionally substituted.

[00165] The term "heteroaryl" as used herein, alone or in combination, refers to optionally substituted aromatic monoradicals containing from about five to about twenty skeletal ring atoms, where one or more of the ring atoms is a heteroatom independently selected from among

oxygen, nitrogen, sulfur, phosphorous, silicon, selenium and tin but not limited to these atoms and with the proviso that the ring of said group does not contain two adjacent O or S atoms. In embodiments in which two or more heteroatoms are present in the ring, the two or more heteroatoms can be the same as each another, or some or all of the two or more heteroatoms can each be different from the others. The term heteroaryl includes optionally substituted fused and non-fused heteroaryl radicals having at least one heteroatom. The term heteroaryl also includes fused and non-fused heteroaryls having from five to about twelve skeletal ring atoms, as well as those having from five to about ten skeletal ring atoms. Bonding to a heteroaryl group can be via a carbon atom or a heteroatom. Thus, as a non-limiting example, an imidiazole group may be attached to a parent molecule via any of its carbon atoms (imidazol-2-yl, imidazol-4-yl or imidazol-5-yl), or its nitrogen atoms (imidazol-1-yl or imidazol-3-yl). Likewise, a heteroaryl group may be further substituted via any or all of its carbon atoms, and/or any or all of its heteroatoms. A fused heteroaryl radical may contain from two to four fused rings where the ring of attachment is a heteroaromatic ring and the other individual rings may be alicyclic, heterocyclic, aromatic, heteroaromatic or any combination thereof. A non-limiting example of a single ring heteroaryl group includes pyridyl; fused ring heteroaryl groups include benzimidazolyl, quinolinyl, acridinyl; and a non-fused bi-heteroaryl group includes bipyridinyl. Further examples of heteroaryls include, without limitation, furanyl, thienyl, oxazolyl, acridinyl, phenazinyl, benzimidazolyl, benzofuranyl, benzoxazolyl, benzothiazolyl, benzothiadiazolyl, benzothiophenyl, benzoxadiazolyl, benzotriazolyl, imidazolyl, indolyl, isoxazolyl, isoquinolinyl, indolizinyl, isothiazolyl, isoindolyloxadiazolyl, indazolyl, pyridyl, pyridazyl, pyrimidyl, pyrazinyl, pyrrolyl, pyrazinyl, pyrazolyl, purinyl, phthalazinyl, pteridinyl, quinolinyl, quinazolinyl, quinoxalinyl, triazolyl, tetrazolyl, thiazolyl, triazinyl, thiadiazolyl and the like, and their oxides, such as for example pyridyl-N-oxide. Illustrative examples of heteroaryl groups include the following moieties:



and the like.

[00166] The heteroaryl radical may be a monocyclic, bicyclic, tricyclic or tetracyclic ring system, which may include fused or bridged ring systems; and the nitrogen, carbon or sulfur atoms in the heteroaryl radical may be optionally oxidized; the nitrogen atom may be optionally quaternized. Examples include, but are not limited to, azepinyl, acridinyl, benzimidazolyl,

benzothiazolyl, benzindolyl, benzodioxolyl, benzofuranyl, benzooxazolyl, benzothiazolyl, benzothiadiazolyl, benzo[*b*][1,4]dioxepinyl, 1,4-benzodioxanyl, benzonaphthofuranyl, benzoxazolyl, benzodioxolyl, benzodioxinyl, benzopyranyl, benzopyranonyl, benzofuranyl, benzofuranonyl, benzothienyl (benzothiophenyl), benzotriazolyl, benzo[4,6]imidazo[1,2-a]pyridinyl, carbazolyl, cinnolinyl, dibenzofuranyl, dibenzothiophenyl, furanyl, furanonyl, isothiazolyl, imidazolyl, indazolyl, indolyl, indazolyl, isoindolyl, indolinyl, isoindolinyl, isoquinolyl, indolizinyl, isoxazolyl, naphthyridinyl, oxadiazolyl, 2-oxoazepinyl, oxazolyl, oxiranyl, 1-oxidopyridinyl, 1-oxidopyrimidinyl, 1-oxidopyrazinyl, 1-oxidopyridazinyl, 1-phenyl-1*H*-pyrrolyl, phenazinyl, phenothiazinyl, phenoxazinyl, phthalazinyl, pteridinyl, purinyl, pyrrolyl, pyrazolyl, pyridinyl, pyrazinyl, pyrimidinyl, pyridazinyl, quinazolinyl, quinoxalinyl, quinolinyl, quinuclidinyl, isoquinolinyl, tetrahydroquinolinyl, thiazolyl, thiadiazolyl, triazolyl, tetrazolyl, triazinyl, and thiophenyl (*i.e.*, thienyl).

[00167] All the above groups may be either substituted or unsubstituted. The term "substituted" as used herein means any of the above groups (*e.g,* alkyl, alkylene, alkoxy, aryl, cycloalkyl, haloalkyl, heterocyclyl and/or heteroaryl) may be further functionalized wherein at least one hydrogen atom is replaced by a bond to a non-hydrogen atom substituent. Unless stated specifically in the specification, a substituted group may include one or more substituents selected from: oxo, amino, $-CO_2H$, nitrile, nitro, hydroxyl, thiooxy, alkyl, alkylene, alkoxy, aryl, cycloalkyl, heterocyclyl, heteroaryl, dialkylamines, arylamines, alkylarylamines, diarylamines, trialkylammonium ($-N^+R_3$), N-oxides, imides, and enamines; a silicon atom in groups such as trialkylsilyl groups, dialkylarylsilyl groups, alkyldiarylsilyl groups, triarylsilyl groups, perfluoroalkyl or perfluoroalkoxy, for example, trifluoromethyl or trifluoromethoxy. "Substituted" also means any of the above groups in which one or more hydrogen atoms are replaced by a higher-order bond (*e.g.*, a double- or triple-bond) to a heteroatom such as oxygen in oxo, carbonyl, carboxyl, and ester groups; and nitrogen in groups such as imines, oximes, hydrazones, and nitriles. For example, "substituted" includes any of the above groups in which one or more hydrogen atoms are replaced with $-NH_2$, $-NR_gC(=O)NR_gR_h$, $-NR_gC(=O)OR_h$, $-NR_gSO_2R_h$, $-OC(=O)NR_gR_h$, $-OR_g$, $-SR_g$, $-SOR_g$, $-SO_2R_g$, $-OSO_2R_g$, $-SO_2OR_g$, $=NSO_2R_g$, and $-SO_2NR_gR_h$. In the foregoing, R_g and R_h are the same or different and independently hydrogen, alkyl, alkoxy, alkylamino, thioalkyl, aryl, aralkyl, cycloalkyl, cycloalkylalkyl, haloalkyl, heterocyclyl, *N*-heterocyclyl, heterocyclylalkyl, heteroaryl, *N*-heteroaryl and/or heteroarylalkyl. In addition, each of the foregoing substituents may also be optionally substituted with one or more of the above substituents. Furthermore, any of the above groups may be substituted to include one or more internal oxygen, sulfur, or nitrogen atoms. For example, an alkyl group may be substituted with one or more internal oxygen atoms to form an ether or polyether group.

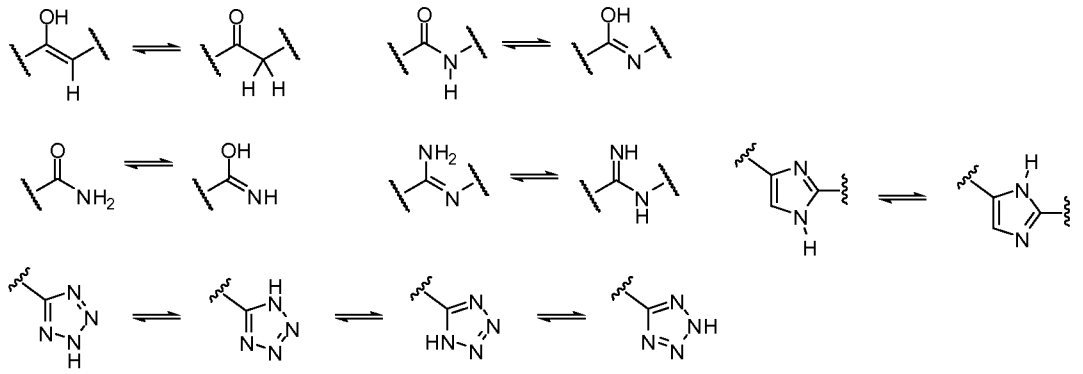
Similarily, an alkyl group may be substituted with one or more internal sulfur atoms to form a thioether, disulfide, etc.

[00168] The term "optional" or "optionally" means that the subsequently described event or circumstance may or may not occur, and that the description includes instances where said event or circumstance occurs and instances in which it does not. For example, "optionally substituted alkyl" means either "alkyl" or "substituted alkyl" as defined above. Further, an optionally substituted group may be un-substituted (e.g., $-CH_2CH_3$), fully substituted (e.g., $-CF_2CF_3$), mono-substituted (e.g., $-CH_2CH_2F$) or substituted at a level anywhere in-between fully substituted and mono-substituted (e.g., $-CH_2CHF_2$, $-CH_2CF_3$, $-CF_2CH_3$, $-CFHCHF_2$, etc). It will be understood by those skilled in the art with respect to any group containing one or more substituents that such groups are not intended to introduce any substitution or substitution patterns (e.g., substituted alkyl includes optionally substituted cycloalkyl groups, which in turn are defined as including optionally substituted alkyl groups, potentially ad infinitum) that are sterically impractical and/or synthetically non-feasible. Thus, any substituents described should generally be understood as having a maximum molecular weight of about 1,000 daltons, and more typically, up to about 500 daltons.

[00169] An "effective amount" or "therapeutically effective amount" refers to an amount of a compound administered to a mammalian subject, either as a single dose or as part of a series of doses, which is effective to produce a desired therapeutic effect.

[00170] "Treatment" of an individual (e.g. a mammal, such as a human) or a cell is any type of intervention used in an attempt to alter the natural course of the individual or cell. In some embodiments, treatment includes administration of a pharmaceutical composition, subsequent to the initiation of a pathologic event or contact with an etiologic agent and includes stabilization of the condition (e.g., condition does not worsen) or alleviation of the condition. In other embodiments, treatment also includes prophylactic treatment (e.g., administration of a composition described herein when an individual is suspected to be suffering from a bacterial infection).

[00171] A "tautomer" refers to a proton shift from one atom of a molecule to another atom of the same molecule. The compounds presented herein may exist as tautomers. Tautomers are compounds that are interconvertible by migration of a hydrogen atom, accompanied by a switch of a single bond and adjacent double bond. In bonding arrangements where tautomerization is possible, a chemical equilibrium of the tautomers will exist. All tautomeric forms of the compounds disclosed herein are contemplated. The exact ratio of the tautomers depends on several factors, including temperature, solvent, and pH. Some examples of tautomeric interconversions include:



[00172] A "metabolite" of a compound disclosed herein is a derivative of that compound that is formed when the compound is metabolized. The term "active metabolite" refers to a biologically active derivative of a compound that is formed when the compound is metabolized. The term "metabolized," as used herein, refers to the sum of the processes (including, but not limited to, hydrolysis reactions and reactions catalyzed by enzymes, such as, oxidation reactions) by which a particular substance is changed by an organism. Thus, enzymes may produce specific structural alterations to a compound. For example, cytochrome P450 catalyzes a variety of oxidative and reductive reactions while uridine diphosphate glucuronyl transferases catalyze the transfer of an activated glucuronic-acid molecule to aromatic alcohols, aliphatic alcohols, carboxylic acids, amines and free sulfhydryl groups. Further information on metabolism may be obtained from The Pharmacological Basis of Therapeutics, 9th Edition, McGraw-Hill (1996). Metabolites of the compounds disclosed herein can be identified either by administration of compounds to a host and analysis of tissue samples from the host, or by incubation of compounds with hepatic cells *in vitro* and analysis of the resulting compounds. Both methods are well known in the art. In some embodiments, metabolites of a compound are formed by oxidative processes and correspond to the corresponding hydroxy-containing compound. In some embodiments, a compound is metabolized to pharmacologically active metabolites.

[00215] Furthermore, in some embodiments, the compounds described herein exist as geometric isomers. In some embodiments, the compounds described herein possess one or more double bonds. The compounds presented herein include all cis, trans, syn, anti, entgegen (E), and zusammen (Z) isomers as well as the corresponding mixtures thereof. In some situations, compounds exist as tautomers. The compounds described herein include all possible tautomers within the formulas described herein. In some situations, the compounds described herein possess one or more chiral centers and each center exists in the R configuration, or S confirguration. The compounds described herein include all diastereomeric, enantiomeric, and epimeric forms as well as the corresponding mixtures thereof. In additional embodiments of the compounds and methods provided herein, mixtures of enantiomers and/or diastereoisomers, resulting from a single preparative step, combination, or interconversion are useful for the applications described herein. In some embodiments, the compounds described herein are prepared as their individual stereoisomers by reacting a racemic mixture of the compound with an optically active resolving agent to form a pair of diastereoisomeric compounds, separating the diastereomers and recovering the optically pure enantiomers. In some embodiments, dissociable complexes are preferred (e.g., crystalline diastereomeric salts). In some embodiments, the diastereomers have

In some embodiments, the diastereomers are separated by chiral chromatography, or preferably, by separation/resolution techniques based upon differences in solubility. In some embodiments, the optically pure enantiomer is then recovered, along with the resolving agent, by any practical means that would not result in racemization.

Certain isotopically-labeled compounds, for example those into which radioactive isotopes such as ^{3}H and ^{14}C are incorporated, are useful in drug and/or substrate tissue distribution assays. Tritiated, i. e., ^{3}H and carbon-14, i. e., ^{14}C, isotopes are particularly preferred for their ease of preparation and detectability. Further, substitution with heavy isotopes such as deuterium, *i.e.*, ^{2}H, produces certain therapeutic advantages resulting from greater metabolic stability, for example increased *in vivo* half-life or reduced dosage requirements. In some embodiments, the isotopically labeled compounds, pharmaceutically acceptable salt, ester, prodrug, solvate, hydrate or derivative thereof is prepared by any suitable method.

[00217] In some embodiments, the compounds described herein are labeled by other means, including, but not limited to, the use of chromophores or fluorescent moieties, bioluminescent labels, or chemiluminescent labels.

[00225] Solvates contain either stoichiometric or non-stoichiometric amounts of a solvent, and, in some embodiments, are formed during the process of crystallization with pharmaceutically acceptable solvents such as water, ethanol, and the like. Solvates of the compounds described herein can be conveniently prepared or formed during the processes described herein. By way of example only, hydrates of the compounds described herein can be conveniently prepared by recrystallization from an aqueous/organic solvent mixture, using organic solvents including, but not limited to, dioxane, tetrahydrofuran or methanol. In addition, the compounds

[00227] Thus, the compounds described herein include all their crystalline forms, known as polymorphs. Polymorphs include the different crystal packing arrangements of the same elemental composition of a compound. In certain instances, polymorphs have different X-ray diffraction patterns, infrared spectra, melting points, density, hardness, crystal shape, optical and electrical properties, stability, and solubility. In certain instances, various factors such as the recrystallization solvent, rate of crystallization, and storage temperature cause a single crystal form to dominate.

