Apparatus and Method for Facilitating the Transmission of Vapour Particles Directly into a Nasal Passage

Abstract: There is provided an apparatus for facilitating the transmission of vapour particles directly into a nasal passage, including at least one structural member (22) and at least one absorbent member (34) at each end of the at least one structural member for containing a liquid able to be evaporated to form the vapour particles. Preferably, there are at least two studs (30) positioned at intermediate positions between the ends of the at least one structural member. A method for transmission of vapour particles/medication directly into a nasal passage using the apparatus is also provided.
APPARATUS AND METHOD FOR FACILITATING THE TRANSMISSION OF VAPOUR PARTICLES DIRECTLY INTO A NASAL PASSAGE

FIELD OF INVENTION

The present invention relates to an apparatus and method for facilitating the transmission of vapour particles directly into a nasal passage.

BACKGROUND

Aromatherapy is the use of essences of plants processed as essential oils for therapeutic benefits such as, for example, attaining balance in a human body, enhancing the immunity system, preventing or minimizing illnesses, calming nerves, enhancing attention spans, and so forth. It is incorrect to generalise aromatherapy to be solely reliant on the sense of smell. This is because each essential oil has a unique combination of constituents which interact with the body. It is this interaction with the constituents that provides the beneficial efforts for the body.

At the moment, common techniques used for aromatherapy are:

- Massaging of essential oil onto desired body part(s);
- Hot/Cold Compress: Application of a compress to the desired body part(s) with appropriate amounts of essential oils added to the compress maintained at a preferred temperature;
- Inhaling essential oils by vaporizing the oils using hot water in a basin or bowl;
- Inhaling essential oils by vaporizing the oils using aroma burners;
- Taking baths with drops of essential oils added to the water; and
- Direct inhalation from an absorbent material with drops of essential oils added.

It is widely acknowledged that direct inhalation of essential oils is the best way of reaping the benefits of aromatherapy. Methods of vaporization mentioned above do not maximize the amount of essential oils being vaporized and, consequently,
inhaled. There is significant wastage of essential oils when such methods are employed. As such, the amount of essential oils required must be increased, consequently increasing the cost incurred. Unfortunately, in order to make aromatherapy more economical, impure essential oils augmented with synthetic ingredients are used. Such practices are more often than not detrimental to health due to the inhalation of synthetic substances.

Furthermore, nasal inhalation provides more rapid effectiveness as compared to digestive, oral inhalation or dermal compress as the active ingredients are passed straight to the lungs where they are absorbed directly into the blood stream.

SUMMARY

There is provided an apparatus for facilitating the transmission of vapour particles directly into a nasal passage, including: at least one structural member; and at least one absorbent member at each end of the at least one structural member for containing a liquid able to be evaporated to form the vapour particles. Preferably, there are at least two studs positioned at intermediate positions between the ends of the at least one structural member.

Preferably, the at least one absorbent member is made from a material selected from: sponge, fabric, cotton, paper, wood, absorbent polymers and so forth. It is most preferable that the structural member is made from a material selected from: copper, aluminum, iron, steel, ductile polymers and so forth. The structural member may preferably be coated with a material selected from: PVC, silicon, latex, vinyl, nitrile, synthetic polymer, and so forth.

It is preferable that the at least one absorbent member is located within a holder. The holder may preferably have a perforated disc in its inner rim. The holder may also have a solid disc in its inner rim. The absorbent member may be in a shape selected from: disc-shaped, spherical-shaped, pyramid-shaped, polygonal-shaped, hemispherical-shaped, and so forth. The absorbent member may be used to
contain liquid selected from: essential oils, or liquid medication. The liquid medication may be of the type typically introduced via nasal drops/sprays.

There is also provided an apparatus for facilitating the transmission of vapour particles directly into a nasal passage, including: at least one structural member; and at least one absorbent member enveloping the at least one structural member for containing a liquid able to be evaporated to form the vapour particles.

There is also provided a method for the transmission of vapour particles directly into a nasal passage using the aforementioned apparatus, and a method for the transmission of medication directly into a nasal passage using the aforementioned apparatus.