Prodrugs

[00228] In some embodiments, the compounds described herein exist in prodrug form. The invention provides for methods of treating diseases by administering such prodrugs. The invention further provides for methods of treating diseases by administering such prodrugs as pharmaceutical compositions.

[00229] Prodrugs are generally drug precursors that, following administration to an individual and subsequent absorption, are converted to an active, or a more active species via some process, such as conversion by a metabolic pathway. Some prodrugs have a chemical group present on the prodrug that renders it less active and/or confers solubility or some other property to the drug. Once the chemical group has been cleaved and/or modified from the prodrug the active drug is generated. Prodrugs are often useful because, in some situations, they are easier to administer than the parent drug. They are, for instance, bioavailable by oral administration whereas the parent is not. In certain insatnces, the prodrug also has improved solubility in pharmaceutical compositions over the parent drug. An example, without limitation, of a prodrug would be a compound as described herein which is administered as an ester (the "prodrug") to facilitate transmittal across a cell membrane where water solubility is detrimental to mobility but which then is metabolically hydrolyzed to the carboxylic acid, the active entity, once inside the cell where water-solubility is beneficial. A further example of a prodrug might be a short peptide (polyamino acid) bonded to an acid group where the peptide is metabolized to reveal the active

moiety. (See for example Bundgaard, "Design and Application of Prodrugs" in *A Textbook of Drug Design and Development*, Krosgaard-Larsen and Bundgaard, Ed., 1991, Chapter 5, 113-191, which is incorporated herein by reference).

[00230] In some embodiments, prodrugs are designed as reversible drug derivatives, for use as modifiers to enhance drug transport to site-specific tissues. The design of prodrugs to date has been to increase the effective water solubility of the therapeutic compound for targeting to regions where water is the principal solvent.

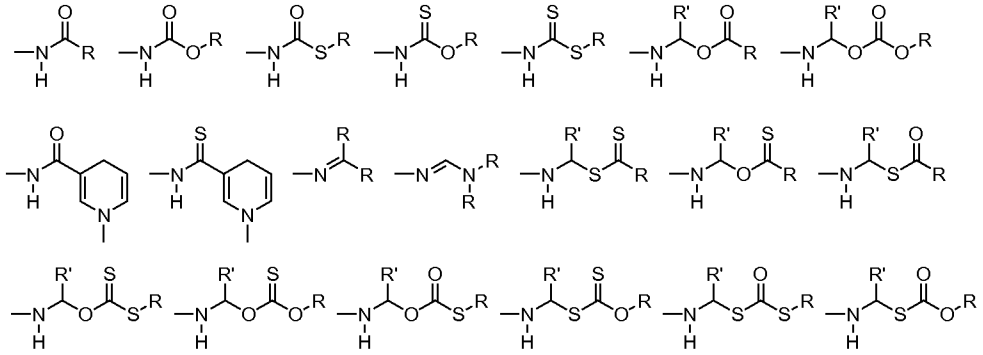
[00231] Additionally, prodrug derivatives of compounds described herein can be prepared by methods described herein are otherwise known in the art (for further details see Saulnier *et al.*, *Bioorganic and Medicinal Chemistry Letters*, **1994**, *4*, 1985). By way of example only, appropriate prodrugs can be prepared by reacting a non-derivatized compound with a suitable carbamylating agent, such as, but not limited to, 1,1-acyloxyalkylcarbanochloridate, *para*-nitrophenyl carbonate, or the like. Prodrug forms of the herein described compounds, wherein the prodrug is metabolized *in vivo* to produce a derivative as set forth herein are included within the scope of the claims. Indeed, some of the herein-described compounds are prodrugs for another derivative or active compound.

[00232] In some embodiments, prodrugs include compounds wherein an amino acid residue, or a polypeptide chain of two or more (e. g., two, three or four) amino acid residues is covalently joined through an amide or ester bond to a free amino, hydroxy or carboxylic acid group of compounds of the present invention. The amino acid residues include but are not limited to the 20 naturally occurring amino acids and also includes 4-hydroxyproline, hydroxylysine, demosine, isodemosine, 3-methylhistidine, norvaline, beta-alanine, gamma-aminobutyric acid, cirtulline, homocysteine, homoserine, ornithine and methionine sulfone. In other embodiments, prodrugs include compounds wherein a nucleic acid residue, or an oligonucleotide of two or more (e. g., two, three or four) nucleic acid residues is covalently joined to a compound of the present invention.

[00233] Pharmaceutically acceptable prodrugs of the compounds described herein also include, but are not limited to, esters, carbonates, thiocarbonates, N-acyl derivatives, N-acyloxyalkyl derivatives, quaternary derivatives of tertiary amines, N-Mannich bases, Schiff bases, amino acid conjugates, phosphate esters, metal salts and sulfonate esters. Compounds having free amino, amido, hydroxy or carboxylic groups can be converted into prodrugs. For instance, free carboxyl groups can be derivatized as amides or alkyl esters. In certain instances, all of these prodrug moieties incorporate groups including but not limited to ether, amine and carboxylic acid functionalities.

[00234] Hydroxy prodrugs include esters, such as though not limited to, acyloxyalkyl (e.g. acyloxymethyl, acyloxyethyl) esters, alkoxycarbonyloxyalkyl esters, alkyl esters, aryl esters, phosphate esters, sulfonate esters, sulfate esters and disulfide containing esters; ethers, amides, carbamates, hemisuccinates, dimethylaminoacetates and phosphoryloxymethyloxycarbonyls, as outlined in *Advanced Drug Delivery Reviews* **1996**, *19*, 115.

[00235] Amine derived prodrugs include, but are not limited to the following groups and combinations of groups:



as well as sulfonamides and phosphonamides.

[00236] In certain instances, sites on any aromatic ring portions are susceptible to various metabolic reactions, therefore incorporation of appropriate substituents on the aromatic ring structures, can reduce, minimize or eliminate this metabolic pathway.

Metabolites

[00237] In some embodiments, compounds of Formula (I) or Formula (II) are susceptible to various metabolic reactions. Therefore, in some embodiments, incorporation of appropriate substituents into the structure will reduce, minimize, or eliminate a metabolic pathway. In specific embodiments, the appropriate substituent to decrease or eliminate the susceptibility of an aromatic ring to metabolic reactions is, by way of example only, a halogen, or an alkyl group.

[00238] In additional or further embodiments, the compounds of Formula (I) or Formula (II) described herein are metabolized upon administration to an organism in need to produce a metabolite that is then used to produce a desired effect, including a desired therapeutic effect.

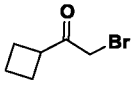
[00366] Compound 78 was prepared by analogy to Compound 75 except that 2-acetylthiazole was used instead of 2-acetylpyridine as the initial starting material. Bromination can be carried out by analogy to the synthesis of the bromoketone precursor of compound 88.

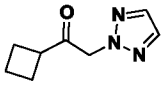
Part E: Synthesis of Compound 88

[00367] Compound 88 is prepared using analogous procedures as those used to prepare Compound 42, substituting cyclobutyl-(N2)triazolyl ketone for Intermediate-14 (Scheme C).

Synthesis of cyclobutyl-(N2)triazolyl ketone



[00368] To a cooled solution of cyclobutyl-methyl ketone (1 equiv) in MeOH was added bromine (1 equiv) dropwise at 0 °C for 30 min. The resulting reaction mixture was stirred at the same temperature for about 2 h, and then at RT for another 30 min. The unreacted bromine was then quenched carefully with the 10 % aqueous solution of $Na_2S_2O_3$. The mixture was then extracted with ether, and washed with $NaHCO_3$ and brine. The combined organic extract was dried over anhydrous $MgSO_4$, filtered, and concentrated to afford the desired bromoketone.



[00369] To the solution of the bromoketone (1.0 equiv) and triazole (1.2 equiv) in ACN was added DIPEA (1.2 equiv). The resulting reaction mixture was then heated to reflux for 1 h. The reaction mixture was concentrated and purified by flash column chromatography to afford the desired cyclobutyl-triazolyl ketone as a pale yellow oil which solidified slowly with time.

[00370] Additional compounds appearing in Table 1 were prepared using procedures analogous to the preceding procedures.

A selective ALK-5 TGF-β1 receptor inhibitor (SB-431542) was used

as a positive control. The 4 day long assay was amenable to screens on the order of 100,000 wells and facilitated the identification of compounds that selectively inhibit fibroblast to myofibroblast transdifferentiation. This assay was used to identify a hit compound (itraconazole) and was used to evaluate focused panels of itraconazole analogues generated from medicinal chemistry efforts.

[00372] The activity of Itraconazole and its analogues was confirmed by analyzing changes in gene expression of multiple genes associated with fibroblast to myofibroblast transdifferentiation using biochemical methods (i.e., Western blot and RT-PCR). These 4-day assays were used to evaluate sets of 6 compounds at a time in 4-point dose response fashion.

[00373] α-SMA assays

[00374] Quiescent rat hepatic stellate cells were seeded in 384 well plates (350 cells per well) coated with Poly-D-lysine in stellate cell medium (Sciencell). After 24 hour incubation, cells were treated with the indicated doses of itraconazole for 48 hours in the presence of 10ng/mL of TGF-β1 in hepatic stellate medium. Following fixation and staining with an anti smooth muscle actin antibody, cell morphology was analyzed with a Cellomics cell insight imaging reader (Figure 1 for representative images). Cells were analyzed for mean cellular area of a-SMA staining (Figure 5a) or mean fluorescence intensity of SMA staining (Figure 5b). In this assay itraconazole reproducibly induced dose dependent decreases in both mean cellular area and alpha smooth muscle actin staining, indicating the inhibition of myofibroblast transdifferentiation and activation.

[00375] Western blot analyses of fibrosis-related proteins in cells exposed to TGFβ and itraconazole (Itra)

[00376] Human lung fibroblasts were seeded at 10^5 cells per well in 6 well dishes in assay medium (2% fetal bovine serum, DMEM). After 24 incubation, medium was changed to assay medium containing TGF-β1 (10ng/mL) and simultaneously treated with itraconazole (10 μM), SB431542 (10μM) or vehicle control (Figure 6). After incubation for 48 hours, cells were harvested by brief trypsinization and centrifugation. Cells were lysed in Cell Lytic M (Sigma) and lysate concentrations normalized via absorption readings at 260nm. Samples were boiled in 2X sample buffer and 10% beta-mercaptoethanol. Three micrograms of lysate were loaded into each gel lane and then separated by SDS-PAGE on 10% Bis-Tris gels and then transferred via semi dry transfer to PVDF membranes. After blocking in 5% milk in TRIS buffered saline with Tween-20 (0.1%), membranes were exposed to appropriate primary antibodies. Blots were incubated with HRP- conjugated secondary antibodies and visualized using film and SuperSignal West Dura Chemiluminescent Substrate (Pierce). In this assay itraconazole reproducibly induced

dose dependent decreases in levels of induced alpha smooth muscle actin protein levels, indicating the inhibition of myofibroblast transdifferentiation and activation.

[00377] Gene expression analysis of human lung fibroblasts treated with itraconazole

[00378] Human lung fibroblasts were seeded at 10^5 cells per well in 6 well dishes in assay medium (2% fetal bovine serum in DMEM). After 24 hours, medium was changed to assay medium containing TGF-β1 (10ng/mL) and itraconazole (500nM). After 48 hours of incubation at 37C, cells were harvested by brief trypsinization and centrifugation. RNA was extracted using RNeasy kit (Qiagen) and cDNA amplified using SuperScript III First-Strand Synthesis kit (Life Technologies). qPCRs reactions were then performed using a fibrosis focused RT2 Profiler PCR Array kit with supplied plate and reagents. Data was analyzed using N=1 per reaction per treatment condition. Data was expressed as fold regulation relative to a sample not treated with TGF-β1 (Figure 7a). Raw data from the fibrosis focused RT2 Profiler PCR Array is shown in Figure 7b. In this assay itraconazole reproducibly induced dose dependent changes in multiple fibrosis-related genes, indicating the inhibition of myofibroblast transdifferentiation and activation.

[00379] Anti-fibrotic activity of itraconazole and analogs thereof did not result from P450 inhibition associated with anti-fungal activity. Itraconazole inhibited VEGF and Hedgehog pro-fibrotic signaling pathways.

[00380] qPCR analysis of Hedgehog related genes in rat hepatic stellate cells treated with itraconazole

[00381] Rat hepatic stellate cells were seeded at 10^5 cells per well in 6 well dishes coated with poly-D-lysine in stellate cell medium (Sciencell) and allowed to proliferate to full confluence (~2 weeks). Medium was then switched to DMEM and 0.5% fetal bovine serum with 1 ug/mL SHH-N (R&D systems). Cells were treated with SHH-N and compounds (cyclopamine 5μM (positive control), itraconazole 1μM) for 24 hours. Cells were harvested by brief trypsinzation and centrifugation. RNA was extracted using RNeasy kit (Qiagen) and cDNA amplified using SuperScript III First-Strand Synthesis kit (Life Technologies). qPCR was performed using a SYBR green mastermix (Takara). Relative levels of PTCH1 (protein patched homolog 1) and GLI1 (GLI family zinc finger 1) mRNA (see Figures 8a and 8b; raw data for both qPCR experiments is shown in Figure 8c) indicated that itraconazole inhibits Hedgehog signaling in rat hepatic stellate cells.

[00382] Western blot analyses of COL1-GFP HSCs after knockdown of Smoothened

[00383] COL1-GFP HSCs (an immortalized mouse hepatic stellate cell line with GFP knocked into the collagen locus) were plated at 7.5^5 cells per well in assay medium (10% fetal bovine serum , DMEM). After 24 hours, cells were transduced with lentiviral particles. After 24 hours of

incubation with viral particles, cells were switched to fresh assay medium and incubated for 48 hours. Cells were lysed in Cell Lytic M (Sigma) and lysate concentrations normalized via absorption readings at 260nm. Samples were boiled in 2X sample buffer and 10% beta-mercaptoethanol. Equal amounts of lysate were loaded into each gel lane and then separated by SDS-PAGE on 10% Bis-Tris gels and then transferred via semi dry transfer to PVDF membranes. After blocking in 5% milk in TRIS buffered saline with Tween-20 (0.1%), membranes were exposed to appropriate primary antibodies. Blots were incubated with HRP-conjugated secondary antibodies and visualized using film and SuperSignal West Dura Chemiluminescent Substrate (Pierce); see Figure 9. Constructs for lentivirally delivered shRNAs were obtained from Sigma as MISSION glycerol stocks. Lentiviruses were packaged using 293T cells and packaging vectors pMD2.G and pSPAX2. Clones 71, 12, and 95 correspond to shRNAs to SMO and pLKO is plasmid SCH002 which encodes a non-targeting shRNA. shRNA mediated knockdown of SMO and the resultant inhibition of Hedgehog signaling in rat hepatic stellate cells partially recapitulated the anti-fibrotic activity of itraconazole.

[00384] Western blot analysis of VEGFR2 migration pattern after treatment with itraconazole

[00385] Quiescent rat hepatic stellate cells were seeded at 10^5 cells per well in 6 well dishes coated with Poly-D-Lysine in stellate cell medium (Sciencell). After 24 hour incubation, cells were then treated with various doses of itraconazole for 24 hours. Cells were harvested by brief trypsinization and centrifugation. Cells were lysed in Cell Lytic M (Sigma) and lysate concentrations normalized via absorption readings at 260nm. Samples were boiled in 2X sample buffer and 10% beta-mercaptoethanol. Equal amounts of lysate were loaded into each gel lane and then separated by SDS-PAGE on 10% Bis-Tris gels and then transferred via semi dry transfer to PVDF membranes. After blocking in 5% milk in TRIS buffered saline with Tween-20 (0.1%), membranes were exposed to appropriate primary antibodies. Blots were incubated with HRP- conjugated secondary antibodies and visualized using film and SuperSignal West Dura Chemiluminescent Substrate (Pierce); see Figure 10. Itraconazole inhibited VEGFR2 glycosylation and trafficking, thereby causing an inhibition of pro-fibrotic VEGF signaling in rat hepatic stellate cells.

[00386] Western blot analysis of rat hepatic stellate cells treated with combinations of VEGFR and Hedgehog inhibiting compounds

[00387] Quiescent rat hepatic stellate cells were seeded at 10^5 cells per well in 6 well dishes coated with Poly-D-Lysine in stellate cell medium (Sciencell). After 24 hour incubation, cells were switched to stellate cell medium containing 10ng/mL TGF-β1 and the indicated combinations of compounds. After 48 hours of treatment, cells were harvested by brief

trypsinization and centrifugation. Cells were lysed in Cell Lytic M (Sigma) and lysate concentrations normalized via absorption readings at 260nm. Samples were boiled in 2X sample buffer and 10% beta-mercaptoethanol. Three micrograms of lysate were loaded into each gel lane and then separated by SDS-PAGE on 10% Bis-Tris gels and then transferred via semi dry transfer to PVDF membranes. After blocking in 5% milk in TRIS buffered saline with Tween-20 (0.1%), membranes were exposed to appropriate primary antibodies. Blots were incubated with HRP- conjugated secondary antibodies and visualized using film and SuperSignal West Dura Chemiluminescent Substrate (Pierce); see Figure 11. Pharmacological inhibition of either VEGF or Hedgehog signaling in rat hepatic stellate cells partially recapitulated the anti-fibrotic activity of itraconazole or analogs thereof. Dual pharmacological inhibition of VEGF and Hedgehog signaling in rat hepatic stellate cells recapitulated the anti-fibrotic activity of itraconazole.

[00388] Activity of itraconazole and compound 42 in a hedgehog reporter assay

[00389] TM3-GLI-LUC cells (stable clone of mouse TM3 cells expressing Gli-Luc reporter) were harvested and then seeded at 5,000 cells per well in 384 well plates in 40uL of assay medium (DMEM:F12 and 2% fetal bovine serum). Compounds were dissolved in DMSO in serial dilutions and transferred to the assay plates using a 100nL pintool head on a Biomek automated workstation. After transfer of compounds, 10uL of assay medium containing the small molecule hedgehog agonist SAG was added such that the final assay concentration of SAG was 10nM or 400nM. Assay plates were incubated for 48 hours before using Bright-Glo reagents to determine luminance signals on an Envision plate reader. Relative GLI-LUC activity of TM3-GLI-LUC cells exposed to 10nM SAG and indicated doses of inhibitor are shown in Figure 12a. Relative GLI-LUC activtity of TM3-GLI-LUC cells exposed to 400nM SAG and indicated doses of inhibitor are shown in Figure 12b. N=3 per dose. Itraconazole and analogs thereof inhibited pro-fibrotic Hedgehog signaling in rat hepatic stellate cells.

[00390] Western blot analyses of LX2 human hepatic stellate cells after knockdown of VEFGR1, VEGFR2, or SMO.

[00391] LX2 cells (an immortalized human hepatic stellate cells line, Scot Friedman lab) were plated at 10^5 cells per well in assay medium (10% fetal bovine serum , DMEM). After 24 hours, cells were transduced with lentiviral particles. After 24 hours of incubation with viral particles, cells were switched to fresh assay medium and incubated for 48 hours. Cells were lysed in Cell Lytic M (Sigma) and lysate concentrations normalized via absorption readings at 260nm. Samples were boiled in 2X sample buffer and 10% beta-mercaptoethanol. Equal amounts of lysate were loaded into each gel lane and then separated by SDS-PAGE on 10% Bis-Tris gels and then transferred via semi dry transfer to PVDF membranes. After blocking in 5% milk in TRIS buffered saline with Tween-20 (0.1%), membranes were exposed to appropriate primary

antibodies. Blots were incubated with HRP- conjugated secondary antibodies and visualized using film and SuperSignal West Dura Chemiluminescent Substrate (Pierce); see Figure 13. Constructs for lentivirally delivered shRNAs were obtained from Sigma as MISSION glycerol stocks. Lentiviruses were packaged using 293T cells and packaging vectors pMD2.G and pSPAX2. Clone 65 corresponds to a shRNA targeting SMO, 31 and 32 correspond to a shRNA targeting VEGFR1, clones 86 and 87 correspond to a shRNA targeting VEGFR2, and pLKO is plasmid SCH002 which encodes a non-targeting shRNA. Genetic knockdown of VEGF and Hedgehog signaling in human stellates cells inhibited pro-fibrotic myofibroblast activation and partially recapitulated the anti-fibrotic activity of itraconazole and analogs thereof.

Cyp reversible inhibition assay

[00393] The purpose of this assay was to determine reversible inhibition of Cyp enzyme with a given compound using a substrate probe turnover as the surrogate for inhibition. This was done with human liver microsomes rather an isolated enzyme to account for metabolites of parent drug leading to a potential drug-drug interaction through Cyp inhibition. The substrate turnover (for example conversion of midazolam to hydroxyl midazolam) was monitored by LCMSMS (Q1/Q2 = 342.2/203.2). Test compounds were tested in a 7-point dose response curve starting from 50 μM to 50 nM (~3-fold dilution series). For Cyp 3A4, the positive control compound was ketoconazole with an IC_{50} ~ 25 nM.

[00394] The detailed protocol was as follows:

- Prepared test compounds and standard inhibitors working solution (100×).
- Pulled microsomes out of the –80°C freezer to thaw on ice, labeled with the date and put back to freezer immediately after using.
- Added 20 μL of the substrate solutions to corresponding wells.
- Added 20 μL PB to Blank wells.
- Added 2 μL of the test compounds and positive control working solution to corresponding wells.
- Added 2 μL MeOH to No Inhibitor wells and Blank wells.
- Prepared HLM working solution.
- Added 158 μL of the HLM working solution to all wells of incubation plate.
- Pre-warmed the plate for about 10 min at 37°C water bath.
- Prepared NADPH cofactor solution.
- Added 20 μL NADPH cofactor to all incubation wells.
- Mixed and incubated for 10 minutes at 37°C water bath.
- At the time point, terminated the reaction by adding 400 μL cold stop solution (200 ng/mL Tolbutamide in ACN).
- Centrifuged the samples at 4000 rpm for 20 minutes to precipitate protein.

- Transferred 200 µL supernatant to 200 µL HPLC water and shook for 10 min.
- Analyzed samples by LC/MS/MS.

[00395] Compound data obtained by this assay are shown in Table 2.

Cyp time-dependent inhibition (TDI) assay

[00396] The purpose of this assay was to ascertain the ability for compounds to form irreversibly inhibited cytochrome P450 adducts (also known as mechanism-based inhibition (MBI)) in human liver microsomes. Compared to competitive CYP inhibition, it has been recognized that MBI is a much greater concern in drug discovery and development, because

inactivation of CYPs can lead to non-linear pharmacokinetics and underestimate drug-drug interaction potential. The data from this assay was used in conjunction to the reversible inhibition assay. The TDI assay was generally performed in liver microsomes to assess TDI potential of parent drug as well as metabolites. The readout was an IC_{50} shift with NADPH (the inactivation/TDI set) to allow for compound to be converted to a reactive species and without NADPH (control set to correct for protein degradation during pre-incubation of 20 minutes). Then both incubation sets were diluted with fresh assay buffer containing NADPH Cyp specific substrates (midazolam for Cyp3A4) and inhibition of midazolam hydroxylation was measured by LC-MS/MS (Q1/Q2 = m/z 342.2/203.2). An IC_{50} shift > 1.5-fold was considered to be positive for time dependent inhibition where the 20 min pre-incubation leads to an increase in potency. Troleandomycin was used as a positive control compound, exhibiting a TDI IC_{50} shift of >20. Test compounds were tested in a 7-point dose response curve starting from 50 μM to 50 nM (~3-fold dilution series).

[00397] The detailed protocol was as follows:

- Prepared test compounds and positive control working solution (100×) in 1:1 DMSO/MeOH
- Pulled microsomes out of the –80°C freezer to thaw.
- Prepared incubation mix and added 147.5 μL to all wells of incubation plate.
- Prepared cofactor solution and substrate dilution solution.
    - Added 2.5 μL of the test compounds and positive control working solution to corresponding wells. Final compound concentrations in 7-point dose response from 50 μM to 50 nM
    - Added 2.5 μL 1:1 DMSO/MeOH to NIC wells
- Pre-warmed the plate for about 10 min at 37°C.
- Added 50 μL cofactor to pre-incubation wells
- Added 50 μL substrate dilution solution to incubation wells.
- Mixed and pre-incubated for 20 minutes at 37°C water bath.
- Added 50 μL cofactor to incubation wells;
    - Added 50 μL substrate dilution solution to pre-incubation wells.
- Mixed and incubated for 5 minutes at 37°C water bath.
- At the time point, terminated the reaction by adding cold 250 μL IS-fortified stop solution to all wells.
- Centrifuged the incubation plate at 4000 rpm for 20 min.
- Transferred 200 μL supernatant into 200 μL HPLC water and shook for 10 min.

- Analyzed samples by LCMS.

[00398] Compound data obtained from this assay are shown in Table 3.

PXR (Cyp 3A4) activation assay

[00399] CYP3A4 metabolism was evaluated by using P450--Glo™ CYP3A4 Assay with Luciferin--IPA as the substrate of CYP3A4 and represented as RLU (Relative Luminescence Units). PXR activation was evaluated by using a luciferase detection reagent, ONE--Glo™ and represented as RLU. The luminescence light intensity was directly proportional to the extent of PXR activation and accompanying gene transcription in the DPX2 cells. Compounds were tested at 10, 1, and 0.1 μM in the assay. Fold of induction = (RLU/RFU of compound treated sample)/ (RLU/RFU of vehicle treated sample), RFU was the signal of cell viability. RLU was the signal of CYP3A metabolism and PXR activation. 0.1% DMSO was used as vehicle. Cell viability was detected by using CellTiter--FluorTM and represented as RFU (Relative Fluorescence Units).

[00400] Activation potency was defined as negative, weak, moderate and strong. Negative, weak, moderate and strong activators are those that give < 15%, <40%, <69% and >70%, respectively, of the response produced by 10 μM RIF at 10 μM.

[00401] Compound data obtained from this assay are shown in Table 4.

Candida albicans anti-fungal MIC potency determination

[00402] The wild type *Candida albicans* (ATCC 10231) was used and Fluconazole, amphotericin B, itraconazole and terbinafine were purchased from Sigma and used as positive controls.

[00403] The highest assay concentration for all test compounds and fluconazole was 100 μM. Fluconazole was also tested at the highest concentration of 64 μg/ml, and amphotercin B and terbinafine at 16 and 64 μg/ml. The test compounds were in DMSO stock solution at a concentration of 10 mM. Two stock solutions in DMSO were prepared for fluconazole at 10 mM and 6.4 mg/ml. Amphotericin B and terbinafine stock solutions in DMSO were prepared at 1.6 and 6.4 mg/ml.

[00404] Serial dilution of 100X stock solutions: 4 μl of stock solution was added into 196 μl of RPMI1640 (MOPS buffered and free of HEPES and sodium bicarbonate) in the first well of a row of a sterile u-bottom 96-well plate. The rest of the wells was filled with 100 μl RPMI1640. The 2-fold serial dilution was made sequentially by transferring 100 μl solution to the next well and mixing by pipetting, until 11th well. The extra 100 μl in 11th well was discarded. Therefore, the compound wells contained 100 μl of 2× of testing concentrations of drugs in RPMI1640. The 12th well was filled with only 100 μl RPMI1640.

[00405] *C. albicans* 3147 (ATCC 10231) glycerol frozen stock was streaked on Sabouraud dextrose agar (SDA). The plate was incubated at 35°C ambient atmosphere for 20 h. Single colonies were suspended into sterile saline until turbidity reached 0.1 (1-5×106 CFU/ml) using a Siemens turbidity meter. This suspension was diluted 50× in RPMI1640 in a 15 ml conical, and then it was further diluted 20× in RPMI1640 in a 50 ml conical. This gave 1-5×103 CFU/ml suspension and was used as inoculum. The cell density in inoculum was plate-counted to be 4.94×103 CFU/ml.

[00406] MIC determination: Within 15 min, 100 μl of prepared bacterial inoculum was added into each well of compound/RPMI1640-containing plate. The plates were incubated at 35°C in ambient atmosphere. The photos were taken at 24 h and 48 h. The MIC end points for fluconazole and amphotericin B were read according to the M27-A3 protocol (Reference Method for Broth Dilution Antifungal Susceptibility Testing of Yeasts; Approved Standard-Third Edition, M27-A3 standard published 01/01/2008 by Clinical and Laboratory Standards Institute). The MIC for compounds for test cmpds and terbinafine (not mentioned in M27-A3 protcol) were read as if they were azoles.

[00407] Data for compounds tested in this assay are shown in Table 5.