DESCRIPTION OF DRAWINGS

In order that the invention may be better understood and readily put into practical effect, there shall now be described by way of non-limitative example only preferred embodiments of the present invention, the description being in reference to the accompanying illustrative drawings in which:

Figure 1 is a perspective view of a preferred embodiment;
Figure 2 is an exploded perspective view of a holder of a preferred embodiment;
Figure 3 is top view of an absorbent member;
Figure 4 is a perspective view of an alternative embodiment of the holder;
Figure 5 is a perspective view of an alternative embodiment;
Figure 6 is a perspective view of another alternative embodiment in partial section;
Figure 7 is a perspective view of a further alternative embodiment;
Figure 8 is a side view of a preferred embodiment when in use; and
Figure 9 is a view corresponding to Figure 2 of a final embodiment; and
Figure 10 is a partial side view of the embodiment of Figure 9 when assembled.
DESCRIPTION OF PREFERRED EMBODIMENTS

Referring to Figure 1, there is provided an apparatus 20 for facilitating the transmission of vapour particles directly into a nasal passage. The apparatus 20 may include a structural member 22 with a holder 24 at each of a first end 26, and a second end 28, respectively, of the structural member 22. "At" in the case, may mean at, adjacent to, and in close proximity with. Absorbent members 34 may be located within each holder 24. The structural member 22 may have at least two studs 30 positioned at intermediate positions between the first 26 and second 28 ends of the structural member 22. The structural member 22 may be made of a plurality of components.

The structural member 22 may be flexible and bendable to form a U-shaped structure (as shown). The first 26 and second 28 ends of the structural member 22 may be bent from proximal positions 40 and 42 respectively. This may enhance the fit of the apparatus 20 in the nostrils of a user. The structural member 22 may be made from materials such as, for example, copper, aluminum, iron, steel, ductile polymers, and so forth. The structural member 22 may be coated with materials, such as, for example, PVC, silicon, latex, vinyl, nitrile, synthetic polymers, and so forth. The structural member 22 may be coated with the said materials as it may add comfort to a user of the apparatus 20 by being less abrasive, and by minimizing contact between the skin of the user (which may react adversely/allergically to some materials) and the material of the structural member 22. The material used to coat the structural member 22 may also be skin coloured to camouflage the apparatus 20 when being used in the users' nostrils. The structural member 22 may be bent into a shape whereby the apparatus 20 may securely grip the central nasal bone. Figure 8 shows the apparatus 20 when in use in the nostrils 32 of a user 100.

The studs 30 positioned at intermediate positions between the first 26 and second 28 ends of the structural member 22 may be located at positions that may enhance the grip-ability of the apparatus 20 for ease of handling.
An exploded perspective view of the holder 24 is shown in Figure 2. The holder 24 may have a disc 38 fitted in the inner rim 36 of the holder 24. The disc 38 may be perforated to allow the passage of air or it may be a solid disc. A disc-like absorbent member 34 is shown being placed into the holder 24. The absorbent member 34 may fit and conform to the inner rim 36 of the holder 24 and rest against the disc 38. The absorbent member 34 may be made from a liquid absorbing material such as, for example, sponge, fabric, cotton, paper, wood, absorbent polymers and so forth. The absorbent member 34 may be used to contain liquids, such as, for example, essential oils, or liquid medication. The liquid medication may be typically introduced via nasal drops/sprays. A solid disc may be preferred as it allows the absorbent member 34 to lose its contents through only one surface. This may slow the rate at which the absorbent member 34 dries (i.e., loses its liquid content). The holder 24 may prevent the liquid content in the absorbent member 34 from escaping from the absorbent member 34 as this may cause irritation/an allergic reaction to the user.

Figure 3 shows a top view of the absorbent member 34. The absorbent member 34 may have a plurality of through holes 44 in and through the absorbent member 34. The holes 44 may be present in the absorbent member 34 to facilitate the passage of air through the absorbent member 34 to aid in the evaporation of the liquid content in the absorbent member 34.

Figure 4 shows an alternative embodiment of the holder 24 of the present invention. The absorbent member 34 may be connected to a cavity 46 in the structural member 22. The cavity 46 may extend through all or part of the structural member 22 and acts as reservoir for the liquid. The cavity 46 may be used with a sponge 48 if desired or required. The holder 24 may also have a disc (not shown) located in the inner rim 36 or the holder 24. The cavity 46 (with or without the sponge 48) increases the amount of liquid that may be stored for use by the absorbent member 34. The absorbent member 34 may also have through holes 44.