Mouse pharmacokinetic (PK) studies

[00408] Compounds with suitable *in vitro* ADME properties were progressed to *in vivo* PK studies. A snapshot format in mice was used to quickly assess the potential for lead candidates to be orally bioavailable. The snapshot format involved a single dose (typically 20 mg/kg) given orally in a standard vehicle (5% PEG/DMSO in water for example). Compounds were infused directly into MS analysis to determine unique MRM (multiple reaction monitoring) signal that is concentration dependent in either ESI positive or negative modes. HPLC analysis using various solvent gradients was performed from organic and aqueous solution to ensure good peak shape of desired Q1/Q2 masses. Formulations included 45% Cyclodextrin in water (as is used clinically for Itraconazole). Other formulations that may used are solutol, Eudragit, MC/Tween, etc. Standard curves were generated using plasma spiked with compound at various concentrations (10 ng/mL to 2000 ng/mL) to determine linear range of Q1/Q2 mass signal to compound concentration using female mouse heparinized plasma. Mice were dosed orally with compound, plasma samples collected by retro-orbital bleeds. Five time points were collected (30 min, 1 h, 4 h, 8 h, 24h) into heparinized collection tubes. Protein precipitation was performed and compound extracted in cold acetonitrile and analyzed by MS. Nonwinlin was used for PK modeling as needed.

[00409] Study results are presented in Table 6.

EXAMPLE II: Animal Models

[00410] To demonstrate *in vivo* anti-fibrotic activity, carbon tetrachloride (CCl_4) induced liver and bleomycin induced lung and skin rodent fibrosis models were established. These *in vivo* assays took 6-8 weeks to complete (including full histological analysis). Typical experiments consisted of groups of 6-8 animals treated with itraconazole (2-4 doses), 1 or 2 itraconazole analogues (2-4 doses), vehicle, and benchmark treatments (pirfenidone and AM-152). AM-152 (Amira Pharmaceuticals) is an LPA1 (Lysophosphatidic acid 1) receptor antagonist. This target has been described as relevant to exacerbation of IPF systems in a mouse bleomycin model (British Journal of Pharmacology (2010), 160, 1699–1713). AM-152 is an advanced compound on this target as has been previously described in more detail in WO 2012/078805 and was used as a positive control and comparator to the compound disclosed in this application.

[00411] Bleomycin-induced lung fibrosis model

[00412] Nine-week old B6 male mice (Taconic farms) were surgically implanted with osmotic pumps delivering 25mg/kg bleomycin for seven days. 17 days after surgery mice were treated with drug for 2 weeks. Drug treatments were administered as described in study design (Figure 14). Previously described anti-fibrotic drugs AM-152 and pirfenidone were used as positive control drugs. Lung sections were stained with Masson's trichrome and following scanning, eight random fields were taken per animal for analysis. Data are represented as mean and s.e.m. (Figure 15a). A graphical representation of model used to evaluate anti-fibrotic drugs is shown in Figure 15b. Representative images of Masson's trichrome stained lung from indicated treatment groups are shown in Figure 15c. Stained lung sections were analyzed according to a modified

Ashcroft scoring system (Figure 16) and using an unbiased automated image analysis method. Total Masson's trichrome stained area was generated using an automated image analysis macro in ImageJ. Each image was then converted to an RGB stack, and the threshold for stained area was set such that only lung tissue was included in the analysis while empty spaces such as respiratory ducts and alveoli were excluded. Total stained area was then determined by using the area measurement function within ImageJ. Mean Ashcroft scores and mean percent stained area values indicated that itraconazole and analogs thereof dose dependently decreased lung fibrosis disease severity in this model (Figures 17a and 17b). At a dose of 10 mg/kg (SID), compound 42 decreased lung fibrosis disease severity with efficacy that was as good or better when compared to control compounds AM-152 (30 mg/kg BID) and pirfenidone (400 mg/kg, BID).

[00413] Carbon tetrachloride-induced liver fibrosis model

[00414] Drug treatments were administered as described in study design (Figure 18). Liver sections were stained with Sirius Red solution. After scanning, 5 random images per animal were generated. Total percent area positive for Sirius Red staining was generated using an automated image macro in Image J. Briefly, each image was converted to a RGB stack, and the threshold for stained area was set such that no nuclei were included in the analysis. Total red area was quantitatively determined by using the area measurement function within ImageJ (Figure 19a). Numerical data of the image analysis of the CCl_4-induced liver fibrosis model is shown in Figure 19b. Representative images of Sirius Red stained liver sections of the CCl_4-induced liver fibrosis model are shown in Figure 19c. Levels in alpha smooth muscle actin (αSMA) livers were analyzed by western blot (Figure 19d). Pieces of liver from the CCl_4 -induced liver fibrosis model were homogenized in PBS with a homogenizer and steel balls. Debris was discarded by centrifugation and lysate concentrated determined by Nanodrop absorbance measurements at 260nm. Equal amounts of lysate were loaded into each gel lane and then separated by SDS-PAGE on 10% Bis-Tris gels and then transferred via semi dry transfer to PVDF membranes. After blocking in 5% milk in TRIS buffered saline with Tween-20 (0.1%), membranes were exposed to appropriate primary antibodies. Blots were incubated with HRP-conjugated secondary antibodies and visualized using film and SuperSignal West Dura Chemiluminescent Substrate (Pierce). Siruis red staining and western blot analysis indicated that itraconazole dose dependently decreased liver fibrosis disease severity.

[00415] Rodent wound healing model

[00416] The effect of itraconazole and analogs thereof on normal wound healing was evaluated using a standard rodent wound healing model (study design shown in Figure 20; results in Figure 21). Five days prior to the initiation of the model, mice were anesthetized and the back skin hair was removed using Nair. On day 1, mice were weighed and one sterile biopsy punch (5 mm

diameter) was made by punching through the full thickness of the folded back skin (2 x 5 mm dial holes in total). The size of the wounds was measured daily using calipers. Body weight was monitored twice a week thoughout the study. On day 1and until the end of the study, drug treatment (25 mg/kg, SID of itraconazole, 25 mg/kg SID compound 42 or vehicle) was administered daily using 5ml/kg dosing volume. On days 7, 11 and 14, animals were euthanized from each group and wounds were collected for histological analysis. When collecting the wounds, wounds were cut out including a few mm of the surrounding skin. For each animal, two pieces of wound were collected and fixed for histology analysis. Itraconazole and compound 42 had no effect on tissue architecture or rates of normal wound healing compared to vehicle controls, based on histological analysis and daily caliper measurements.

EXAMPLE III: Phase II Clinical Study for scleroderma

[00417] A phase II placebo controlled randomized double blind clinical trial demonstrates Proof of Concept for an optimized anti-fibrotic itraconazole analogue in patients with diffuse cutaneous scleroderma or systemic scleroderma with diffuse cutaneous involvement. Patients that satisfy the enrollment criteria make up two equal groups of 30. The experimental arm is given a single high dose of drug every day for 6 months and the placebo comparator arm will be given placebo every day for 6 months. The single high dose of drug is determined based on preclinical efficacy, target engagement in a preclinical cynomolgus toxicology study and a phase I safety study. The primary outcome measure is a comparison of the efficacy of drug vs placebo based on percent variation in m-RSS (score 0-51, 17 site) between inclusion and monthly visits. Secondary outcome measures are a comparison of efficacy of drug vs placebo based on variation in m-RSS between inclusion and follow-up time points (1, 3 and 6 months); assessment of target engagement as determined by expression profiling of hedgehog and VEGFR target genes using skin biopsies obtained at inclusion and at 6 months; assessment of skin thickness at inclusion and 6 months using skin biopsies; assessment of treatment of non-cutaneous symptoms in systemic scleroderma patients; assessment of quality of life using a health assessment questionnaire and the Dermatology Quality of Life Index; and assessment of tolerance of treatment using clinical and laboratory monitoring of side effects (including assessment of signs of negative inotropic effects using cardiac ultrasound). Successful Proof of Concept will be established if >40% of patients have m-RSS improvement (defined as decline in m-RSS of ≥5.3 units between baseline and last study visit at 6 months).

[00418] The precise target patient population consists of patients diagnosed with diffuse (or severe) cutaneous scleroderma (modified Rodnan skin score, m-RSS ≥16/51). Patients diagnosed with localized diffuse cutaneous scleroderma or systemic scleroderma with diffuse

cutaneous involvement, as defined by the American College of Rheumatology, are the known patient subsets.

[00419] Inclusion and exclusion criteria for patient recruitment of a phase II proof of concept study are as follows. Patients will be 18 years of age or older with documented diagnosis of cutaneous or systemic scleroderma. A baseline m-RSS of ≥16/51 indicative of diffuse cutaneous scleroderma is required. A pre-inclusion cardiac ultrasound ejection fraction score of more than 55% (i.e., normal) is required for inclusion. Patients will be excluded if they have been treated with a drug (e.g., methotrexate, corticosteroids, cyclophosphamide, bosentan) that has the potential to interfere with the course of disease within a 3 month period prior to the start of the trial. Patients suffering from severe organ failure, chronic liver disease (e.g., liver cirrhosis, chronic hepatitis), cancer, chronic illness (e.g., rheumatoid arthritis, systemic lupus erythematosus, diabetes, HIV) or having anomalous blood chemistry will be excluded. Patients having had major surgery less than 4 weeks before inclusion will be excluded. Patients contraindicated to itraconazole, as specified in product specifications, will be excluded. Specifically, patients with evidence of ventricular dysfunction (e.g., congestive heart failure, CHF), at risk of CHF or having been treated with inotropic drugs will be excluded. Patients having suffered myocardial infarction less than 6 months prior to inclusion will be excluded.

[00420] Patients included in a phase II proof of concept study are identified and selected for treatment in collaboration with dermatology clinicians at multiple sites within the United States. A coordinating investigator that is a member of the Scleroderma Clinical Trials Consortium oversees patient recruitment and serves as the study chair. Patients are diagnosed with localized diffuse cutaneous scleroderma or systemic scleroderma with diffuse cutaneous involvement. Patients are stratified based on scleroderma diagnosis (i.e., localized or systemic), sex and age to ensure equal distribution within treatment populations. Additionally, patients are stratified based on the severity of cutaneous involvement to ensure an equal number of patients with severe cutaneous involvement (m-RSS ≥ 20/51) within treatment populations. This stratification requires an initial diagnostic test involving cutaneous induration scale and skin biopsy. Patients are required to undergo a cardiac ultrasound diagnostic test prior to inclusion to ensure normal heart function (ejection fraction score >55%).

[00421] As there is currently no treatment indicated directly to inhibit fibrosis in scleroderma patients, there is no comparator agent to be used in studies of patients. The new agent is dosed alone. Patients taking any medication are monitored to ensure that the new agent does not alter the pharmacokinetic and metabolism properties of the medication being taken.

[00422] The modified Rodnan skin score (m-RSS) is an identified, measurable and validated biomarker used to evaluate clinical efficacy in scleroderma patients. Briefly, total skin surface is

arbitrarily divided into 17 sites. In each area, manual palpitation is used to asses a skin score. The skin score varies from 0-3 based on degree of skin thickening (0, uninvolved; 1, mild; 2, moderate; 3, severe). The total skin score is the of sum scores from each of the 17 areas (maximum score of 51). Patients having a score of between 16 and 19 are classified as diffuse and those having a score of ≥20 are classified as severe. This skin scoring system has been demonstrated to correlate very well with the extent of dermal fibrosis and also correlates well with the extent of fibrosis/dysfunction in internal organs (in systemic scleroderma patients). Target engagement in skin can be assessed by monitoring changes in expression of hedgehog and VEGFR target genes using skin biopsies.

EXAMPLE IV: Phase II Clinical Study for Idiopathic Pulmonary Fibrosis

[00423] The purpose of this study is to determine the safety and efficacy of compound of formula (I) and formula (II) for the treatment of idiopathic pulmonary fibrosis, compared with placebo. The clinical trial is interventional. The allocation of the clinical study participants is randomized; the intervention model is parallel assignment; and there is a double blind masking of the study (subject, caregiver, investigator). The present clinical study primarily measures the rate of change of forced vital capacity, and secondarily measures the safety based on AEs, vital signs and clinical laboratory tests.

[00424] The inclusion criteria for patient recruitment are as follows:

- Both genders between the ages of 40 and 80 years, inclusive, at randomization.
- Have clinical symptoms consistent with Idiopathic Pulmonary Fibrosis (IPF).
- Have first received a diagnosis of IPF at least 6 months and no more than 48 months before randomization. The date of diagnosis is defined as the date of the first available HRCT or surgical lung biopsy consistent with IPF/UIP.

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.

2. ☐ As all searchable claims could be searched without effort justifying additional fees, this Authority did not invite payment of additional fees.

3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

☐ The additional search fees were accompanied by the applicant's protest and, where applicable, the payment of a protest fee.

☐ The additional search fees were accompanied by the applicant's protest but the applicable protest fee was not paid within the time limit specified in the invitation.

☐ No protest accompanied the payment of additional search fees.

纤维化的小分子抑制剂

相关申请的交叉引用

[0001] 本申请要求 2013 年 6 月 7 日提交的美国专利申请号 61/832,768 的权益，其通过引用全文并入本文。

背景技术

[0002] 纤维化，通常被定义为过量结缔组织的产生，是由于多种潜在疾病而发生的。慢性炎症或组织损伤 / 重塑是典型的诱发纤维化的事件。具体的疾病实例包括特发性肺纤维化 (IPF)、与酒精性和非酒精性肝硬化的后期相关的肝纤维化、肾纤维化、心脏纤维化以及由异常创伤愈合导致的瘢痕疙瘩形成 [Wynn, T. A. (2004) Nature Reviews Immunology. 4:583-594 ; Friedman, S. L. (2013) Science Translation Medicine. 5(167):1-17]。另外，纤维化是与慢性自身免疫病相关的关键病理学特征，该慢性自身免疫病包括类风湿性关节炎、克罗恩病、系统性红斑狼疮和硬皮病。代表迫切未满足的医疗需求的疾病包括特发性肺纤维化 (IPF)、硬皮病和非酒精性脂肪性肝炎 (NASH) 相关的肝纤维化。预计 NASH 相关肝纤维化的增加的发病率直接与 2 型糖尿病和肥胖症的发病率并列。

[0003] 硬皮病是一种罕见的慢性自身免疫病，其特征在于正常组织被致密的厚纤维组织替代。尽管硬皮病的确切根本原因未知，但该疾病通常涉及免疫细胞介导的皮肤肌成纤维细胞的活化，从而导致过量细胞外基质蛋白 (例如，I 型胶原蛋白) 的沉积，这导致皮肤变厚，并且在一些情况下导致多个器官的硬化和最终衰竭。目前，硬皮病尚没有治愈性方法。其治疗仅限于尝试控制症状，并且通常需要方法的联合。尽管局限于皮肤的硬皮病通常不危及生命，但影响多个内脏器官的系统性硬皮病可能是威胁生命的疾病。

[0115] 在一些实施方案中，该方法进一步包括确定一种或多种额外的测试剂是否是纤维化的抑制剂。在一些实施方案中，确定一种或多种额外的测试剂是否被鉴定为纤维化的抑制剂基于第一样品中的肌成纤维细胞组成与所述一个或多个额外的样品中的肌成纤维细胞组成的比较。在一些实施方案中，如果所述一个或多个额外的样品中的肌成纤维细胞组成低于第一样品中的肌成纤维细胞组成，则将第一测试剂鉴定为纤维化的抑制剂。在一些实施方案中，如果所述一个或多个额外的样品中的肌成纤维细胞组成比第一样品中的肌成纤维细胞组成低至少约 5％、10％、15％、20％、25％、30％、35％、40％、45％、50％、55％、60％、65％、70％、75％、80％、85％或 90％，则将第一测试剂鉴定为纤维化的抑制剂。在一些实施方案中，如果所述一个或多个额外的样品中的肌成纤维细胞组成比第一样品中的肌成纤维细胞组成低至少约 1.5、2、2.5、3、3.5、4、4.5、5、6、7、8、9、10、11、12、13、14 或 15 倍，则将第一测试剂鉴定为纤维化的抑制剂。

具体实施方式

[0138] 纤维化是一个极为重要却令人惊讶地被忽视的健康问题。在西方国家，所有自然死亡中的近 45％归因于慢性纤维增生性疾病。然而，目前只有一种在临床上批准的药物（吡非尼酮）专门针对纤维化的发病机理并且直接表明用于纤维化疾病的治疗。纤维化影响身体几乎每一个组织，并且当其高度进展时，可以导致器官功能失常和死亡。显然，对新型抗纤维化药物的鉴定是尚未得到满足的医疗需求，其将对多种疾病人群中的患者具有显著的有益影响。此外，目前硬皮病尚没有治愈性方法，而治疗仅限于症状控制。

[0139] 纤维化，通常被定义为过量结缔组织的产生，是由于多种潜在疾病而发生的。慢性炎症或组织损伤 / 重塑是典型的诱发纤维化的事件。纤维化影响身体几乎每一个组织，并且当其高度进展时，可以导致器官功能失常和死亡。具体的疾病实例包括特发性肺纤维化 (IPF)；与酒精性和非酒精性肝硬化的后期相关的肝纤维化；肾纤维化；心脏纤维化；和由异常创伤愈合导致的瘢痕疙瘩形成。另外，纤维化是与慢性自身免疫病相关的关键病理学特征，该慢性自身免疫病包括类风湿性关节炎、硬皮病、克罗恩病和系统性红斑狼疮。就此而言，纤维化是一个极为重要却令人惊讶地被忽视的健康问题。实际上，在西方国家，所有自然死亡中的近 45％归因于慢性纤维增生性疾病。然而，目前只有一种在临床上批准的药物（吡非尼酮，仅批准在欧洲用于治疗 IPF）专门针对纤维化的发病机理并且直接表明用于纤维化疾病的治疗。遗憾的是，吡非尼酮具有显著的肝和胃肠副作用，因此建议用吡非尼酮治疗的患者避免直接暴露于阳光，因为已知这会引起光敏反应，从而导致皮疹、皮肤干燥或瘙痒。最近，溶血磷脂酸 1(LPA1) 拮抗剂（例如，AM-152）已被证明在 IPF 的临床前模型中是有效的。然而，AM-152 的临床效力仍有待证明。显然，对新型抗纤维化药物的鉴定是一个重要的尚未得到满足的医疗需求，其将对多种疾病人群中的患者具有显著的有益影响。

[0140] 尽管可以在给定组织或器官中引起纤维化过程的疾病和诱因具有多样性，但在迄今研究的所有情况下存在共同的生化和细胞机理。在损害或炎性损伤后，固有的成纤维细胞（在某些情况下，募集的、已经经历上皮向间质转变的来源于骨髓的循环纤维细胞或上皮细胞）被激活并“转分化”为表达 α－平滑肌肌动蛋白（α-SMA）的肌成纤维细胞，其分泌创伤修复所需的细胞外基质 (ECM) 成分。在肝纤维化的情况下，被称为静息肝星形细胞 (HSC) 的固有周细胞群体“转分化”成产生 I 型胶原蛋白的、表达 α-SMA 的、纤维发生的、“活化的”HSC。转化生长因子 β1(TGF-β1) 介导的 Smad 3/4 信号传导通常驱使固有的成

纤维细胞或 HSC 转分化为肌成纤维细胞或活化的 HSC，并在后者群体中刺激 ECM 成分的产生。血小板衍生生长因子 (PDGF) 也充当驱使细胞活化和增殖的共同促纤维化细胞因子。

[0141] 用于治疗进行性纤维化疾病的一种治疗性方法是针对于众多的复杂病因免疫过程中的一种。此方法受到机理明确性的缺乏和基础疾病的潜在恶化的限制。用于治疗不同纤维化疾病的一种有吸引力的替代方法是直接针对于转分化途径，该途径负责静息成纤维细胞与活化的促纤维化肌成纤维细胞的相互转化。能够阻断成纤维细胞向活化肌成纤维细胞转化的药物可以在受伤或损伤（例如，心肌梗死）后预防性地施用，或在能够修复的器官疾病的早期（例如，肝纤维化、IPF 或硬皮病）治疗性地施用。TGF-β1 产生的直接抑制剂（例如，吡非尼酮）不是慢性给药的理想候选物，并且对自身免疫病的治疗而言是特别不可取的，因为它们有恶化自身免疫反应的可能。可替代地，能够诱导存在的肌成纤维细胞向静息细胞命运逆转的药物将在多种组织类型中的纤维化治疗中具有广泛的应用性，并可能潜在地在疾病后期有效。

[0142] 已经使用初级人肺成纤维细胞和初级啮齿动物 HSC 建立了高含量成像试验，其使得能够鉴定抑制肌成纤维细胞形成 / 活化或诱导活化肌成纤维细胞向静息成纤维细胞状态逆转的小分子。已经确定了在适用于高通量小分子筛选的小型化 (384 孔板）形式中促进稳健的体外转分化的条件（包括血清饥饿和后续 TGF-β 处理）。抑制试验基于与成纤维细胞向肌成纤维细胞转分化相关的 α-SMA 免疫荧光染色和细胞形态学变化。使用选择性 ALK-5TGF-β1 受体抑制剂 (SB-43154) 为阳性对照，该抑制试验已被用于开始筛选一批约 100,000 种小分子，这批小分子由生物活性小分子和基于 2D 和 3D 结构多样性以及内在“类药性”性质汇集的多样性集合组成。初步筛选导致鉴定出多个先前确定的抗纤维化分子。由于已知的脱靶毒性问题或证实的体内效力缺乏，这些分子中的大多数具有有限的临床实用性。然而，除这些外，三唑抗真菌剂伊曲康唑也被鉴定为肌成纤维细胞形成的高度有效的抑制剂（在远低于与成纤维细胞或其他对照细胞类型中的毒性相关的剂量的剂量下）。

[0143] 通过使用生化方法（即，Western 印迹和 RT-PCR) 分析与成纤维细胞向肌成纤维细胞的转分化相关的多个基因的表达变化，在体外证实了伊曲康唑的活性。使用药理学方法，此分子的抗纤维化活性的机理基础已经被确定为 hedgehog 信号传导和血管内皮生长因子 (VEFG) 受体糖基化 / 运输的双重抑制（单独的任一活性均不是足够的）。令人鼓舞地，确定了伊曲康唑的活性适用于人和啮齿动物细胞类型，以及来源于多种组织类型（例如，肺、肝、皮肤、心脏）的细胞。使用吡非尼酮和 AM-152 作为基准对照化合物，证明伊曲康唑在博来霉素诱发的肺和四氯化碳诱发的肝纤维化小鼠模型中都具有效力。就此而言，FDA 批准的药物伊曲康唑已经被确定为开发用于治疗多种纤维化相关疾病的新的一类药物的新型先导物。

[0144] 此药物作为抗纤维化药物，特别是在治疗肝纤维化中的应用的潜在限制是已知的肝毒性特征，该特征与 1,2,4 三唑部分的 N4 对血红素铁的配位相关，其导致 P450 酶（最显著的是 Cyp3A4) 的抑制，这是与伊曲康唑的 VEGF 和 Hgh 活性不同的活性。就此而言，旨在鉴定具有有利的肝毒性特征并且抗纤维化效力进一步改善的最优化伊曲康唑类似物的药物化学工作已经开始。从最初的一组约 30 种伊曲康唑类似物（其中 N4 的 pKa 降低或 N4 氮被碳取代）中，已经鉴定了几种候选先导物，其中 Cyp 抑制活性消除而体外抗纤维化活性得到保留。值得注意的是，这些化合物的药代动力学性质与母体化合物的药代动力学性质

是可比的。基于观察到的体外活性、体内效力、啮齿动物血清暴露和人暴露数据，预期对于最终临床候选物，效力和 / 或暴露的 5 倍改善是所期望的。初步构效关系研究显示，通过在三唑取代基远侧的位点处进行修饰，可以实现效力增强。化学工作正在进行并且将被用于优化效力、暴露 (C_{max}>5 倍体外 EC_{50}) 和毒性特征（基于人脱靶组概况分析、hERG 和 AMES 体外毒性试验以及 Cyp 诱导 / 抑制试验）。将用肺和肝啮齿动物纤维化模型对最优化的伊曲康唑类似物证明可重现的疾病改善活性（即，效力等于或大于现有的（吡非尼酮）或未来可能的 (AM-152) 医疗标准的效力）。

[0167] 上述所有基团可以是取代的或未取代的。如本文所使用的术语“取代的”指任何上述基团 (例如，烷基、亚烷基、烷氧基、芳基、环烷基、卤代烷基、杂环基和 / 或杂芳基) 可进一步被官能化，其中至少一个氢原子被连接非氢原子取代基的键所替代。除非在说明书中具体说明，被取代的基团可包括选自以下的一个或多个取代基：氧代、氨基、$-CO_2H$、腈、硝基、羟基、硫代氧基 (thiooxy)、烷基、亚烷基、烷氧基、芳基、环烷基、杂环基、杂芳基、二烷基胺、芳基胺、烷基芳基胺、二芳基胺、三烷基铵 ($-N^+R_3$)、N- 氧化物、酰亚胺和烯胺；在诸如三烷基甲硅烷基、二烷基芳基甲硅烷基、烷基二芳基甲硅烷基、三芳基甲硅烷基的基团中的硅原子，全氟烷基或全氟烷氧基，例如三氟甲基或三氟甲氧基。“取代的”还指其中一个或多个氢原子被连接杂原子的更高级的键 (例如，双键或三键) 所替代的任何上述基团，所述杂原子例如为在氧代、羰基、羧基和酯基团中的氧，和在诸如亚胺、肟、腙和腈的基团中的氮。例如，“取代的”包括其中一个或多个氢原子被 $-NH_2$、$-NR_gC(=O)NR_gR_h$、$-NR_gC(=O)OR_h$、$-NR_gSO_2R_h$、$-OC(=O)NR_gR_h$、$-OR_g$、$-SR_g$、$-SOR_g$、$-SO_2R_g$、$-OSO_2R_g$、$-SO_2OR_g$、$=NSO_2R_g$

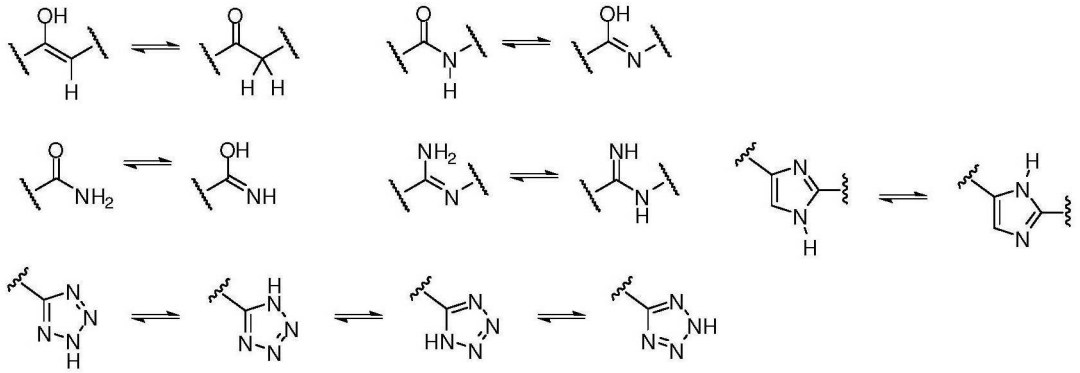
和 $-SO_2NR_gR_h$ 所替代的上述任何基团。在上文中，R_g 和 R_h 相同或不同，并且独立地为氢、烷基、烷氧基、烷基氨基、硫代烷基、芳基、芳烷基、环烷基、环烷基烷基、卤代烷基、杂环基、N- 杂环基、杂环基烷基、杂芳基、N- 杂芳基和 / 或杂芳基烷基。此外，上述取代基中的每一个还可任选地被一个或多个上述取代基所取代。此外，任何上述基团均可被取代，以包括一个或多个内部氧、硫或氮原子。例如，烷基可被一个或多个内部氧原子所取代，以形成醚或聚醚基团。相似地，烷基可被一个或多个内部硫原子所取代，以形成硫醚、二硫化物等。

[0168] 术语“任选的”或“任选地”意指随后描述的事件或情况可能发生或可能不发生，并且该描述包括其中所述事件或情况发生的情形和所述事件或情况不发生的情形。例如，“任选取代的烷基”意指如上所定义的“烷基”或“被取代的烷基”。此外，任选取代的基团可以是未取代的（例如，$-CH_2CH_3$）、完全取代的（例如，$-CF_2CF_3$）、单取代的（例如，$-CH_2CH_2F$），或以在完全取代和单取代之间的任一水平被取代的（例如，$-CH_2CHF_2$、$-CH_2CF_3$、$-CF_2CH_3$、$-CFHCHF_2$ 等）。本领域技术人员将会理解，对于含有一个或多个取代基的任何基团，这些基团并不旨在引入在空间上不能实现的和 / 或在合成上不可行的任何取代或取代模式（例如，被取代的烷基包括任选取代的环烷基，而该环烷基反过来又被定义为包括任选取代的烷基，如此可能无限循环）。因此，所述的任何取代基一般应理解为具有约 1,000 道尔顿，并且更典型地，高达约 500 道尔顿的最大分子量。

[0169] “有效量”或“治疗有效量”指作为单剂量或作为系列剂量的一部分施用于哺乳动物受试者并有效地产生所需治疗效果的化合物的量。

[0170] 对个体（例如，哺乳动物，如人）或细胞的“治疗（处理）”是在试图改变个体或细胞的自然进程中使用的任何类型的干预。在一些实施方案中，治疗包括在病理性事件或与病原体接触开始后施用药物组合物，并包括病况的稳定化（例如，病况不恶化）或病况的缓解。在其他实施方案中，治疗还包括预防性处理（例如当个体被怀疑为患有细菌感染时，施用本文所述的组合物）。