Figure 5 shows an alternative embodiment of the apparatus 20. The apparatus 20 may include a structural member 22 with absorbent members 50 located at a first
end 26 and a second end 28 respectively of the structural member 22. The structural member 22 may be made from materials such as, for example, copper, aluminum, iron, steel, ductile polymers, and so forth. The structural member 22 may have at least two studs 30 positioned at intermediate positions between the first 26 and second 28 ends of the structural member 22. The absorbent members 50 may be formed from materials, such as, for example, sponge, fabric, cotton, paper, absorbent polymers and so forth; and in different shapes, such as, for example, spherical-shaped, pyramid-shaped, polygonal-shaped, hemispherical-shaped, and so forth. The absorbent members 50 may be soaked with liquid content such as, for example, essential oils, and liquid medication. The liquid medication may be typically introduced via nasal drops/sprays. The apparatus 20 is used in an identical manner as the preferred embodiment of the present invention.

Referring to Figure 6, there is shown another alternative embodiment of the apparatus 20. The apparatus 20 may also include a structural member 22 with nostril plugs 52 located along a length of the structural member 22 from an intermediate position to the first end 26 and a second end 28 respectively. The structural member 22 may be made from materials such as, for example, copper, aluminum, iron, steel, ductile polymers and so forth. The structural member 22 may have at least two studs 30 positioned at intermediate positions between the first 26 and second 28 ends of the structural member 22. Disc-like absorbent members 34 may be inserted into the nostril plugs 52. Plug 52 may have a disc (not shown) fitted in the inner rim 54 of the plug 52. The disc may be perforated to allow the passage of air or it may be a solid disc. The disc-like absorbent member 34 may be placed into the plug 52. The absorbent member 34 may fit and conform to the inner rim 54 of the plug 52 and rest against the disc. The absorbent members 34 may be formed from materials, such as, for example, sponge, fabric, cotton, paper, absorbent polymers and so forth. The absorbent members 50 may be soaked with liquid content such as, for example, essential oils, and liquid medication. The liquid medication may be typically introduced via nasal drops/sprays. The apparatus 20 is used in an identical manner as the preferred embodiment of the present invention. However, this embodiment of the apparatus 20 may be less readily accepted as the
users' would have the appearance of flared nostrils, and may be uncomfortable to the user.

Referring to Figure 7, there is shown yet another alternative embodiment of the apparatus 20. Figure 7a shows the apparatus 20 being bent prior to being placed into the nostrils of a user. Figure 7b shows the apparatus 20 prior to being bent. The apparatus 20 may have a structural member 22 enveloped by an absorbent member 56. The structural member 22 may be made from materials such as, for example, copper, aluminum, iron, steel, ductile polymers and so forth. The absorbent member 56 may be soaked with liquid content such as, for example, essential oils, and liquid medication. The liquid medication may be typically introduced via nasal drops/sprays. The absorbent member 56 may have an adhesive side 58 and a non-adhesive side 60. The adhesive side 58 may be used to adhere the apparatus 20 to the central nasal bone. The apparatus 20 may be bent into a U-shape with each end in each nostril with the adhesive side 58 adhering to the central nasal bone for anchorage to the central nasal bone. The non-adhesive side 60 may be exposed for the circulation of air on the absorbent member 56.

Figure 8 shows the apparatus 20 when in use. A second end 28 of the structural member 22 is placed in one nostril 32 of a user 100 and the first end 26 of the structural member 22 is placed in the other nostril of the user 100. The structural member 22 may be bent by gripping studs at intermediate positions (not shown) between the first 26 and second 28 ends of the structural member 22. This allows for various sizes and shapes of noses, and for various sizes and separation of nostrils. The structural member 22 may be bent such that holder 24 does not cause discomfort to the user 100, and the apparatus 20 does not fall out from the nose of the user 100. Each holder 24 should have at least one absorbent member 34 soaked with liquid content such as, for example, essential oils, and liquid medication. The liquid medication may be typically introduced via nasal drops/sprays. When the apparatus 20 is placed in such a position, the normal breathing of the user 100 would allow for the transmission of vapour particles into a nasal passage. The apparatus 20 may also be used to reduce the effect of foul
smells in environments such as, for example, in washrooms, wet markets, vehicle
exhaust emissions, smoking areas, sewage areas, rubbish clearing areas, and so
forth. Due to the small size of the apparatus 20, coupled with the eliminating of the
burning of essential oils, or external devices, it can be used anywhere and at any
time. Given that the transmission of vapour particles is directly into the nasal
passage of the user 100, discomfort is minimized to people surrounding the user
100 with sensitive noses, and who dislike the smell of the liquid content in the
absorbent members 34.