[0171] “互变异构体”指从分子的一个原子到同一分子的另一个原子的质子转移。本文提供的化合物可作为互变异构体存在。互变异构体为通过氢原子的迁移（伴随单键和相邻双键的转换）可相互转化的化合物。在可能发生互变异构的键合排列中，将存在互变异构体的化学平衡。考虑了本文所公开的化合物的所有互变异构形式。互变异构体的确切比例取决于若干因素，包括温度、溶剂和 pH。互变异构体相互转化的一些实例包括：



[0172] 本文所公开的化合物的“代谢物”为当化合物被代谢时所形成的该化合物的衍生物。术语“活性代谢物”指化合物被代谢时所形成的该化合物的生物活性衍生物。如本文所使用的，术语“代谢”指通过其使特定物质被生物体所改变的过程（包括但不限于，水解

反应和由酶催化的反应，如氧化反应）的总和。因此，酶可产生化合物的特定结构改变。例如，细胞色素 P450 催化多种氧化和还原反应，而尿苷二磷酸葡糖醛酸基转移酶催化活化的葡糖醛酸分子转变为芳香醇、脂肪族醇、羧酸、胺和游离巯基。关于代谢的进一步信息可从 The Pharmacological Basis of Therapeutics, 第九版，McGraw-Hill(1996) 中获得。本文所公开的化合物的代谢物可通过以下方法来鉴定：将化合物施用于宿主并对来自该宿主的组织样品进行分析，或将化合物与肝细胞在体外温育并对所得化合物进行分析。这两种方法都是本领域公知的。在一些实施方案中，化合物的代谢物通过氧化过程形成，并对应于相应的含羟基化合物。在一些实施方案中，化合物被代谢成药理活性代谢物。

[0225] 溶剂化物含有化学计量或非化学计量的量的溶剂，并且在一些实施方案中，在与药学上可接受的溶剂如水、乙醇等结晶的过程中形成。当溶剂是水时形成水合物，或者当溶剂是醇时形成醇化物。本文所述化合物的溶剂化物可方便地在本文所述的过程中制备或形成。仅举例来说，可方便地使用包括但不限于二氧杂环己烷、四氢呋喃或甲醇的有机溶剂，通过从水性 / 有机溶剂混合物中再结晶来制备本文所述化合物的水合物。此外，本文提供的化合物可以以非溶剂化以及溶剂化的形式存在。一般而言，对于本文提供的化合物和方法而言，溶剂化形式被视为与非溶剂化形式等同。

多晶型物

[0226] 在一些实施方案中，本文所述的化合物以多晶型物的形式存在。本发明提供通过施用此类多晶型物来治疗疾病的方法。本发明进一步提供通过以药物组合物形式施用此类多晶型物来治疗疾病的方法。

[0227] 因此，本文所述的化合物包括其所有结晶形式，称为多晶型物。多晶型物包括化合物的具有相同元素组成的不同晶体堆积排列。在某些情况下，多晶型物具有不同的 X- 射线衍射图案、红外光谱、熔点、密度、硬度、晶体形状、光学和电学性质、稳定性和溶解度。在某些情况下，诸如再结晶溶剂、结晶速率和储存温度等各种因素使单一晶体形式占优势。

前药

[0228] 在一些实施方案中，本文所述的化合物以前药的形式存在。本发明提供通过施用此类前药来治疗疾病的方法。本发明进一步提供以药物组合物形式施用此类前药来治疗疾病的方法。

[0229] 前药一般为药物前体，其在施用于个体且随后吸收后经由诸如通过代谢途径转化的某一过程转化为具有活性或活性更强的物质。一些前药在前药上具有使其活性较低和 / 或赋予药物溶解性或一些其他性质的化学基团。一旦化学基团从前药上裂解和 / 或修饰，即产生活性药物。因为在一些情况下前药比母体药物更易于施用，前药通常为可用的。例如，它们可通过口服施用而可生物利用，而母体药物则不能。在某些情况下，前药在药物组合物中也具有比母体药物改善的溶解度。前药的一个实例是但不限于如本文所述的化合物，其以酯的形式（“前药”）施用以促进跨过其中水溶性对移动性不利的细胞膜输送，但其随后一旦在水溶性有利的细胞内部则代谢水解成羧酸（活性实体）。前药的另一实例可以是与酸基团键合的短肽（聚氨基酸），其中该肽经代谢以显露活性部分。（参见例如 Bundgaard, “Design and Application of Prodrugs”, A Textbook of Drug Design and Development, Krosgaard-Larsen 和 Bundgaard 编，1991, 第 5 章，113-191，其通过引用并入本文）。

[0230] 在一些实施方案中，前药被设计成可逆性药物衍生物，以用作提高药物向位点特异性组织输送的调节剂。迄今为止，前药的设计是为了提高靶向以水为主要溶剂的区域的治疗性化合物的有效水溶性。

[0231] 另外，本文所述化合物的前药衍生物可通过本文所述或本领域已知的方法制

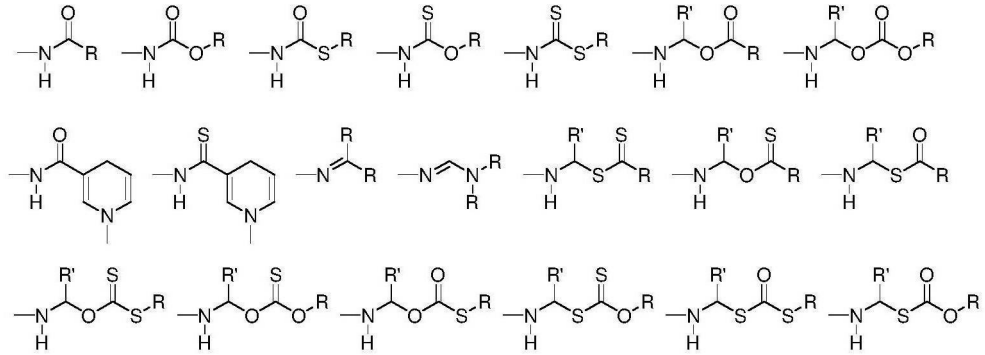
备（关于更多细节，请参见 Saulnier 等人，Bioorganic and Medicinal Chemistry Letters,1994,4,1985）。仅举例而言，可通过使未衍生化的化合物与诸如但不限于氯甲酸 1,1- 酰氧基烷基酯、碳酸对硝基苯基酯等合适的氨基甲酰化试剂反应来制备适当的前药。本文所述化合物的前药形式（其中前药在体内代谢产生如本文所述的衍生物）包括在权利要求书的范围内。实际上，一些本文所述的化合物为另一衍生物或活性化合物的前药。

[0232] 在一些实施方案中，前药包括其中氨基酸残基或具有两个或两个以上（例如 2、3 或 4 个）氨基酸残基的多肽链经由酰胺键或酯键共价连接至本发明化合物的游离氨基、羟基或羧酸基团的化合物。氨基酸残基包括但不限于 20 种天然存在的氨基酸，并且也包括 4- 羟基脯氨酸、羟赖氨酸、锁链赖氨酸 (demosine)、异锁链赖氨酸、3- 甲基组氨酸、正缬氨酸、β - 丙氨酸、γ - 氨基丁酸、瓜氨酸、高半胱氨酸、高丝氨酸、鸟氨酸和甲硫氨酸砜。在其他实施方案中，前药包括其中核酸残基或具有两个或两个以上（例如 2、3 或 4 个）核酸残基的寡核苷酸共价连接至本发明化合物的化合物。

[0233] 本文所述化合物的药学上可接受的前药也包括但不限于酯、碳酸酯、硫代碳酸酯、N- 酰基衍生物、N- 酰氧基烷基衍生物、叔胺的季铵化衍生物、N- 曼尼希碱、席夫碱、氨基酸偶联物、磷酸酯、金属盐和磺酸酯。具有游离氨基、酰胺基、羟基或羧基的化合物可转化为前药。例如，游离羧基可衍生为酰胺或烷基酯。在某些情况下，所有这些前药部分中引入包括但不限于醚、胺和羧酸官能团的基团。

[0234] 羟基前药包括酯，诸如但不限于酰氧基烷基（例如酰氧基甲基、酰氧基乙基）酯、烷氧基羰氧基烷基酯、烷基酯、芳基酯、磷酸酯、磺酸酯、硫酸酯和含有二硫化物的酯；醚、酰胺、氨基甲酸酯、半琥珀酸酯、二甲基氨基乙酸酯和磷酰基氧基甲氧基羰基，如 Advanced Drug Delivery Reviews 1996,19,115 中所概述的。

[0235] 胺衍生的前药包括但不限于以下基团和基团的组合：



以及磺酰胺和磷酰胺。

[0236] 在某些情形下，在任何芳香环部分上的位点易发生各种代谢反应，因此在芳香环结构上并入合适的取代基可减少、最小化或消除该代谢途径。

代谢物

[0237] 在一些实施方案中，式 (I) 或式 (II) 的化合物易发生各种代谢反应。因此在一些实施方案中，将合适的取代基并入结构中将减少、最小化或消除代谢途径。在具体的实施方案中，仅举例而言，减少或消除芳香环对代谢反应的敏感性的合适的取代基为卤素或烷基。

[0238] 在另外的或进一步的实施方案中，式 (I) 或式 (II) 的化合物在施用于有需要的生物体后被代谢以产生代谢物，该代谢物随后用于产生所期望的效果，包括所期望的治疗效

果。

实施例 I :生物学试验

[0371] 使用初级人肺成纤维细胞和初级啮齿动物 HSC 建立了基于与成纤维细胞向肌成纤维细胞转分化相关的 α -SMA 染色和细胞形态学变化的高含量成像试验。确定了在适用于高通量小分子筛选的小型化 (384 孔板) 形式中促进稳健的体外转分化的条件 (包括血清饥饿和后续 TGF-β 处理)。使用选择性 ALK-5TGF-β 1 受体抑制剂 (SB-431542) 作为阳性对照。为期 4 天的试验适用于对数量级为 100,000 的孔进行筛选，并且有利于鉴定选择性抑制成纤维细胞向肌成纤维细胞转分化的化合物。该试验用于鉴定命中化合物 (伊曲康唑) 并用于评价从药物化学工作产生的集中的各组伊曲康唑类似物。

[0372] 通过使用生化方法 (即，Western 印迹和 RT-PCR) 分析与成纤维细胞向肌成纤维细胞转分化相关的多个基因的基因表达的变化，证实了伊曲康唑及其类似物的活性。使用这些为期 4 天的试验以 4 点剂量响应的方式一次评价 6 种化合物的组。

[0373] α -SMA 试验

[0374] 将静息大鼠肝星形细胞接种在用聚 -D- 赖氨酸包被的 384 孔板 (每个孔 350 个细胞) 中的星形细胞培养基 (Sciencell) 中。24 小时温育后，在肝星形细胞培养基中存在 10ng/mL 的 TGF-β 1 的情况下，用指定剂量的伊曲康唑处理细胞 48 小时。在固定并用抗平滑肌肌动蛋白抗体染色后，用 Cellomics 细胞透视成像读取仪分析细胞形态学 (图 1 为代表性图像)。然后分析细胞的 a-SMA 染色的平均细胞面积 (图 5a) 或 SMA 染色的平均荧光强度 (图 5b)。在该试验中，伊曲康唑可重现地诱导了平均细胞面积和 α 平滑肌肌动蛋白染色两者的剂量依赖性减少，表明对肌成纤维细胞转分化和活化的抑制。

[0375] 暴露于 TGFβ 和伊曲康唑 (Itra) 的细胞中纤维化相关蛋白质的 Western 印迹分析

[0376] 将人肺成纤维细胞以 10^5 个细胞 / 孔接种于 6 孔皿中的测定培养基 (2％胎牛血清，DMEM) 中。24 小时温育后，将培养基更换为含有 TGF-β 1(10ng/mL) 的测定培养基，并同时用伊曲康唑 (10μM)、SB431542(10μM) 或载体对照处理 (图 6)。温育 48 小时后，通过短暂的胰蛋白酶化和离心收获细胞。将细胞在 Cell Lytic M(Sigma) 中裂解，并且通过在 260nm 处的吸光度读数对裂解物浓度进行归一化。将样品在 2X 样品缓冲液和 10％ β - 巯基乙醇中煮沸。将三微克裂解物加载到每个凝胶泳道中，然后通过 SDS-PAGE 在 10％ Bis-Tris 凝胶上分离，然后通过半干式转印仪转移到 PVDF 膜上。在含 Tween-20(0.1％) 的 TRIS 缓冲盐水中的 5％乳中封闭后，将膜暴露于合适的第一抗体。将印迹与 HRP 偶联的第二抗体温育，并采用薄膜和 SuperSignal West Dura 化学发光底物 (Pierce) 使其可视化。在该试验中，伊曲康唑可再现地诱导了诱导的 α 平滑肌肌动蛋白水平的剂量依赖性水平降低，表明对肌成纤维细胞转分化和活化的抑制。

[0377] 用伊曲康唑处理的人肺成纤维细胞的基因表达分析

[0378] 将人肺成纤维细胞以 10^5 个细胞 / 孔接种于 6 孔皿中的测定培养基 (在 DMEM 中的 2％胎牛血清) 中。24 小时后，将培养基更换为含有 TGF-β 1(10ng/mL) 和伊曲康唑

(500nM) 的测定培养基。37℃温育 48 小时后,通过短暂的胰蛋白酶化和离心收获细胞。使用 RNeasy 试剂盒 (Qiagen) 提取 RNA,并使用 SuperScript III 第一链合成试剂盒 (Life Technologies) 扩增 cDNA。然后使用提供有板和试剂的集中于纤维化的 RT2Profiler PCR 阵列试剂盒进行 qPCR 反应。每个处理条件每个反应使用 N = 1 分析数据。数据表示为相对于未用 TGF-β1 处理的样品的调节倍数 (图 7a)。来自集中于纤维化的 RT2Profiler PCR 阵列的原始数据在图 7b 中示出。在该试验中,伊曲康唑可再现地诱导了多个纤维化相关基因的剂量依赖性变化,表明对肌成纤维细胞转分化和活化的抑制。

[0379] 伊曲康唑及其类似物的抗纤维化活性不是由与抗真菌活性相关的 P450 抑制造成的。伊曲康唑抑制 VEGF 和 Hedgehog 促纤维化信号途径。

[0380] 用伊曲康唑处理的大鼠肝星形细胞中 Hedgehog 相关基因的 qPCR 分析

[0381] 将大鼠肝星形细胞以 10^5个细胞 / 孔接种在用聚 -D- 赖氨酸包被的 6 孔皿中的星形细胞培养基 (Sciencell) 中,并使其增殖至完全汇合 (约 2 周)。然后将培养基更换为含 1μg/mL SHH-N(R&D systems) 的 DMEM 和 0.5%胎牛血清。用 SHH-N 和化合物 (环杷明 5μM(阳性对照)、伊曲康唑 1μM) 处理细胞 24 小时。通过短暂的胰蛋白酶化和离心收获细胞。使用 RNeasy 试剂盒 (Qiagen) 提取 RNA,并使用 SuperScript III 第一链合成试剂盒 (Life Technologies) 扩增 cDNA。使用 SYBR 绿主混合物 (Takara) 进行 qPCR。PTCH1(蛋白质修补 (patch) 同系物 1) 和 GLI1(GLI 家族锌指 1)mRNA 的相对水平 (见图 8a 和 8b ;qPCR 实验的原始数据均在图 8c 中示出) 表明,伊曲康唑抑制大鼠肝星形细胞中的 Hedgehog 信号传导。

[0382] Smoothened 敲减后 COL1-GFP HSC 的 Western 印迹分析

[0383] 将 COL1-GFP HSC(GFP 敲入胶原蛋白基因座的无限增殖化小鼠肝星形细胞系) 以 7.5^5个细胞 / 孔接种到测定培养基 (10%胎牛血清,DMEM) 中。24 小时后,用慢病毒颗粒转导细胞。与病毒颗粒温育 24 小时后,将细胞切换至新鲜的测定培养基中并温育 48 小时。将细胞在 Cell Lytic M(Sigma) 中裂解,并且通过在 260nm 处的吸光度读数对裂解物浓度进行归一化。将样品在 2X 样品缓冲液和 10% β- 巯基乙醇中煮沸。将等量的裂解物加载到每个凝胶泳道中,然后通过 SDS-PAGE 在 10% Bis-Tris 凝胶上分离,然后通过半干式转印仪转移到 PVDF 膜上。在含 Tween-20(0.1%) 的 TRIS 缓冲盐水中的 5%乳中封闭后,将膜暴露于合适的第一抗体。将印迹与 HRP 偶联的第二抗体温育,并采用薄膜和 SuperSignal West Dura 化学发光底物 (Pierce) 使其可视化 ;见图 9。用于慢病毒递送的 shRNA 的构建体以 MISSION 甘油储备物的形式从 Sigma 获得。采用 293T 细胞和包装载体 pMD2.G 和 pSPAX2 包装慢病毒。克隆 71、12 和 95 对应于针对 SMO 的 shRNA,pLKO 是编码非靶向 shRNA 的质粒 SCH002。shRNA 介导的 SMO 敲减和所导致的大鼠肝星形细胞中 Hedgehog 信号传导的抑制部分地说明 (recapitulated) 了伊曲康唑的抗纤维化活性。

[0385] 将静息大鼠肝星形细胞以 10^5个细胞 / 孔接种在用聚 -D- 赖氨酸包被的 6 孔皿中的星形细胞培养基 (Sciencell) 中。温育 24 小时后,用不同剂量的伊曲康唑处理细胞 24 小时。通过短暂的胰蛋白酶化和离心收获细胞。将细胞在 Cell Lytic M(Sigma) 中裂解,并且通过在 260nm 处的吸光度读数对裂解物浓度进行归一化。将样品在 2X 样品缓冲液和 10% β- 巯基乙醇中煮沸。将等量的裂解物加载到每个凝胶泳道中,然后通过 SDS-PAGE 在 10%

Bis-Tris 凝胶上分离，然后通过半干式转印仪转移到 PVDF 膜上。在含 Tween-20(0.1％）的 TRIS 缓冲盐水中的 5％乳中封闭后，将膜暴露于合适的第一抗体。将印迹与 HRP 偶联的第二抗体温育，并采用薄膜和 SuperSignal West Dura 化学发光底物 (Pierce) 使其可视化；见图 10。伊曲康唑抑制了 VEGFR2 糖基化和运输，由此导致大鼠肝星形细胞中的促纤维化 VEGF 信号传导的抑制。

[0387] 将静息大鼠肝星形细胞以 10^5个细胞 / 孔接种在用聚 -D- 赖氨酸包被的 6 孔皿中的星形细胞培养基 (Sciencell) 中。24 小时温育后，将细胞切换至含 10ng/mL TGF-β1 和指定化合物组合的星形细胞培养基。48 小时的处理后，通过短暂的胰蛋白酶化和离心收获细胞。将细胞在 Cell Lytic M(Sigma) 中裂解，并且通过在 260nm 处的吸光度读数对裂解物浓度进行归一化。将样品在 2X 样品缓冲液和 10％ β- 巯基乙醇中煮沸。将三微克裂解物加载到每个凝胶泳道中，然后通过 SDS-PAGE 在 10％ Bis-Tris 凝胶上分离，然后通过半干式转印仪转移到 PVDF 膜上。在含 Tween-20(0.1％）的 TRIS 缓冲盐水中的 5％乳中封闭后，将膜暴露于合适的第一抗体。将印迹与 HRP 偶联的第二抗体温育，并采用薄膜和 SuperSignal West Dura 化学发光底物 (Pierce) 使其可视化；见图 11。大鼠肝星形细胞中 VEGF 或 Hedgehog 信号传导的药理学抑制部分地说明了伊曲康唑或其类似物的抗纤维化活性。大鼠肝星形细胞中 VEGF 和 Hedgehog 信号传导的双重药理学抑制说明了伊曲康唑的抗纤维化活性。

Cyp 可逆抑制试验

[0393] 本试验的目的是使用底物探针转换 (turnover) 作为抑制的替代物,用给定化合物确定 Cyp 酶的可逆抑制。这使用人肝微粒体而不是分离的酶进行,以解释母体药物的代谢物通过 Cyp 抑制导致潜在的药物 - 药物相互作用。通过 LCMSMS(Q1/Q2 = 342.2/203.2)监测底物转换 (例如,咪达唑仑向羟基咪达唑仑的转化)。在从 50μM 开始至 50nM(约 3 倍稀释系列) 的 7 点剂量响应曲线中对测试化合物进行测试。对于 Cyp 3A4,阳性对照化合物是 IC_{50}约为 25nM 的酮康唑。

[0394] 详细方案如下 :

●制备测试化合物和标准抑制剂工作溶液 (100×)。

●将微粒体从 -80℃冰箱中取出以在冰上融化,标以日期并在使用后立即放回冰箱。

●向对应的孔添加 20μL 的底物溶液。

●向空白孔添加 20μL PB。

●向对应的孔添加 2μL 的测试化合物和阳性对照工作溶液。

●向无抑制剂孔和空白孔添加 2μL MeOH。

●制备 HLM 工作溶液。

●向温育板的所有孔添加 158μL 的 HLM 工作溶液。

●在 37℃水浴下预热该板约 10min。

●制备 NADPH 辅因子溶液。

●向所有温育孔添加 20μL NADPH 辅因子。

●在 37℃水浴下混合并温育 10 分钟。

●在该时间点，通过添加 400 μL 冷终止溶液（ACN 中的 200ng/mL 甲苯磺丁脲）终止反应。

●将样品以 4000rpm 离心 20 分钟以使蛋白质沉淀。

●将 200 μL 上清液转移至 200 μL HPLC 水中并摇动 10min。

●通过 LC/MS/MS 分析样品。

[0395] 通过该试验获得的化合物数据在表 2 中示出。

Cyp 时间依赖性抑制 (TDI) 试验

[0396] 本试验的目的是确定化合物在人肝微粒体中形成不可逆抑制的细胞色素 P450 加合物 (adduct)(也称为基于机理的抑制 (MBI)) 的能力。相比于竞争性的 CYP 抑制，已经认识到 MBI 在药物发现和开发中受到更大的关注，因为 CYP 的灭活可以导致非线性药代动力学并低估药物 - 药物相互作用潜力。来自该试验的数据与可逆抑制试验结合使用。TDI 试验通常在肝微粒体中进行，以评价母体药物以及代谢物的 PDI 潜力。读出值是存在允许将化合物转化为反应性物质的 NADPH(灭活 /TDI 组) 和不存在 NADPH(用于校正 20 分钟预温育期间蛋白质降解的对照组) 时的 IC_{50}变化。然后这两个温育组均用含有 NADPH Cyp 特异性底物 (咪达唑仑用于 Cyp3A4) 的新鲜测定缓冲液稀释，并通过 LC-MS/MS(Q1/Q2 = m/z 342.2/203.2) 测量咪达唑仑羟基化的抑制。IC_{50}变化 >1.5 倍被认为对时间依赖性抑制是阳性的，其中 20min 预温育导致效力增加。使用醋竹桃霉素作为阳性对照化合物，展现出 TDI IC_{50}变化 >20。在从 50 μM 开始至 50nM(约 3 倍稀释系列) 的 7 点剂量响应曲线中对测试化合物进行测试。

[0397] 详细方案如下：

●在 1:1DMSO/MeOH 中制备测试化合物和阳性对照工作溶液 (100×)。

●将微粒体从 -80℃冰箱中取出以融化。

●制备温育混合物并向温育板的所有孔添加 147.5 μL。

●制备辅因子溶液和底物稀释溶液。

○向对应的孔添加 2.5 μL 的测试化合物和阳性对照工作溶液。最终化合物浓度在 50 μM 至 50nM 的 7 点剂量响应中。

○向 NIC 孔添加 2.5 μL 1:1DMSO/MeOH。

●将该板在 37℃下预热约 10min。

●向预温育孔添加 50μL 辅因子。

●向温育孔添加 50μL 的底物稀释溶液。

●在 37℃水浴下混合并预温育 20 分钟。

●向温育孔添加 50μL 辅因子；

○向预温育孔添加 50μL 的底物稀释溶液。

●在 37℃水浴下混合并温育 5 分钟。

●在该时间点，通过向所有孔添加 250μL IS 强化的终止溶液终止反应。

●将温育板以 4000rpm 离心 20 分钟。

●将 200μL 上清液转移至 200μL HPLC 水中并摇动 10min。

●通过 LCMS 分析样品。

PXR(Cyp 3A4) 活化试验

[0399] 通过采用 P450--Glo™ CYP3A4 试验，用萤光素—IPA 作为 CYP3A4 的底物，评价了 CYP3A4 代谢，并表示为 RLU（相对发光单位）。使用萤光素酶检测试剂 ONE--Glo™评价 PXR 活化并表示为 RLU。发光的光强度与 DPX2 细胞中 PXR 活化和伴随基因转录的程度成正比。在该试验中在 10、1 和 0.1μM 下测试化合物。诱导倍数＝（化合物处理的样品的 RLU/RFU)/（载体处理的样品的 RLU/RFU)，RFU 是细胞活力的信号。RLU 是 CYP3A 代谢和 PXR 活化的信号。使用 0.1％ DMSO 作为载体。通过使用 CellTiter--Fluor™检测细胞活力，并表示为 RFU（相对荧光单位）。

[0400] 活化效力被确定为阴性、弱、适中和强。阴性、弱、适中和强活化剂分别是达到 10μM RIF 在 10μM 下产生的响应的 <15％、<40％、<69％和 >70％的那些活化剂。

白色假丝酵母抗真菌 MIC 效力测定

[0402] 采用野生型白色假丝酵母 (ATCC 10231)，氟康唑、两性霉素 B、伊曲康唑和特比萘芬从 Sigma 购买并用作阳性对照。

[0403] 所有测试化合物和氟康唑的最高测定浓度为 100μM。氟康唑还在 64μg/ml 的最高浓度下进行了测试，而两性霉素 B 和特比萘芬在 16 和 64μg/ml 下进行测试。测试化合物以 10mM 的浓度存在于 DMSO 储备溶液中。以 10mM 和 6.4mg/ml 制备氟康唑在 DMSO 中的两种储备溶液。以 1.6mg/ml 和 6.4mg/ml 制备两性霉素 B 和特比萘芬在 DMSO 中的储备溶液。

[0404] 100X 储备溶液的系列稀释：将 4μl 储备溶液添加至无菌 u 形底 96 孔板的行的第一孔中的 196μl RPMI1640(MOPS 缓冲的，并且没有 HEPES 和碳酸氢钠）中。其他孔用 100μl RPMI1640 填充。通过将 100μl 溶液转移至下一孔并通过移液混合，直至第 11 孔，连续制得 2 倍系列稀释液。将第 11 孔中额外的 100μl 丢弃。因此，化合物孔含有 100μl 在 RPMI1640 中的 2× 测试浓度的药物。第 12 孔仅用 100μl RPMI1640 填充。

[0405] 将白色假丝酵母 3147(ATCC 10231) 甘油冷冻储备物在 Sabouraud 右旋糖琼脂 (SDA) 上划线。将板在 35℃环境气氛下温育 20h。将单菌落悬浮在无菌盐水中，直至使用 Siemens 浊度仪测得浊度达到 0.1(1-5×10^6CFU/ml)。该悬浮液在 15ml 锥形管中的 RPMI1640 中稀释 50×，然后进一步在 50ml 锥形管中的 RPMI1640 中稀释 20×。这产生了 1-5×10^3CFU/ml 的悬浮液并将其用作接种物。对接种物中的细胞密度进行平板计数，为 4.94×10^3CFU/ml。

[0406] MIC 测定：在 15min 内，将 100μl 制备的细菌接种物添加至含化合物 /RPMI1640 的板的每个孔中。将板在 35℃和环境气氛下温育。在 24h 和 48h 时拍摄照片。根据 M27-A3 方案（临床和实验室标准化学会 (Clinical and Laboratory Standards Institute) 于 2008 年 1 月 1 日发表的 Reference Method for Broth Dilution Antifungal Susceptibility Testing of Yeasts；Approved Standard- 第三版，M27-A3 标准）读取氟康唑和两性霉素 B 的 MIC 终点。测试化合物和特比萘芬的化合物的 MIC（未在 M27-A3 方案中提及）按其为唑类读取。

[0407] 在该测定中测得的化合物数据在表 5 中示出。

小鼠药代动力学 (PK) 研究

[0408] 具有合适的体外 ADME 性质的化合物进一步进行体内 PK 研究。使用在小鼠中的快照 (snapshot) 形式快速评价先导候选物的口服可利用的潜力。快照形式涉及在标准载体 (例如,5% PEG/DMSO 水溶液) 中口服给予的单剂量 (通常为 20mg/kg)。将化合物直接注入 MS 分析中,以确定独特的 MRM(多反应监测) 信号,该信号以 ESI 阳性或阴性模式是浓度依赖性的。使用从有机溶液至水溶液的多种溶剂梯度进行 HPLC 分析,以确保期望的 Q1/Q2 质量的良好峰形。制剂包括 45%环糊精的水溶液 (如临床上针对伊曲康唑使用的)。可以使用的其他制剂为 solutol、Eudragit、MC/Tween 等。使用雌性小鼠肝素化的血浆,使用掺加不同浓度 (10ng/mL 至 2000ng/mL) 的化合物的血浆生成标准曲线,以确定 Q1/Q2 质量信号相对于化合物浓度的线性范围。对小鼠进行化合物的口服给药,通过眼眶后取血收集血浆样品。在 5 个时间点 (30min、1h、4h、8h、24h) 收集至肝素化的收集管中。进行蛋白质沉淀,化合物在冷乙腈中萃取并通过 MS 进行分析。如需要,将 Nonwinlin 用于 PK 建模。