Most essential oils are anti-septic to some degree. Hence, when the apparatus 20
is employed in the nostril 32 of the user 100, air may be cleansed before entering
the nasal passage and, subsequently, the respiratory system.

Apparatus 20 may also be used to introduce medication through inhalation. There
may be a way to use the apparatus 20 to aid smokers trying to quit smoking
through the use of appropriate essential oils that may simulate the effects of
nicotine or nicotine itself.

Figures 9 and 10 show a variant of the embodiment of Figure 2. Here, the holder
24 has a top rim 92 through which the absorbent member 34 may pass. Each
holder 24 also has an arcuate slot 90 extending around a part of the side wall of the
holder 24, and through which the absorbent member 34 may also pass. There may
be one or more slots 90 around the holder 24. Depending on the number and
location of the slots, the absorbent member 34 may be passed into the holder 24 in
the direction of one of the arrows a, b, c, or d.

Whilst there has been described in the foregoing description preferred
embodiments of the present invention, it will be understood by those skilled in the
technology concerned that many variations or modifications may be made to details
of design or construction without departing from the present invention.

The present invention extends to all features disclosed either individually, or in all
possible permutations and combinations.
CLAIMS

1. An apparatus for facilitating the transmission of vapour particles directly into a nasal passage, including:
   at least one structural member; and
   at least one absorbent member at each end of the at least one structural member for containing a liquid able to be evaporated to form the vapour particles.

2. The apparatus as claimed in claim 1, further including at least two studs positioned at intermediate positions between the ends of the at least one structural member.

3. The apparatus as claimed in either claim 1 or 2, wherein the at least one absorbent member is made from a material selected from the group consisting of: sponge, fabric, cotton, paper, wood, and absorbent polymers.

4. The apparatus as claimed in any one of claims 1 to 3, wherein the structural member is made from a material selected from the group consisting of: copper, aluminum, iron, steel and ductile polymers.

5. The apparatus as claimed in any one of claims 1 to 4, wherein the structural member is coated with a material selected from the group consisting of: PVC, silicon, latex, vinyl, nitrile and synthetic polymers.

6. The apparatus as claimed in any one of claims 1 to 5, wherein the at least one absorbent member is locatable within a holder.

7. The apparatus as claimed in claim 6, wherein the holder has a perforated disc in its inner rim, the disc being one of: solid, and perforated.

8. The apparatus as claimed in claim 6 or claim 7, wherein the holder has a side wall with at least one slot therein for the passage therethrough of the at least one absorbent member.
9. The apparatus as claimed in any one of claims 1 to 8, wherein the absorbent member is in a shaped selected from the group consisting of: disc-shaped, spherical-shaped, pyramid-shaped, polygonal-shaped, and hemispherical-shaped.

10. The apparatus as claimed in any one of claims 1 to 9, wherein the liquid is selected from the group consisting of: essential oils, nicotine and liquid medication.

11. The apparatus as claimed in any one of claims 1 to 10, wherein the structural member is hollow for the least a part of its length.

12. An apparatus for facilitating the transmission of vapour particles directly into a nasal passage, including:
   at least one structural member; and
   at least one absorbent member enveloping the at least one structural member for containing a liquid able to be evaporated to form the vapour particles.

13. The apparatus as claimed in claim 12, wherein the at least one absorbent member is made from a material selected from the group consisting of: sponge, fabric, cotton, paper, and absorbent polymers.

14. The apparatus as claimed in either claim 12 or 13, wherein the structural member is made from a material selected from the group consisting of: copper, aluminum, iron, steel and ductile polymers.

15. The apparatus as claimed in any one of claims 12 to 14, wherein the structural member is coated with a material selected from the group consisting of: PVC, silicon, latex, vinyl, nitrile and synthetic polymers.

16. The apparatus as claimed in any one of claims 12 to 15, wherein the liquid is selected from the group consisting of: essential oils, nicotine and liquid medication.
17. A method for the transmission of vapour particles directly into a nasal passage using the apparatus as claimed in any one of claims 1 to 16.

18. A method for the transmission of medication directly into a nasal passage using the apparatus as claimed in any one of claims 1 to 16.