[0409] 研究结果在表 6 中呈现。

实施例 II :动物模型

[0410] 为证明体内抗纤维化活性,建立了四氯化碳 (CCl_4) 诱发的肝及博来霉素诱发的肺和皮肤啮齿动物纤维化模型。这些体内试验耗时 6-8 周完成 (包括完整的组织学分析)。典型的实验由包括 6-8 只动物的组组成,这些动物用伊曲康唑 (2-4 个剂量)、1 或 2 种伊曲康唑类似物 (2-4 个剂量)、载体和基准治疗 (吡非尼酮和 AM-152) 来处理。AM-152(Amira Pharmaceuticals) 是 LPA1(溶血磷脂酸 1) 受体拮抗剂。该目标已经被描述为与小鼠博来霉素模型中 IPF 系统的恶化相关 (British Journal of Pharmacology(2010),160,1699 - 1713)。如先前已经在 WO 2012/078805 中更详细描述的,AM-152 在该目标上是在先的 (advanced) 化合物,因此将其用作阳性对照和本申请中公开的化合物的比较剂。

[0411] 博来霉素诱发的肺纤维化模型

[0412] 向九周龄的 B6 雄性小鼠 (Taconic farms) 中手术植入持续 7 天递送 25mg/kg 博来霉素的渗透泵。手术后 17 天,用药物治疗小鼠两周。如研究设计中描述的施用药物治疗 (图 14)。先前描述的抗纤维化药物 AM-152 和吡非尼酮被用作阳性对照药物。用 Masson 三色染色对肺切片进行染色,并且在扫描后,每个动物取八个随机区域进行分析。数据表示为平均值和标准差 (s.e.m.)(图 15a)。用于评价抗纤维化药物的模型的图示在图 15b 中示出。来自指定治疗组的 Masson 三色染色的肺的代表性图像在图 15c 中示出。根据改良的 Ashcroft 评分系统 (图 16),使用无偏差的自动化图像分析方法分析染色的肺切片。使用 ImageJ 中的自动化图像分析宏生成 Masson 三色染色总面积。然后将每个图像转化为 RGB 堆栈 (stack),并且设置染色面积的阈值,使得仅肺组织被包含在分析中而空的间隙如呼吸导管和肺泡被排除在外。然后使用 ImageJ 内的面积测量功能确定总染色面积。平均 Ashcroft 得分和平均染色面积百分比值表明,伊曲康唑及其类似物以剂量依赖性的方式减轻了该模型中的肺纤维化疾病严重程度 (图 17a 和图 17b)。在 10mg/kg(SID) 的剂量下,化合物 42 减轻了肺纤维化疾病严重程度,其效力与对照化合物 AM-152(30mg/kg BID) 和吡非尼酮 (400mg/kg,BID) 相比同样好或更好。

[0413] 四氯化碳诱发的肝纤维化模型

[0414] 如研究设计中描述的施用药物治疗(图18)。用天狼星红溶液对肝切片进行染色。扫描后,每只动物生成5幅随机图像。使用Image J中的自动化图像宏产生天狼星红染色阳性的总面积百分比。简而言之,每幅图像均转化为RGB堆栈,并且设置染色面积的阈值,使得分析中不包含细胞核。使用ImageJ内的面积测量功能定量确定总红色面积(图19a)。CCl_4诱发的肝纤维化模型的图像分析的数值数据在图19b中示出。CCl_4诱发的肝纤维化模型的天狼星红染色肝切片的代表性图像在图19c中示出。通过Western印迹分析肝中α平滑肌肌动蛋白(αSMA)的水平(图19d)。使用匀浆器和钢球将来自CCl_4诱发肝纤维化模型的肝的小片在PBS中匀浆化。通过离心丢弃残渣,并通过在260nm处的Nanodrop吸光度测定确定浓缩的裂解物。将等量的裂解物加载到每个凝胶泳道中,然后通过SDS-PAGE在10%Bis-Tris凝胶上分离,然后通过半干式转印仪转移到PVDF膜上。在含Tween-20(0.1%)的TRIS缓冲盐水中的5%乳中封闭后,将膜暴露于合适的第一抗体。将印迹与HRP偶联的第二抗体温育,并采用薄膜和SuperSignal West Dura化学发光底物(Pierce)使其可视化。天狼星红染色和Western印迹分析表明,伊曲康唑以剂量依赖的方式减轻肝纤维化疾病严重程度。

[0415] 啮齿动物创伤愈合模型

[0416] 使用标准啮齿动物创伤愈合模型,评价了伊曲康唑及其类似物对正常创伤愈合的影响(研究设计示于图20;结果在图21中)。该模型开始前五天,将小鼠麻醉并用Nair去除背部皮肤毛发。在第1天,将小鼠称重,并通过刺穿折叠的背部皮肤的整个厚度进行了一个无菌活检穿孔(5mm直径)(总共2x 5mm转盘(dial)孔)。使用卡尺每天测量创伤的大小。在整个研究期间每周监测体重两次。第1天直至研究结束,使用5ml/kg的给药体积每天施用药物治疗(伊曲康唑为25mg/kg,SID,化合物42或载体为25mg/kg SID)。在第7、11和14天,使来自每组的动物安乐死,并收集创伤用于组织学分析。收集创伤时,将创伤连同几mm的周围皮肤一起切出。对于每只动物,收集并固定两片创伤用于组织学分析。基于组织学分析和每天卡尺测量,相比于载体对照,伊曲康唑和化合物42对组织结构或正常创伤愈合速率没有影响。

实施例III:硬皮病的II期临床研究

[0417] 安慰剂对照的、随机化的双盲II期临床试验显示了优化的抗纤维化伊曲康唑类似物在弥漫性皮肤硬皮病或系统性硬皮病伴弥漫性皮肤累及的患者中的概念验证。满足入选标准的患者组成两个各30人的同等组。实验组每天被给予单次高剂量的药物持续6个月,而安慰剂比较组将每天给予安慰剂持续6个月。药物的单次高剂量根据临床前效力、临床前食蟹猴毒理学研究中的目标契合(engagement)和I期安全性研究来确定。主要结果评价是基于纳入时与每月访视之间的m-RSS(分数0-51,17个部位)的变化百分比,药物与安慰剂的效力比较。次要结果评价是基于纳入时与随访时间点(1、3和6个月)之间的m-RSS变化,药物与安慰剂的效力比较;目标契合的评价,其使用在纳入时和6个月时获得的皮肤活检物,通过hedgehog和VEGFR靶基因的表达谱分析来确定;使用皮肤活检物对纳入时和6个月时的皮肤厚度的评估;在系统性硬皮病患者中对非皮肤症状的治疗的评价;使用健康评价问卷和皮肤病学生活质量指数(Dermatology Quality of Life Index)对生活质量的评价;以及使用副作用的临床和实验室监测对治疗耐受性的评价(包括使用心脏

超声对阴性变力性效应的指征的评价）。如果 >40％的患者有 m-RSS 改善（定义为基线与 6 个月时的最后研究访视之间 m-RSS 下降≥ 5.3 单位），则将确定概念验证成功。

[0418] 精确的目标患者群体由诊断为弥漫性（或重度）皮肤硬皮病（改良的 Rodnan 皮肤得分 m-RSS ≥ 16/51）的患者组成。诊断为局部弥漫性皮肤硬皮病或系统性硬皮病伴弥漫性皮肤累及的患者（由美国风湿病学会 (American College of Rheumatology) 确定的）是已知的患者亚组。

[0419] II 期概念验证研究的患者招募的入选和排除标准如下。患者为 18 岁或以上，有皮肤或系统性硬皮病的诊断记录。需要指示弥漫性皮肤硬皮病的≥ 16/51 的基线 m-RSS。入选需要入选前的心脏超声射血分数得分大于 55％（即正常）。如果患者在试验开始前的 3 个月内已接受有可能干扰病程的药物（例如，甲氨蝶呤、皮质类固醇、环磷酰胺、波生坦）的治疗，则患者将被排除。患有严重器官衰竭、慢性肝病（例如，肝硬化、慢性肝炎）、癌症、慢性疾病（例如，类风湿性关节炎、系统性红斑狼疮、糖尿病、HIV）或具有异常血液化学的患者将被排除。在入选前不到 4 周内有过重大手术的患者将被排除。如产品说明书中说明的，禁忌伊曲康唑的患者将被排除。具体而言，有心室功能障碍（例如，充血性心力衰竭，CHF）的迹象、有 CHF 风险或已经接受变力性药物治疗的患者将被排除。在入选前不到 6 个月内发生心肌梗死的患者将被排除。

[0420] 确定并选择了包含在 II 期概念验证研究中的患者，以在美国的多个地点与皮肤科临床医生合作治疗。作为硬皮病临床试验团体 (Scleroderma Clinical Trials Consortium) 成员的协调研究者监督患者的招募并担任研究的主席。患者被诊断为局部弥漫性皮肤硬皮病或系统性硬皮病伴弥漫性皮肤累及。基于硬皮病诊断（即，局部的或系统性的）、性别和年龄对患者进行分层，以确保治疗群体内的同等分布。另外，基于皮肤累及的严重程度对患者进行分层，以确保治疗群体内有相等人数的患者具有严重的皮肤累及 (m-RSS ≥ 20/51)。该分层需要包括皮肤硬化度量和皮肤活检的初始诊断试验。患者需在入选前经历心脏超声诊断试验，以确保心脏功能正常（射血分数得分 >55％）。

[0421] 由于目前没有直接指明抑制硬皮病患者中的纤维化的疗法，因此在患者的研究中没有使用比较剂。新药剂单独给药。监测施用任何药物的患者，以确保新药剂不改变所用药物的药代动力学和代谢性质。

[0422] 确定改良 Rodnan 皮肤得分 (m-RSS)，使用可测量的和经验证的生物标志物来评价在硬皮病患者中的临床效力。简而言之，将总皮肤表面任意地分成 17 个部位。在每一区域中，采用手动触诊来估计皮肤得分。皮肤得分基于皮肤增厚程度从 0 至 3 变化 (1，未累及；2，轻度；2，中度；3，重度）。总皮肤得分为 17 个区域中的每一个的得分之和（最大得分为 51)。得分在 16 到 19 之间的患者被分类为弥漫性的，而得分≥ 20 的患者被分类为重度的。该皮肤评分系统已经被证明与真皮纤维化的程度非常好地相关，并且与内脏器官的纤维化 / 功能障碍的程度（在系统性硬皮病患者红）也很好地相关。皮肤中的目标契合可以通过使用皮肤活检监测 hedgehog 和 VEGFR 靶基因的表达变化而评估。

实施例 IV：特发性肺纤维化的 II 期临床研究

[0423] 本研究的目的是确定式 (I) 和式 (II) 化合物相比于安慰剂，在治疗特发性肺纤维化中的安全性和有效性。该临床试验是干预性的。该临床研究参与者的分配是随机化的；干预模型为平行指定；并且该研究为双盲遮掩（受试者、照护者、研究者）。本临床研究主

要测量用力肺活量的变化率，而次要地基于不良事件、生命体征和临床实验室检测评价安全性。

[0424] 患者招募的入选标准如下：

●随机化时，性别不限，年龄为 40 至 80 岁（含）。

●具有与特发性肺纤维化（IPF）吻合的临床症状。

●在随机化前至少 6 个月并且不超过 48 个月内，已经第一次接受了 IPF 的诊断。诊断日期被定义为第一次可获得的与 IPF/UIP 吻合的 HRCT 或外科肺活检的日期。

●通过高分辨率计算机断层扫描（HRCT）或外科肺活检（SLB）诊断为普通型间质性肺纤维化（UIP）或 IPF。

●在 HRCT 扫描上，纤维化变化（蜂窝状、网状变化）的程度大于肺气肿的程度。

●如果进行，在支气管活检、BAL 或 SLB 上没有支持替代诊断的特征。

●筛选时，预测的支气管扩张剂后 FVC 百分比为 50％至 80％（含）。

●在筛选时与第一天之间，支气管扩张剂后 FVC（以升测量）有变化，该变化小于 10％相对差异，计算为：100％绝对值（筛选 FVC(L)- 第 1 天 FVC(L))/ 筛选时 FVC(L)。

●筛选时，一氧化碳弥散量（DLCO）为 30％至 80％（含）（针对血红蛋白和高度调整）。

●在研究者看来，在之前的一年中，IPF 疾病严重程度的测量值没有改善的迹象。

●筛选时，在 6 分钟行走测试（6MWT）中能够行走 150 米或更远。

●筛选时，显示出在 6MWT 过程中氧饱和度降低 2 个百分点或更多（可以用补充氧气滴定法进行，以保持氧饱和度水平 >88％）。

●能够理解并签署书面知情同意书。

●能理解坚持研究治疗和研究方案的重要性，并愿意在整个研究过程中遵守所有的研究要求，包括伴随用药限制。

●有生育能力的女性（WOCBP）和与 WOCBP 具有活跃性行为的男性必须使用可接受的避孕方法。

[0425] 患者招募的排除标准如下：

i）目标疾病排除

(2) 筛选时，施用支气管扩张剂后 1 秒内用力呼气量（FEV1)/FVC 比小于 0.8。

(3) 筛选时，具有支气管扩张剂响应，其被定义为相比于使用支气管扩张剂前的值，在使用支气管扩张剂后 FEV1 或 FVC 或两者有 12％或更多的绝对增加，以及 200mL 的增加。

ii）医疗史及并发疾病

(1) 具有已知会导致肺纤维化的临床显著的环境暴露史。

(2) 具有已知的对间质性肺病的解释。

(3) 有任何结缔组织疾病的临床诊断。

(4) 当前具有临床显著的哮喘或慢性阻塞性肺疾病。

(5) 有活动性感染的临床证据。

(6) 有任何可能导致显著失能或可能在未来 2 年内需要显著医疗或手术干预的恶性肿瘤史。这不包括针对局部癌症（例如，基底细胞癌）的小手术过程。

(8) 有终末期肝病史。

(9) 有需要透析的终末期肾病史。

(a) 研究性疗法,定义为在参与地点的国家中尚未批准上市用于任何适应症的任何药物。

(b) 任何细胞毒性的、免疫抑制的、细胞因子调节的或受体 - 拮抗剂药剂,包括但不限于硫唑嘌呤、波生坦 (bosetan)、安立生坦、环磷酰胺、环孢菌素、依那西普、伊洛前列素、英夫利昔单抗、白三烯拮抗剂、甲氨喋呤、吗替麦考酚酯、他罗利姆、孟鲁司特、四硫钼酸盐、肿瘤坏死因子 α 抑制剂、NAC、甲磺酸伊马替尼、干扰素 γ-1b、吡非尼酮和酪氨酸激酶抑制剂。

(c) 秋水仙素、肝素和华法林。如果对于同一适应症没有临床上可接受的替代疗法,如果是针对非 IPF 适应症给予,则可以使用西地那非(每日使用);针对勃起功能障碍的间歇使用是允许的。
